Overview

Kount aggregates and evaluates data from two primary sources, the **Data Collector (DC)** and the **Risk Inquiry Service (RIS)**. Subsequent to collecting and evaluating customer data, Kount returns a string of key-value pairs to the merchant. Order related data is also displayed in the Agent Web Console (AWC) accessible via a secured merchant login over the Internet.

The Data Collector gathers information from a customer's device by redirecting the device browser momentarily to Kount then back to the merchant. This passive analysis obfuscates Kount's interaction with the customer and does not affect the customer's purchasing experience.

The Risk Inquiry Service evaluates the data provided by the Data Collector and the order-form data submitted from the merchant to create a fraud score. Merchant specified rules are also assessed for each transaction during this evaluation process. Once an order has been evaluated a response string of key-value pairs is returned to the merchant including a score, device fingerprint, and an automated response code. Upon receipt of this response data the merchant can disposition orders based upon specified rules.

DISCLAIMER: This is an internal document of **Kount Inc**. Distribution to third parties is unauthorized. Kount Inc. believes this information to be accurate as of the date of publication but makes no guarantees with regard to the information or its accuracy. All information is subject to change without notice. All company and product names used herein are trademarks of their respective owners.

Technical Specifications Guide v.5.5.5

Kount Data Collector and Risk Inquiry Service

Kount Environments

Kount has separate environments for test and production. Initial integration for both the Data Collector and Risk Inquiry Service will take place in the test environment. A boarding document containing required test environment information will be sent to the merchant.

The test environment is **not** engineered to support load testing; it is designed primarily to verify connectivity and proper data submission. Many features such as order linking, scoring, device location, and persona related information are limited in the test environment.

Test credit cards can be passed into the test environment but will fail in the production environment.

Port 443/HTTPS is required for submission and receipt of Data Collector and Risk Inquiry Service data in both the test and production environments.

Upon certifying that the correct data is being passed for both the Data Collector and Risk Inquiry Service the merchant will be issued a Certification Letter along with an additional boarding document providing

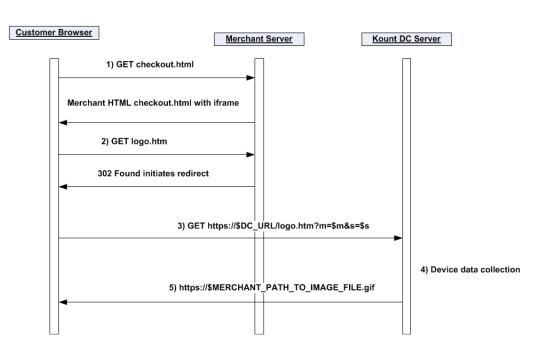

6

the production environment information. Any customized data created in the test environment will have to be re-created in the production environment, this includes, users, rules, site IDs, user defined fields, and certificates.

The test environment will continue to be available to the merchant for testing purposes but should not be used with production traffic from the merchant. Typically Kount has quarterly releases with new or enhanced features that are backward compatible. These new features will be available in the test environment as well.

Data Collector

The Data Collector process provides data related to the device initiating the transaction, this process is transparent to the customer and sub second. The data collected is used in conjunction with the RIS data.

Kount Data Collector

The following sequence describes the Data Collector process:

- 1. Customer browses to merchant order form page containing Data Collector code
- 2. Customer browser automatically requests redirect on the Data Collector element
- 3. Customer browser is redirected to Kount servers
- 4. Kount collects device attributes
- 5. Kount directs customer browser to display static image hosted by merchant

Data Collector Requirements

- 1. Port 443 must be available to post and receive data from Kount
- 2. Merchant adds code to their checkout process.
 - HTML iframe:
 - The iframe should be placed on the order form page where the payment method or credit card information is requested, usually near the bottom of the page.
 - Server side code:
 - The server side code consists of a logo.htm and logo.gif server side executable scripts.
 - Code to create a unique session identifier:
 - When the form page is accessed, a session identifier must be created and stored to be used as the session identifier in the subsequent RIS post from the merchant to Kount. This identifier must be unique for at least 30 days and must be unique for every transaction submitted by each unique customer. If a single session ID were to be used on multiple transactions, those transactions would link together and erroneously affect the persona information and Kount score.
- 3. Merchant supplies static image URL to Kount.
 - The static image can be an image that is currently being displayed on the page or Kount can provide an image if desired.
 - If the path or image requires change by the merchant subsequent to moving into production, Kount must be notified of the new path or filename to avoid possible failure.

The following code examples demonstrate various ways to code for the data collector. Additional details can be found in the FAQ and Troubleshooting section.

DISCLAIMER: All of the code presented in this document is for example purposes only. Any production implementation performed by the customer should follow all internal code quality standards of the customer's organization including security review.

Data	Size	Description	Example
KOUNT_SERVER_URL	N/A	HTTPS URL path to the Kount servers provided in boarding documentation from Kount	https://tst.kaptcha.com
MERCHANT_ID	6	Six digit identifier issued by Kount.	999999
SESSION_ID	Min: 1 Max: 32	Alpha-numeric string that must be unique over a thirty (30) day period of time cre- ated by merchant.	1BDB721BA17E4A4BB58B21A5460D0B
MERCHANT_URL	N/A	Merchant's website URL	https://www.somecompany.com/

Session creation code example

```
<?php

$sess = session_id();

if (!$sess) {

    // If the session hasn't already been started, start it now and look up the id

    session_start();

    $sess = session_id();

}

// The session id is now available for use in the variable $sess

// For more details and examples on working with sessions in PHP, see:

// http://us2.php.net/manual/en/book.session.php

// http://us2.php.net/session_start

// http://us2.php.net/session_id

?>
```

10

HTML iframe example

Requirements – The iframe has a minimum width=1 and height=1

```
<iframe width=1 height=1 frameborder=0 scrolling=no src=https://MERCHANT_URL/logo.htm?
    m=merchantId&s=sessionId>
    <img width=1 height=1 src=https://MERCHANT_URL/logo.gif?m=merchantId&s=sessionId>
</iframe>
```

Server side code examples

PHP

logo.htm

```
<?php
    $m=$_GET['m'];
    $s=$_GET['s'];
    header ("HTTP/1.1 302 Found");
    header ("Location: https://KOUNT_SERVER_URL/logo.htm?m=$m&s=$s");
?>
```

logo.gif

<?php

```
$m=$_GET['m'];
$s=$_GET['s'];
header ("HTTP/1.1 302 Found");
header ("Location: https://KOUNT_SERVER_URL/logo.htm?m=$m&s=$s");
}
```

JAVA

```
LogoHtm.java
```

```
Technical Specifications Guide v.5.5.5
```

LogoGif.java

}

.NET

Add the following to the appSettings section of the Web.config file:

```
<appSettings> <add key="DC.Url" value="https://tst.kaptcha.com" />
logo.aspx public void Page_Load (object sender, System.EventArgs e) {
    Response.Redirect(string.Format("{0}/logo.htm?m={1}&s={2}",
    ConfigurationManager.AppSettings["DC.Url"], Request["m"], Request["s"]));
}
```

logo.aspx

```
public void Page_Load (object sender, System.EventArgs e) {
    Response.Redirect(string.Format("{0}/logo.htm?m={1}&s={2}",
    ConfigurationManager.AppSettings["DC.Url"], Request["m"], Request["s"]));
}
```

logo_gif.aspx

```
public void Page_Load (object sender, System.EventArgs e) {
    Response.Redirect(string.Format("{0}/logo.htm?m={1}&s={2}",
    ConfigurationManager.AppSettings["DC.Url"], Request["m"], Request["s"]));
}
```

Technical Specifications Guide v.5.5.5

Phone-to-Web Order Submissions

When a merchant submits phone orders via the same web page interface as a customer, the data regarding the merchant's device is being sent to Kount, not the customer's device data. This will cause order linking to occur and in time will elevate the score of all orders associated with the persona.

IMPORTANT: Linking will also occur if the browser session ID is used as the transaction session ID and multiple orders are submitted from within the same browser session without closing the browser. To avoid this type of linking, the browser session ID could be incremented appending the UNIX timestamp, choose a different methodology for creating the session ID, or **agents must close the browser between orders to ensure a new session has been created**.

There are two different methods for receiving phone orders.

- 1. If the customer service agents navigate to a separate order entry page that does not collect iframe data: Call Center/Phone Orders will be posted as a Mode=P; hard code the IP address specifically to 10.0.0.1 and provide the phone number within the ANID field (if no phone number is available, pass 0123456789 hard coded).
- 2. If the customer service agents navigate to **the same page as the customer (iframe data is collected):** Phone-to-Web Oerder Submission script example is in Appendix A (to exclude merchant owned IP addresses that should not be forwarded to Kount), post Call Center Orders as a Mode=Q; hard code the IP address specifically to 10.0.0.1.

