

When I click on a link in email, a different website (from launcher that I created) opens up instead:

What did you do? (steps to reproduce):

Linux Mint 19

Firefox Quantum 61.0.1 (64-bit) / Mozilla Firefox for Linux Mint mint - 1.0

Thunderbird 52.9.1 (64-bit)

I created a launcher to launch BBC World Service website in Linux Mint 19 (firefox <https://www.bbc.co.uk/podcast>). It worked fine.

Weeks later I wanted to try out Brave browser, so first I installed snapd (sudo apt install snapd / <https://docs.snapcraft.io/core/install-linux-mint>) then I installed Brave (sudo snap install brave / <https://snapcraft.io/brave>).

Later I wanted to see if my launcher would launch "BBC World Service website" using the Brave browser instead of Firefox, so I edited the launcher in the menu, changing "firefox <https://www.bbc.co.uk/podcast>" so that it read "brave <https://www.bbc.co.uk/podcast>".

What happened? (actual results):

When I clicked on my menu icon for BBC World Service, the Brave Browser launched, but it didn't open up the BBC World Service webpage (<https://www.bbc.co.uk/podcast>).

I edited the Menu launcher back to Firefox and checked that it worked correctly (which it did).

What should have happened? (expected results):

Later on I tried to launch a webpage by clicking on a link on an email (<http://jsw.elearninglogin.com/>) but instead of opening this web page it opened the webpage from my Menu launcher (i.e. <https://www.bbc.co.uk/podcast>).

I tried to open other / different links from other / different emails and the same BBC website opened up.

I made Google Chrome my default browser and when I clicked on my email links, the correct website opened up (problem solved, except I like Firefox more than Chrome).

I uninstalled Brave (sudo snap remove / <https://utappia.org/2016/04/22/how-to-search-install-remove-snap-packages-in-ubuntu/>).

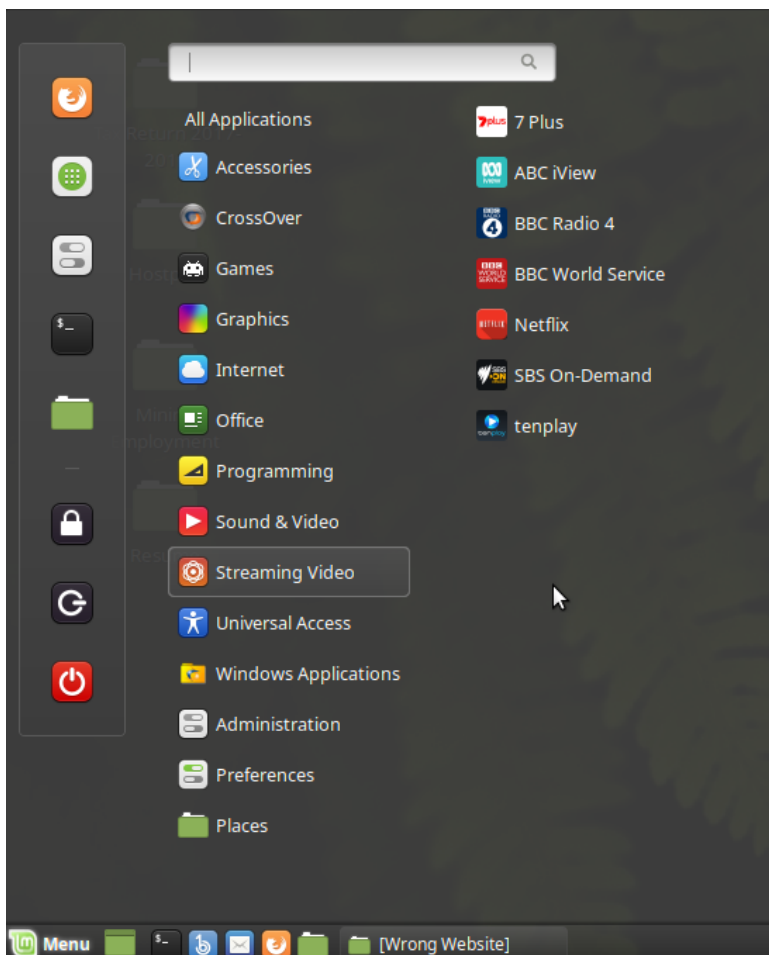

Then I logged out and logged back in. Problem persisted.

