a) we can,
b) did you receive an email a minute later with the skipped branch reported as successful?

Hey Aki,

Is it the case that if a branch doesn't convert for some reason (like below), it is a non-serious problem, that doesn't need human attention? Is this the reason we say it is successful, because it is nothing that requires human intervention?

If this is the case, I can imagine something like the email subject could say "successful, with warnings" and maybe the message body could explain there was a (non-serious) problem that does not require human attention (or whatever the case may be).

I think just a couple of words of explanation in the email is fine, to explain why the subject says it is successful, but the body seems to imply it wasn't. Whatever that reason might be - so the reader is able to reconcile these two pieces of information.

Pete

Yes, though I'm open to suggestions on how to make these clearer.

Hey guys,

Is it correct that the email subject says "Successful conversion" yet the email body says "Summary is non-zero: error - Error getting changes for alder; skipping!" ?