In any of the above circumstances, if the email address is not provided to the agents, the agents will need to input noemail@kount.com as the email address in order to prevent linking.

The scripts found in **Appendix A** demonstrate configuration examples of excluding merchant owned IP addresses that should not be forwarded on to the Kount server.

Required and Optional fields can be found in Appendix B.

Data Collector FAQ

General:

Kount®

Q: Where do I get the Merchant ID?

A Sandbox Boarding Information document will be sent following the initial kick-off call with the Merchant ID and URLs associated with the DC and RIS processes. A separate document for production will be sent with the production service URLs once the test transaction have been certified.

Q: Why does Kount require a redirect?

The redirect gathers device information without interfering with the order process. The redirect also obfuscates the communication between Kount and the customer.

Q: How do I receive a login to the AWC?

Kount will create the initial administrator user. Once the user has been created an automated e-mail will be sent requesting a password creation.

Q: Should I send production traffic to the test environment to test with?

Production traffic should not be sent to the test environment due to the possibility of skewed scoring from the test orders.

Iframe:

Q: Where should I place the iframe on my website?

If multiple forms of payment methods are available, i.e. Credit Card, PayPal, Bill Me Later, the iframe should be included on the page where the payment method is chosen. If only a single payment method is used, i.e. Credit Card, then the iframe should be included on the page where the customer inputs their credit card information.

IMPORTANT: Place the iframe only on one page. Do not place the image on multiple form pages on your website.

Q: Are there size restrictions on the iframe?

Yes, the iframe must be at least 1x1 pixels in size.

Q: Does it matter where the iframe shows up on the web page?

No, this is left to the merchant to decide.

Q: Why an iframe?

If a user were to source the page there would be no mention of Kount in the source. It also eliminates the possibility of being indexed by various search engines or crawlers.

Q: Why are there two files in the iframe?

The logo.gif file is a fallback in case iframes have been disabled or the browser does not support iframes.

Q: Are both the iframe and image required?

Yes both are required to ensure that a connection is made by the customer device.

Q: Why don't I just use the image, we don't have any iframes anywhere else on our site.

The manner in which iframes are handled by browsers provides greater insight to Kount.

Q: Why do the .htm and .gif files get interpreted as server side code?

By using .htm and .gif file extensions there is less concern from end users that may inspect the source code.

Session Identifier:

Q: What does the session identifier do?

The session identifier is used to join the device data with the order data sent by the RIS process. When the RIS process posts data to Kount it must use the session identifier that was created when the customer initiated the DC HTML.

Q: Does the session identifier need to be unique?

Yes, the session identifier must be unique over a thirty day time period. If there are duplicate session identifiers, device data originating from the DC process may be erroneously connected to RIS order data.

Q: Are there limitations on the session identifier?

Yes, it must be alpha-numeric with a minimum of one character and a maximum of 32 characters long.

Q: What should I use for the session identifier?

The merchant determines, as long as the limitation guidelines are followed. Many merchants use a portion of the application session that is generated when the page is created as the session identifier.

Q: What happens when a user leaves the page after a session identifier has been created then returns to finish the order?

There can be multiple session identifiers created, only the last session will be used to join with the RIS transaction.

Technical Specifications Guide v.5.5.5

Image:

Q: Does it matter where the image is displayed on the page?

It is recommended to display the iframe below the fold of the initial web page but can be located anywhere on the page.

Q: Why does the merchant need to give Kount the path to an image for the redirection?

Kount must have this path to finish the 302 redirect for the image to load. If the path has not been supplied to Kount a broken image icon will be displayed on the merchant page.

Q: Does the image need to be accessible via the Internet?

Yes the image must be publicly available from the Internet.

Q: Why does the path need to be HTTPS?

If the image is not secure, a notification will appear alerting the customer that there are unsecure items on the check out form.

Q: Does it matter what the name of the file is?

If a customer were to inspect the source of the page there should be no indication of interaction from Kount. To alleviate the possibility of a merchant's customer questioning the interaction between Kount and the merchant do not include any reference to Kount in the file name.

Q: Do you have an example of an image.

Example of the "Secure Payments" image that Kount provides and is included in the initial boarding documentation sent from Kount.

Troubleshooting the Data Collector

Q: Is the correct Kount URL being used?

Verify that the correct Kount Data Collector URL is being used, test URL or production URL.

Q: Have you provided Kount with the HTTPS URL path to the image?

If the URL path has not been set there will be a broken image displayed on the page.

Q: Is the image available via the Internet?

Test this by pasting the path of the URL in a browser on an external network and verify that the image appears.

Q: Have appropriate DNS entries, NATs, and firewall settings been configured correctly?

Due to the security concerns regarding test environments or production environment the merchant's network operations may need to verify that proper access is available.

Q: Are the logo.htm and logo.gif files being interpreted as server-side code?

If the files are not interpreted as server-side code, when requested the files will serve up the source code instead of performing the redirect. This can be tested by pointing the browser directly to the logo.htm or logo.gif URLs and verify that the static image appears. If source code appears, then the files are not being interpreted correctly. This can also be tested via a UNIX wget command.

Q: Does the redirect contain the correct Merchant ID?

Verify that the redirect Merchant ID is the correct six digit ID supplied by Kount.

Q: Is the Session ID created in the DC process the same session ID being sent with the RIS post?

Ensure that the Session ID being created and stored during the DC process is the correct one being used in the RIS post to Kount and adheres to the session ID requirements.

Q: I enter the Kaptcha URL and my web browser is redirected to the Google Kaptcha page as a 302 redirect error. What went wrong?

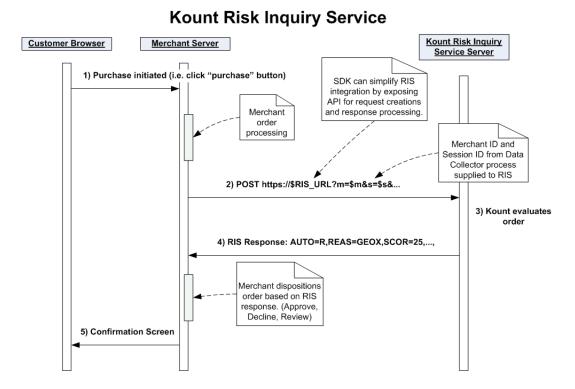

The wrong URL was entered. Most likely, the URL https://ssl.kaptcha.com was passed in. /logo.htm should be appended to the end of the URL so it looks like https://ssl.kaptcha.com/logo.htm. Also, the following example https://someplace.verifi.com/logo.html will correct the redirect error, keeping in mind that "someplace.verifi.com" is just sample text.

Technical Specifications Guide v.5.5.5

Risk Inquiry Service (RIS)

Kount®

The Risk Inquiry Service (RIS) joins device data provided from the data collector process with the customer order data sent from the merchant. Once the device data and the order data are combined, RIS evaluates and scores each transaction. Subsequent to the evaluation RIS returns a response string back to the merchant to be used by the merchant to approve, decline or hold the order for review. Each transaction will continue to be evaluated and dynamically scored for up to fourteen days. The following section describes how to implement the Risk Inquiry Service.

The following sequence describes the RIS process:

- 1. Customer initiates purchase
- 2. Merchant initiates RIS request to Kount via HTTPS URL encoded post
- 3. Kount evaluates transaction
- 4. Kount returns evaluation response to merchant
- 5. Notification is displayed to customer

Risk Inquiry Service Requirements

RIS data posted to Kount must be URL encoded and submitted as key-value pairs. Much of the work can be simplified by utilizing a Kount provided SDK, including URL encoding. Kount provides a Software Development Kit (SDK) for Java, .NET, PHP, and Perl environments.

Recommendations regarding each development environment and their supported versions, configuration, logging, and paths are found in the README file located in the "docs" directory in each respective SDK, please read the documentation associated with each SDK.

