hover.class overlaps onto other tabs in window

noticed this bug upon going to the list url. however i also found the same problem at <http://www.scriptfx.com/frontpagetips/hover.htm>

Whenever you have tabbed browser window open and one of the tabbed pages uses the front page hover java applet, the applet is activated by mouseover commands even when another tab is in view.

for instance i opened a bugzilla reporting page in a new tab and i made the hover applet appear on the bugzilla page by moving my mouse over the area where the applet exists on the other tab.

☐ This is a security problem that needs to be kept confidential ([security policy](#)).
