

constructing Panels

Where do panels come from?

Where do panels come from?

Panels started as replacement for Notification Bars.

Panels have since been extended into different forms and for different use cases. This has opened up new interface possibilities but also created *inconsistencies* and *inefficiencies* on top of the an incomplete foundation.

We would like to get to a point where panels are more *predictable*, *coherent* and *polished*.

What types of panels do we currently have?

What types of panels do we currently have?

- 1 Prompt / Notification — e.g. Password
- 2 List / Menu — e.g. History
- 3 Full Featured UI — e.g. Hello!
- 4 Combinations of the above — e.g. Device Permissions

1 *Prompt / Notification*

Prompt / Notification | Overview

Benefits over Notification Bars:

- Contextual — points to an anchor
- Allows for richer UI
- Compact and Contained — doesn't require full width window

Negatives compared to Notification Bars:

- Overlay content, more intrusive — pushes user action

Serious (but fixable) Problems:

- Transient — easy to dismiss/miss/ignore
- Hard to get back to — many icons are not persistent

Prompt / Notification

| *Current List of Notifications*

*Persistent**:

- Password
- Geolocation
- Plugins (CtP)
- Web Notifications
- Blocked Content
- WebRTC
- Pointer Lock

**Should be persistent*

Transient:

- Add-on Install
- Web App Install
- Plugin Install
- Service Install

Prompt / Notification | *Inconsistencies & Problems*

Inconsistently styled and sized notification icons

Too many options, hidden options

Redundant and inconsistent close buttons

Inconsistent native and non-native UI elements

Inconsistent widths

Don't Hide Hide Pointer

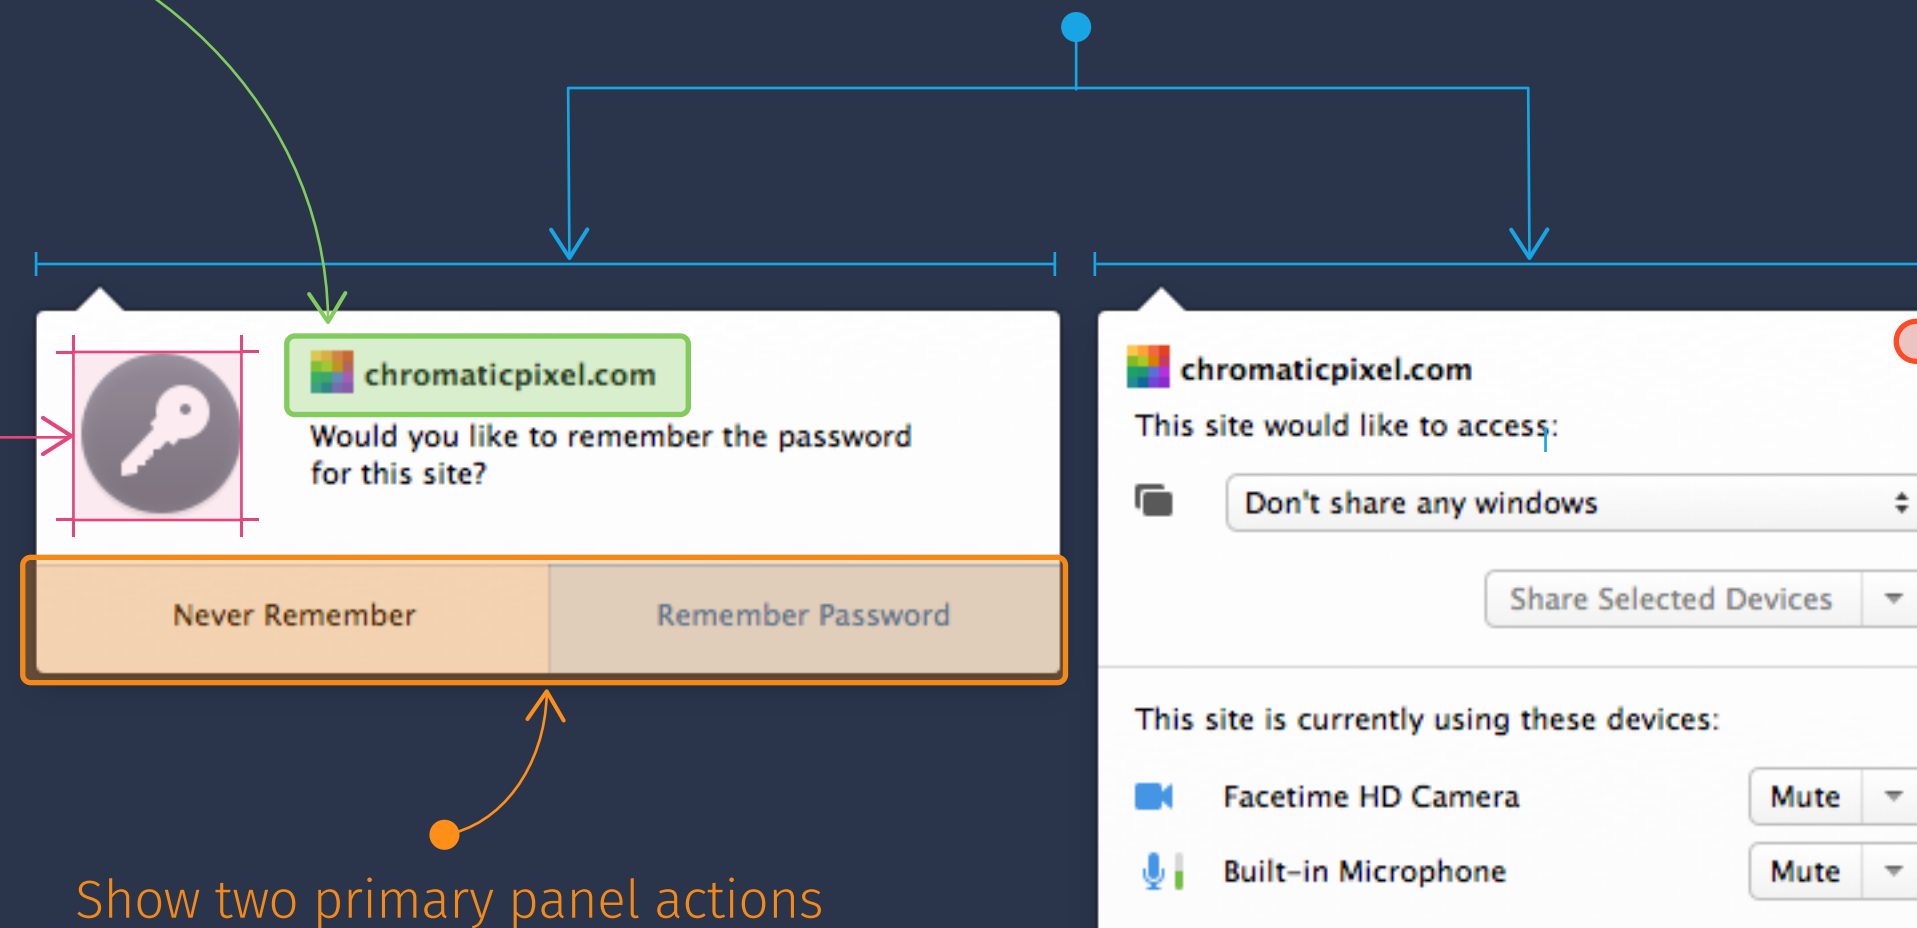

Prompt / Notification | Improvements

Pull the site identity from the message copy to make it clear which site you are granting permissions

Establish a set of consistent default panel widths

Fix Icon style and size

Remove close buttons

Show two primary panel actions for most cases and highlight the default/preferred action

Update all UI elements to a custom appearance

Prompt / Notification | *Stickyness*

Notification icons currently disappear* after you choose an action. It isn't clear how to get them back or where to go if you made a mistake or changed your mind. One solution would be to persist the indicators. This does have some drawbacks...