- 1. Port 443 must be available to post and receive data from Kount.
- 2. An X509 certificate is required for authentication to Kount. This certificate is exported from the Kount Agent Web Console for each merchant from the Admin tab -> RIS Certificates menu. If multiple servers will be submitting RIS requests, all servers must have the certificate to authenticate to Kount. This certificate must be in place prior to sending RIS requests to Kount.
 - Instructions on how to export the RIS certificate are found in the **RIS Certificate Requests** section of the specification guide.
 - Supported Browsers for certificate exportation:
 - Microsoft Internet Explorer version 7 and newer (Must be in compatibility Mode for version 10+)
 - $\circ~$ Mozilla Firefox version 5 and newer
 - Apple Safari
 - NOTE: Google Chrome does not support the exportation of certificates.
- 3. SSL support is required for the RIS process.
- 4. The session identifier created during the data collector process must be passed as the session identifier for the RIS transaction. This identifier must be unique for at least 30 days. If a single session ID were to be used on multiple transactions, those transactions would link together and erroneously affect the persona information in the Kount score.
- 5. In order to utilize the various SDKs, several required static settings must be configured. Please refer to the README files included in each of the SDKs.
 - PHP settings.ini
 - .NET App.config
 - Perl Kount::Ris::Settings
 - Java All settings are included in inquiry

Technical Specifications Guide v.5.5.5

The table below describes the required static settings found in the SDK:

| Data | Size | Description | Example |
|--------------------|------|--|-----------------------------|
| Merchant_ID | 6 | Six digit identifier issued by Kount. | 999999 |
| KOUNT_SERVER_URL | N/A | HTTPS URL path to the
Kount servers provided in boarding
documentation from Kount | https://risk.test.kount.net |
| LOGGER | N/A | Specifies which logger to use: SIM-
PLE or NOP. | SIMPLE |
| SIMPLE_LOG_LEVEL | N/A | If SIMPLE logging is enabled, this
lists logging levels in order of
decreasing severity:FATAL, ERROR,
WARN, INFO, DEBUG | WARN |
| SIMPLE_LOG_FILE | N/A | Name of the log file for SIMPLE log-
ging | kount-sdk-ris.log |
| SIMPLE_LOG_PATH | N/A | Path to where log file will be written.
(Must be a valid path) | /some/path/to/log |
| Client Certificate | N/A | Depending on the SDK environment
certain client certificate information
will be required. | kount-ris-certificate.p12 |

When to Invoke the Risk Inquiry Service

- 1. **Pre-Authorization:** Query Kount before attempting an authorization from the payment gateway, below are the considerations regarding pre-authorization
 - Allows the merchant to avoid processing fees on orders set to "decline" by the merchant.
 - All credit card information can be sent to Kount
 - An update RIS call (MODE=U) must be made to update order number and status of payment authorization including AUTH, AVST, AVSZ, and CVVR data provided by payment gateway.
 - $\circ~$ For pre-authorization queries set the following required fields as:
 - * MACK=Y
 - * AUTH=A
 - Once the transaction has been processed, update required and additional fields with MODE=U post (see RIS Service Modes section)
- 2. **Post-Authorization:** Query Kount after the payment gateway has been contacted, below are the considerations regarding post-authorization
 - All payment gateway information can be passed to Kount (Authorization, AVS, CVV) allowing rules to be created regarding AVS and CVV data.
 - Some payment gateways do not pass credit card data once they have received it
 - Single RIS query, no update is necessary

RIS Data Submission

When submitting data to RIS, it is recommended to send as much data as possible. As part of the RIS post there are required fields and if not populated an error will be returned in the RIS response. Please refer to the SDK documentation with details on how to submit the data for both optional and required fields.

Appendix B lists all fields that are available to post to Kount.

Phone-to-Web Order Submissions

When a merchant submits phone orders via the same web page interface as a customer, the data regarding the merchant's device is being sent to Kount, not the customer's device data. This will cause order linking to occur and in time will elevate the score of all orders associated with the persona.

IMPORTANT: Linking will also occur if the browser session ID is used as the transaction session ID and multiple orders are submitted from within the same browser session without closing the browser. To avoid this type of linking, the browser session ID could be incremented appending the UNIX timestamp, choose a different methodology for creating the session ID, or **agents must close the browser between orders to ensure a new session has been created**.

There are two different methods for receiving phone orders.

- 1. If the customer service agents navigate to a **separate order entry page that does not collect iframe data:** Call Center/Phone Orders will be posted as a Mode=P; hard code the IP address specifically to 10.0.0.1 and provide the phone number within the ANID field (if no phone number is available, pass 0123456789 hard coded).
- 2. If the customer service agents navigate to **the same page as the customer (iframe data is collected):** Phone-to-Web Oerder Submission script example is in Appendix A (to exclude merchant owned IP addresses that should not be forwarded to Kount), post Call Center Orders as a Mode=Q; hard code the IP address specifically to 10.0.0.1.

In any of the above circumstances, if the email address is not provided to the agents, the agents will need to input noemail@kount.com as the email address in order to prevent linking.

The scripts found in **Appendix A** demonstrate configuration examples of excluding merchant owned IP addresses that should not be forwarded on to the Kount server.

Required and Optional fields can be found in Appendix B.

Technical Specifications Guide v.5.5.5

Risk Inquiry Service Modes

Modes are used to specify what type of data is being submitted to Kount.

Q Initial queries directed from the merchant to Kount that do not originate from a call center environment **P** Initial queries originating from a call center environment

- IP Address must be hard coded as "10.0.0.1".
- If customer does not provide an e-mail address, use the value EMAL=noemail@kount.com.
- PayPal is not a valid payment type for MODE=P.

X Update query made after an initial MODE=Q or P request and/or any MODE=U updates have been made. Updates to certain fields can be made and the transaction will be re-evaluated and return an updated RIS response to the merchant. These updates will be displayed in the AWC. This query will count towards the number of RIS transactions purchased. The same fields listed in the MODE=U section can be changed for MODE=X transactions.

U Update call to Kount, does not cause a reevaluation of the transaction but will update what is displayed in the Agent Web Console (AWC). This update call does not count towards the number of RIS transactions purchased. Only certain fields can be updated with MODE=U calls.

| AUTH | РТҮР |
|-------|-------|
| AVSZ | РТОК |
| AVST | PENC |
| CVVR | RFCB |
| MACK | SESS* |
| MERC* | TRAN* |
| MODE* | VERS* |
| ORDR | |
| | |

* Required fields in MODE=U

E This mode designates an error has occurred and is returned to the merchant in the RIS response.

Appendix C lists all warning and error codes.

RIS Payment Types

Kount supports multiple payment types and depending upon the payment type chosen by the customer certain payment tokens are required. If the PayPal Payer ID or Google Checkout Account ID is not sent in the inquiry mode, then it must be sent in the update mode related to the transaction otherwise the order details will not be displayed in the Agent Web Console.

Kount has the ability to add arbitrary payment types rapidly to support an international market. To view the current list of supported payment types, use the API endpoint:

https://api.kount.net/rpc/support/payments.html

See the **API Specification Guide** for further details.

The content of the endpoint is generated in HTML but changing the extension to .xml or .json will produce content in those formats.

RIS Payment Encryption Options

When using the Kount SDK all credit card information is irreversibly hashed prior to transmission from the merchant to Kount.

If not using the SDK the following encryption options are available.

KHASH Kount proprietary hash used to hash the credit card number before passing it to Kount. The hashing algorithm source code can be found in each one of the SDKs or can be requested from Kount.

PTYP=CARD PENC=KHASH

Output - BIN + 14 alpha-numeric characters. Example - 123456A12C34E56G7DFG

MASK Ability to pass the first six and last four of a credit card filled in with XXXs. PENC=MASK is only valid with PTYP=CARD.

PTYP=CARD PENC=MASK

Output BIN + 10 capital "X" characters + Last 4 of credit card Example - 123456XXXXXXX7890

Note: the "X" characters must all be capital "X".

Important: The above example value is just for purposes of illustration. The PTOK should be the same length as the original card number. You can use the card number with the first 6 and last 4 numerals present and the rest of the numbers in the card masked by "Xs" but the number of characters <u>must</u> be the same as those of the actual card number.

Shopping Cart Data

Kount®

Each RIS request must be submitted with a minimum of one shopping cart item. While other RIS data is entered in as key-value pairs, shopping cart items must be submitted as an array. Each item is an index in the array, and each index must contain the following five attributes.:

| Attribute | Туре | Size | Description | Example |
|--------------|---------|-------|--|----------------|
| PROD_TYPE[] | String | 1-255 | High level description of the item. | TV |
| PROD_ITEM[] | String | 1-255 | Typically the SKU number for the item. | SKU-2385-42P |
| PROD_DESC[] | String | 0-255 | Specific description of the item. | 42 Inch Plasma |
| PROD_QUANT[] | Integer | Long | The quantity of the item being pur-
chased. | 1 |
| PROD_PRICE[] | Integer | Long | Price per unit item, displayed in low-
est currency factor. | 75890 |

Technical Specifications Guide v.5.5.5

User Defined Fields

Kount provides a way for merchants to include additional information related to their business that may not be a standard field in Kount by creating user defined fields. UDFs are created in the Kount Agent Web Console by browsing to the Fraud Control tab and clicking on User Defined Fields. Once you have defined the UDF in the AWC you will be able to pass this data into Kount via an array called UDF as key-value pairs where the label is the key and the data passed in is the value. The maximum number of UDFs that can be created is up to the merchant but response time for evaluating transactions will degrade as more UDFs are added. There are four data types available for user defined fields.