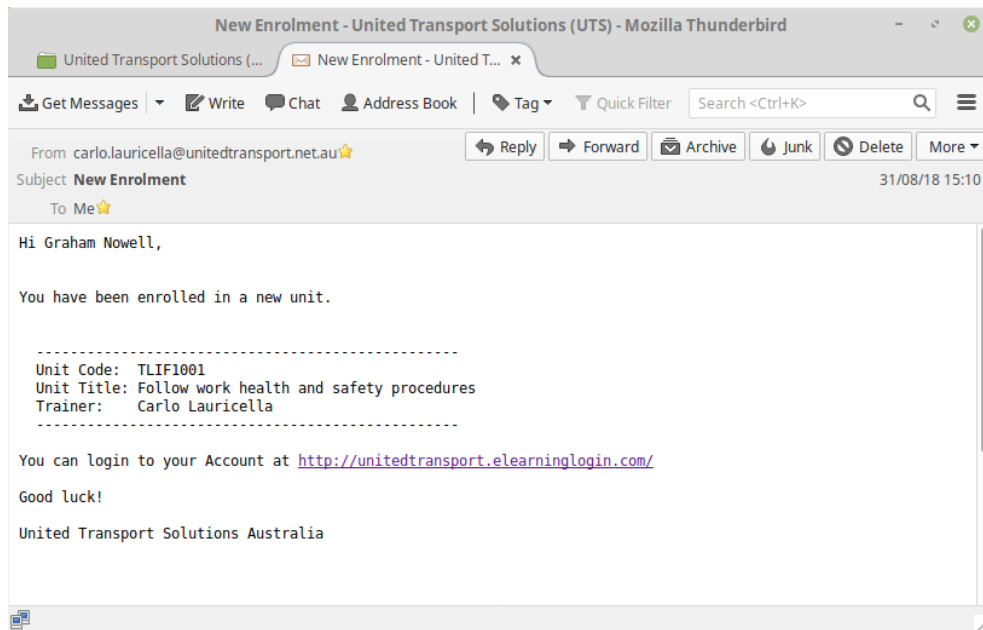

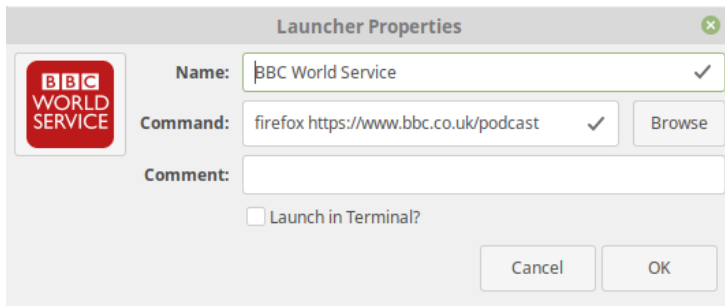

I removed the Menu Launcher for "firefox <https://www.bbc.co.uk/podcast>".

Then I logged out and logged back in. Problem persisted.