*Most of them — exceptions being Click-to-Play and Blocked Content

Prompt / Notification | Stickyness

Common case:
- Three-ish icons

Believable case:
- Device Permissions
- Geolocation
- Plugin
- Content Protection

Worst case:
- All the permissions!

Prompt / Notification | *Stickyness*

Out of scope for this bug, another option would be to explore a redesign of the site identity UI to contain all the passive permissions.

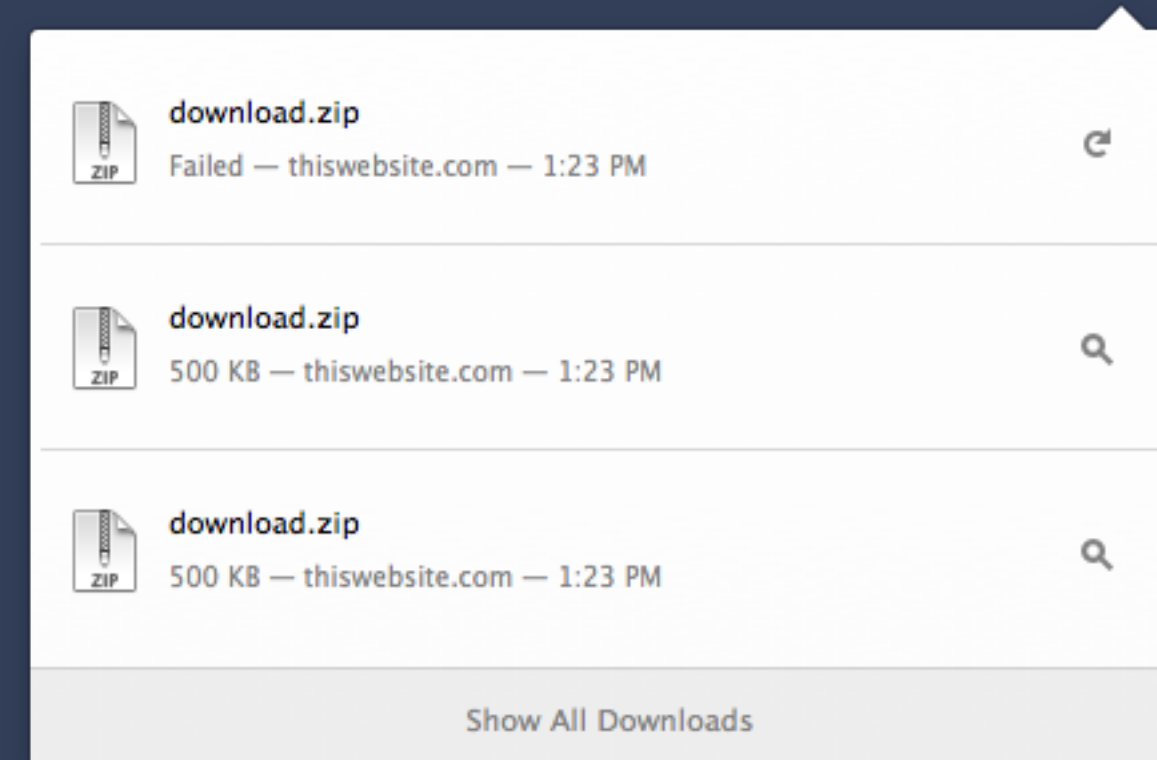

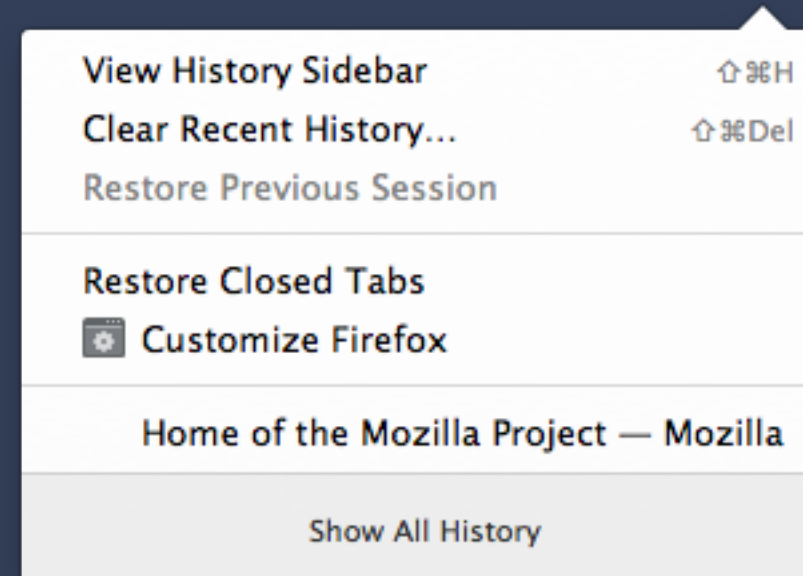

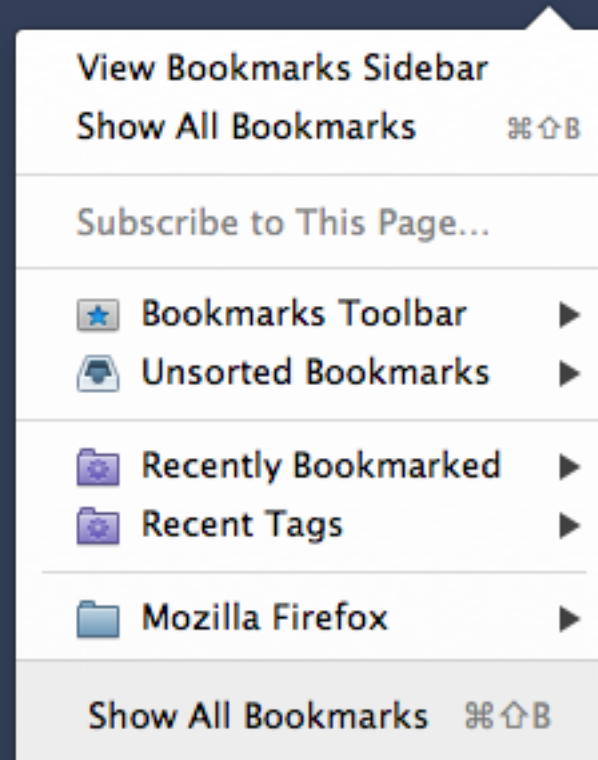

2 *List / Menu*

List panels are much like traditional menus, with the significant differences being more *versatility* and *options for enhanced list items*.