NOTE: UDF labels can be up to 28 characters in length.

- 1. Number
- 2. Alpha-Numeric (can be added to a VIP list)
- 3. Date
- 4. Amount

| Array [key]=Value | Size | Description | Example |
|--------------------------------|-------|---|--|
| UDF[NUMERIC_LABEL]=value | 1-255 | Numbers, negative signs, and deci-
mal points. | UDF[FREQUENCY]=107.9 |
| UDF[ALPHA_NUMERIC_LABEL]=value | 1-255 | Letters, numbers or both. | UDF[COUPON]=BUY11 |
| UDF[DATE_LABEL]=value | 1-20 | Formatted as YYYY-MM-DD or YYYY-
MM-DD HH:MI:SS | UDF[FIRST_CONTACT]
=2012/04/10 17:00:01 |
| UDF[AMOUNT_LABEL]=value | 1-255 | Integers only, no decimal points, signs or symbols. | UDF[BALANCE]=1100 |

RIS Response

Kount®

After a merchant has posted RIS information to Kount, a key-value pair string will be returned back to the merchant. The RIS response format will be the same that was specified in the RIS post, with the default being named pairs. Each data field must be invoked by 'getter' methods on the response object found in the SDK. The merchant can then use the RIS response to automate the order management process by keying off of the **AUTO** field and can utilize any of the additional data returned for internal processing.

An important use of the RIS response is the ability to verify if the Data Collector process was successful and view any warnings or errors that were made during the RIS post from the merchant. The KAPT field is used to determine if the Data Collector process was successful. KAPT=Y means successful, KAPT=N means the process was unsuccessful. All warnings will be displayed in the response and if errors do occur the RIS response will be returned with a MODE=E.

Appendix C lists all warning and error codes.

Kount recommends at the minimum the following methods/functions used in the RIS response:

RIS response Java method examples:

| MERC - | getMerchantId() |
|-----------|--------------------|
| MODE - | getMode() |
| TRAN - | getTransactionId() |
| ORDR - | getOrderNumber() |
| AUTO - | getAuto() |
| SCOR - | getScore() |
| KAPT - | getKaptcha() |
| SITE - | getSite() |
| WARNING - | hasWarnings() |
| | getWarningCount() |
| | getWarnings() |
| ERROR - | hasErrors() |
| | getErrorCount() |
| | getErrors() |
| | getErrorCode() |

Appendix D lists examples of RIS Responses.

Predictive Response - Test environment only

Predictive Response is a mechanism that can be used by Kount merchants to submit test requests and receive back predictable RIS responses. This means that a merchant, in order to test RIS, can generate a particular request that is designed to provide one or more specific RIS responses and/or errors. The predictive response inquiries are not actual RIS inquiries, which means the data will never be submitted to the database and will not be displayed in the Agent Web Console.

The primary reason for having Predictive Response functionality is to diagnose error responses being received from RIS. For instance, a merchant may receive a large number of different error codes after submitting a RIS request. Most of these errors can be reliably reproduced by passing malformed, missing, or additional data in the RIS request. However, some of the errors are extremely difficult or even impossible to reproduce through simple means. There is no way to re-create these errors in a systematic or predictable fashion using RIS request input, rules, and/or Data Collector.

In addition, the merchant may wish to invoke a specific response in order to understand how their respective OMS will manage certain responses or data returned in the Kount response. Predictive Response allows merchants to submit requests designed to return exact responses including errors. An example would be if a merchant wanted to submit a RIS request that would return the very specific responses SCOR=71, AUTO=E, and GEOX=CA.

Predictive Responses are created using the UDF (User Defined Fields) override option. These User Defined Fields do not need to be created through the Agent Web Console, they can be simply passed in as additional fields in the Predictive Response RIS inquiry. In order to create a Predictive Response RIS Inquiry, the request must contain a specific email parameter in the EMAL field: predictive@kount.com. All other elements of the RIS request you submit must be valid elements and contain the minimum set of required RIS keys.

Below is the hard coded default reply:

```
'TRAN' => '6V100HV36D98',
'AUTO' => 'A',
'SCOR' => 50,
'GEOX' => 'US',
'BRND' => 'VISA',
'REGN' => 'ID',
'NETW' => 'A',
'CARDS' => 2,
'DEVICES' => 1,
'EMAILS' => 3,
'VELO' => 4,
'VMAX' => 4,
'SITE' => 'DEFAULT',
'DEVICE_LAYERS' => 'D67BC18BAD.6EF0902E51.8C96FA9E7B.61FD602D96.940A6D1454',
```

```
'FINGERPRINT' => '00482B9BED15A272730FCB590FFEBDDD',
'TIMEZONE' => 420,
'REGION'=> 'ID',
'COUNTRY'=> 'US',
'PROXY' => 'N',
'JAVASCRIPT' => 'Y',
'FLASH' \Rightarrow 'Y',
'COOKIES' => 'Y',
'HTTP_COUNTRY' => 'US',
'LANGUAGE' => 'EN',
'MOBILE_DEVICE' => 'N',
'MOBILE_TYPE' => '',
'MOBILE_FORWARDER' => 'N',
'VOICE_DEVICE' => 'N',
'PC_REMOTE' => 'N',
'REASON_CODE'=> '',
'MASTERCARD' => '',
'DDFS' => '2013-07-19',
'DSR' => '1080x1920',
'UAS' => 'Mozilla/5.0 (X11; Linux x86_64) AppleWebKit/537.31 (KHTML, like Gecko)
Chrome/26.0.1410.63 Safari/537.31',
'BROWSER' => 'Chrome 26.0.1410.63',
'OS' => 'Linux x86_64',
'PIP_IPAD' => '',
'PIP_LAT' => '',
'PIP_LON' => '',
'PIP_COUNTRY' => '',
'PIP_REGION' => '',
'PIP_CITY' => '',
'PIP_ORG' => '',
'IP_IPAD' => '10.0.0.1',
'IP_LAT' => '43.6091',
'IP_LON' => '-116.2097',
'IP_COUNTRY' => 'US',
'IP_REGION' => 'Idaho',
'IP_CITY' => 'Boise',
'IP_ORG' => 'Kount Inc.'
```

To pass in a request that will result in a specific response, use one or more UDF overrides to trigger a mock RIS response.

The basic syntax is: UDF[~K!_label]="foo"

 \sim K!_ is the prefix, **label** is the desired field for which you want a response, such as **SCOR** or **ERRO**, and after the equal sign (=), enter the specific value you want returned. The \sim K!_ prefix is required to trigger the **UDF** to become a predictive response field.

Example 1:

You want to send in a request that will result in a Kount Score of **18**, an Auto Decision of **E**, and a **601 System Error** code.

Request:

 $UDF[\sim K!_SCOR] = 18$ $UDF[\sim K!_AUTO] = E$

 $UDF[\sim K! ERRO] = 601$

Response:

SCOR=18

AUTO=E

ERRO=601

Example 2:

You want to pass in a request that will result in a Kount Score of **42**, an Auto Decision of **Decline** and a **GEOX** of **Nigeria**.

Request:

UDF[~K!_SCOR]=42 UDF[~K!_AUTO]=D

UDF[~K!_GEOX]=NG

Response:

SCOR=42

AUTO=D

GEOX=NG

You can use **UDF** overrides to pass in an unlimited number of mock requests but all of the fields you pass in that are not overrides <u>must</u> be valid. In the response, all of the other elements, besides the **UDF** overrides will be the default values, including **MODE** and **MERC**.

Kount Event Notification System (ENS) and Kount Application Programming Interface (API)

Kount allows a great deal of control over fraud management through a variety of methods including the Kount score, rules to determine risk thresholds, VIP lists, and many others that are administered through the Kount Agent Web Console or AWC. Kount also provides the ability for interaction for some functions without the need of the Agent Web Console by utilizing the Kount Event Notification System (ENS) and the Kount Application Programming Interface (API).

Specification guides for the ENS and API can be requested from your account manager or access the API endpoints list by pointing your browser to https://api.kount.net/rpc/list.html.

NOTE: A separate API certificate is required.

RIS Certificate Requests

To preserve the security of RIS data, merchants must authenticate to Kount using an X.509 certificate when submitting RIS requests. Certificates are exported via a browser. Additional coding examples can be found in the SDK Guide.

