General

- I miss a chapter about execution server administration and configuration

1.1 Creating a repository

- Figure 1.1 outdated

- 5 – click Finish

- 6 – no confirmation prompt

- Figure 1.2 – 6 – warn users that the repository will be indexed and so on – you may copy "The Repository will be indexed. Some workbench features may be unavailable until indexing has completed

1.3 Removing a repository

- It is simpler to remove a repository from Business Central in RepositoryEditor – this option is missing in the docs (it's also possible to remove a repository via kie-config-cli)

- Therefore, describe all the options for creating, removing, …. repository, …. or just use the easiest way in the business central. At no cost please do not mix the approaches.

1.4 Managing Assets

- Managed Branches - "(for both single and mult-projects)" → "(for both single and mult>I<-projects)"

1.7 Creating a project

- 4 – note – the note is invalid – project name can contain spaces and special characters – only artifactId must comply the Maven rules.

1.9 Configuring deployment to a remote Nexus repository

- Nexus is a repository man>**A**<ger.

- *Localhost URL used in the example does not refer to a remote nexus repository*

- Please do not encourage users to use plaintext passwords in the settings.xml. The settings-security.xml with a master password should be used instead.

- Repostiories → repos>**it**<ories

2.2 Configuring Logging

- Logback.xml is not located at business-central.war/WEB-INF/classes/logback.xml by default and the file needs to be created there.

- Shouldn't be the log4j.xml located at WEB-INF/>**classes**</log4j.xml?

- Could you provide links to other guides when you refer to them?
  https://access.redhat.com/documentation/en-US/JBoss_Enterprise_Application_Platform/6.4/html/Administration_and_Configuration_Guide/index.html

3. Command Line Configuration

- Download steps - 4 – update version from 6.0.3 to 6.1.0

3.1 Starting the kie-config-cli tool in online mode

- The tool also asks for the user credentials

3.3 Commands available for the kie-config-cli tool

- fetch-changes command is missing

- Please, group the commands by some categories. (Repository Management, Role/User Management, GIT changes, etc.) For documentation I am very easily lost in what the tool can offer me.

4. Migration

- Update this section for BRMS – visibly it's copied from BPM Suite Administration and Configuration Guide.

4.1 Data Migration

- Adminstration → Admin>**I**<stration

5.1 Configuring Red Hat Jboss BRMS with Apache Spring

- Please, remove Apache before Spring – it's not an Apache project

6. Deploying Red Hat Jboss BRMS Artifacts to Fuse

7.4 Access Control

- Located at: remove the JBOSS_HOME property or make the URL full (add /standalone/deployments/)

8.2 Downloading Red Hat Jboss ON for Jboss BRMS

- 4 – the version of the JON plugin is 3.3.0 for BRMS 6.1.0

- Update 8.3 section accordingly