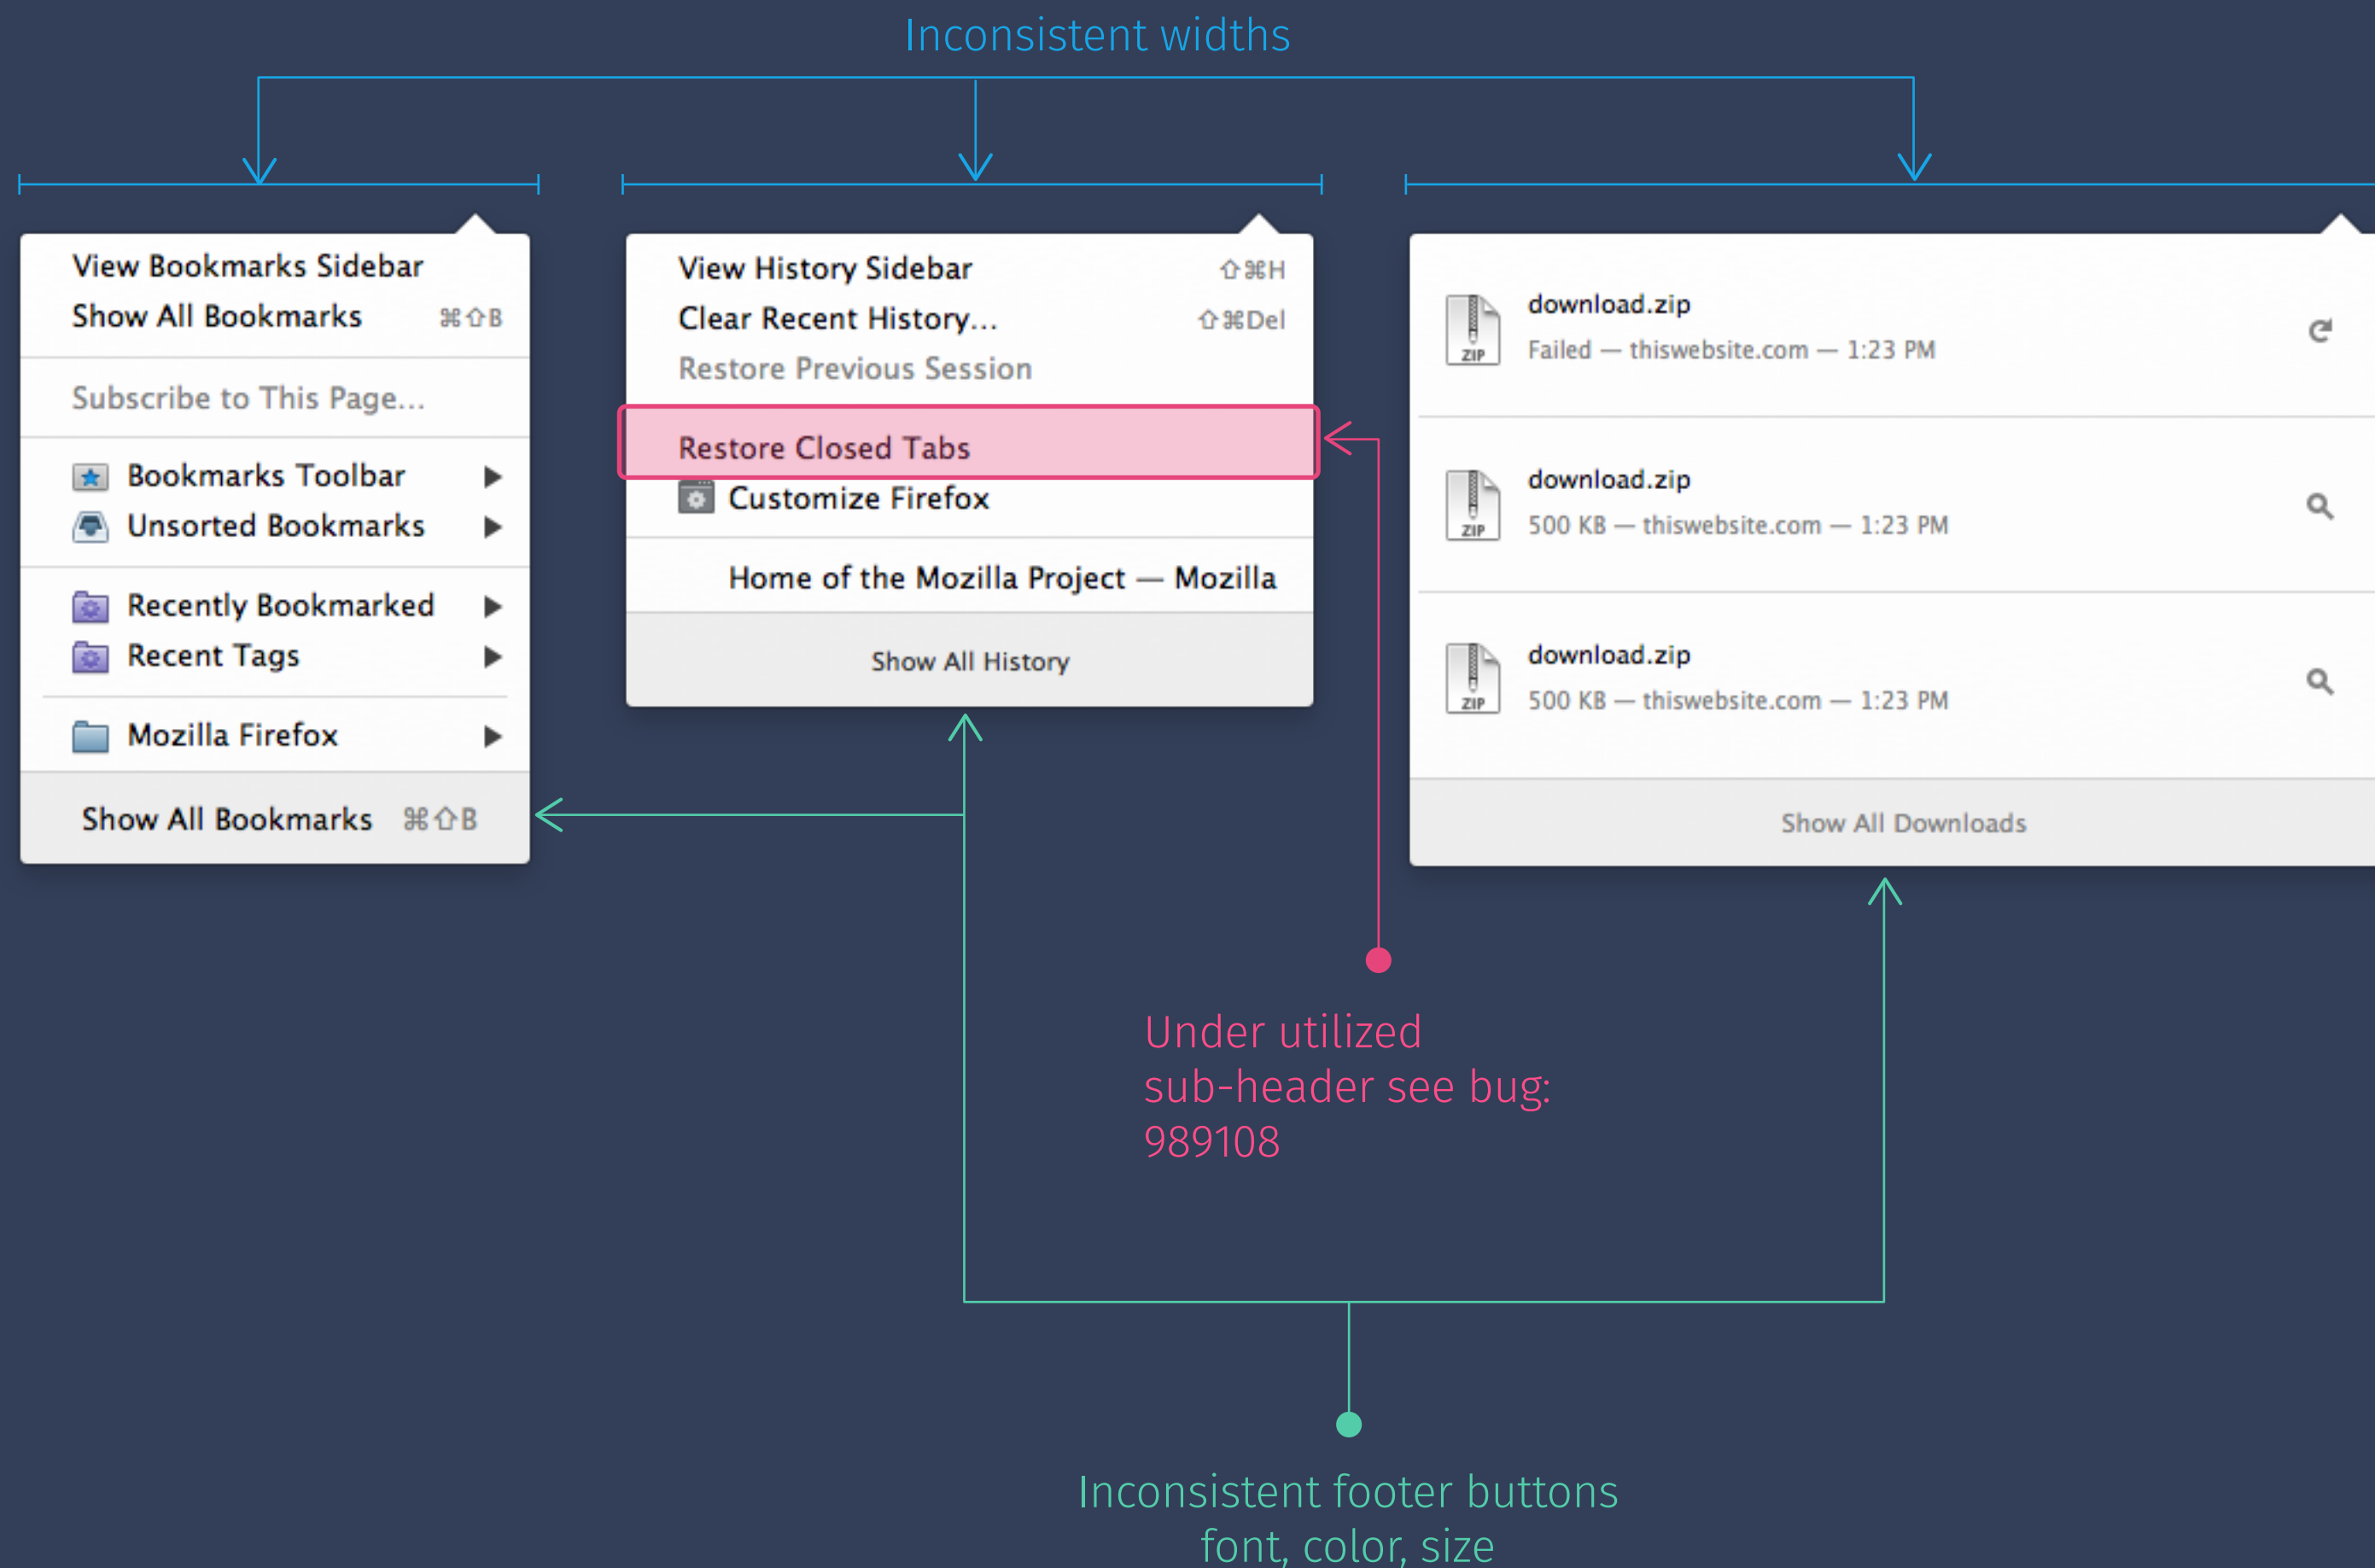

Examples:

- History
- Bookmarks
- Downloads
- Developer
- Character Encoding

List / Menu | Example Panels

List / Menu | *Inconsistencies & Problems*

3 *Full Featured UI*

Some panels don't conform to the templates of Notifications and Lists. These panels may use aspects of Lists and Notifications but they also use other complex interface elements. They do have reusable *patterns* and *conventions* that should be used for *familiarity* and *consistency*.

Examples:

- Forget Panel
- Menu Panel
- Hello! Panel
- Edit Bookmarks Panel

Full Featured UI | Example Panels

Breaking This Into Actionable Chunks

(Clumping)

Breaking This Into Actionable Chunks

Independent Chunk #1 — Consistency and Polish:

- Spec out and update panels to be consistent and polished
 - Includes: Alignment, dimensions, behaviors, styles, icons, layout, reusing common UI patterns

Independent Chunk #2 — Rework Notification Action Options:

- Evaluate and streamline options in the notification; goal two primary actions per notification

Independent Chunk #3 — Operation Sticky Notifications:

- Make notifications harder to lose
 - Includes: Not closing panel on window switch, figure out persistent indicators,

Thank you!