Required certificate format:

| PHP SDK | .pem |
|----------|-----------|
| PERL SDK | .p12/.pfx |
| Java SDK | .p12/.pfx |
| .NET SDK | .p12/.pfx |

Please see Appendix E for further specifics and details on Certificate creation and issuance.

- Instructions on how to export the RIS certificate are found in the **RIS Certificate Requests** section of the specification guide.
- Supported Browsers for certificate exportation:
 - Microsoft Internet Explorer version 7 and newer (Must be in Compatibility Mode for 10+)
 - Mozilla Firefox version 5 and newer
 - Apple Safari
- NOTE: Google Chrome does not support the exportation of certificates.
- SSL support is required for the RIS process.

Once the certificate has been exported it will be referenced in the relevant SDK configuration file.

PHP settings.ini

```
PEM_CERTIFICATE=/path/to/certificate.pem
PEM_KEY_FILE=/path/to/keyfile.pem
PEM_PASS_PHRASE=passphrase
```

```
.NET App.config
```

```
<!-- Private key certificate file -->
<add key="Ris.CertificateFile" value=/path/to/certificate.p12 />
<!-- RIS private key pass phrase -->
<add key="Ris.PrivateKeyPassword" value=passphrase />
```

```
Technical Specifications Guide v.5.5.5
```

Perl Kount::Ris::Settings

```
HTTPS_PKCS12_FILE => /path/to/certificate.p12 ,
HTTPS_PKCS12_PASSWORD => passphrase ,
```

Java

```
KountRisClient krc = new KountRisClient(passphrase, "https://risk.test.kount.net/",
"/path/to/certificate.p12");
```

Technical Specifications Guide v.5.5.5

FAQ Risk Inquiry Service

General

Q: Do RIS requests need to be initiated from the same server as the Data Collector process? No, they can be autonomous, but the RIS session ID must be the same session ID sent from the DC process for that transaction.

- **Q:** How soon does the RIS request need to be sent after the Data Collector? There is no set time though the sooner the better.
- **Q:** How do I code for the **PayPal** payment type? There are a couple of options available.
 - 1. On the initial RIS inquiry call (MODE=Q), specify the payment type as PayPal (PTYP=PYPL). With this method of coding for PayPal the order details will not be displayed in the Agent Web Console until after the PayPal Payer ID has been returned to Kount in the subsequent RIS update call (MODE=U).
 - 2. On the initial RIS inquiry call (MODE=Q), specify the payment type as NONE. This method will allow the order details to be displayed in the Agent Web Console. Once the PayPal Payer ID is returned send an update call to Kount, (MODE=U) and update the PTYP, and PTOK fields.
- **Q:** Why am I not seeing any log files in the path I specified? Check your configuration file and make sure the logger is set to the desired logging level.

Troubleshooting Risk Inquiry Service

General

Is the correct Kount URL being used?

- Verify that the correct RIS URL is being used, test URL or production URL.
- Can the URL be resolved?
- Have the RIS responses been checked for errors or warnings?

Appendix B

RIS Required Inquiry Keys

| RIS Required
Inquiry Key | Description | Max Field
Length | Source | Required |
|-----------------------------|--|---------------------|----------|--------------------------------------|
| ANID | Automatic Number Identification (ANI)
submitted with order. If the ANI can-
not be determined, merchant must pass
0123456789 as the ANID. This field is only
valid for MODE=P RIS submissions. | 32 | Merchant | MODE=P |
| AUTH | Authorization Status returned to merchant
from processor. Acceptable values for the
AUTH field are 'A' for Authorized or 'D' for
Decline.
In Kount, orders where AUTH=A will ag-
gregate towards order velocity of the per-
sona while orders where AUTH=D will
decrement the velocity of the persona. | | | MODE=Q
MODE=P |
| CURR | Country of currency submitted on order | 3 | Merchant | MODE=Q
MODE=P |
| EMAL | Email address submitted by customer. If a call center is accepting orders on behalf of customers and the customer does not provide an email address, noemail@kount.com must be submitted. | 64 | Merchant | MODE=Q |
| IPAD | Dotted Decimal IPv4 address that the mer-
chant sees coming from the customer. If
MODE=P or the Phone to Web exclusion is
used, the IPAD field should be hard coded
to be 10.0.0.1. Other than MODE=P or
Phone to Web, the IPAD field should never
be an anonymous IP address (i.e. 10.X.X.X
or 192.168.X.X). | 16 | Merchant | MODE=Q
MODE=P |
| MACK | Merchants acknowledgement to ship/pro-
cess the order. The MACK field must be set
as 'Y' if persona data is to be collected to
strengthen the Kount score. | 1 | Merchant | MODE=Q
MODE=P |
| MERC | Merchant ID assigned to the merchant by
Kount. | 6 | Merchant | MODE=Q
MODE=P
MODE=X
MODE=U |

| RIS Required | Description | Max Field | Source | Required |
|---------------------|---|--------------------------------|----------|--------------------------------------|
| Inquiry Key
MODE | Specifies what mode type the RIS post is:
MODE=Q
MODE=P
MODE=X
MODE=U | Length
1 | Merchant | MODE=Q
MODE=P
MODE=X
MODE=U |
| PROD_DESC | Shopping cart data array attribute for spe-
cific description of the item being pur-
chased. | 256 | Merchant | MODE=Q
MODE=P |
| PROD_ITEM | Shopping cart data array attribute typically the SKU for an item | 256 | Merchant | MODE=Q
MODE=P |
| PROD_PRICE | Shopping cart data array attribute for the price of the single item. Must be a natural number including 0. | for the no max Merchant MODE=Q | | ~ |
| PROD_QUANT | Shopping cart data array attribute signify-
ing the quantity of the item being purchased | no max | Merchant | MODE=Q
MODE=P |
| PROD_TYPE | Shopping cart data array attribute high
level or generalized description of the item
added to the shopping cart | 256 | Merchant | MODE=Q
MODE=P |
| РТОК | Payment token submitted by merchant for
order (credit card, payer ID, routing/transit
and account number) | 32 | Merchant | MODE=Q
MODE=P |
| РТҮР | Payment Type submitted by merchant:
CARD - Credit Card
PYPL - PayPal
CHEK - Check
NONE - None
GDMP - Green Dot Money Pack
GOOG - Google Checkout
BLML - Bill Me Later
GIFT - Gift Card
BPAY - BPAY
NETELLER - Neteller
GIROPAY - GiroPay
ELV - ELV
MERCADE_PAGO - Mercade Pago
SEPA - Single Euro Payments Area
INTERAC - Interac
CARTE_BLEUE - Carte Bleue
POLI - POLi
SOFORT - Sofort | 4 | Merchant | MODE=Q
MODE=P |

| RIS Required
Inquiry Key | Description | Max Field
Length | Source | Required |
|-----------------------------|--|---------------------|-----------------------|--------------------------------------|
| SESS | Unique session ID 32 | | Merchant | MODE=Q
MODE=P
MODE=X
MODE=U |
| SITE | Website identifier of where order origi-
nated. | | Merchant | MODE=Q
MODE=P |
| TOTL | Total amount in currency submitted in low-
est currency factor. e.g. USD = pennies
(\$1.00 = 100). TOTL must be a natural
number including 0.15 | | Merchant | MODE=Q
MODE=P |
| TRAN | Kount transaction ID required for update calls to Kount. MODE=U and MODE=X | | Kount | MODE=U
MODE=X |
| VERS | Specifies version of Kount, built into SDK,
must be supplied by merchant if not using
the SDK | | Kount - Mer-
chant | MODE=Q
MODE=P
MODE=X
MODE=U |

