4. overview

This document provides a definition regarding the interface exposed by BlueVia Flows module towards BlueVia Web Portal related to main actors in neoSDP Service scenario:

- Applications

1. Base URL

The Base URL for this RESTful interface follows this scheme:

`https://{serverRoot}/{apiName}/{version}`

where:

- {serverRoot}: It is the path where resource is available. It usually refers to a DNS name.
- {apiName}: bvflows
- {version}: It defines the version of the interface

For simplicity purposes, the following simplification is considered along this Chapter with regards to Base URL naming:

`https://{apiRoot}`

where:

- {apiRoot}={serverRoot}/bvflows/{version}

2. HTTP guidelines

As a RESTful interface, CRUD operations are allowed:

- Create: POST http Verb

iError! No se encuentra el origen de la referencia.	9 de 35
--	---------

9XXXXX-XXX-XXXX	9 of 35
-----------------	---------

9XXXXX-XXX-XXXX	9 of 35
-----------------	---------

Table of contents (cont.)

- Read: GET http Verb
- Update: PUT http Verb
- Delete: DELETE http Verb

When an action over a determined resource is not suitable to be modelled as a CRUD operation, it is preferred to define such actions as part of resource URL.

Regarding the use of http headers, the following MUST be considered:

HTTP Headers in Requests:

- Authorization: Mandatory. In principle Basic Http authentication would be implemented
- TransactionInfo header with the following data:
 - appid = 10000, where 10000 indicates Mozilla Market

HTTP Headers in Responses:

- Location: Mandatory for POST Responses, when the POST ‘action’ results in the creation of a new resource
- Other headers are not precluded

3. **Pagination in ‘GET’ (READ) Operations**

To ask for specific pagination needs in any GET operation, the following scheme is used:

offset: used in the request to specify the offset of the first result to be Mandatory with respect to the list of results that would be Mandatory if no offset were provided.

limit: used in the request to specify the maximum number of results to return at a time. Value must be a non-negative integer and defaults to 0 if no value is specified. A limit of 0 means that is up to the API server to determine how many results to return by default (some servers may return all results by default; others may return a fixed default number like 20).

For instance, specifying offset=0&limit=20 will return the first 20 results. A subsequent query of offset=20&count=20 will return the next 20 results, and so on.

For instance: GET {serverRoot}/management/{version}/developers?limit=50&offset=50 will return 50 results beginning at 50th element.

iError! No se encuentra el origen de la referencia.	10 de 35
---	----------

9XXXXX-XXX-XXXX	10 of 35
-----------------	----------

9XXXXX-XXX-XXXX	10 of 35
-----------------	----------

Table of contents (cont.)

By **default**, any response with multiple elements will return 25 elements per request, if no limit is defined.

totalResults: only used in the response to indicate the total number of possible results, so the client knows how many pages of results exist.

4. Filtering

Filtering allows to retrieve/update some fields within a block of information.

The format followed to implement such functionality is the use of a Query Parameter named “fields” where the filter values are separated by “,” (AND logic applied):

fields=element1,element2,element5

It's resource operation specific to restrict and limit allowed values for filter parameters and its specific usage in requests.

Example: This will return name and address information elements about the resource:

GET path/Contacts/{userID}/{contactID}?fields=name,address

5. Searches

Searches is to receive as response only those results that satisfy the criterion (criterion=value) indicated in the request (E.g. request the call logs for a caller identified by its MSIDN: caller=MSISDN).

Several Search criteria can be indicated. In that case, a logical AND is applied to compose the different criterion:

Criterion1=value1 AND Criterion2=value3

iError! No se encuentra el origen de la referencia.	11 de 35
---	----------

9XXXXX-XXX-XXXX	11 of 35
-----------------	----------

9XXXXX-XXX-XXXX	11 of 35
-----------------	----------

Table of contents (cont.)

Additionally, several values for the same search criterion can be indicated. In that case, the different values can be combined using either AND or OR logical operations, but not both at the same time within the same criterion:

Criterion1= value1 AND value2

Criterion2= value3 OR value4

Hence, the search format is as follows:

(Criterion1=value1 AND/OR value2 ...) AND (Criterion2 = value3 AND/OR value4 ...) ...

Every operation will indicate the possible search criteria, possible values and multiplicity. Values of the search criterion are always coded as strings but the table describes the type of the value to be parsed to string. Multiplicity indicates if a search criterion can have more than one value.

To implement searches, each allowed search criterion is mapped to a query parameter in the Request.

For each search criterion:

- ‘AND’ is indicated by the appearance of one query parameter with several values, separated by the ‘,’ symbol, in the following way:

criterion1=value1,value2

- ‘OR’ is indicated by the appearance of one query parameter with several values separated

by the ‘|’ symbol, in the following way:

criterion2=value3|value4

Several search criteria can be indicated separated by ‘&’ symbol (AND logic), in the following way:

criterion1=value1,value2&criterion2=value3|value4

iError! No se encuentra el origen de la referencia.

12 de 35

9XXXXX-XXX-XXXX

12 of 35

9XXXXX-XXX-XXXX

12 of 35

Table of contents (cont.)

It's resource operation specific to restrict and limit allowed search parameters and its specific usage (logic) in requests.

