NEW PRODUCT RELEASES

- Have released ups v3_3c as current in KITS to fix problem with using wildcarding for ups list under IRIX 5. Beta release of ups 3.4 is available in KITS. The latest beta release is b3_4a, although b3_4b will be there currently.
- Have released emacs v19_29 as current in KITS. OSF1 version available.
- Have released www v2_5 as current in KITS. Contains mosaic 2.5 but omits netscape. Instead instructions on how to obtain netscape and integrate into the www product are provided.
- Have released rbio v8_1c as test in KITS. This is a compiled version of rbio as opposed to the source code only that had been released as a NULL flavor. We have used ups extended flavors to provide all the possible configurations. A base flavor (i.e. IRIX+5) indicates the Operating System type and release with both CPS and OCS capabilities compiled in. The extension of +NOCPS and/or +NOOCS indicate those features are not available in that specific release of the product.
- Have released futil v5_0 as current in KITS after a long test period so we can begin work on futil v5_1. futil v5_1 will contain ispell (formerly in fmh) and a UNIX version of telephone.
- Have released gcc v2_7_0 as current in KITS.

PRODUCTS UNDER DEVELOPMENT

- Working on new release of shells that contains perl Version 5.
- Mail products (exmh v1_6_1, mh v6_8_3, and mailtools v1_0) are in alpha-test phase. Hope to have beta test versions ready both in KITS and on FNALU by the end of the month.
- Working on ghostview v2_0 (also contains ghostscript 3.33). Goal for release is mid-August.

Reminder: Detailed product status is posted weekly in fnal.comp.unix and can be found in WWW at http://www-oss.fnal.gov:8000/uas/
