This example is written on *an* iMac (running Sierra) using the Apple Chancery font. The version of Open Office used is 4.1.3 and demonstrates the failure of this version to properly display the font properly vis-a-vis letters at end-of-word vs. the same letters at end-of-line. The margins have been brought in so the lines will be shorter and, therefore, more *of* them.

The Apple Chancery font is a very beautiful font *which* among other things, displays, for some letters, that letter differently depending upon whether it is the final letter on a line or the final letter of a word within a line. At the end *of* a line some letters such as 'n' 't' 'h' 'f' 'd' and 'u' have *an* extension, or "tail," *which* extend to the right adding to the elegance of the font. These have disappeared in the last two versions of Open Office, with end-of-line appearance same as end-of-word.

I agree with mroe that this is a completely different issue than issue 124496. This issue is concerned with a specific font rendering differently between different versions of AOO on macOS. Issue 124496 deals with different variants of fonts (bold,etc.) not being available in the AOO fonts dropdown. I believe that this issue should stand alone to allow a Mac user to confirm.
