

This is what's happening now, (only with the markers flipped to point the opposite direction).

Here's a proposed improvement, where the number boxes get wider as needed, the number is slid over so that it's full visible, and the arrow still pointing in the correct direction.

Then, of course, the trickiest question becomes — what happens in the corners?

I believe we should slide the ones that don't fit over, keeping the pointer pointing down the line, but making the box wide enough to fit an off-centered number.
