Draft Standard for Information Technology— Portable Operating System Interface (POSIX®)

Draft Technical Standard: Base Specifications, Issue 7

Prepared by the Austin Group (www.opengroup.org/austin)

Abstract

POSIX.1-200x defines a standard operating system interface and environment, including a command interpreter (or "shell"), and common utility programs to support applications portability at the source code level. POSIX.1-200x is intended to be used by both application developers and system implementors and comprises four major components (each in an associated volume):

- General terms, concepts, and interfaces common to all volumes of this standard, including utility conventions and C-language header definitions, are included in the Base Definitions volume.
- Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume.
- Definitions for a standard source code-level interface to command interpretation services (a "shell") and common utility programs for application programs are included in the Shell and Utilities volume.
- Extended rationale that did not fit well into the rest of the document structure, which contains historical information concerning the contents of POSIX.1-200x and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume.

The following areas are outside the scope of POSIX.1-200x:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

POSIX.1-200x describes the external characteristics and facilities that are of importance to application developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

Keywords

application program interface (API), argument, asynchronous, basic regular expression (BRE), batch job, batch system, built-in utility, byte, child, command language interpreter, CPU, extended regular expression (ERE), FIFO, file access control mechanism, input/output (I/O), job control, network, portable operating system interface (POSIX®), parent, shell, stream, string, synchronous, system, thread, X/Open System Interface (XSI)

Feedback

POSIX.1-200x has been prepared by the Austin Group. Feedback relating to the material contained in POSIX.1-200x may be submitted using the Austin Group web site at www.opengroup.org/austin/bugreport.html.

Foreword

POSIX.1-200x was developed by the Austin Group, a joint working group of members of the IEEE, members of The Open Group, and members of ISO/IEC Joint Technical Committee 1.

POSIX.1-200x is structured as four volumes, as follows:

- Volume 1: Base Definitions

  Includes general terms, concepts, and interfaces common to all volumes, including utility conventions and C-language header definitions.

- Volume 2: System Interfaces

  Includes definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery.

- Volume 3: Shell and Utilities

  Includes definitions for a standard source code-level interface to command interpretation services (a "shell") and common utility programs for application programs.

- Volume 4: Rationale

  Includes extended rationale that did not fit well into the rest of the document structure, containing historical information concerning the contents of POSIX.1-200x and why features were included or discarded by the standard developers.

Introduction

Note: This introduction is not part of POSIX.1-200x, Standard for Information Technology — Portable Operating System Interface (POSIX).

This draft standard was developed, and is maintained, by a joint working group of members of the IEEE Portable Applications Standards Committee, members of The Open Group, and members of ISO/IEC Joint Technical Committee 1. This joint working group is known as the Austin Group.[1]

The Austin Group arose out of discussions amongst the parties which started in early 1998, leading to an initial meeting and formation of the group in September 1998. The purpose of the Austin Group is to develop and maintain the core open systems interfaces that are the POSIX® 1003.1 (and former 1003.2) standards, ISO/IEC 9945, and the core of the Single UNIX Specification.

The approach to specification development has been one of "write once, adopt everywhere", with the deliverables being a set of specifications that carry the IEEE POSIX designation, The Open Group's Technical Standard designation, and an ISO/IEC designation.

This unique development has combined both the industry-led efforts and the formal standardization activities into a single initiative, and included a wide spectrum of participants. The Austin Group continues as the maintenance body for this document.

Anyone wishing to participate in the Austin Group should contact the chair with their request. There are no fees for participation or membership. You may participate as an observer or as a contributor. You do not have to attend face-to-face meetings to participate; electronic participation is most welcome. For more information on the Austin Group and how to participate, see www.opengroup.org/austin.

Background

The developers of POSIX.1-200x represent a cross section of hardware manufacturers, vendors of operating systems and other software development tools, software designers, consultants, academics, authors, applications programmers, and others.

Conceptually, POSIX.1-200x describes a set of fundamental services needed for the efficient construction of application programs. Access to these services has been provided by defining an interface, using the C programming language, a command interpreter, and common utility programs that establish standard semantics and syntax. Since this interface enables application developers to write portable applications—it was developed with that goal in mind—it has been designated POSIX,[2] an acronym for Portable Operating System Interface.

Although originated to refer to the original IEEE Std 1003.1-1988, the name POSIX more correctly refers to a *family* of related standards: IEEE Std 1003.*n* and the parts of ISO/IEC 9945. In earlier editions of the IEEE standard, the term POSIX was used as a synonym for IEEE Std 1003.1-1988. A preferred term, POSIX.1, emerged. This maintained the advantages of readability of the symbol "POSIX" without being ambiguous with the POSIX family of standards.

---

1. The Austin Group is named after the location of the inaugural meeting held at the IBM facility in Austin, Texas in September 1998.

2. The name POSIX was suggested by Richard Stallman. It is expected to be pronounced *pahz-icks*, as in *positive*, not *poh-six*, or other variations. The pronunciation has been published in an attempt to promulgate a standardized way of referring to a standard operating system interface.

Audience

The intended audience for POSIX.1-200x is all persons concerned with an industry-wide standard operating system based on the UNIX system. This includes at least four groups of people:

1. Persons buying hardware and software systems
2. Persons managing companies that are deciding on future corporate computing directions
3. Persons implementing operating systems, and especially
4. Persons developing applications where portability is an objective

Purpose

Several principles guided the development of POSIX.1-200x:

- Application-Oriented

  The basic goal was to promote portability of application programs across UNIX system environments by developing a clear, consistent, and unambiguous standard for the interface specification of a portable operating system based on the UNIX system documentation. POSIX.1-200x codifies the common, existing definition of the UNIX system.

- Interface, Not Implementation

  POSIX.1-200x defines an interface, not an implementation. No distinction is made between library functions and system calls; both are referred to as functions. No details of the implementation of any function are given (although historical practice is sometimes indicated in the RATIONALE section). Symbolic names are given for constants (such as signals and error numbers) rather than numbers.

- Source, Not Object, Portability

  POSIX.1-200x has been written so that a program written and translated for execution on one conforming implementation may also be translated for execution on another conforming implementation. POSIX.1-200x does not guarantee that executable (object or binary) code will execute under a different conforming implementation than that for which it was translated, even if the underlying hardware is identical.

- The C Language

  The system interfaces and header definitions are written in terms of the standard C language as specified in the ISO C standard.

- No Superuser, No System Administration

  There was no intention to specify all aspects of an operating system. System administration facilities and functions are excluded from this standard, and functions usable only by the superuser have not been included. Still, an implementation of the standard interface may also implement features not in POSIX.1-200x. POSIX.1-200x is also not concerned with hardware constraints or system maintenance.

- Minimal Interface, Minimally Defined

  In keeping with the historical design principles of the UNIX system, the mandatory core facilities of POSIX.1-200x have been kept as minimal as possible. Additional capabilities have been added as optional extensions.

- Broadly Implementable

  The developers of POSIX.1-200x endeavored to make all specified functions implementable across a wide range of existing and potential systems, including:

  1. All of the current major systems that are ultimately derived from the original UNIX system code (Version 7 or later)
  2. Compatible systems that are not derived from the original UNIX system code
  3. Emulations hosted on entirely different operating systems
  4. Networked systems
  5. Distributed systems
  6. Systems running on a broad range of hardware

  No direct references to this goal appear in POSIX.1-200x, but some results of it are mentioned in the Rationale (Informative) volume.

- Minimal Changes to Historical Implementations

  When the original version—IEEE Std 1003.1-1988—was published, there were no known historical implementations that did not have to change. However, there was a broad consensus on a set of functions, types, definitions, and concepts that formed an interface that was common to most historical implementations.

  The adoption of the 1988 and 1990 IEEE system interface standards, the 1992 IEEE shell and utilities standard, the various Open Group (formerly X/Open) specifications, and IEEE Std 1003.1-2001 and its technical corrigenda have consolidated this consensus, and this version reflects the significantly increased level of consensus arrived at since the original versions. The authors of the original versions tried, as much as possible, to follow the principles below when creating new specifications:

  1. By standardizing an interface like one in an historical implementation; for example, directories
  2. By specifying an interface that is readily implementable in terms of, and backwards-compatible with, historical implementations, such as the extended *tar* format defined in the *pax* utility
  3. By specifying an interface that, when added to an historical implementation, will not conflict with it; for example, the *sigaction*( ) function

  POSIX.1-200x is specifically not a codification of a particular vendor's product.

  It should be noted that implementations will have different kinds of extensions. Some will reflect "historical usage" and will be preserved for execution of pre-existing applications. These functions should be considered "obsolescent" and the standard functions used for new applications. Some extensions will represent functions beyond the scope of POSIX.1-200x. These need to be used with careful management to be able to adapt to future extensions of POSIX.1-200x and/or port to implementations that provide these services in a different manner.

- Minimal Changes to Existing Application Code

  A goal of POSIX.1-200x was to minimize additional work for application developers. However, because every known historical implementation will have to change at least slightly to conform, some applications will have to change.

POSIX.1-200x

POSIX.1-200x defines the Portable Operating System Interface (POSIX) requirements and consists of the following topics arranged as a series of volumes within the standard:

- Base Definitions
- System Interfaces
- Shell and Utilities
- Rationale (Informative)

Base Definitions

The Base Definitions volume provides common definitions for this standard, therefore readers should be familiar with it before using the other volumes.

This volume is structured as follows:

- Chapter 1 is an introduction.
- Chapter 2 defines the conformance requirements.
- Chapter 3 defines general terms used.
- Chapter 4 describes general concepts used.
- Chapter 5 describes the notation used to specify file input and output formats in this volume and the Shell and Utilities volume.
- Chapter 6 describes the portable character set and the process of character set definition.
- *locale* describes the syntax for defining internationalization locales as well as the POSIX locale provided on all systems.
- Chapter 8 describes the use of environment variables for internationalization and other purposes.
- Chapter 9 describes the syntax of pattern matching using regular expressions employed by many utilities and matched by the *regcomp*( ) and *regexec*( ) functions.
- Chapter 10 describes files and devices found on all systems.
- Chapter 11 describes the asynchronous terminal interface for many of the functions in the System Interfaces volume and the *stty* utility in the Shell and Utilities volume.
- Chapter 12 describes the policies for command line argument construction and parsing.
- Chapter 13 defines the contents of headers which declare constants, macros, and data structures that are needed by programs using the services provided by the System Interfaces volume.

Comprehensive references are available in the index.

System Interfaces

The System Interfaces volume describes the interfaces offered to application programs by POSIX-conformant systems. Readers are expected to be experienced C language programmers, and to be familiar with the Base Definitions volume.

This volume is structured as follows:

- Chapter 1 explains the status of this volume and its relationship to other formal standards.
- Chapter 2 contains important concepts, terms, and caveats relating to the rest of this volume.
- Chapter 3 defines the functional interfaces to the POSIX-conformant system.

Comprehensive references are available in the index.

Shell and Utilities

The Shell and Utilities volume describes the commands and utilities offered to application programs on POSIX-conformant systems. Readers are expected to be familiar with the Base Definitions volume.

This volume is structured as follows:

- Chapter 1 explains the status of this volume and its relationship to other formal standards. It also describes the defaults used by the utility descriptions in Chapter 4.
- Chapter 2 describes the command language used in POSIX-conformant systems.
- Chapter 3 describes a set of services and utilities that are implemented on systems supporting the Batch Environment Services and Utilities option.
- Chapter 4 consists of reference pages for all utilities available on POSIX-conformant systems.

Comprehensive references are available in the index.

Rationale (Informative)

This volume is being published to assist in the process of review. It contains historical information concerning the contents of this standard and why features were included or discarded by the standard developers. It also contains notes of interest to application programmers on recommended programming practices, emphasizing the consequences of some aspects of POSIX.1-200x that may not be immediately apparent.

This volume is organized in parallel to the normative volumes of this standard, with a separate part for each of the three normative volumes.

Within this volume, the following terms are used:

base standard
The portions of POSIX.1-200x that are not optional, equivalent to the definitions of *classic* POSIX.1 and POSIX.2.

POSIX.0
Although this term is not used in the normative text of POSIX.1-200x, it is used in this volume to refer to IEEE Std 1003.0-1995.

POSIX.1b
Although this term is not used in the normative text of POSIX.1-200x, it is used in this volume to refer to the elements of the POSIX Realtime Extension amendment. (This was

earlier referred to as POSIX.4 during the standard development process.)

POSIX.1c
Although this term is not used in the normative text of POSIX.1-200x, it is used in this volume to refer to the POSIX Threads Extension amendment. (This was earlier referred to as POSIX.4a during the standard development process.)

standard developers
The individuals and companies in the development organizations responsible for POSIX.1-200x: the IEEE P1003.1 working groups, The Open Group Base working group, advised by the hundreds of individual technical experts who balloted the draft standards within the Austin Group, and the member bodies and technical experts of ISO/IEC JTC 1/SC22.

XSI option
The portions of POSIX.1-200x addressing the extension added for support of the Single UNIX Specification.

Typographical Conventions

The following typographical conventions are used throughout this standard. In the text, this standard is referred to as POSIX.1-200x, which is technically identical to The Open Group Base Specifications, Issue 7.

The typographical conventions listed here are for ease of reading only. Editorial inconsistencies in the use of typography are unintentional and have no normative meaning in POSIX.1-200x.

