
Parent frame: the frame behind this one... anchored to page, background image set to "area".

This frame: anchored to a paragraph in the parent frame. This frame has a white background with a 25% transparency set.

If the parent frame has a border set, everything prints fine- you will see this frame with a white background with 25% transparency/bleed.

BUT if you simply remove the border from the parent frame, transparency on THIS frame goes to 100%... there is no [75%] white background at all and you can barely read this printed text.

This has been tested extensively in OO 2.1 with no problems. But in OO 2.3.0, it fails and shows the problem. During the problem, you can create a working and proper PDF, but when it is printed (cups/hp laser printers) it fails.