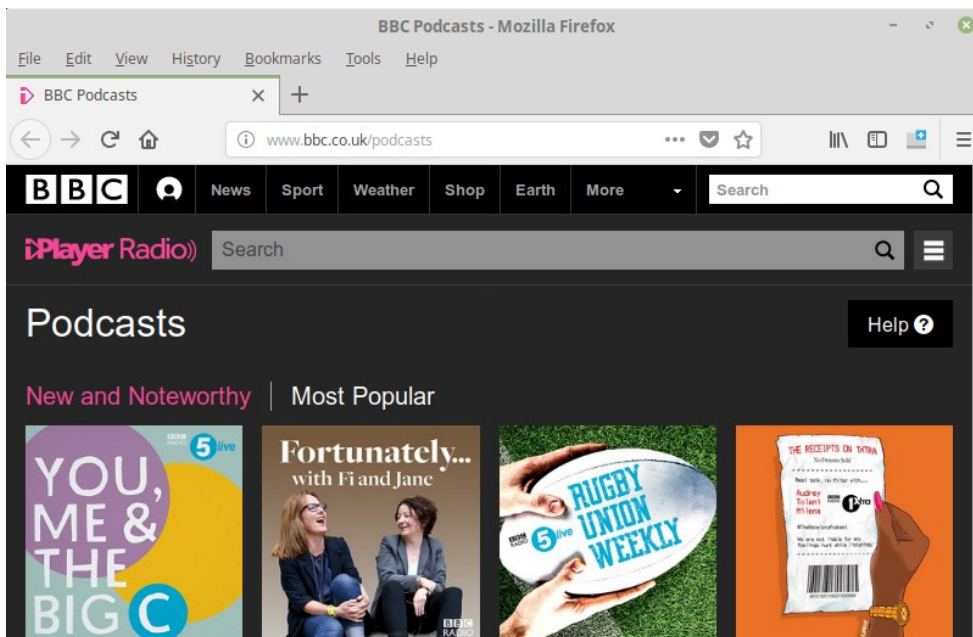

I uninstalled Firefox (using Linux Mint Software Manager), logged out, logged back in, reinstalled Firefox, logged out, logged back in, problem persisted.

My "firefox <https://www.bbc.co.uk/podcast>" launcher was stored in a an Application Menu, which I had called Streaming Video. When I clicked on a link in one of my emails, it didn't launch "firefox <https://www.bbc.co.uk/podcast>" which I had deleted, but instead launched the next

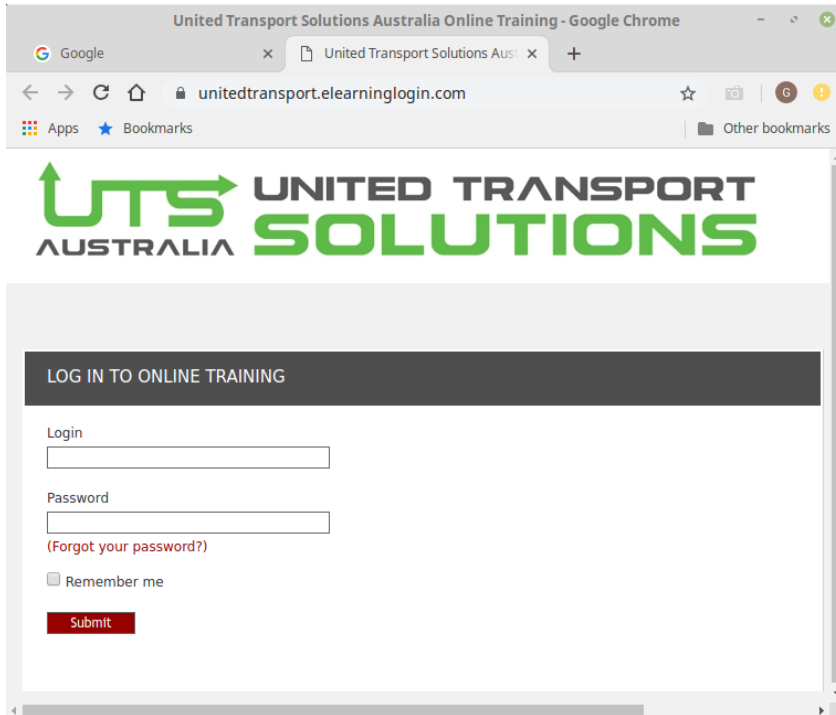

When I click on <http://unitedtransport.elearninglogin.com/> the following web page opens up:

If I set Google Chrome as the default browser the correct web page opens up.

If I cut and paste the link into Firefox, the correct webpage opens up.