Reference	Example	Notes
C-Language Data Structure	**aiocb**	
C-Language Data Structure Member	*aio_lio_opcode*	
C-Language Data Type	**long**	
C-Language External Variable	*errno*	
C-Language Function	*system*( )	
C-Language Function Argument	*arg1*	
C-Language Function Family	*exec*	
C-Language Header	**<sys/stat.h>**	
C-Language Keyword	**return**	
C-Language Macro with Argument	*assert*( )	
C-Language Macro with No Argument	INET_ADDRSTRLEN	
C-Language Preprocessing Directive	**define**	
Commands within a Utility	**a**, **c**	
Conversion Specification, Specifier/Modifier Character	%A, g, E	1
Environment Variable	*PATH*	
Error Number	[EINTR]	
Example Output	**Hello, World**	
Filename	**/tmp**	
Literal Character	'c','\r'	2
Literal String	"abcde"	2
Optional Items in Utility Syntax	**[ ]**	
Parameter	<*directory pathname*>	
Special Character	<newline>	3
Symbolic Constant	_POSIX_VDISABLE	
Symbolic Limit, Configuration Value	{LINE_MAX}	4
Syntax	include <sys/stat.h>	

Reference	Example	Notes
User Input and Example Code	`echo Hello, World`	5
Utility Name	*awk*	
Utility Operand	*file_name*	
Utility Option	**–c**	
Utility Option with Option-Argument	**–w** *width*	

Notes:

1. Conversion specifications, specifier characters, and modifier characters are used primarily in date-related functions and utilities and the *fprintf* and *fscanf* formatting functions.
2. Unless otherwise noted, the quotes shall not be used as input or output. When used in a list item, the quotes are omitted. The literal characters <apostrophe> (also known as single-quote) and <backslash> are either shown as the C constants `'\''` and `'\\'`, respectively, or as the special characters <apostrophe>, single-quote, and <backslash> depending on context.
3. The style selected for some of the special characters, such as <newline>, matches the form of the input given to the *localedef* utility. Generally, the characters selected for this special treatment are those that are not visually distinct, such as the control characters <tab> or <newline>.
4. Names surrounded by braces represent symbolic limits or configuration values which may be declared in appropriate headers by means of the C **define** construct.
5. Brackets shown in this font, `"[ ]"`, are part of the syntax and do *not* indicate optional items. In syntax the `'|'` symbol is used to separate alternatives, and ellipses (`"..."`) are used to show that additional arguments are optional.

Shading is used to identify extensions and options; see Section 1.7.1 (on page 7).

Footnotes and notes within the body of the normative text are for information only (informative).

Informative sections (such as Rationale, Change History, Application Usage, and so on) are denoted by continuous shading bars in the margins.

Ranges of values are indicated with parentheses or brackets as follows:

- (*a*,*b*) means the range of all values from *a* to *b*, including neither *a* nor *b*.
- [*a*,*b*] means the range of all values from *a* to *b*, including *a* and *b*.
- [*a*,*b*) means the range of all values from *a* to *b*, including *a*, but not *b*.
- (*a*,*b*] means the range of all values from *a* to *b*, including *b*, but not *a*.

Note: A symbolic limit beginning with POSIX is treated differently, depending on context. In a C-language header, the symbol POSIX*string* (where *string* may contain underscores) is represented by the C identifier _POSIX*string*, with a leading underscore required to prevent ISO C standard name space pollution. However, in other contexts, such as languages other than C, the leading underscore is not used because this requirement does not exist.

Participants

POSIX.1-200x was prepared by the Austin Group, sponsored by the Portable Applications Standards Committee of the IEEE Computer Society, The Open Group, and ISO/SC22.

Note: This section will be completed once the standard is approved.

Trademarks

The following information is given for the convenience of users of POSIX.1-200x and does not constitute an endorsement by the IEEE or The Open Group of these products. Equivalent products may be used if they can be shown to lead to the same results.

There may be other products mentioned in the text that might be covered by trademark protection and readers are advised to verify them independently.

Chapter 1

Introduction

1.1 Scope

POSIX.1-200x defines a standard operating system interface and environment, including a command interpreter (or "shell"), and common utility programs to support applications portability at the source code level. It is intended to be used by both application developers and system implementors.

POSIX.1-200x comprises four major components (each in an associated volume):

1. General terms, concepts, and interfaces common to all volumes of POSIX.1-200x, including utility conventions and C-language header definitions, are included in the Base Definitions volume of POSIX.1-200x.
2. Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume of POSIX.1-200x.
3. Definitions for a standard source code-level interface to command interpretation services (a "shell") and common utility programs for application programs are included in the Shell and Utilities volume of POSIX.1-200x.
4. Extended rationale that did not fit well into the rest of the document structure, containing historical information concerning the contents of POSIX.1-200x and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume of POSIX.1-200x.

The following areas are outside of the scope of POSIX.1-200x:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

POSIX.1-200x describes the external characteristics and facilities that are of importance to application developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

The facilities provided in POSIX.1-200x are drawn from the following base documents:

- IEEE Std 1003.1, 2004 Edition (POSIX-1) (incorporating IEEE Std 1003.1-2001, IEEE Std 1003.1-2001/Cor 1-2002, and IEEE Std 1003.1-2001/Cor 2-2004)

- The Open Group Technical Standard, 2006, Extended API Set Part 1
- The Open Group Technical Standard, 2006, Extended API Set Part 2
- The Open Group Technical Standard, 2006, Extended API Set Part 3
- The Open Group Technical Standard, 2006, Extended API Set Part 4
- ISO/IEC 9899: 1999, Programming Languages — C (including ISO/IEC 9899: 1999/Cor.1: 2001(E), ISO/IEC 9899: 1999/Cor.2: 2004(E), and ISO/IEC 9899: 1999/Cor.3: 200x(E))

Emphasis has been placed on standardizing existing practice for existing users, with changes and additions limited to correcting deficiencies in the following areas:

- Issues raised by Austin Group defect reports, IEEE Interpretations against IEEE Std 1003.1, and ISO/IEC defect reports against ISO/IEC 9945
- Issues raised in corrigenda for The Open Group Technical Standards and working group resolutions from The Open Group
- Issues arising from ISO TR 24715: 2006, Conflicts between POSIX and the LSB
- Changes to make the text self-consistent with the additional material merged
- Features, marked Legacy or obsolescent in the base documents, have been considered for removal in this version
- A review and reorganization of the options within the standard
- Alignment with the ISO/IEC 9899: 1999 standard, including Technical Corrigendum 2

1.2 Conformance

Conformance requirements for POSIX.1-200x are defined in Chapter 2 (on page 15).

1.3 Normative References

The following standards contain provisions which, through references in POSIX.1-200x, constitute provisions of POSIX.1-200x. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on POSIX.1-200x are encouraged to investigate the possibility of applying the most recent editions of the standards listed below. Members of IEC and ISO maintain registers of currently valid International Standards.

1.4 Change History

Change history is described in the Rationale (Informative) volume of POSIX.1-200x, and in the CHANGE HISTORY section of reference pages.

1.5 Terminology

For the purposes of POSIX.1-200x, the following terminology definitions apply:

can
Describes a permissible optional feature or behavior available to the user or application. The feature or behavior is mandatory for an implementation that conforms to POSIX.1-200x. An application can rely on the existence of the feature or behavior.

implementation-defined
Describes a value or behavior that is not defined by POSIX.1-200x but is selected by an implementor. The value or behavior may vary among implementations that conform to POSIX.1-200x. An application should not rely on the existence of the value or behavior. An application that relies on such a value or behavior cannot be assured to be portable across conforming implementations.

The implementor shall document such a value or behavior so that it can be used correctly by an application.

legacy
Describes a feature or behavior that is being retained for compatibility with older applications, but which has limitations which make it inappropriate for developing portable applications. New applications should use alternative means of obtaining equivalent functionality.

may
Describes a feature or behavior that is optional for an implementation that conforms to POSIX.1-200x. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

---

2. ISO/IEC documents can be obtained from the ISO office: 1 Rue de Varembé, Case Postale 56, CH-1211, Genève 20, Switzerland/Suisse

To avoid ambiguity, the opposite of *may* is expressed as *need not*, instead of *may not*.

shall
For an implementation that conforms to POSIX.1-200x, describes a feature or behavior that is mandatory. An application can rely on the existence of the feature or behavior.

For an application or user, describes a behavior that is mandatory.

should
For an implementation that conforms to POSIX.1-200x, describes a feature or behavior that is recommended but not mandatory. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

For an application, describes a feature or behavior that is recommended programming practice for optimum portability.

undefined
Describes the nature of a value or behavior not defined by POSIX.1-200x which results from use of an invalid program construct or invalid data input.

The value or behavior may vary among implementations that conform to POSIX.1-200x. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

unspecified
Describes the nature of a value or behavior not specified by POSIX.1-200x which results from use of a valid program construct or valid data input.

The value or behavior may vary among implementations that conform to POSIX.1-200x. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

1.6 Definitions and Concepts

Definitions and concepts are defined in Chapter 3 (on page 33) and Chapter 4 (on page 107).

1.7 Portability

Some of the utilities in the Shell and Utilities volume of POSIX.1-200x and functions in the System Interfaces volume of POSIX.1-200x describe functionality that might not be fully portable to systems meeting the requirements for POSIX conformance (see Chapter 2, on page 15).

Where optional, enhanced, or reduced functionality is specified, the text is shaded and a code in the margin identifies the nature of the option, extension, or warning (see Section 1.7.1, on page 7). For maximum portability, an application should avoid such functionality.

Unless the primary task of a utility is to produce textual material on its standard output, application developers should not rely on the format or content of any such material that may be produced. Where the primary task *is* to provide such material, but the output format is incompletely specified, the description is marked with the OF margin code and shading. Application developers are warned not to expect that the output of such an interface on one

system is any guide to its behavior on another system.

1.7.1 Codes

The codes and their meanings are as follows. See also Section 1.7.2 (on page 13).

ADV Advisory Information
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the ADV margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the ADV margin legend.

BE Batch Environment Services and Utilities
The functionality described is optional.

Where applicable, utilities are marked with the BE margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the BE margin legend.

CD C-Language Development Utilities
The functionality described is optional.

Where applicable, utilities are marked with the CD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the CD margin legend.

CPT Process CPU-Time Clocks
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the CPT margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the CPT margin legend.

CX Extension to the ISO C standard
The functionality described is an extension to the ISO C standard. Application developers may make use of an extension as it is supported on all POSIX.1-200x-conforming systems.

With each function or header from the ISO C standard, a statement to the effect that "any conflict is unintentional" is included. That is intended to refer to a direct conflict. POSIX.1-200x acts in part as a profile of the ISO C standard, and it may choose to further constrain behaviors allowed to vary by the ISO C standard. Such limitations and other compatible differences are not considered conflicts, even if a CX mark is missing. The markings are for information only.

Where additional semantics apply to a function or header, the material is identified by use of the CX margin legend.

FD FORTRAN Development Utilities
The functionality described is optional.

Where applicable, utilities are marked with the FD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the FD margin legend.

FR FORTRAN Runtime Utilities
The functionality described is optional.

Where applicable, utilities are marked with the FR margin legend in the SYNOPSIS section.

Where additional semantics apply to a utility, the material is identified by use of the FR margin legend.

FSC File Synchronization
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the FSC margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the FSC margin legend.

IP6 IPV6
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the IP6 margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the IP6 margin legend.

MC1 Non-Robust Mutex Priority Protection or Non-Robust Mutex Priority Inheritance or Robust Mutex Priority Protection or Robust Mutex Priority Inheritance
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

This is a shorthand notation for combinations of multiple option codes.

Where applicable, functions are marked with the MC1 margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MC1 margin legend.

Refer to Section 1.7.2 (on page 13).

ML Process Memory Locking
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the ML margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the ML margin legend.

MLR Range Memory Locking
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MLR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MLR margin legend.

MON Monotonic Clock
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MON margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MON margin legend.

MSG Message Passing
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MSG margin legend in the SYNOPSIS section.

Where additional semantics apply to a function, the material is identified by use of the MSG margin legend.

MX IEC 60559 Floating-Point
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the MX margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the MX margin legend.

OB Obsolescent
The functionality described may be removed in a future version of this volume of POSIX.1-200x. Strictly Conforming POSIX Applications and Strictly Conforming XSI Applications shall not use obsolescent features.

Where applicable, the material is identified by use of the OB margin legend.

OF Output Format Incompletely Specified
The functionality described is an XSI extension. The format of the output produced by the utility is not fully specified. It is therefore not possible to post-process this output in a consistent fashion. Typical problems include unknown length of strings and unspecified field delimiters.

Where applicable, the material is identified by use of the OF margin legend.

OH Optional Header
In the SYNOPSIS section of some interfaces in the System Interfaces volume of POSIX.1-200x an included header is marked as in the following example:

OH
```
#include <sys/types.h>
#include <grp.h>
struct group *getgrnam(const char *name);
```

The OH margin legend indicates that the marked header is not required on XSI-conformant systems.

PIO Prioritized Input and Output
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the PIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the PIO margin legend.

PS Process Scheduling
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the PS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the PS margin legend.

RPI Robust Mutex Priority Inheritance
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the RPI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the RPI margin legend.

RPP Robust Mutex Priority Protection
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the RPP margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the RPP margin legend.

RS Raw Sockets
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the RS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the RS margin legend.

SD Software Development Utilities
The functionality described is optional.

Where applicable, utilities are marked with the SD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the SD margin legend.

SHM Shared Memory Objects
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SHM margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SHM margin legend.

SIO Synchronized Input and Output
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SIO margin legend.

SPN Spawn
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SPN margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SPN margin legend.

SS Process Sporadic Server
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the SS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the SS margin legend.

TCT Thread CPU-Time Clocks
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TCT margin legend in the SYNOPSIS section.

Where additional semantics apply to a function, the material is identified by use of the TCT margin legend.

TEF Trace Event Filter
The functionality described is optional. This functionality is dependent on support for the Trace option. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TEF margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TEF margin legend.

TPI Non-Robust Mutex Priority Inheritance
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPI margin legend.

TPP Non-Robust Mutex Priority Protection
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPP margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPP margin legend.

TPS Thread Execution Scheduling
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TPS margin legend.