RIS Optional Keys

| RIS Optional
Keys | Description | Max Field
Length | Source |
|----------------------|--|---------------------|----------|
| ANID | Automatic Number Identification (ANI) submitted with or-
der. If the ANI cannot be determined, merchant must
pass 0123456789 as the ANID. This field is optional for
MODE=Q RIS submissions. | 32 | Merchant |
| AVST | Address Verification System Street verification response re-
turned to merchant from processor. Acceptable values are
'M' for match, 'N' for no-match, or 'X' for unsupported or
unavailable. | | |
| AVSZ | Address Verification System Zip Code verification response
returned to merchant from processor. Acceptable values
are 'M' for match, 'N' for no-match, or 'X' for unsupported
or unavailable. | 1 | Merchant |
| B2A1 | Billing street address - Line 1 | 256 | Merchant |
| B2A2 | Billing street address - Line 2 | 256 | Merchant |
| B2CC | Billing address - Country | 2 | Merchant |
| B2CI | Billing address - City | 256 | Merchant |
| B2PC | Billing address - Postal Code | 20 | Merchant |
| B2PN | Bill-to Phone Number | 32 | Merchant |

| RIS Optional
Keys | Description | Max Field Source
Length | |
|----------------------|--|----------------------------|----------|
| B2ST | Billing address - State/Province | 256 | Merchant |
| BPREMISE | Bill-to premise address for UK (Required for 192.com) | 256 | Merchant |
| BSTREET | Bill-to street address for UK (Required for 192.com) | 256 | Merchant |
| CASH | Total cash amount in currency submitted | 15 | Merchant |
| CVVR | Card Verification Value response returned to merchant
from processor. Acceptable values are 'M' for match, 'N'
for no-match, or 'X' unsupported or unavailable. | 1 | Merchant |
| DOB | Date of Birth Format YYYY-MM-DD | YYYY-MM-DD | Merchant |
| EPOC | Date customer account was created by merchant. UNIQ. | 10 | Merchant |
| FRMT | Specifies the format of the RIS response if not using SDK, XML, JSON, YAML | 4 | Merchant |
| GENDER | M or F | 1 | Merchant |
| NAME | Name submitted with the order | 64 | Merchant |
| ORDR | Merchant's Order Number | 32 | Merchant |
| S2A1 | Shipping street address - Line 1 | 256 | Merchant |
| S2A2 | Shipping street address - Line 2 | 256 | Merchant |
| S2CC | Shipping address - Country | 2 | Merchant |
| S2CI | Shipping address - City | 256 Merchant | |
| S2EM | Shipping address - Email address of recipient | 64 Merchant | |
| S2NM | Shipping address - Name of recipient | 64 | Merchant |
| S2PC | Shipping address - Postal Code | 20 | Merchant |
| S2PN | Ship-to Phone Number | 32 | Merchant |
| S2ST | Shipping address - State/Province | 256 | Merchant |
| SHTP | Shipping type. The following nomenclature is expected for shipping types to be passed to Kount.
SHTP:
Same Day = SD
Next Day = ND
Second Day = 2D
Standard = ST | 2 | Merchant |
| SPREMISE | Ship-to premise address for UK (Required for 192.com) | | |
| SSTREET | Ship-to street address for UK (Required for 192.com) | 256 Merchant | |
| UNIQ | Merchant assigned account number for consumer | 32 Merchant | |
| UAGT | Customer User-Agent HTTP header | 1024 | Merchant |

RIS Response Keys

| RIS Response Keys | Description | Source |
|-------------------------------------|---|--------|
| AUTO
Displayed as STAT in
AWC | Auto-decision response code: A - Approve D - Decline R - Review E - Escalate | Kount |
| BRND | Brand of credit card used when payment type is 'credit card' | Kount |
| CARDS | Total number of credit cards associated to persona as seen by Kount | Kount |
| COOKIES | A flag to indicate if the device placing order has 'cookies' enabled or not | Kount |
| COUNTERS_TRIGGERED | Number of unique counter names triggered during rules evaluation | Kount |
| COUNTER_NAME_X | Name of counter triggered | Kount |
| COUNTER_VALUE_X | Sum of the number of times a counter was triggered | Kount |
| COUNTRY | Two character ISO country code associated with the phys-
ical device | Kount |
| DEVICE_LAYERS | 5 device layers representing the operating system,
browser, javascript settings, cookie setting and flash set-
tings. Device layers are used to create the device finger-
print. | Kount |
| DEVICES | Total number of unique devices associated to persona as seen by Kount | Kount |
| EMAILS | Total number of unique email addresses associated to per-
sona as seen by Kount | Kount |
| ERROR_COUNT | Number of errors merchant RIS post created | Kount |
| ERROR_N | Error code displayed in RIS response | Kount |
| FINGERPRINT | The unique fingerprint of the device placing the order | Kount |
| FLASH | A flag to indicate if the device placing order has 'flash' en-
abled or not | Kount |
| GEOX | Persona related country with highest probability of fraud | Kount |
| HTTP_COUNTRY | User Home country the device owner has set in the device's Control Panel | Kount |
| JAVASCRIPT | A flag to indicate if the device placing order has 'javascript'
enabled or not | Kount |

| RIS Response Keys | Description | Source |
|-------------------|--|----------|
| КАРТ | Whether or not device data was collected by the Data Collector process | Kount |
| KYCF | Know Your Customer Flag Kount | |
| LANGUAGE | The language the device owner has set in the device's Con-
trol Panel | |
| LOCALTIME | The local time the device owner has set in the device's Control Panel | Kount |
| MERC | Kount Merchant ID | Merchant |
| MOBILE_DEVICE | Is the device placing the order of a mobile nature (iPhone;
Android; Blackberry; iPad, etc.) | Kount |
| MOBILE_FORWARDER | If device is mobile, is it using a forwarder to process the Kount carrier's service | |
| MOBILE_TYPE | iPhone; Android; Blackberry; iPad, etc. Kount | |
| MODE | Specifies what mode type the RIS post is, Q, P, X, U, E | Merchant |
| NETW | Riskiest network type associated with persona within the last 14 days Kount • A - Anonymous • H - High School • L - Library • N - Normal • O - Open Proxy • P - Prison • S - Satellite • S - Satellite | |
| ORDER | Merchant's Order Number | Merchant |
| PC_REMOTE | Is the device enabled to use PC Remote software Kount | |
| PROXY | Was a proxy server detected with this order Kount | |

| RIS Response Keys | Description | Source |
|--------------------|---|----------|
| REAS | Reason code associated with AUTO fieldKount• AMNT - Amount• GEOX - Persona related country with highest probability of fraud• LIST - VIP List (E-Mail, Card, Address, Gift Card, Device ID)• NETW - Network Type• SCOR - Kount Score• VELO - Sales velocity in a fourteen day time frame• VMAX - Sales velocity in a six hour time frame | |
| REGN | Region associated to the Device Location (when SRC=Kaptcha provided) | Kount |
| RULES_TRIGGERED | Number of rules triggered by the RIS post | Kount |
| RULE_DESCRIPTION_X | Rule descriptions associated with RULE_ID_X | Kount |
| RULE_ID_X | Rule ID associated with merchant created rules | Kount |
| SCOR | Kount score | Kount |
| SESS | Unique session ID | Merchant |
| SITE | Website identifier of where order originated | Merchant |
| STAT | Status returned as AUTO by Kount: Kount: • A - Approve Kount: • D - Decline R - Review • E - Escalate Additional status codes displayed in the AWC. • C - Original transaction was approved but due to dynamic scoring the transaction now has an elevated score and may require reevaluation. • X - Trnasaction was flagged for review but never acted upon and has timed out. • Y - Original transaction was approved but updated with AUTH=D and then timed out. | |
| TIMEZONE | The timezone the device owner has set in the device's Con-
trol Panel. The value listed represents the number of min-
utes from Greenwich Meantime. Divide by 60 to get num-
ber of hours. | |
| TRAN | Kount transaction ID number | Kount |

| RIS Response Keys | Description | Source |
|-------------------|--|--------|
| VELO | Quantity of orders seen from persona within last 14 days.
AUTH field must be equal to 'A'. | Kount |
| VERS | Specifies version of Kount, built into SDK, must be supplied by merchant if not using the SDKMerchant-Kount | |
| VMAX | Quantity of orders from persona within the most active 6
hour window in last 14 days. AUTH field must be equal to
'A'. | |
| VOICE_DEVICE | Is the device voice activated (related to mobile devices) Kount | |
| WARNING_COUNT | Number of warnings merchant RIS post created Kount | |
| WARNING_N | Warning code displayed in RIS response | Kount |

Expanded RIS Response Keys

Starting with Kount 5.5.5, an expanded list of RIS Response Keys are available:

- 1. [DDFS] Date device first seen
- 2. [DSR] Device screen resolution
- 3. [UAS] User agent string
- 4. [BROWSER] Web browser
- 5. [OS] Operating System (OS)
- 6. [PIP_IPAD] Pierced IP address
 - [PIP_COUNTRY] Country of pierced IP address
 - [PIP_LAT] Latitude of pierced IP address
 - [PIP_LON] Longitude of pierced IP address
 - [PIP_CITY] City of pierced IP address
 - [PIP_REGION] State/Region of pierced IP address
 - [PIP_ORG] Owner of pierced IP address or address block (i.e. name of company)
- 7. [IP_IPAD] IP address of proxy
 - [IP_COUNTRY] Country of proxy IP address
 - [IP_LAT] Latitude of proxy IP address
 - [IP_LON] Longitude of proxy IP address
 - [IP_CITY] City of proxy IP address
 - [IP_REGION] State/Region of proxy IP address
 - [IP_ORG] Owner of IP address or address block (i.e. name of company)