Example:

Return Apps whose name is 'Soccer 2012':

```
GET {apiRoot}/Apps?name= Soccer%202012%0D%0A
```

6. Resources

All resources uses JSON as the default format.

iError! No se encuentra el origen de la referencia.	13 de 35
9XXXXX-XXX-XXXX	13 of 35
9XXXXXX-XXX-XXXX	13 of 35

Table of contents (cont.)

5. APPLICATIONS INTERFACE

This interface is defined for Management and Provisioning of BlueVia applications.

1. Resource 'Collection of Applications'

This section shows the possible operations over this resource:

1. **getApplication (criteria)**

GET	{apiRoot}/apps{format}	getApplication (criteria)
-----	------------------------	---------------------------

This operation allowes retrieving a list of Applications (All, or the ones matching some criteria).

Query Parameter	Mandatory	Description
developerId	no	The developer owner of the application
status	no	The application status. Allowed values: <ul style="list-style-type: none">• 'active'• 'deprecated'
name	no	The name of the application
keyword	no	The reserved keyword for the use of shared shortcodes in App
serviceId	yes	Bluevia Service Id

iError! No se encuentra el origen de la referencia.	14 de 35
---	----------

9XXXXX-XXX-XXXX	14 of 35
-----------------	----------

9XXXXX-XXX-XXXX	14 of 35
-----------------	----------

Table of contents (cont.)

unsig

NOTES:

1.- When querying for an Application name, e.g.: GET {apiRoot}/apps?name='Soccer', this query shall be penalized in terms of efficiency (i.e. processing time), unless the query would be filtered by name as well. Therefore the optimized query would be: GET {apiRoot}/apps?name='Soccer' &fields=name

RESPONSE:

Parameter	Mandatory	Type	Description
apps	yes	application type [0..N] (see below)	An array of app's entities.
totalResults	yes	number	Total number of applications matching criteria.

NOTE: In case no matching result is returned, response will be OK but empty and totalResults=0.

Application Entity:

Parameter	Mandatory	Type	Description

iError! No se encuentra el origen de la referencia.	15 de 35
---	----------

9XXXXX-XXX-XXXX	15 of 35
-----------------	----------

9XXXXX-XXX-XXXX	15 of 35
-----------------	----------

Table of contents (cont.)

appId	yes	string	Application Identifier generated by SDP. Primary Key in Service Profile.
name	no	string	Name of Application.
description	no	string	Description of Application
icon	no	string	Icon of the Application (BASE64)
supportEmail	no	string	E-mail provided by developer for application support
developerId	yes	string	Developer Identifier in SDP platform
status	no	string	Application Status. Allowed values: - 'active' - 'deprecated'
consumerKey	no	string	oauth_consumer_key
consumerSecret	no	string	oauth_consumer_secret
reverseCertificate	no	string	Server (i.e. App) Certificate for MO scenario security, encoded as base64 string.
appApis	no	complex type [0..N] (see section 5.4)	List of APIs consumed by Application and their underlying configuration. See section 5.4 for details

Example:

REQUEST:

iError! No se encuentra el origen de la referencia.	16 de 35
9XXXXX-XXX-XXXX	16 of 35
9XXXXX-XXX-XXXX	16 of 35

                "541276",
                "349385"
            ],
            "keyword": "motoGP"
        },
        {
            "apiId": "payment"
        }
    ]
}
```

RESPONSE:

HTTP/1.1 200 OK

3. deleteApplication (appId)

{appId}: App's Identifier within the service (i.e. primary key in DD.BB).

DELETE	{apiRoot}/apps/{appId}	deleteApplication (appId)
--------	------------------------	---------------------------

iError! No se encuentra el origen de la referencia.	29 de 35
---	----------

9XXXXX-XXX-XXXX	29 of 35
-----------------	----------

9XXXXX-XXX-XXXX	29 of 35
-----------------	----------

Table of contents (cont.)

This operation allows deleting an Application profile.

Example:

REQUEST:

```
DELETE /apps/123425 HTTP 1.1
```

RESPONSE:

```
HTTP/1.1 204 No Content
```

4. **resetApplicationCredentials (appId)**

{appId}: App's Identifier within the service (i.e. primary key in DD.BB).

POST	{apiRoot}/apps/{appId}/resetcredentials{format}	resetApplicationCredentials (appId)
-------------	---	--

This operation allows resetting Application credentials, generating a new ones.

RESPONSE:

An element of 'application' instance, composed by

Parameter	Mandatory	Type	Description
appId	yes	string	Application Identifier
consumerKey	yes	string	New oauth_consumer_key
consumerSecret	yes	string	New oauth_consumer_secret

iError! No se encuentra el origen de la referencia.	30 de 35
---	----------

9XXXXX-XXX-XXXX	30 of 35
-----------------	----------

9XXXXX-XXX-XXXX	30 of 35
-----------------	----------

Table of contents (cont.)

Example:

REQUEST:

```
POST /apps/123425/resetcredentials HTTP/1.1
```

RESPONSE:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 135

{
    "appId": "2123425",
    "consumerKey": "34t34674568b7b57b8",
    "consumerSecret": "235ccdy45756un79"
}
```

iError! No se encuentra el origen de la referencia.