TRC Trace
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRC margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRC margin legend.

TRI Trace Inherit
The functionality described is optional. This functionality is dependent on support for the Trace option. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRI margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRI margin legend.

TRL Trace Log
The functionality described is optional. This functionality is dependent on support for the Trace option. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TRL margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TRL margin legend.

TSA **Thread Stack Address Attribute**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSA margin legend for the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSA margin legend.

TSH **Thread Process-Shared Synchronization**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSH margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSH margin legend.

TSP **Thread Sporadic Server**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSP margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSP margin legend.

TSS **Thread Stack Size Attribute**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TSS margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TSS margin legend.

TYM **Typed Memory Objects**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the TYM margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TYM margin legend.

UP **User Portability Utilities**
The functionality described is optional.

Where applicable, utilities are marked with the UP margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the UP margin legend.

UU **UUCP Utilities**
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the UU margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the UU margin legend.

XSI **X/Open System Interfaces**
The functionality described is part of the X/Open Systems Interfaces option. Functionality marked XSI is an extension to the ISO C standard. Application developers may confidently make use of such extensions on all systems supporting the X/Open System Interfaces option.

If an entire SYNOPSIS section is shaded and marked XSI, all the functionality described in that reference page is an extension. See Section 2.1.4 (on page 19).

XSR XSI STREAMS
The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the XSR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the XSR margin legend.

1.7.2 Margin Code Notation

Some of the functionality described in POSIX.1-200x depends on support of more than one option, or independently may depend on several options. The following notation for margin codes is used to denote the following cases.

A Feature Dependent on One or Two Options

In this case, margin codes have a <space> separator; for example:

SHM This feature requires support for only the Shared Memory Objects option.

SHM TYM This feature requires support for both the Shared Memory Objects option and the Typed Memory Objects option; that is, an application which uses this feature is portable only between implementations that provide both options.

A Feature Dependent on Either of the Options Denoted

In this case, margin codes have a '|' separator to denote the logical OR; for example:

SHM|TYM This feature is dependent on support for either the Shared Memory Objects option or the Typed Memory Objects option; that is, an application which uses this feature is portable between implementations that provide any (or all) of the options.

A Feature Dependent on More than Two Options

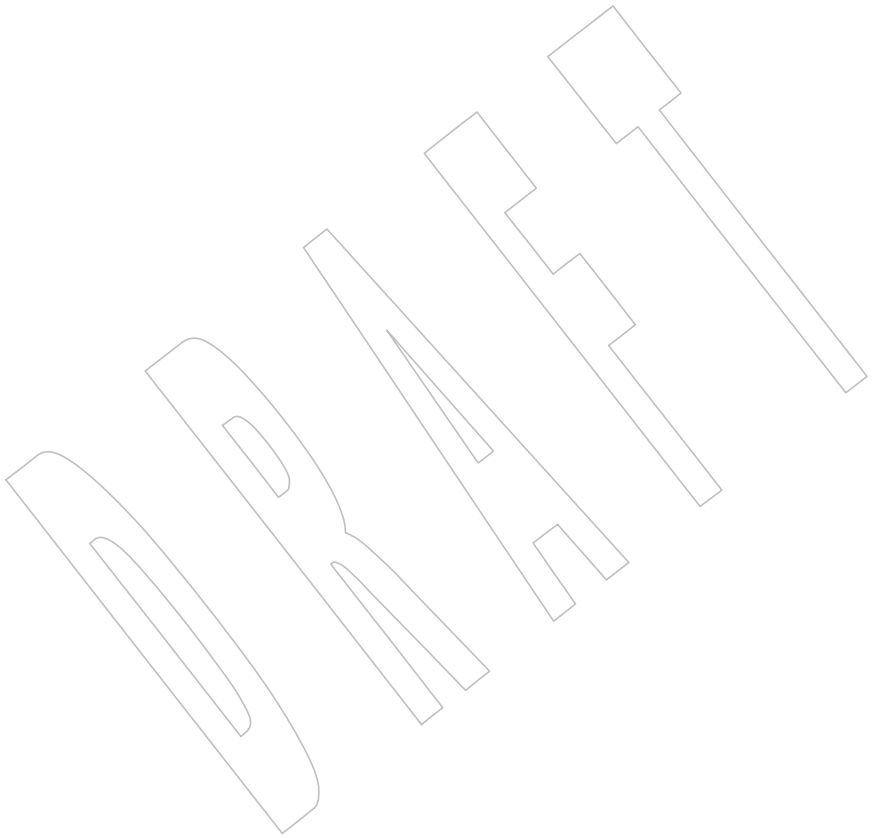
The following shorthand notations are used:

MC1 The MC1 margin code is shorthand for TPP|TPI|RPP|RPI. Features which are shaded with this margin code require support of either the Non-Robust Mutex Priority Protection option or the Non-Robust Mutex Priority Inheritance option or the Robust Mutex Priority Protection option or the Robust Mutex Priority Inheritance option.

Large Sections Dependent on an Option

Where large sections of text are dependent on support for an option, a lead-in text block is provided and shaded accordingly; for example:

XSI This section describes extensions to support interprocess communication. The functionality described in this section shall be provided on implementations that support the XSI option (and the rest of this section is not further shaded).



Chapter 2

Conformance

2.1 Implementation Conformance

For the purposes of POSIX.1-200x, the implementation conformance requirements given in this section apply.

2.1.1 Requirements

A *conforming implementation* shall meet all of the following criteria:

1. The system shall support all utilities, functions, and facilities defined within POSIX.1-200x that are required for POSIX conformance (see Section 2.1.3, on page 16). These interfaces shall support the functional behavior described herein.
2. The system may support the X/Open System Interfaces (XSI) option as described in Section 2.1.4 (on page 19).
3. The system may support one or more options as described under Section 2.1.5 (on page 20). When an implementation claims that an option is supported, all of its constituent parts shall be provided.
4. The system may provide non-standard extensions. These are features not required by POSIX.1-200x and may include, but are not limited to:
   - Additional functions
   - Additional headers
   - Additional symbols in standard headers
   - Additional utilities
   - Additional options for standard utilities
   - Additional environment variables
   - Additional file types
   - Non-conforming file systems (for example, legacy file systems for which _POSIX_NO_TRUNC is false, case-insensitive file systems, or network file systems)
   - Dynamically populated file systems (for example, **/proc**)
   - Additional character special files with special properties (for example, **/dev/stdin**, **/dev/stdout**, and **/dev/stderr**)

   Non-standard extensions of the utilities, functions, or facilities specified in POSIX.1-200x should be identified as such in the system documentation. Non-standard extensions, when used, may change the behavior of utilities, functions, or facilities defined by POSIX.1-200x. The conformance document shall define an environment in which an application can be run with the behavior specified by POSIX.1-200x. In no case shall such

an environment require modification of a Strictly Conforming POSIX Application (see Section 2.2.1, on page 29).

2.1.2 Documentation

A conformance document with the following information shall be available for an implementation claiming conformance to POSIX.1-200x. The conformance document shall have the same structure as POSIX.1-200x, with the information presented in the appropriate sections and subsections. Sections and subsections that consist solely of subordinate section titles, with no other information, are not required. The conformance document shall not contain information about extended facilities or capabilities outside the scope of POSIX.1-200x.

The conformance document shall contain a statement that indicates the full name, number, and date of the standard that applies. The conformance document may also list international software standards that are available for use by a Conforming POSIX Application. Applicable characteristics where documentation is required by one of these standards, or by standards of government bodies, may also be included.

The conformance document shall describe the limit values found in the headers **<limits.h>** (on page 268) and **<unistd.h>** (on page 430), stating values, the conditions under which those values may change, and the limits of such variations, if any.

The conformance document shall describe the behavior of the implementation for all implementation-defined features defined in POSIX.1-200x. This requirement shall be met by listing these features and providing either a specific reference to the system documentation or providing full syntax and semantics of these features. When the value or behavior in the implementation is designed to be variable or customized on each instantiation of the system, the implementation provider shall document the nature and permissible ranges of this variation.

The conformance document may specify the behavior of the implementation for those features where POSIX.1-200x states that implementations may vary or where features are identified as undefined or unspecified.

The conformance document shall not contain documentation other than that specified in the preceding paragraphs except where such documentation is specifically allowed or required by other provisions of POSIX.1-200x.

The phrases "shall document" or "shall be documented" in POSIX.1-200x mean that documentation of the feature shall appear in the conformance document, as described previously, unless there is an explicit reference in the conformance document to show where the information can be found in the system documentation.

The system documentation should also contain the information found in the conformance document.

2.1.3 POSIX Conformance

A conforming implementation shall meet the following criteria for POSIX conformance.

528 *2.1.3.1 POSIX System Interfaces*

529 The following requirements apply to the system interfaces (functions and headers):

530 • The system shall support all the mandatory functions and headers defined in
531 POSIX.1-200x, and shall set the symbolic constant _POSIX_VERSION to the value 200xxxL.

532 • Although all implementations conforming to POSIX.1-200x support all the features
533 described below, there may be system-dependent or file system-dependent configuration
534 procedures that can remove or modify any or all of these features. Such configurations
535 should not be made if strict compliance is required.

536 The following symbolic constants shall be defined with a value other than –1. If a constant
537 is defined with the value zero, applications should use the *sysconf*( ), *pathconf*( ), or
538 *fpathconf*( ) functions, or the *getconf* utility, to determine which features are present on the
539 system at that time or for the particular pathname in question.

540 — _POSIX_CHOWN_RESTRICTED

541 The use of *chown*( ) is restricted to a process with appropriate privileges, and to
542 changing the group ID of a file only to the effective group ID of the process or to one
543 of its supplementary group IDs.

544 — _POSIX_NO_TRUNC

545 Pathname components longer than {NAME_MAX} generate an error.

546 • The following symbolic constants shall be defined by the implementation as follows:

547 — Symbolic constants defined with the value 200xxxL:

548 _POSIX_ASYNCHRONOUS_IO
549 _POSIX_BARRIERS
550 _POSIX_CLOCK_SELECTION
551 _POSIX_MAPPED_FILES
552 _POSIX_MEMORY_PROTECTION
553 _POSIX_READER_WRITER_LOCKS
554 _POSIX_REALTIME_SIGNALS
555 _POSIX_SEMAPHORES
556 _POSIX_SPIN_LOCKS
557 _POSIX_THREAD_SAFE_FUNCTIONS
558 _POSIX_THREADS
559 _POSIX_TIMEOUTS
560 _POSIX_TIMERS

561 — Symbolic constants defined with a value greater than zero:

562 _POSIX_JOB_CONTROL
563 _POSIX_SAVED_IDS

564 — Symbolic constants defined with a value other than –1.

565 _POSIX_VDISABLE

566 **Note:** The symbols above represent historical options that are no longer allowed as options, but
567 are retained here for backwards-compatibility of applications.

- The system may support one or more options (see Section 2.1.6, on page 26) denoted by the following symbolic constants:

  _POSIX_ADVISORY_INFO
  _POSIX_CPUTIME
  _POSIX_FSYNC
  _POSIX_IPV6
  _POSIX_MEMLOCK
  _POSIX_MEMLOCK_RANGE
  _POSIX_MESSAGE_PASSING
  _POSIX_MONOTONIC_CLOCK
  _POSIX_PRIORITIZED_IO
  _POSIX_PRIORITY_SCHEDULING
  _POSIX_RAW_SOCKETS
  _POSIX_SHARED_MEMORY_OBJECTS
  _POSIX_SPAWN
  _POSIX_SPORADIC_SERVER
  _POSIX_SYNCHRONIZED_IO
  _POSIX_THREAD_ATTR_STACKADDR
  _POSIX_THREAD_CPUTIME
  _POSIX_THREAD_ATTR_STACKSIZE
  _POSIX_THREAD_PRIO_INHERIT
  _POSIX_THREAD_PRIO_PROTECT
  _POSIX_THREAD_PRIORITY_SCHEDULING
  _POSIX_THREAD_PROCESS_SHARED
  _POSIX_THREAD_SPORADIC_SERVER
  _POSIX_TRACE
  _POSIX_TRACE_EVENT_FILTER
  _POSIX_TRACE_INHERIT
  _POSIX_TRACE_LOG
  _POSIX_TYPED_MEMORY_OBJECTS
  _XOPEN_CRYPT
  _XOPEN_REALTIME
  _XOPEN_REALTIME_THREADS
  _XOPEN_STREAMS
  _XOPEN_UNIX

  If any of the symbolic constants _POSIX_TRACE_EVENT_FILTER, _POSIX_TRACE_LOG, or _POSIX_TRACE_INHERIT is defined to have a value other than −1, then the symbolic constant _POSIX_TRACE shall also be defined to have a value other than −1.

  If the Advisory Information option is supported, there shall be at least one file system that supports the functionality.

2.1.3.2 *POSIX Shell and Utilities*

The following requirements apply to the shell and utilities:

- The system shall provide all the mandatory utilities in the Shell and Utilities volume of POSIX.1-200x with all the functional behavior described therein.
- The system shall support the Large File capabilities described in the Shell and Utilities volume of POSIX.1-200x.

- The system may support one or more options (see Section 2.1.6, on page 26) denoted by the following symbolic constants. (The literal names below apply to the *getconf* utility.)

  POSIX2_C_DEV
  POSIX2_CHAR_TERM
  POSIX2_FORT_DEV
  POSIX2_FORT_RUN
  POSIX2_LOCALEDEF
  POSIX2_PBS
  POSIX2_PBS_ACCOUNTING
  POSIX2_PBS_LOCATE
  POSIX2_PBS_MESSAGE
  POSIX2_PBS_TRACK
  POSIX2_SW_DEV
  POSIX2_UPE
  XOPEN_UNIX
  XOPEN_UUCP

Additional language bindings and development utility options may be provided in other related standards or in a future version of this standard. In the former case, additional symbolic constants of the same general form as shown in this subsection should be defined by the related standard document and made available to the application without requiring POSIX.1-200x to be updated.

