These below are the step to replicate the bug. The witer I used is OpenOfiice 4.1.1
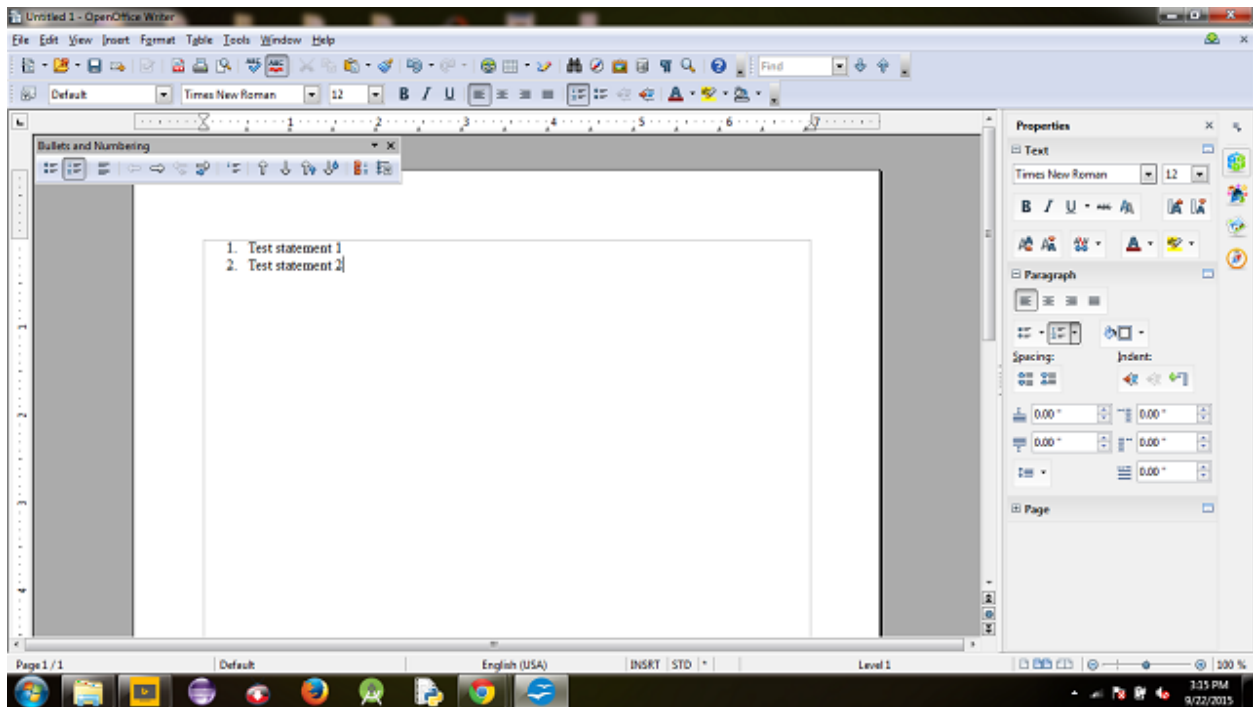

Step 1: Write a text in a single line.

Step 2: Apply numbering on the text which you entered as shown in the figure. To apply numbering click on numbering function as shown by the red arrow.
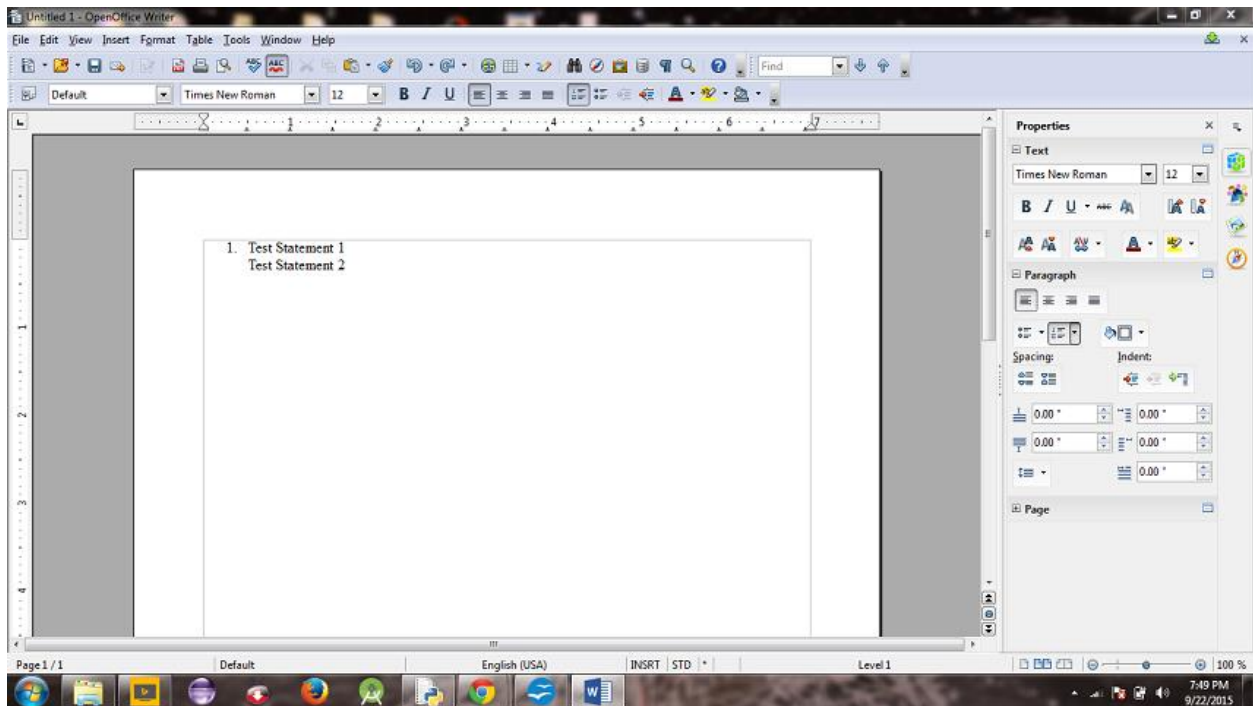

