- hlt events: hlt1520, hlt2030, hlt3050, minbias
- $Ntuple - Maker$ was used for jet reconstruction and to retrieve information about E_t of calorimeter cells
- Three models of trigger were tested:
  1. Window 12×12 towers sliding 4×4 towers
  2. The same as the first one but then inside this window we calculate E_t for each of the four corners (8×8 towers)
  3. Window 6×6 towers sliding 2×2 towers
- Important notice: During calculations was not applied cut on E_t of individual towers