2.1.4 XSI Conformance

XSI This section describes the criteria for implementations providing conformance to the X/Open System Interfaces (XSI) option (see Section 3.442, on page 104). The functionality described in this section shall be provided on implementations that support the XSI option (and the rest of this section is not further shaded).

POSIX.1-200x describes utilities, functions, and facilities offered to application programs by the X/Open System Interfaces (XSI) option. An XSI-conforming implementation shall meet the criteria for POSIX conformance and the following requirements listed in this section.

XSI-conforming implementations shall set the symbolic constant _XOPEN_UNIX to a value other than –1 and shall set the symbolic constant _XOPEN_VERSION to the value 700.

2.1.4.1 *XSI System Interfaces*

The following requirements apply to the system interfaces when the XSI option is supported:

- The system shall support all the functions and headers defined in POSIX.1-200x as part of the XSI option denoted by the XSI marking in the SYNOPSIS section, and any extensions marked with the XSI option marking (see Section 1.7.1, on page 7) within the text.
- The system shall support the following options defined within POSIX.1-200x (see Section 2.1.6, on page 26):

  _POSIX_FSYNC
  _POSIX_THREAD_ATTR_STACKADDR
  _POSIX_THREAD_ATTR_STACKSIZE
  _POSIX_THREAD_PROCESS_SHARED

- The system may support the following XSI Option Groups (see Section 2.1.5.2, on page 22) defined within POSIX.1-200x:
  - — Encryption
  - — Realtime
  - — Advanced Realtime
  - — Realtime Threads
  - — Advanced Realtime Threads
  - — Tracing
  - — XSI STREAMS

2.1.4.2 *XSI Shell and Utilities Conformance*

The following requirements apply to the shell and utilities when the XSI option is supported:

- The system shall support all the utilities defined in the Shell and Utilities volume of POSIX.1-200x as part of the XSI option denoted by the XSI marking in the SYNOPSIS section, and any extensions marked with the XSI option marking (see Section 1.7.1, on page 7) within the text.
- The system shall support the User Portability Utilities option and the Terminal Characteristics option.
- The system shall support creation of locales (see Chapter 7, on page 135).
- The C-language Development utility *c99* shall be supported.
- The XSI Development Utilities option may be supported. It consists of the following software development utilities:

admin	*delta*	*rmdel*	*val*
cflow	*get*	*sact*	*what*
ctags	*nm*	*sccs*	
cxref	*prs*	*unget*	

2.1.5 Option Groups

An Option Group is a group of related functions or options defined within the System Interfaces volume of POSIX.1-200x.

If an implementation supports an Option Group, then the system shall support the functional behavior described herein.

If an implementation does not support an Option Group, then the system need not support the functional behavior described herein.

2.1.5.1 *Subprofiling Considerations*

Profiling standards supporting functional requirements less than that required in POSIX.1-200x may subset both mandatory and optional functionality required for POSIX Conformance (see Section 2.1.3, on page 16) or XSI Conformance (see Section 2.1.4, on page 19). Such profiles shall organize the subsets into Subprofiling Option Groups.

XRAT Appendix E (on page 3711) describes a representative set of such Subprofiling Option Groups for use by profiles applicable to specialized realtime systems. POSIX.1-200x does not require that the presence of Subprofiling Option Groups be testable at compile-time (as symbols defined in any header) or at runtime (via *sysconf*( ) or *getconf*).

A Subprofiling Option Group may provide basic system functionality that other Subprofiling Option Groups and other options depend upon.[3] If a profile of POSIX.1-200x does not require an implementation to provide a Subprofiling Option Group that provides features utilized by a required Subprofiling Option Group (or option),[4] the profile shall specify[5] all of the following:

- Restricted or altered behavior of interfaces defined in POSIX.1-200x that may differ on an implementation of the profile
- Additional behaviors that may produce undefined or unspecified results
- Additional implementation-defined behavior that implementations shall be required to document in the profile's conformance document

if any of the above is a result of the profile not requiring an interface required by POSIX.1-200x.

The following additional rules shall apply to all profiles of POSIX.1-200x:

- Any application that conforms to that profile shall also conform to POSIX.1-200x, unless the application depends on the definition of a profile support indicator macro in **<unistd.h>** (that is, a profile shall not require restricted, altered, or extended behaviors of an implementation of POSIX.1-200x).
- Profiles are permitted to require the definition of a *profile support indicator macro* with a name beginning _POSIX_AEP_ in **<unistd.h>**.
- Profiles shall require the definition of the macro _POSIX_SUBPROFILE in **<unistd.h>** on implementations that do not meet all of the requirements of a POSIX.1-conforming implementation.
- Profiles are permitted to add additional requirements to the limits defined in **<limits.h>** and **<stdint.h>**, subject to the following:

  For the limits in **<limits.h>** and **<stdint.h>**:

  — If the limit is specified as having a fixed value, it shall not be changed by a profile.

  — If a limit is specified as having a minimum or maximum acceptable value, it may be changed by a profile as follows:

    — A profile may increase a minimum acceptable value, but shall not make a minimum acceptable value smaller.

---

3. As an example, the File System profiling option group provides underlying support for pathname resolution and file creation which are needed by any interface in POSIX.1-200x that parses a *path* argument. If a profile requires support for the Device Input and Output profiling option group but does not require support for the File System profiling option group, the profile must specify how pathname resolution is to behave in that profile, how the O_CREAT flag to *open*( ) is to be handled (and the use of the character `'a'` in the *mode* argument of *fopen*( ) when a filename argument names a file that does not exist), and specify lots of other details.

4. As an example, POSIX.1-200x requires that implementations claiming to support the Range Memory Locking option also support the Process Memory Locking option. A profile could require that the Range Memory Locking option had to be supplied without requiring that the Process Memory Locking option be supplied as long as the profile specifies everything an application developer or system implementor would have to know to build an application or implementation conforming to the profile.

5. Note that the profile could just specify that any use of the features not specified by the profile would produce undefined or unspecified results.

— A profile may reduce a maximum acceptable value, but shall not make a maximum acceptable value larger.

- A profile shall not change a limit specified as having a minimum or maximum value into a limit specified as having a fixed value.
- A profile shall not create new limits.
- Any implementation that conforms to POSIX.1-200x (including all options and extended limits required by the profile) shall also conform to that profile, except for the possible omission from **<unistd.h>** of a profile support indicator macro required by the profile.

2.1.5.2 *XSI Option Groups*

XSI This section describes Option Groups to support the definition of XSI conformance within the System Interfaces volume of POSIX.1-200x. The functionality described in this section shall be provided on implementations that support the XSI option and the appropriate Option Group (and the rest of this section is not further shaded).

The following Option Groups are defined.

Encryption

The Encryption Option Group is denoted by the symbolic constant _XOPEN_CRYPT. It includes the following functions:

crypt( ), *encrypt*( ), *setkey*( )

These functions are marked CRYPT.

Due to export restrictions on the decoding algorithm in some countries, implementations may be restricted in making these functions available. All the functions in the Encryption Option Group may therefore return [ENOSYS] or, alternatively, *encrypt*( ) shall return [ENOSYS] for the decryption operation.

An implementation that claims conformance to this Option Group shall set _XOPEN_CRYPT to a value other than –1.

Realtime

The Realtime Option Group is denoted by the symbolic constant _XOPEN_REALTIME.

This Option Group includes a set of realtime functions drawn from options within POSIX.1-200x (see Section 2.1.6, on page 26).

Where entire functions are included in the Option Group, the NAME section is marked with REALTIME. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within POSIX.1-200x.

An implementation that claims conformance to this Option Group shall set _XOPEN_REALTIME to a value other than –1.

This Option Group consists of the set of the following options from within POSIX.1-200x (see Section 2.1.6, on page 26):

773 _POSIX_FSYNC
774 _POSIX_MEMLOCK
775 _POSIX_MEMLOCK_RANGE
776 _POSIX_MESSAGE_PASSING
777 _POSIX_PRIORITIZED_IO
778 _POSIX_PRIORITY_SCHEDULING
779 _POSIX_SHARED_MEMORY_OBJECTS
780 _POSIX_SYNCHRONIZED_IO

781 If the symbolic constant _XOPEN_REALTIME is defined to have a value other than –1, then the
782 following symbolic constants shall be defined by the implementation to have the value 200xxxL:

783 _POSIX_MEMLOCK
784 _POSIX_MEMLOCK_RANGE
785 _POSIX_MESSAGE_PASSING
786 _POSIX_PRIORITY_SCHEDULING
787 _POSIX_SHARED_MEMORY_OBJECTS
788 _POSIX_SYNCHRONIZED_IO

789 The functionality associated with _POSIX_FSYNC shall always be supported on XSI-conformant
790 systems.

791 Support of _POSIX_PRIORITIZED_IO on XSI-conformant systems is optional. If
792 _POSIX_PRIORITIZED_IO is supported, then asynchronous I/O operations performed by
793 *aio_read*(), *aio_write*(), and *lio_listio*() shall be submitted at a priority equal to the scheduling
794 priority equal to a base scheduling priority minus *aiocbp->aio_reqprio*. If Thread Execution
795 Scheduling is not supported, then the base scheduling priority is that of the calling process;
796 otherwise, the base scheduling priority is that of the calling thread. The implementation shall
797 also document for which files I/O prioritization is supported.

798 **Advanced Realtime**

799 An implementation that claims conformance to this Option Group shall also support the
800 Realtime Option Group.

801 Where entire functions are included in the Option Group, the NAME section is marked with
802 ADVANCED REALTIME. Where additional semantics have been added to existing pages, the
803 new material is identified by use of the appropriate margin legend for the underlying option
804 defined within POSIX.1-200x.

805 This Option Group consists of the set of the following options from within POSIX.1-200x (see
806 Section 2.1.6, on page 26):

807 _POSIX_ADVISORY_INFO
808 _POSIX_CPUTIME
809 _POSIX_MONOTONIC_CLOCK
810 _POSIX_SPAWN
811 _POSIX_SPORADIC_SERVER
812 _POSIX_TYPED_MEMORY_OBJECTS

813 If the implementation supports the Advanced Realtime Option Group, then the following
814 symbolic constants shall be defined by the implementation to have the value 200xxxL:

_POSIX_ADVISORY_INFO
_POSIX_CPUTIME
_POSIX_MONOTONIC_CLOCK
_POSIX_SPAWN
_POSIX_SPORADIC_SERVER
_POSIX_TYPED_MEMORY_OBJECTS

If the symbolic constant _POSIX_SPORADIC_SERVER is defined, then the symbolic constant _POSIX_PRIORITY_SCHEDULING shall also be defined by the implementation to have the value 200xxxL.

Realtime Threads

The Realtime Threads Option Group is denoted by the symbolic constant _XOPEN_REALTIME_THREADS.

This Option Group consists of the set of the following options from within POSIX.1-200x (see Section 2.1.6, on page 26):

_POSIX_THREAD_PRIO_INHERIT
_POSIX_THREAD_PRIO_PROTECT
_POSIX_THREAD_PRIORITY_SCHEDULING

Where applicable, whole pages are marked REALTIME THREADS, together with the appropriate option margin legend for the SYNOPSIS section (see Section 1.7.1, on page 7).

An implementation that claims conformance to this Option Group shall set _XOPEN_REALTIME_THREADS to a value other than –1.

If the symbol _XOPEN_REALTIME_THREADS is defined to have a value other than –1, then the following options shall also be defined by the implementation to have the value 200xxxL:

_POSIX_THREAD_PRIO_INHERIT
_POSIX_THREAD_PRIO_PROTECT
_POSIX_THREAD_PRIORITY_SCHEDULING

Advanced Realtime Threads

An implementation that claims conformance to this Option Group shall also support the Realtime Threads Option Group.

Where entire functions are included in the Option Group, the NAME section is marked with ADVANCED REALTIME THREADS. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within POSIX.1-200x.

This Option Group consists of the set of the following options from within POSIX.1-200x (see Section 2.1.6, on page 26):

_POSIX_THREAD_CPUTIME
_POSIX_THREAD_SPORADIC_SERVER

If the symbolic constant _POSIX_THREAD_SPORADIC_SERVER is defined to have the value 200xxxL, then the symbolic constant _POSIX_THREAD_PRIORITY_SCHEDULING shall also be defined by the implementation to have the value 200xxxL.

If the implementation supports the Advanced Realtime Threads Option Group, then the following symbolic constants shall be defined by the implementation to have the value 200xxxL:

857 _POSIX_THREAD_CPUTIME
858 _POSIX_THREAD_SPORADIC_SERVER

859 **Tracing**

860 This Option Group includes a set of tracing functions drawn from options within POSIX.1-200x
861 (see Section 2.1.6, on page 26).

862 Where entire functions are included in the Option Group, the NAME section is marked with
863 TRACING. Where additional semantics have been added to existing pages, the new material is
864 identified by use of the appropriate margin legend for the underlying option defined within
865 POSIX.1-200x.

866 This Option Group consists of the set of the following options from within POSIX.1-200x (see
867 Section 2.1.6, on page 26):

868 _POSIX_TRACE
869 _POSIX_TRACE_EVENT_FILTER
870 _POSIX_TRACE_LOG
871 _POSIX_TRACE_INHERIT

872 If the implementation supports the Tracing Option Group, then the following symbolic
873 constants shall be defined by the implementation to have the value 200xxxL:

874 _POSIX_TRACE
875 _POSIX_TRACE_EVENT_FILTER
876 _POSIX_TRACE_LOG
877 _POSIX_TRACE_INHERIT

878 **XSI STREAMS**

879 OB XSR This section describes the XSI STREAMS Option Group, denoted by the symbolic constant
880 _XOPEN_STREAMS. The functionality described in this section shall be provided on
881 implementations that support the XSI STREAMS option (and the rest of this section is not
882 further shaded).