Appendix C

RIS Warning and Error Codes

| Warning/Error
Code | Warning/Error Label | Brief Description |
|-----------------------|---------------------|---|
| 201 | MISSING_VERS | Missing version of Kount, this is built into SDK but must
be supplied by merchant if not using the SDK |
| 202 | MISSING_MODE | The mode type for post is missing Refer to Risk Inquiry
Service Modes section of this document |
| 203 | MISSING_MERC | The six digit Kount Merchant ID was not sent |
| 204 | MISSING_SESS | The unique session ID was not sent |
| 205 | MISSING_TRAN | Kount transaction ID number |
| 211 | MISSING_CURR | The currency was missing in the RIS submission |
| 212 | MISSING_TOTL | The total amount was missing |
| 221 | MISSING_EMAL | The email address was missing |
| 222 | MISSING_ANID | For MODE=P RIS inqueries the caller ID is missing |
| 223 | MISSING_SITE | The website identifier that was created in the Agent Web
Console ('DEFAULT' is the default website ID) is missing |
| 231 | MISSING_PTYP | The payment type is missing. Refer to the RIS Payment Types section of this document for details |
| 232 | MISSING_CARD | The credit card information is missing |
| 233 | MISSING_MICR | Missing Magnetic Ink Character Recognition string |
| 234 | MISSING_PYPL | The PayPal Payer ID is missing |
| 235 | MISSING_PTOK | The payment token is missing. Refer to the RIS Payment
Types section of this document for details |
| 241 | MISSING_IPAD | The IP address is missing |
| 251 | MISSING_MACK | The merchant acknowledgement is missing |
| 261 | MISSING_POST | The RIS query submitted to Kount contained no data |
| 271 | MISSING_PROD_TYPE | The shopping cart data array attribute is missing. Refer to the Shopping Cart Data section of this document for details |
| 272 | MISSING_PROD_ITEM | The shopping cart data array attribute is missing. Refer to the Shopping Cart Data section of this document for details |
| 273 | MISSING_PROD_DESC | The shopping cart data array attribute is missing. Refer to the Shopping Cart Data section of this document for details |
| 274 | MISSING_PROD_QUANT | The shopping cart data array attribute is missing. Refer to the Shopping Cart Data section of this document for details |

| Warning/Error
Code | Warning/Error Label | Brief Description |
|-----------------------|---------------------|--|
| 275 | MISSING_PROD_PRICE | The shopping cart data array attribute is missing. Refer to the Shopping Cart Data section of this document for details |
| 301 | BAD_VERS | The version of Kount supplied by merchant does not fit the four integer parameter |
| 302 | BAD_MODE | The mode type is invalid. Refer to the RIS Inquiry Service
Modes section of this document for details |
| 303 | BAD_MERC | The six digit Kount Merchant ID is malformed or wrong |
| 304 | BAD_SESS | The unique session ID is invalid. Refer to the Data Collec-
tor Requirements and Section creation code example sec-
tions of this document for details |
| 305 | BAD_TRAN | Kount transaction ID number is malformed |
| 311 | BAD_CURR | The currency was wrong in the RIS submission |
| 312 | BAD_TOTL | The total amount is wrong. TOTL is the whole number amount charged to customer |
| 321 | BAD_EMAL | The email address does not meet required format or is greater than 64 characters in length |
| 322 | BAD_ANID | For MODE=P RIS inqueries the caller ID is malformed |
| 323 | BAD_SITE | The website identifier that was created in the Agent Web
Console ('DEFAULT' is the default website ID) does not
match what was created in the AWC. |
| 324 | BAD_FRMT | The specified format is wrong. Format options are key value pairs, XML, JSON, YAML |
| 331 | BAD_PTYP | The payment type is wrong. Refer to the RIS Payment Types section of this document for details |
| 332 | BAD_CARD | The credit card information is malformed or wrong, test cards do not work in the production environment |
| 333 | BAD_MICR | Malformed or improper Magnetic Ink Character Recogni-
tion string. Refer to the RIS Payment Types section of this
document for details |
| 334 | BAD_PYPL | The PayPal Payer ID is malformed or corrupt. Refer to the RIS Payment Types section of this document for details |
| 335 | BAD_GOOG | Malformed or improper Google Checkout Account ID
string. Refer to the RIS Payment Types section of this doc-
ument for details |
| 336 | BAD_BLML | Malformed or improper Bill Me Later account number. Re-
fer to the RIS Payment Types section of this document for
details |
| 337 | BAD_PENC | The encryption method specified is wrong |
| 338 | BAD_GDMP | The GreenDot payment token is not a valid payment token |

| Warning/Error
Code | Warning/Error Label | Brief Description |
|-----------------------|---------------------|---|
| 339 | BAD_HASH | When payment type equals 'CARD', [PTYP=CARD]
and payment encryption type equals 'KHASH',
[PENC=KHASH] the value must be 20 characters in
length. |
| 340 | BAD_MASK | Invalid or excessive characters in the PTOK field |
| 341 | BAD_IPAD | The IP address does not match specifications |
| 342 | BAD_GIFT | The Gift Card payment token is invalid due to invalid char-
acters, null, or exceeding character length |
| 351 | BAD_MACK | The merchant acknowledgement must be 'Y' or 'N' |
| 362 | BAD_CART | There is a discrepancy in the shopping cart key count and
the number of items actually being sent in the cart |
| 371 | BAD_PROD_TYPE | The shopping cart data array attribute is missing. Refer to the Shopping Cart Data section of this document for details |
| 372 | BAD_PROD_ITEM | The shopping cart data array attribute is corrupt or miss-
ing. Refer to the Shopping Cart Data section of this docu-
ment for details |
| 373 | BAD_PROD_DESC | The shopping cart data array attribute is corrupt or miss-
ing. Refer to the Shopping Cart Data section of this docu-
ment for details |
| 374 | BAD_PROD_QUANT | The shopping cart data array attribute is corrupt or miss-
ing. Refer to the Shopping Cart Data section of this docu-
ment for details |
| 375 | BAD_PROD_PRICE | The shopping cart data array attribute is corrupt or miss-
ing. Refer to the Shopping Cart Data section of this docu-
ment for details |
| 399 | BAD_OPTN | A UDF has been mistyped or does not exist in the Agent
Web Console |
| 401 | EXTRA_DATA | RIS keys submitted by merchant were not part of SDK |
| 404 | UNNECESSARY_PTOK | When PTYP equals NONE and a PTOK is submitted |
| 501 | UNAUTH_REQ | Error regarding certificate |
| | | Using test certificate in prod |
| | | • Using prod certificate in test |
| | | Certificate passphrase is wrong |
| | | Merchant ID does not match |
| | | Certificate has expired |
| 502 | UNAUTH_MERC | Invalid Merchant ID has been entered |
| 601 | SYS_ERR | Unspecified system error - Contact Merchant Services |

51

| Warning/Error
Code | Warning/Error Label | Brief Description |
|-----------------------|---------------------|---|
| 602 | SYS_NOPROCESS | Kount will not process particular transaction |
| 701 | NO_HDR | No header found with merchantId=[XXXXX], ses-
sionId=[htot2kk5khpamo45f777q455], trans=[122347]
This error occurs when a RIS request goes to the database
and there is no data available in the reply. The Update
post had an invalid transaction ID#. Check all required
fields for update post and confirm they are being passed
correctly. |

• Missing: When this designation appears, the customer has failed to complete a required field.

• Bad: When this designation appears, some data was sent but failed to meet specifications. This could also be explained as malformed data or bad code that did not meet specifications, such as AVS=W instead of AVS=M.

Appendix E

Kount®

To preserve the security of RIS data, merchants must authenticate to RIS using an X.509 certificate when submitting RIS requests. Certificates are exported via a browser. Additional details regarding the certificate are found in the SDK Guide.

Supported Browsers for certificate exportation:

- Microsoft Internet Explorer version 7 and newer (must be in compatibility mode for IE 10).
- Mozilla Firefox version 5 and newer
- Apple Safari

NOTE: Google Chrome does not support the exportation of certificates.

Converting RIS Certificates to Different Formats

Depending on a variety of factors, you may need to convert your certificate to a different format in order to effectively submit a RIS request.

If you are using a web browser that exports P12 or PFX files, such as Mozilla Firefox, or Internet Explorer, you may need to use the OpenSSL command-line tool to convert the certificate to a PEM formatted certificate file and key file. If you are using a Windows platform, you can download OpenSSL for Windows to perform the conversion.

When converting the exported certificate, verify these two factors:

- 1. Is OpenSSL the application used to convert the file?
- 2. Has cURL been compiled with NSS?

If both are true, it is requisite that the version of OpenSSL be 0.9.x. If OpenSSL version 1.x.x is used, the converted certificate will not function and an error will be thrown.

