# Firefox installation

Presented if running from a disk image, or a location that does not include "Applications" in the path.

May be skipped by hidden preference.

Dialog to choose install for all/user only/do not install (fig. 1)

Do not install

User/All

Auth fails

Check for previous version

Newer version exists

Old version exists

No previous version

Not writable

Administrator authorization

Check if destination is writable

Ask to rename or remove old version (fig. 2)

Copy app bundle

Replace newer version

Offer to launch newer version, confirm replacement, or run in-place

Use existing (newer) version

Run in-place

Re-launch and remove self

Continue running without installing

1–if not installed

Firefox is not properly installed.

Firefox would like to install itself to the Applications folder, where it will no longer add clutter to your Downloads folder.

(Do not Install)   (Install for Me Only)   (Install for Everyone)

☐ Do not offer to install again   ☑ Add Firefox to Dock

Do we even need this toggle?
(Maybe use a hidden preference to skip this window, useful to developers, etc. but not necessary for average user)

2–if old version installed already

An older version of Firefox is already installed.

A previous version of Firefox is installed. Would you like to replace the previous version, or rename and keep it?

(Rename and Keep)   (Replace Previous Version)

What if the installed version is newer or the same version?

Add cancel button in place of (or in addition to) rename and keep?