883 This Option Group includes functionality related to STREAMS, a uniform mechanism for
884 implementing networking services and other character-based I/O as described in XSH Section
885 2.6 (on page 494).

886 It includes the following functions:

887 *fattach*( ) *ioctl*( )
888 *fdetach*( ) *isastream*( )
889 *getmsg*( ) *putmsg*( )
890 *getpmsg*( ) *putpmsg*( )

891 and the **<stropts.h>** header.

892 Where applicable, whole pages are marked STREAMS, together with the appropriate option
893 margin legend for the SYNOPSIS section (see Section 1.7.1, on page 7). Where additional
894 semantics have been added to existing pages, the new material is identified by use of the
895 appropriate margin legend for the underlying option defined within POSIX.1-200x.

896 An implementation that claims conformance to this Option Group shall set _XOPEN_STREAMS
897 to a value other than –1.

2.1.6 Options

The symbolic constants defined in **<unistd.h>**, Constants for Options and Option Groups (on page 430) reflect implementation options for POSIX.1-200x. These symbols can be used by the application to determine which of three categories of support for optional facilities are provided by the implementation.

1. Option not supported for compilation.

   The implementation advertises at compile time (by defining the constant in **<unistd.h>** with value –1, or by leaving it undefined) that the option is not supported for compilation and, at the time of compilation, is not supported for runtime use. In this case, the headers, data types, function interfaces, and utilities required only for the option need not be present. A later runtime check using the *fpathconf*( ), *pathconf*( ), or sysconf functions defined in the System Interfaces volume of POSIX.1-200x or the *getconf* utility defined in the Shell and Utilities volume of POSIX.1-200x can in some circumstances indicate that the option is supported at runtime. (For example, an old application binary might be run on a newer implementation to which support for the option has been added.)

2. Option always supported.

   The implementation advertises at compile time (by defining the constant in **<unistd.h>** with a value greater than zero) that the option is supported both for compilation and for use at runtime. In this case, all headers, data types, function interfaces, and utilities required only for the option shall be available and shall operate as specified. Runtime checks with *fpathconf*( ), *pathconf*( ), or sysconf shall indicate that the option is supported.

3. Option might or might not be supported at runtime.

   The implementation advertises at compile time (by defining the constant in **<unistd.h>** with value zero) that the option is supported for compilation and might or might not be supported at runtime. In this case, the *fpathconf*( ), *pathconf*( ), or *sysconf*( ) functions defined in the System Interfaces volume of POSIX.1-200x or the *getconf* utility defined in the Shell and Utilities volume of POSIX.1-200x can be used to retrieve the value of each symbol on each specific implementation to determine whether the option is supported at runtime. All headers, data types, and function interfaces required to compile and execute applications which use the option at runtime (after checking at runtime that the option is supported) shall be provided, but if the option is not supported at runtime they need not operate as specified. Utilities or other facilities required only for the option, but not needed to compile and execute such applications, need not be present.

If an option is not supported for compilation, an application that attempts to use anything associated only with the option is considered to be requiring an extension. Unless explicitly specified otherwise, the behavior of functions associated with an option that is not supported at runtime is unspecified, and an application that uses such functions without first checking *fpathconf*( ), *pathconf*( ), or sysconf is considered to be requiring an extension.

Margin codes are defined for each option (see Section 1.7.1, on page 7).

2.1.6.1 *System Interfaces*

Refer to **<unistd.h>**, Constants for Options and Option Groups (on page 430) for the list of options.

940 *2.1.6.2 Shell and Utilities*

941 Each of these symbols shall be considered valid names by the implementation. Refer to
942 **<unistd.h>**, Constants for Options and Option Groups (on page 430).

943 The literal names shown below apply only to the *getconf* utility.

944 CD POSIX2_C_DEV
945 The system supports the C-Language Development Utilities option.

946 The utilities in the C-Language Development Utilities option are used for the development
947 of C-language applications, including compilation or translation of C source code and
948 complex program generators for simple lexical tasks and processing of context-free
949 grammars.

950 The utilities listed below may be provided by a conforming system; however, any system
951 claiming conformance to the C-Language Development Utilities option shall provide all of
952 the utilities listed.

953 *c99*
954 *lex*
955 *yacc*

956 POSIX2_CHAR_TERM
957 The system supports the Terminal Characteristics option. This value need not be present on
958 a system not supporting the User Portability Utilities option.

959 Where applicable, the dependency is noted within the description of the utility.

960 This option applies only to systems supporting the User Portability Utilities option. If
961 supported, then the system supports at least one terminal type capable of all operations
962 described in POSIX.1-200x; see Section 10.2 (on page 198).

963 FD POSIX2_FORT_DEV
964 The system supports the FORTRAN Development Utilities option.

965 The *fort77* FORTRAN compiler is the only utility in the FORTRAN Development Utilities
966 option. This is used for the development of FORTRAN language applications, including
967 compilation or translation of FORTRAN source code.

968 The *fort77* utility may be provided by a conforming system; however, any system claiming
969 conformance to the FORTRAN Development Utilities option shall provide the *fort77* utility.

970 FR POSIX2_FORT_RUN
971 The system supports the FORTRAN Runtime Utilities option.

972 The *asa* utility is the only utility in the FORTRAN Runtime Utilities option.

973 The *asa* utility may be provided by a conforming system; however, any system claiming
974 conformance to the FORTRAN Runtime Utilities option shall provide the *asa* utility.

975 POSIX2_LOCALEDEF
976 The system supports the Locale Creation Utilities option.

977 If supported, the system supports the creation of locales as described in the *localedef* utility.

978 The *localedef* utility may be provided by a conforming system; however, any system
979 claiming conformance to the Locale Creation Utilities option shall provide the *localedef*
980 utility.

OB BE POSIX2_PBS

The system supports the Batch Environment Services and Utilities option (see XCU Chapter 3, on page 2375).

Note: The Batch Environment Services and Utilities option is a combination of mandatory and optional batch services and utilities. The POSIX_PBS symbolic constant implies the system supports all the mandatory batch services and utilities.

POSIX2_PBS_ACCOUNTING

The system supports the Batch Accounting option.

POSIX2_PBS_CHECKPOINT

The system supports the Batch Checkpoint/Restart option.

POSIX2_PBS_LOCATE

The system supports the Locate Batch Job Request option.

POSIX2_PBS_MESSAGE

The system supports the Batch Job Message Request option.

POSIX2_PBS_TRACK

The system supports the Track Batch Job Request option.

SD POSIX2_SW_DEV

The system supports the Software Development Utilities option.

The utilities in the Software Development Utilities option are used for the development of applications, including compilation or translation of source code, the creation and maintenance of library archives, and the maintenance of groups of inter-dependent programs.

The utilities listed below may be provided by the conforming system; however, any system claiming conformance to the Software Development Utilities option shall provide all of the utilities listed here.

ar
make
nm
strip

UP POSIX2_UPE

The system supports the User Portability Utilities option.

The utilities in the User Portability Utilities option shall be implemented on all systems that claim conformance to this option, except for the *vi* utility which is noted as having features that cannot be implemented on all terminal types; if the POSIX2_CHAR_TERM option is supported, the system shall support all such features on at least one terminal type; see Section 10.2 (on page 198).

The list of utilities in the User Portability Utilities option is as follows:

bg *fc* *jobs* *talk*
ex *fg* *more* *vi*

XSI XOPEN_UNIX

The system supports the X/Open System Interfaces (XSI) option (see Section 2.1.4, on page 19).

UU XOPEN_UUCP

The system supports the UUCP Utilities option.

The list of utilities in the UUCP Utilities option is as follows:

uucp
uustat
uux

2.2 Application Conformance

For the purposes of POSIX.1-200x, the application conformance requirements given in this section apply.

All applications claiming conformance to POSIX.1-200x shall use only language-dependent services for the C programming language described in Section 2.3 (on page 31), shall use only the utilities and facilities defined in the Shell and Utilities volume of POSIX.1-200x, and shall fall within one of the following categories.

2.2.1 Strictly Conforming POSIX Application

A Strictly Conforming POSIX Application is an application that requires only the facilities described in POSIX.1-200x. Such an application:

1. Shall accept any implementation behavior that results from actions it takes in areas described in POSIX.1-200x as *implementation-defined* or *unspecified*, or where POSIX.1-200x indicates that implementations may vary
2. Shall not perform any actions that are described as producing *undefined* results
3. For symbolic constants, shall accept any value in the range permitted by POSIX.1-200x, but shall not rely on any value in the range being greater than the minimums listed or being less than the maximums listed in POSIX.1-200x
4. Shall not use facilities designated as *obsolescent*
5. Is required to tolerate and permitted to adapt to the presence or absence of optional facilities whose availability is indicated by Section 2.1.3 (on page 16)
6. For the C programming language, shall not produce any output dependent on any behavior described in the ISO/IEC 9899:1999 standard as *unspecified*, *undefined*, or *implementation-defined*, unless the System Interfaces volume of POSIX.1-200x specifies the behavior
7. For the C programming language, shall not exceed any minimum implementation limit defined in the ISO/IEC 9899:1999 standard, unless the System Interfaces volume of POSIX.1-200x specifies a higher minimum implementation limit
8. For the C programming language, shall define _POSIX_C_SOURCE to be 200xxxL before any header is included

Within POSIX.1-200x, any restrictions placed upon a Conforming POSIX Application shall restrict a Strictly Conforming POSIX Application.

2.2.2 Conforming POSIX Application

2.2.2.1 *ISO/IEC Conforming POSIX Application*

An ISO/IEC Conforming POSIX Application is an application that uses only the facilities described in POSIX.1-200x and approved Conforming Language bindings for any ISO or IEC standard. Such an application shall include a statement of conformance that documents all options and limit dependencies, and all other ISO or IEC standards used.

2.2.2.2 *<National Body> Conforming POSIX Application*

A <National Body> Conforming POSIX Application differs from an ISO/IEC Conforming POSIX Application in that it also may use specific standards of a single ISO/IEC member body referred to here as *<National Body>*. Such an application shall include a statement of conformance that documents all options and limit dependencies, and all other <National Body> standards used.

2.2.3 Conforming POSIX Application Using Extensions

A Conforming POSIX Application Using Extensions is an application that differs from a Conforming POSIX Application only in that it uses non-standard facilities that are consistent with POSIX.1-200x. Such an application shall fully document its requirements for these extended facilities, in addition to the documentation required of a Conforming POSIX Application. A Conforming POSIX Application Using Extensions shall be either an ISO/IEC Conforming POSIX Application Using Extensions or a <National Body> Conforming POSIX Application Using Extensions (see Section 2.2.2.1 and Section 2.2.2.2).

2.2.4 Strictly Conforming XSI Application

A Strictly Conforming XSI Application is an application that requires only the facilities described in POSIX.1-200x. Such an application:

1. Shall accept any implementation behavior that results from actions it takes in areas described in POSIX.1-200x as *implementation-defined* or *unspecified*, or where POSIX.1-200x indicates that implementations may vary
2. Shall not perform any actions that are described as producing *undefined* results
3. For symbolic constants, shall accept any value in the range permitted by POSIX.1-200x, but shall not rely on any value in the range being greater than the minimums listed or being less than the maximums listed in POSIX.1-200x
4. Shall not use facilities designated as *obsolescent*
5. Is required to tolerate and permitted to adapt to the presence or absence of optional facilities whose availability is indicated by Section 2.1.4 (on page 19)
6. For the C programming language, shall not produce any output dependent on any behavior described in the ISO C standard as *unspecified*, *undefined*, or *implementation-defined*, unless the System Interfaces volume of POSIX.1-200x specifies the behavior

7. For the C programming language, shall not exceed any minimum implementation limit defined in the ISO C standard, unless the System Interfaces volume of POSIX.1-200x specifies a higher minimum implementation limit

8. For the C programming language, shall define _XOPEN_SOURCE to be 700 before any header is included

Within POSIX.1-200x, any restrictions placed upon a Conforming POSIX Application shall restrict a Strictly Conforming XSI Application.

2.2.5 Conforming XSI Application Using Extensions

A Conforming XSI Application Using Extensions is an application that differs from a Strictly Conforming XSI Application only in that it uses non-standard facilities that are consistent with POSIX.1-200x. Such an application shall fully document its requirements for these extended facilities, in addition to the documentation required of a Strictly Conforming XSI Application.

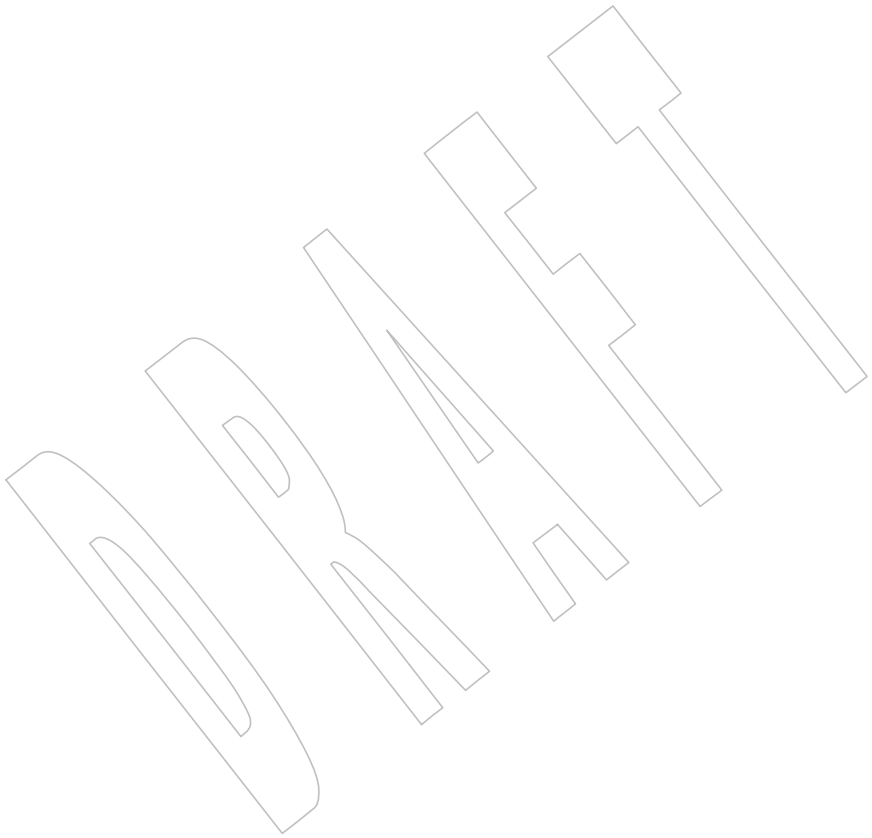
2.3 Language-Dependent Services for the C Programming Language

Implementors seeking to claim conformance using the ISO C standard shall claim POSIX conformance as described in Section 2.1.3 (on page 16).

