1. Demonstration of image bug 1

1. Demonstration of image bug

The following paragraph contains an image referenced twice, once for HTML output and once for print output. The two versions of the image are distinguished by the role attribute in the imagedata element.

When the resulting FO file is rendered by fop-0.20.5rc, everything is ok. When the newer version fop-0.20.5rc2 does the rendering, the image appears twice.

Just a sample image caption (this is the last text in the sample file).