Step 3: Press Enter and write a new line of text.

Step 4: Place your cursor in the start of the second line as shown in the below screenshot.
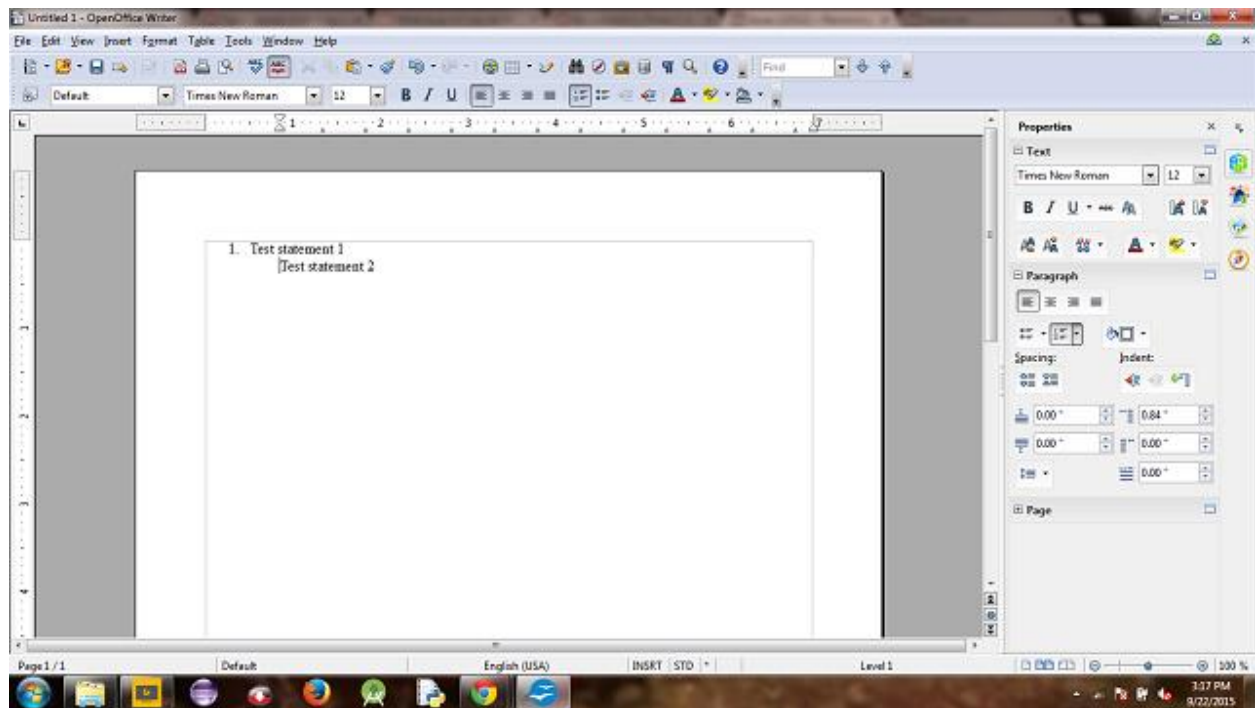

Step 5: Now press the backspace key and you see that the number is deleted but the position of the line 2 will be still.

Step 6: Now hold the indent and drag it from point 1 to point 2. Points are just for reference. You just have to change the position of the ruler to your right side.

Step 7: After applying step 6, your text will look something like this. Now if press the "Tab Key" the second line should get indented but it will not.

Step 8: Now if you press the backspace key and try to press the "Tab Key", even then the line will not be intended.