2.4 Other Language-Related Specifications

POSIX.1-200x is currently specified in terms of the shell command language and ISO C. Bindings to other programming languages are being developed.

If conformance to POSIX.1-200x is claimed for implementation of any programming language, the implementation of that language shall support the use of external symbols distinct to at least 31 bytes in length in the source program text. (That is, identifiers that differ at or before the thirty-first byte shall be distinct.) If a national or international standard governing a language defines a maximum length that is less than this value, the language-defined maximum shall be supported. External symbols that differ only by case shall be distinct when the character set in use distinguishes uppercase and lowercase characters and the language permits (or requires) uppercase and lowercase characters to be distinct in external symbols.



Chapter 3

Definitions

For the purposes of POSIX.1-200x, the following terms and definitions apply. The Authoritative Dictionary of IEEE Standards Terms, Seventh Edition should be referenced for terms not defined in this section.

Note: No shading to denote extensions or options occurs in this chapter. Where the terms and definitions given in this chapter are used elsewhere in text related to extensions and options, they are shaded as appropriate.

3.1 Abortive Release

An abrupt termination of a network connection that may result in the loss of data.

3.2 Absolute Pathname

A pathname beginning with a single or more than two <slash> characters; see also Section 3.266 (on page 75).

Note: Pathname Resolution is defined in detail in Section 4.12 (on page 111).

3.3 Access Mode

A particular form of access permitted to a file.

3.4 Additional File Access Control Mechanism

An implementation-defined mechanism that is layered upon the access control mechanisms defined here, but which do not grant permissions beyond those defined herein, although they may further restrict them.

Note: File Access Permissions are defined in detail in Section 4.4 (on page 108).

3.5 Address Space

The memory locations that can be referenced by a process or the threads of a process.

3.6 Advisory Information

An interface that advises the implementation on (portable) application behavior so that it can optimize the system.

3.7 Affirmative Response

An input string that matches one of the responses acceptable to the *LC_MESSAGES* category keyword **yesexpr**, matching an extended regular expression in the current locale.

Note: The *LC_MESSAGES* category is defined in detail in Section 7.3.6 (on page 164).

3.8 Alert

To cause the user's terminal to give some audible or visual indication that an error or some other event has occurred. When the standard output is directed to a terminal device, the method for alerting the terminal user is unspecified. When the standard output is not directed to a terminal device, the alert is accomplished by writing the alert to standard output (unless the utility description indicates that the use of standard output produces undefined results in this case).

3.9 Alert Character (<alert>)

A character that in the output stream should cause a terminal to alert its user via a visual or audible notification. It is the character designated by `'\a'` in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the alert function.

3.10 Alias Name

In the shell command language, a word consisting solely of underscores, digits, and alphabetics from the portable character set and any of the following characters: `'!'`, `'%'`, `','`, `'@'`.

Implementations may allow other characters within alias names as an extension.

Note: The Portable Character Set is defined in detail in Section 6.1 (on page 125).

3.11 Alignment

A requirement that objects of a particular type be located on storage boundaries with addresses that are particular multiples of a byte address.

Note: See also the ISO C standard, Section B3.

3.12 Alternate File Access Control Mechanism

An implementation-defined mechanism that is independent of the access control mechanisms defined herein, and which if enabled on a file may either restrict or extend the permissions of a given user. POSIX.1-200x defines when such mechanisms can be enabled and when they are disabled.

Note: File Access Permissions are defined in detail in Section 4.4 (on page 108).

3.13 Alternate Signal Stack

Memory associated with a thread, established upon request by the implementation for a thread, separate from the thread signal stack, in which signal handlers responding to signals sent to that thread may be executed.

3.14 Ancillary Data

Protocol-specific, local system-specific, or optional information. The information can be both local or end-to-end significant, header information, part of a data portion, protocol-specific, and implementation or system-specific.

3.15 Angle Brackets

The characters `'<'` (left-angle-bracket) and `'>'` (right-angle-bracket). When used in the phrase "enclosed in angle brackets", the symbol `'<'` immediately precedes the object to be enclosed, and `'>'` immediately follows it. When describing these characters in the portable character set, the names <less-than-sign> and <greater-than-sign> are used.

3.16 Apostrophe Character (<apostrophe>)

The character designated by `'\''` in the C language, also known as the single-quote character. +

3.17 Application

A computer program that performs some desired function.

3.18 Application Address

Endpoint address of a specific application.

3.19 Application Program Interface (API)

The definition of syntax and semantics for providing computer system services.

3.20 Appropriate Privileges

An implementation-defined means of associating privileges with a process with regard to the function calls, function call options, and the commands that need special privileges. There may be zero or more such means. These means (or lack thereof) are described in the conformance document.

Note: Function calls are defined in the System Interfaces volume of POSIX.1-200x, and commands are defined in the Shell and Utilities volume of POSIX.1-200x.

3.21 Argument

In the shell command language, a parameter passed to a utility as the equivalent of a single string in the *argv* array created by one of the *exec* functions. An argument is one of the options, option-arguments, or operands following the command name.

Note: The Utility Argument Syntax is defined in detail in Section 12.1 (on page 213) and XCU Section 2.9.1.1 (on page 2317).

In the C language, an expression in a function call expression or a sequence of preprocessing tokens in a function-like macro invocation.

3.22 Arm (a Timer)

To start a timer measuring the passage of time, enabling notifying a process when the specified time or time interval has passed.

3.23 Asterisk Character (<asterisk>)

The character '*'.

3.24 Async-Cancel-Safe Function

A function that may be safely invoked by an application while the asynchronous form of cancellation is enabled. No function is async-cancel-safe unless explicitly described as such.

3.25 Asynchronous Events

Events that occur independently of the execution of the application.

3.26 Asynchronous Input and Output

A functionality enhancement to allow an application process to queue data input and output commands with asynchronous notification of completion.

3.27 Async-Signal-Safe Function

A function that may be invoked, without restriction, from signal-catching functions. No function is async-signal-safe unless explicitly described as such.

3.28 Asynchronously-Generated Signal

A signal that is not attributable to a specific thread. Examples are signals sent via *kill*( ), signals sent from the keyboard, and signals delivered to process groups. Being asynchronous is a property of how the signal was generated and not a property of the signal number. All signals may be generated asynchronously.

Note: The *kill*( ) function is defined in detail in the System Interfaces volume of POSIX.1-200x.

3.29 Asynchronous I/O Completion

For an asynchronous read or write operation, when a corresponding synchronous read or write would have completed and when any associated status fields have been updated.

3.30 Asynchronous I/O Operation

An I/O operation that does not of itself cause the thread requesting the I/O to be blocked from further use of the processor.

This implies that the process and the I/O operation may be running concurrently.

3.31 Authentication

The process of validating a user or process to verify that the user or process is not a counterfeit.

3.32 Authorization

The process of verifying that a user or process has permission to use a resource in the manner requested.

To ensure security, the user or process would also need to be authenticated before granting access.

3.33 Background Job

See *Background Process Group* in Section 3.35.

3.34 Background Process

A process that is a member of a background process group.

3.35 Background Process Group (or Background Job)

Any process group, other than a foreground process group, that is a member of a session that has established a connection with a controlling terminal.

3.36 Backquote Character

The character `'`', also known as <grave-accent>.

3.37 Backslash Character (<backslash>)

The character designated by `'\\'` in the C language, also known as reverse solidus.

3.38 Backspace Character (<backspace>)

A character that, in the output stream, should cause printing (or displaying) to occur one column position previous to the position about to be printed. If the position about to be printed is at the beginning of the current line, the behavior is unspecified. It is the character designated by `'\b'` in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the backspace function. The backspace defined here is not necessarily the ERASE special character.

Note: Special Characters are defined in detail in Section 11.1.9 (on page 203).

3.39 Barrier

A synchronization object that allows multiple threads to synchronize at a particular point in their execution.

3.40 Basename

The final, or only, filename in a pathname.

3.41 Basic Regular Expression (BRE)

A regular expression (see Section 3.315, on page 84) used by the majority of utilities that select strings from a set of character strings.

Note: Basic Regular Expressions are described in detail in Section 9.3 (on page 183).

3.42 Batch Access List

A list of user IDs and group IDs of those users and groups authorized to place batch jobs in a batch queue.

A batch access list is associated with a batch queue. A batch server uses the batch access list of a batch queue as one of the criteria in deciding to put a batch job in a batch queue.

3.43 Batch Administrator

A user that is authorized to modify all the attributes of queues and jobs and to change the status of a batch server.

3.44 Batch Client

A computational entity that utilizes batch services by making requests of batch servers.

Batch clients often provide the means by which users access batch services, although a batch server may act as a batch client by virtue of making requests of another batch server.

3.45 Batch Destination

The batch server in a batch system to which a batch job should be sent for processing.

Acceptance of a batch job at a batch destination is the responsibility of a receiving batch server. A batch destination may consist of a batch server-specific portion, a network-wide portion, or both. The batch server-specific portion is referred to as the "batch queue". The network-wide portion is referred to as a "batch server name".

3.46 Batch Destination Identifier

A string that identifies a specific batch destination.

A string of characters in the portable character set used to specify a particular batch destination.

Note: The Portable Character Set is defined in detail in Section 6.1 (on page 125).

3.47 Batch Directive

A line from a file that is interpreted by the batch server. The line is usually in the form of a comment and is an additional means of passing options to the *qsub* utility.

Note: The *qsub* utility is defined in detail in the Shell and Utilities volume of POSIX.1-200x.

3.48 Batch Job

A set of computational tasks for a computing system.

Batch jobs are managed by batch servers.

Once created, a batch job may be executing or pending execution. A batch job that is executing has an associated session leader (a process) that initiates and monitors the computational tasks of the batch job.

3.49 Batch Job Attribute

A named data type whose value affects the processing of a batch job.

The values of the attributes of a batch job affect the processing of that job by the batch server that manages the batch job.

3.50 Batch Job Identifier

A unique name for a batch job. A name that is unique among all other batch job identifiers in a batch system and that identifies the batch server to which the batch job was originally submitted.

3.51 Batch Job Name

A label that is an attribute of a batch job. The batch job name is not necessarily unique.

3.52 Batch Job Owner

The *username@hostname* of the user submitting the batch job, where *username* is a user name (see also Section 3.429, on page 102) and *hostname* is a network host name.

3.53 Batch Job Priority

A value specified by the user that may be used by an implementation to determine the order in which batch jobs are selected to be executed. Job priority has a numeric value in the range –1 024 to 1 023.

Note: The batch job priority is not the execution priority (nice value) of the batch job.

3.54 Batch Job State

An attribute of a batch job which determines the types of requests that the batch server that manages the batch job can accept for the batch job. Valid states include QUEUED, RUNNING, HELD, WAITING, EXITING, and TRANSITING.

3.55 Batch Name Service

A service that assigns batch names that are unique within the batch name space, and that can translate a unique batch name into the location of the named batch entity.

3.56 Batch Name Space

The environment within which a batch name is known to be unique.

3.57 Batch Node

A host containing part or all of a batch system.

A batch node is a host meeting at least one of the following conditions:

- Capable of executing a batch client
- Contains a routing batch queue
- Contains an execution batch queue

3.58 Batch Operator

A user that is authorized to modify some, but not all, of the attributes of jobs and queues, and may change the status of the batch server.

3.59 Batch Queue

A manageable object that represents a set of batch jobs and is managed by a single batch server.

Note: A set of batch jobs is called a batch queue largely for historical reasons. Jobs are selected from the batch queue for execution based on attributes such as priority, resource requirements, and hold conditions.

See also XCU Section 3.1.2 (on page 2376).

3.60 Batch Queue Attribute

A named data type whose value affects the processing of all batch jobs that are members of the batch queue.

A batch queue has attributes that affect the processing of batch jobs that are members of the batch queue.

3.61 Batch Queue Position

The place, relative to other jobs in the batch queue, occupied by a particular job in a batch queue. This is defined in part by submission time and priority; see also Section 3.62.

3.62 Batch Queue Priority

The maximum job priority allowed for any batch job in a given batch queue.

The batch queue priority is set and may be changed by users with appropriate privileges. The priority is bounded in an implementation-defined manner.

3.63 Batch Rerunability

An attribute of a batch job indicating that it may be rerun after an abnormal termination from the beginning without affecting the validity of the results.

3.64 Batch Restart

The action of resuming the processing of a batch job from the point of the last checkpoint. Typically, this is done if the batch job has been interrupted because of a system failure.

3.65 Batch Server

A computational entity that provides batch services.

3.66 Batch Server Name

A string of characters in the portable character set used to specify a particular server in a network.