The following pages describe the exportation and conversion of the RIS certificate.

Required certificate format:

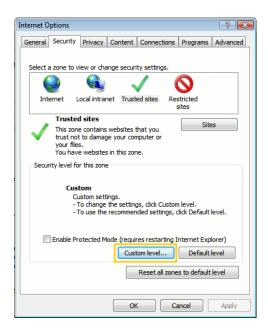

PHP SDK .pem PERL SDK .p12/.pfx Java SDK .p12/.pfx .NET SDK .p12/.pfx

Certificate Exportation and Conversion

This section outlines the required steps for preparing your Internet Explorer 9 web browser to be able to use exported certificates.

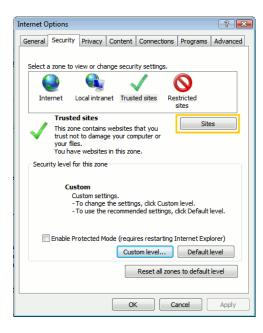

1. Click Tools and then click Internet Options. Click Security tab and then click Custom level button.

2. In the **Settings** box, scroll down and locate **Initialize and script ActiveX controls not marked as safe for scripting (not secure)** and click **Prompt**, then click **OK**.

| iettings | | | |
|-----------|---|--------------|--------------|
| | Download unsigned ActiveX controls | | - |
| | Disable (recommended) | | |
| (| Enable (not secure) | | |
| | Prompt | | |

| | Dromot | | - |
| • | | | • |
| *Takes ef | fect after you restart Internet Expl | orer | |
| | | | |
| | | | |
| | om settings | | |

3. On the Security tab in Internet Options, select Trusted Sites, and then click Sites.

4. In the **Trusted Sites** dialog, in the **Add this website to the zone** field, type in the URL of the website such as in https://awc.test.kount.net and https://awc.kount.net and click **Add**. The URL will be added to the Websites field. Click **Close**.

| Trusted sites | X |

| | Close |

- 6. On the Internet Options dialog, click OK.
- 7. You <u>must</u> restart Internet Explorer to allow your changes to be applied.

Once IE9 has restarted, you are ready to request the RIS certificate from Kount.

Certificate Request

- 1. Browse to desired console, test or production.
- 2. Click the Admin tab, then click RIS Certificates.

| WORKFLOW REPORTS FRAUD CONTROL | ADMIN Order Number |

Certificate Export in Internet Explorer

Kount®

1. In IE click Tools, Internet Options, Content tab, Certificates button.

2. On the **Certificates** window, on the **Personal** tab, click the name of the certificate in the list you wish to export and then click the **Export** button.

| Issued To Issued By Expiratio Friendly Name Imagento_package Kount Merchant API CA 5/7/2013 <none> Imagento_package Kount Merchant API CA 5/7/2013 <none></none></none> | ended purpose: | 5 | All> | | |

| | | | | | |

3. Click Next on the Certificate Export Wizard window.

| Certificate Export Wizard | |
|---------------------------|---|
| | Welcome to the Certificate Export
Wizard This wizard helps you copy certificates, certificate trust
lists and certificate revocation lists from a certificate store
store to your disk. A certificate, which is issued by a certification authority, is
a confirmation of your identity and contains information
used to protect data or to establish secure network
connections. A certificate store is the system area where
certificates are kept. To continue, click Next. |

5. On the **Export File Format** page, select the **Personal Information Exchange** radio button, any of the check boxes beneath the radio button that suits your security needs, and then click **Next**.

NOTE While it is entirely up to the merchant as to which, if any, of these options is selected. To be **PCI Standards** compliant, it is recommended that the **Delete the private key if the export is successful** check box is checked. This prevents any unauthorized person who may gain access to a merchant environment from exporting your private key to a remote location for malicious purposes. However, if you select this option and later require access to it, you will need to request a new RIS certificate from Kount.

| rtificate Export Wizard | | | E |

8. In the **Completing the Certificate Export Wizard** page click **Finish**.

9. A success notification should appear.

Certificate Export in Mozilla Firefox

As you did on Internet Explorer, you will need to open the AWC in Firefox, request a RIS certificate, and then proceed with the following steps.

- 1. In Firefox, click **Tools** and then **Options**.
- 2. On the Options box, select Advanced, select the Encryption tab, and then select View Certificates.

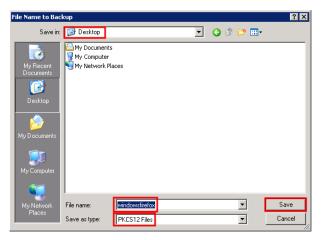

| Options | | | | | | | × |
|-------------|---------------------|-----------------|--------------------|-----------|-------------|-----------|----------|

Technical Specifications Guide v.5.5.5

- 4. When the **File Name to Backup** dialog appears, give the certificate you want to export a name in the **File name** field, select a location to which you want to back up the certificate, such as your desktop, verify that the **PKCS12 Files** file format option is selected, and then click **Save**.
 - The PKCS12 Files option should be selected automatically.

- 5. On the **Choose a Certificate Backup Password** dialog, enter a password for the certificate backup in the **Certificate backup password** field, enter the same password again in the **Certificate backup password** (again) field, and then click **OK**.
 - Notice that the **Password quality meter** bar shows an indication of the "strength" of the password.

| Choose a Certificate Backup Password |
|---|
| The certificate backup password you set here protects the backup file that you are about to create. You
must set this password to proceed with the backup. |
| Certificate backup password: |
| Certificate backup password (again): |
| Important: If you forget your certificate backup password, you will not be able to restore this backup
later. Please record it in a safe location. |
| Password quality meter |
| |
| OK Cancel |

- 6. When the **Alert** dialog indicating that the certificate and private key have been successfully backed up appears, click **OK**.
- 7. On the Certificate Manager dialog, click OK to close.
- 8. Close any other dialogs that may be open.

The RIS certificate has been successfully exported to your computer.

```
Technical Specifications Guide v.5.5.5
```

Certificate Conversion - Prerequisites

Kount®

For Windows operating systems a separate application may be required to perform the certificate conversion.

```
X32-http://gnuwin32.sourceforge.net/packages/openssl.htm
X64-http://code.google.com/p/openssl-for-windows/downloads/list
```

- 1. Copy or move the exported file to the same directory where the openssl.exe file is located.
- 2. Open the command prompt and change directory to where the openssl.exe resides.

- 4. Confirm that the order is held as review in the Agent Web Console.
- 5. Confirm that the order number has populated correctly.

Note: Merchants are responsible for checking interaction with their OMS to validate expected behavior.

Appendix G

Kount®

Required Elements

The following features should be tested prior to Kount certification. Utilize this checklist to help ensure that all data is posting within Kount as expected.

Data Device Collector

Unique Session_ID

- Merchant_URL
- □ Kount_Server_URL

Risk Inquiry Service

X.509 Certificate is being passed

Required Inquiry Keys

Note: Session IDs link the Device Data to the Risk Inquiry Service Data. All Session IDs must be unique for 30 days.

Payment Type Testing

Test all Payment Types that will be passed by the Merchant.

Pixel Testing

The image path must be a HTTPS path.

Technical Specifications Guide v.5.5.5

Optional Elements To Be Tested

When applicable, test the optional features prior to Kount certification. Additionally, all features should be tested for each type of customer available on the merchant website.

Phone Order Testing

1. If the customer service agents navigate to a separate order entry page:

- Orders posted as a Mode=P
- Hard code IP address to 10.0.0.1
- Phone Number within the ANID field is provided

• If no phone number is available, ANID field is hard coded to 0123456789

If no email is provided, EMAIL field is being submitted as noemail@kount.com so that linking does not happen. 2. If the customer service agents navigate to the same order entry page as the customer:

| Q |
|---|
| |

- Hard code IP address to 10.0.0.1
- If no email is provided, EMAIL field is being submitted as noemail@kount.com so that linking does not happen.

Risk Inquiry Service Testing

Confirm that the optional information, listed below, is being passed to Kount during the Risk Inquiry System (RIS) call.

Optional Inquiry Keys

User Defined Fields

Validate that any user defined fields defined in the Agent Web Console are being passed to Kount during RIS call.

Event Notification System (ENS) Testing

Verify the ENS XML file is being received by the URL defined within the Agent Web Console.

Validate that ENS is enabled and to the correct URL within the Agent Web Console Website settings page.

Items that *cannot* be tested in the Sandbox environment:

| Persona Orders | Address and Phone Number Validation through Melissa Data |
|----------------------|--|
| Velo Information | Network Information |
| VMax Information | Device Information |
| Distance Calculators | External Services |
