Bugzilla Bug #174980

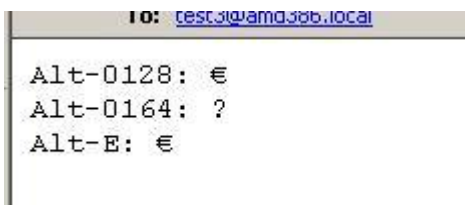

Compose a message with ISO-8859-15

Subject: euro sign test in iso-8859-15

Alt-0128: €
Alt-0164: ¤
Alt-E: €

View the received message (ISO-8859-15):

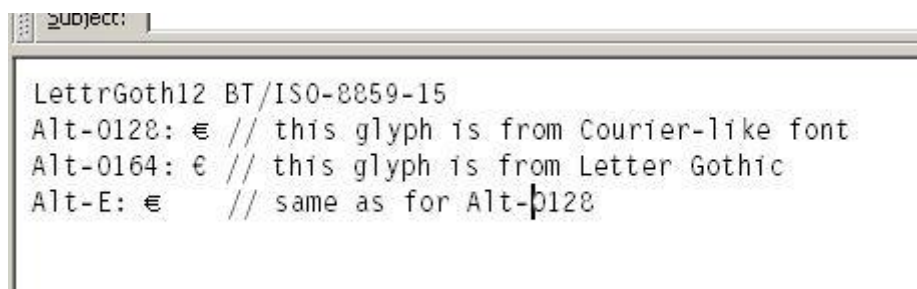

Alt-0128: €
Alt-0164: ?
Alt-E: €

Message source:

```
Subject: euro sign test in iso-8859-15
Content-Type: text/plain; charset=ISO-8859-15; format=flowed
Content-Transfer-Encoding: quoted-printable

Alt-0128: =A4
Alt-0164: ?
Alt-E: =A4
```

Now message composition with euro-enabled Type1-Font (Letter Gothic from Bitstream):

Subject:

LettrGoth12 BT/ISO-8859-15

Alt-0128: € // this glyph is from Courier-like font
Alt-0164: € // this glyph is from Letter Gothic
Alt-E: € // same as for Alt-0128

It seems that Mozilla 1.2 chooses a Courier-glyph instead of the font-supplied Euro-glyph.

Character	Courier New (TrueType)	LettrGoth12 BT (Type1)
Alt-0128	€	€
Alt-0164	¤	€
Alt-E	€	€

Windows 2000 (German)