Note: The Portable Character Set is defined in detail in Section 6.1 (on page 125).

3.67 Batch Service

Computational and organizational services performed by a batch system on behalf of batch jobs.

Batch services are of two types: requested and deferred.

Note: Batch Services are listed in XCU Table 3-5 (on page 2390).

3.68 Batch Service Request

A solicitation of services from a batch client to a batch server.

A batch service request may entail the exchange of any number of messages between the batch client and the batch server.

When naming specific types of service requests, the term "request" is qualified by the type of request, as in *Queue Batch Job Request* and *Delete Batch Job Request*.

3.69 Batch Submission

The process by which a batch client requests that a batch server create a batch job via a *Queue Job Request* to perform a specified computational task.

3.70 Batch System

A collection of one or more batch servers.

3.71 Batch Target User

The name of a user on the batch destination batch server.

The target user is the user name under whose account the batch job is to execute on the destination batch server.

3.72 Batch User

A user who is authorized to make use of batch services.

3.73 Bind

The process of assigning a network address to an endpoint.

3.74 Blank Character (<blank>)

One of the characters that belong to the **blank** character class as defined via the *LC_CTYPE* category in the current locale. In the POSIX locale, a <blank> character is either a <tab> or a <space>.

3.75 Blank Line

A line consisting solely of zero or more <blank> characters terminated by a <newline>; see also Section 3.145 (on page 56).

3.76 Blocked Process (or Thread)

A process (or thread) that is waiting for some condition (other than the availability of a processor) to be satisfied before it can continue execution.

3.77 Blocking

A property of an open file description that causes function calls associated with it to wait for the requested action to be performed before returning.

3.78 Block-Mode Terminal

A terminal device operating in a mode incapable of the character-at-a-time input and output operations described by some of the standard utilities.

Note: Output Devices and Terminal Types are defined in detail in Section 10.2 (on page 198).

3.79 Block Special File

A file that refers to a device. A block special file is normally distinguished from a character special file by providing access to the device in a manner such that the hardware characteristics of the device are not visible.

3.80 Braces

The characters '{' (left-curly-bracket) and '}' (right-curly-bracket). When used in the phrase "enclosed in (curly) braces" the symbol '{' immediately precedes the object to be enclosed, and '}' immediately follows it. When describing these characters in the portable character set, the names <left-curly-bracket> and <left-brace> are used for '{', and <right-curly-bracket> and <right-brace> are used for '}'.

3.81 Brackets

The characters '[' (left-square-bracket) and ']' (right-square-bracket). When used in the phrase "enclosed in (square) brackets" the symbol '[' immediately precedes the object to be enclosed, and ']' immediately follows it. When describing these characters in the portable character set, the names <left-square-bracket> and <right-square-bracket> are used.

3.82 Broadcast

The transfer of data from one endpoint to several endpoints, as described in RFC 919 and RFC 922.

3.83 Built-In Utility (or Built-In)

A utility implemented within a shell. The utilities referred to as special built-ins have special qualities. Unless qualified, the term "built-in" includes the special built-in utilities. Regular built-ins are not required to be actually built into the shell on the implementation, but they do have special command-search qualities.

Note: Special Built-In Utilities are defined in detail in XCU Section 2.14 (on page 2334).

Regular Built-In Utilities are defined in detail in XCU Section 2.9.1.1 (on page 2317).

3.84 Byte

An individually addressable unit of data storage that is exactly an octet, used to store a character or a portion of a character; see also Section 3.87 (on page 47). A byte is composed of a contiguous sequence of 8 bits. The least significant bit is called the "low-order" bit; the most significant is called the "high-order" bit.

Note: The definition of byte from the ISO C standard is broader than the above and might accommodate hardware architectures with different sized addressable units than octets.

3.85 Byte Input/Output Functions

The functions that perform byte-oriented input from streams or byte-oriented output to streams: *fgetc*(), *fgets*(), *fprintf*(), *fputc*(), *fputs*(), *fread*(), *fscanf*(), *fwrite*(), *getc*(), *getchar*(), *getdelim*(), *getline*(), *gets*(), *printf*(), *putc*(), *putchar*(), *puts*(), *scanf*(), *ungetc*(), *vfprintf*(), and *vprintf*().

Note: Functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

3.86 Carriage-Return Character (<carriage-return>)

A character that in the output stream indicates that printing should start at the beginning of the same physical line in which the carriage-return occurred. It is the character designated by `'\r'` in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the movement to the beginning of the line.

3.87 Character

A sequence of one or more bytes representing a single graphic symbol or control code.

Note: This term corresponds to the ISO C standard term multi-byte character, where a single-byte character is a special case of a multi-byte character. Unlike the usage in the ISO C standard, *character* here has no necessary relationship with storage space, and *byte* is used when storage space is discussed.

See the definition of the portable character set in Section 6.1 (on page 125) for a further explanation of the graphical representations of (abstract) characters, as opposed to character encodings.

3.88 Character Array

An array of elements of type **char**.

3.89 Character Class

A named set of characters sharing an attribute associated with the name of the class. The classes and the characters that they contain are dependent on the value of the *LC_CTYPE* category in the current locale.

Note: The *LC_CTYPE* category is defined in detail in Section 7.3.1 (on page 139).

3.90 Character Set

A finite set of different characters used for the representation, organization, or control of data.

3.91 Character Special File

A file that refers to a device (such as a terminal device file) or that has special properties (such as **/dev/null**).

Note: The General Terminal Interface is defined in detail in Chapter 11 (on page 199).

3.92 Character String

A contiguous sequence of characters terminated by and including the first null byte.

3.93 Child Process

A new process created (by *fork*(), *posix_spawn*(), or *posix_spawnp*()) by a given process. A child process remains the child of the creating process as long as both processes continue to exist.

Note: The *fork*(), *posix_spawn*(), and *posix_spawnp*() functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

3.94 Circumflex Character (<circumflex>)

The character '^'.

3.95 Clock

A software or hardware object that can be used to measure the apparent or actual passage of time.

The current value of the time measured by a clock can be queried and, possibly, set to a value within the legal range of the clock.

3.96 Clock Jump

The difference between two successive distinct values of a clock, as observed from the application via one of the "get time" operations.

3.97 Clock Tick

An interval of time; an implementation-defined number of these occur each second. Clock ticks are one of the units that may be used to express a value found in type **clock_t**.

3.98 Coded Character Set

A set of unambiguous rules that establishes a character set and the one-to-one relationship between each character of the set and its bit representation.

3.99 Codeset

The result of applying rules that map a numeric code value to each element of a character set. An element of a character set may be related to more than one numeric code value but the reverse is not true. However, for state-dependent encodings the relationship between numeric code values and elements of a character set may be further controlled by state information. The character set may contain fewer elements than the total number of possible numeric code values; that is, some code values may be unassigned.

Note: Character Encoding is defined in detail in Section 6.2 (on page 128).

3.100 Collating Element

The smallest entity used to determine the logical ordering of character or wide-character strings; see also Section 3.102. A collating element consists of either a single character, or two or more characters collating as a single entity. The value of the *LC_COLLATE* category in the current locale determines the current set of collating elements.

3.101 Collation

The logical ordering of character or wide-character strings according to defined precedence rules. These rules identify a collation sequence between the collating elements, and such additional rules that can be used to order strings consisting of multiple collating elements.

3.102 Collation Sequence

The relative order of collating elements as determined by the setting of the *LC_COLLATE* category in the current locale. The collation sequence is used for sorting and is determined from the collating weights assigned to each collating element. In the absence of weights, the collation sequence is the order in which collating elements are specified between **order_start** and **order_end** keywords in the *LC_COLLATE* category.

Multi-level sorting is accomplished by assigning elements one or more collation weights, up to the limit {COLL_WEIGHTS_MAX}. On each level, elements may be given the same weight (at the primary level, called an equivalence class; see also Section 3.151, on page 57) or be omitted from the sequence. Strings that collate equally using the first assigned weight (primary ordering) are then compared using the next assigned weight (secondary ordering), and so on.

Note: {COLL_WEIGHTS_MAX} is defined in detail in **<limits.h>**.

3.103 Column Position

A unit of horizontal measure related to characters in a line.

It is assumed that each character in a character set has an intrinsic column width independent of any output device. Each printable character in the portable character set has a column width of one. The standard utilities, when used as described in POSIX.1-200x, assume that all characters have integral column widths. The column width of a character is not necessarily related to the internal representation of the character (numbers of bits or bytes).

The column position of a character in a line is defined as one plus the sum of the column widths of the preceding characters in the line. Column positions are numbered starting from 1.

3.104 Command

A directive to the shell to perform a particular task.

Note: Shell Commands are defined in detail in XCU Section 2.9 (on page 2316).

3.105 Command Language Interpreter

An interface that interprets sequences of text input as commands. It may operate on an input stream or it may interactively prompt and read commands from a terminal. It is possible for applications to invoke utilities through a number of interfaces, which are collectively considered to act as command interpreters. The most obvious of these are the *sh* utility and the *system*( ) function, although *popen*( ) and the various forms of *exec* may also be considered to behave as interpreters.

Note: The *sh* utility is defined in detail in the Shell and Utilities volume of POSIX.1-200x.

The *system*( ), *popen*( ), and *exec* functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

3.106 Composite Graphic Symbol

A graphic symbol consisting of a combination of two or more other graphic symbols in a single character position, such as a diacritical mark and a base character.

3.107 Condition Variable

A synchronization object which allows a thread to suspend execution, repeatedly, until some associated predicate becomes true. A thread whose execution is suspended on a condition variable is said to be blocked on the condition variable.

3.108 Connected Socket

A connection-mode socket for which a connection has been established, or a connectionless-mode socket for which a peer address has been set. See also Section 3.109, Section 3.110, Section 3.111, and Section 3.348 (on page 89).

3.109 Connection

An association established between two or more endpoints for the transfer of data

3.110 Connection Mode

The transfer of data in the context of a connection; see also Section 3.111.

3.111 Connectionless Mode

The transfer of data other than in the context of a connection; see also Section 3.110 and Section 3.124 (on page 53).

3.112 Control Character

A character, other than a graphic character, that affects the recording, processing, transmission, or interpretation of text.

3.113 Control Operator

In the shell command language, a token that performs a control function. It is one of the following symbols:

```
&   &&   (   )   ;   ;;   newline   |   ||
```

The end-of-input indicator used internally by the shell is also considered a control operator.

Note: Token Recognition is defined in detail in XCU Section 2.3 (on page 2299).

3.114 Controlling Process

The session leader that established the connection to the controlling terminal. If the terminal subsequently ceases to be a controlling terminal for this session, the session leader ceases to be the controlling process.

3.115 Controlling Terminal

A terminal that is associated with a session. Each session may have at most one controlling terminal associated with it, and a controlling terminal is associated with exactly one session. Certain input sequences from the controlling terminal cause signals to be sent to all processes in the foreground process group associated with the controlling terminal.

Note: The General Terminal Interface is defined in detail in Chapter 11 (on page 199).

3.116 Conversion Descriptor

A per-process unique value used to identify an open codeset conversion.

3.117 Core File

A file of unspecified format that may be generated when a process terminates abnormally.

3.118 CPU Time (Execution Time)

The time spent executing a process or thread, including the time spent executing system services on behalf of that process or thread. If the Threads option is supported, then the value of the CPU-time clock for a process is implementation-defined. With this definition the sum of all the execution times of all the threads in a process might not equal the process execution time, even in a single-threaded process, because implementations may differ in how they account for time during context switches or for other reasons.

3.119 CPU-Time Clock

A clock that measures the execution time of a particular process or thread.

3.120 CPU-Time Timer

A timer attached to a CPU-time clock.

3.121 Current Job

In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities. There is at most one current job; see also Section 3.203 (on page 65).

3.122 Current Working Directory

See *Working Directory* in Section 3.439 (on page 104).

3.123 Cursor Position

The line and column position on the screen denoted by the terminal's cursor.

3.124 Datagram

A unit of data transferred from one endpoint to another in connectionless mode service.

3.125 Data Segment

Memory associated with a process, that can contain dynamically allocated data.

3.126 Deferred Batch Service

A service that is performed as a result of events that are asynchronous with respect to requests.

Note: Once a batch job has been created, it is subject to deferred services.

3.127 Device

A computer peripheral or an object that appears to the application as such.

3.128 Device ID

A non-negative integer used to identify a device.

3.129 Directory

A file that contains directory entries. No two directory entries in the same directory have the same name.

3.130 Directory Entry (or Link)

An object that associates a filename with a file. Several directory entries can associate names

with the same file.

3.131 Directory Stream

A sequence of all the directory entries in a particular directory. An open directory stream may be implemented using a file descriptor.

3.132 Disarm (a Timer)

To stop a timer from measuring the passage of time, disabling any future process notifications (until the timer is armed again).

3.133 Display

To output to the user's terminal. If the output is not directed to a terminal, the results are undefined.

3.134 Display Line

A line of text on a physical device or an emulation thereof. Such a line will have a maximum number of characters which can be presented.

Note: This may also be written as "line on the display".

3.135 Dollar-Sign Character (<dollar-sign>)

The character `'$'`.

3.136 Dot

In the context of naming files, the filename consisting of a single dot character (`'.'`).

Note: In the context of shell special built-in utilities, see *dot* in XCU Section 2.14 (on page 2334).

Pathname Resolution is defined in detail in Section 4.12 (on page 111).

3.137 Dot-Dot

The filename consisting solely of two dot characters ("..").

Note: Pathname Resolution is defined in detail in Section 4.12 (on page 111).

3.138 Double-Quote Character

The character '"', also known as <quotation-mark>.

Note: The "double" adjective in this term refers to the two strokes in the character glyph. POSIX.1-200x never uses the term "double-quote" to refer to two apostrophes or quotation-marks.

3.139 Downshifting

The conversion of an uppercase character that has a single-character lowercase representation into this lowercase representation.

3.140 Driver

A module that controls data transferred to and received from devices.

Note: Drivers are traditionally written to be a part of the system implementation, although they are frequently written separately from the writing of the implementation. A driver may contain processor-specific code, and therefore be non-portable.

3.141 Effective Group ID

An attribute of a process that is used in determining various permissions, including file access permissions; see also Section 3.188 (on page 63).

3.142 Effective User ID

An attribute of a process that is used in determining various permissions, including file access permissions; see also Section 3.428 (on page 102).

3.143 Eight-Bit Transparency

The ability of a software component to process 8-bit characters without modifying or utilizing any part of the character in a way that is inconsistent with the rules of the current coded character set.

3.144 Empty Directory

A directory that contains, at most, directory entries for dot and dot-dot, and has exactly one link to it (other than its own dot entry, if one exists), in dot-dot. No other links to the directory may exist. It is unspecified whether an implementation can ever consider the root directory to be empty.

3.145 Empty Line

A line consisting of only a <newline>; see also Section 3.75 (on page 44).

3.146 Empty String (or Null String)

A string whose first byte is a null byte.

3.147 Empty Wide-Character String

A wide-character string whose first element is a null wide-character code.

3.148 Encoding Rule

The rules used to convert between wide-character codes and multi-byte character codes.

Note: Stream Orientation and Encoding Rules are defined in detail in XSH Section 2.5.2 (on page 493).

3.149 Entire Regular Expression

The concatenated set of one or more basic regular expressions or extended regular expressions that make up the pattern specified for string selection.

Note: Regular Expressions are defined in detail in Chapter 9 (on page 181).

3.150 Epoch

The time zero hours, zero minutes, zero seconds, on January 1, 1970 Coordinated Universal Time (UTC).

Note: See also *Seconds Since the Epoch* defined in Section 4.15 (on page 113).

3.151 Equivalence Class

A set of collating elements with the same primary collation weight.

Elements in an equivalence class are typically elements that naturally group together, such as all accented letters based on the same base letter.

The collation order of elements within an equivalence class is determined by the weights assigned on any subsequent levels after the primary weight.

3.152 Era

A locale-specific method for counting and displaying years.

Note: The *LC_TIME* category is defined in detail in Section 7.3.5 (on page 158).

3.153 Event Management

The mechanism that enables applications to register for and be made aware of external events such as data becoming available for reading.

3.154 Executable File

A regular file acceptable as a new process image file by the equivalent of the *exec* family of functions, and thus usable as one form of a utility. The standard utilities described as compilers can produce executable files, but other unspecified methods of producing executable files may also be provided. The internal format of an executable file is unspecified, but a conforming application cannot assume an executable file is a text file.

3.155 Execute

To perform command search and execution actions, as defined in the Shell and Utilities volume of POSIX.1-200x; see also Section 3.200 (on page 65).

Note: Command Search and Execution is defined in detail in XCU Section 2.9.1.1 (on page 2317).

3.156 Execution Time

See *CPU Time* in Section 3.118 (on page 52).

3.157 Execution Time Monitoring

A set of execution time monitoring primitives that allow online measuring of thread and process execution times.

3.158 Expand

In the shell command language, when not qualified, the act of applying word expansions.

Note: Word Expansions are defined in detail in XCU Section 2.6 (on page 2305).

3.159 Extended Regular Expression (ERE)

A regular expression (see also Section 3.315, on page 84) that is an alternative to the Basic Regular Expression using a more extensive syntax, occasionally used by some utilities.

Note: Extended Regular Expressions are described in detail in Section 9.4 (on page 188).

3.160 Extended Security Controls

Implementation-defined security controls allowed by the file access permission and appropriate privileges (see also Section 3.20, on page 36) mechanisms, through which an implementation can support different security policies from those described in POSIX.1-200x.

Note: See also *Extended Security Controls* defined in Section 4.3 (on page 107).

File Access Permissions are defined in detail in Section 4.4 (on page 108).

3.161 Feature Test Macro

A macro used to determine whether a particular set of features is included from a header.

Note: See also XSH Section 2.2 (on page 468).

3.162 Field

In the shell command language, a unit of text that is the result of parameter expansion, arithmetic expansion, command substitution, or field splitting. During command processing, the resulting fields are used as the command name and its arguments.

Note: Parameter Expansion is defined in detail in XCU Section 2.6.2 (on page 2306).

Arithmetic Expansion is defined in detail in XCU Section 2.6.4 (on page 2310).

Command Substitution is defined in detail in XCU Section 2.6.3 (on page 2309).

Field Splitting is defined in detail in XCU Section 2.6.5 (on page 2311).

For further information on command processing, see XCU Section 2.9.1 (on page 2316).

3.163 FIFO Special File (or FIFO)

A type of file with the property that data written to such a file is read on a first-in-first-out basis.

Note: Other characteristics of FIFOs are described in the System Interfaces volume of POSIX.1-200x, *lseek*( ), *open*( ), *read*( ), and *write*( ).

3.164 File

An object that can be written to, or read from, or both. A file has certain attributes, including access permissions and type. File types include regular file, character special file, block special file, FIFO special file, symbolic link, socket, and directory. Other types of files may be supported by the implementation.

3.165 File Description

See *Open File Description* in Section 3.253 (on page 73).

3.166 File Descriptor

A per-process unique, non-negative integer used to identify an open file for the purpose of file access. The value of a file descriptor is from zero to {OPEN_MAX}. A process can have no more than {OPEN_MAX} file descriptors open simultaneously. File descriptors may also be used to implement message catalog descriptors and directory streams; see also Section 3.253 (on page 73).

Note: {OPEN_MAX} is defined in detail in **<limits.h>**.

3.167 File Group Class

The property of a file indicating access permissions for a process related to the group identification of a process. A process is in the file group class of a file if the process is not in the file owner class and if the effective group ID or one of the supplementary group IDs of the process matches the group ID associated with the file. Other members of the class may be implementation-defined.

3.168 File Mode

An object containing the file mode bits and file type of a file.

Note: File mode bits and file types are defined in detail in **<sys/stat.h>**.

3.169 File Mode Bits

A file's file permission bits, set-user-ID-on-execution bit (S_ISUID), set-group-ID-on-execution bit (S_ISGID), and, on directories, the restricted deletion flag bit (S_ISVTX).

Note: File Mode Bits are defined in detail in **<sys/stat.h>**.

3.170 Filename

A name consisting of 1 to {NAME_MAX} bytes used to name a file. The characters composing the name may be selected from the set of all character values excluding the <slash> character and the null byte. The filenames dot and dot-dot have special meaning. A filename is sometimes referred to as a "pathname component".

Note: Pathname Resolution is defined in detail in Section 4.12 (on page 111).

3.171 File Offset

The byte position in the file where the next I/O operation begins. Each open file description associated with a regular file, block special file, or directory has a file offset. A character special

file that does not refer to a terminal device may have a file offset. There is no file offset specified for a pipe or FIFO.

3.172 File Other Class

The property of a file indicating access permissions for a process related to the user and group identification of a process. A process is in the file other class of a file if the process is not in the file owner class or file group class.

3.173 File Owner Class

The property of a file indicating access permissions for a process related to the user identification of a process. A process is in the file owner class of a file if the effective user ID of the process matches the user ID of the file.

3.174 File Permission Bits

Information about a file that is used, along with other information, to determine whether a process has read, write, or execute/search permission to a file. The bits are divided into three parts: owner, group, and other. Each part is used with the corresponding file class of processes. These bits are contained in the file mode.

Note: File modes are defined in detail in **<sys/stat.h>**.

File Access Permissions are defined in detail in Section 4.4 (on page 108).

3.175 File Serial Number

A per-file system unique identifier for a file.

3.176 File System

A collection of files and certain of their attributes. It provides a name space for file serial numbers referring to those files.

3.177 File Type

See *File* in Section 3.164 (on page 59).

3.178 Filter

A command whose operation consists of reading data from standard input or a list of input files and writing data to standard output. Typically, its function is to perform some transformation on the data stream.

3.179 First Open (of a File)

When a process opens a file that is not currently an open file within any process.

3.180 Flow Control

The mechanism employed by a communications provider that constrains a sending entity to wait until the receiving entities can safely receive additional data without loss.

3.181 Foreground Job

See *Foreground Process Group* in Section 3.183.

3.182 Foreground Process

A process that is a member of a foreground process group.

3.183 Foreground Process Group (or Foreground Job)

A process group whose member processes have certain privileges, denied to processes in background process groups, when accessing their controlling terminal. Each session that has established a connection with a controlling terminal has at most one process group of the session as the foreground process group of that controlling terminal.

Note: The General Terminal Interface is defined in detail in Chapter 11.

3.184 Foreground Process Group ID

The process group ID of the foreground process group.

3.185 Form-Feed Character (<form-feed>)

A character that in the output stream indicates that printing should start on the next page of an output device. It is the character designated by `'\f'` in the C language. If the form-feed is not the first character of an output line, the result is unspecified. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the movement to the next page.

3.186 Graphic Character

A member of the **graph** character class of the current locale.

Note: The **graph** character class is defined in detail in Section 7.3.1 (on page 139).

3.187 Group Database

A system database that contains at least the following information for each group ID:

- Group name
- Numerical group ID
- List of users allowed in the group

The list of users allowed in the group is used by the *newgrp* utility.

Note: The *newgrp* utility is defined in detail in the Shell and Utilities volume of POSIX.1-200x.

3.188 Group ID

A non-negative integer, which can be contained in an object of type **gid_t**, that is used to identify a group of system users. Each system user is a member of at least one group. When the identity of a group is associated with a process, a group ID value is referred to as a real group ID, an effective group ID, one of the supplementary group IDs, or a saved set-group-ID.

3.189 Group Name

A string that is used to identify a group; see also Section 3.187. To be portable across conforming systems, the value is composed of characters from the portable filename character set. The <hyphen> should not be used as the first character of a portable group name.

3.190 Hard Limit

A system resource limitation that may be reset to a lesser or greater limit by a privileged process. A non-privileged process is restricted to only lowering its hard limit.

3.191 Hard Link

The relationship between two directory entries that represent the same file; see also Section 3.130 (on page 53). The result of an execution of the *ln* utility (without the **–s** option) or the *link*( ) function. This term is contrasted against symbolic link; see also Section 3.373 (on page 94).

3.192 Home Directory

The directory specified by the *HOME* environment variable.

3.193 Host Byte Order

The arrangement of bytes in any integer type when using a specific machine architecture.

Note: Two common methods of byte ordering are big-endian and little-endian. Big-endian is a format for storage of binary data in which the most significant byte is placed first, with the rest in descending order. Little-endian is a format for storage or transmission of binary data in which the least significant byte is placed first, with the rest in ascending order. See also Section 4.9 (on page 110).

3.194 Incomplete Line

A sequence of one or more non-<newline> characters at the end of the file.

3.195 Inf

A value representing +infinity or a value representing –infinity that can be stored in a floating type. Not all systems support the Inf values.

3.196 Instrumented Application

An application that contains at least one call to the trace point function *posix_trace_event*( ). Each process of an instrumented application has a mapping of trace event names to trace event type identifiers. This mapping is used by the trace stream that is created for that process.

3.197 Interactive Shell

A processing mode of the shell that is suitable for direct user interaction.

3.198 Internationalization

The provision within a computer program of the capability of making itself adaptable to the requirements of different native languages, local customs, and coded character sets.

3.199 Interprocess Communication

A functionality enhancement to add a high-performance, deterministic interprocess communication facility for local communication.

3.200 Invoke

To perform command search and execution actions, except that searching for shell functions and special built-in utilities is suppressed; see also Section 3.155 (on page 58).

Note: Command Search and Execution is defined in detail in XCU Section 2.9.1.1 (on page 2317).

3.201 Job

A set of processes, comprising a shell pipeline, and any processes descended from it, that are all in the same process group.

Note: See also XCU Section 2.9.2 (on page 2318).

3.202 Job Control

A facility that allows users selectively to stop (suspend) the execution of processes and continue (resume) their execution at a later point. The user typically employs this facility via the interactive interface jointly supplied by the terminal I/O driver and a command interpreter.

3.203 Job Control Job ID

A handle that is used to refer to a job. The job control job ID can be any of the forms shown in the following table:

Table 3-1 Job Control Job ID Formats

Job Control Job ID	Meaning
%%	Current job.
%+	Current job.
%–	Previous job.
%*n*	Job number *n*.
%*string*	Job whose command begins with *string*.
%?*string*	Job whose command contains *string*.

3.204 Last Close (of a File)

When a process closes a file, resulting in the file not being an open file within any process.

3.205 Line

A sequence of zero or more non-<newline> characters plus a terminating <newline> character.

3.206 Linger

The period of time before terminating a connection, to allow outstanding data to be transferred.

3.207 Link

See *Directory Entry* in Section 3.130 (on page 53).

3.208 Link Count

The number of directory entries that refer to a particular file.

3.209 Local Customs

The conventions of a geographical area or territory for such things as date, time, and currency formats.

3.210 Local Interprocess Communication (Local IPC)

The transfer of data between processes in the same system.

3.211 Locale

The definition of the subset of a user's environment that depends on language and cultural conventions.

Note: Locales are defined in detail in Chapter 7 (on page 135).

3.212 Localization

The process of establishing information within a computer system specific to the operation of particular native languages, local customs, and coded character sets.

3.213 Login

The unspecified activity by which a user gains access to the system. Each login is associated with exactly one login name.

3.214 Login Name

A user name that is associated with a login.

3.215 Map

To create an association between a page-aligned range of the address space of a process and some memory object, such that a reference to an address in that range of the address space results in a reference to the associated memory object. The mapped memory object is not necessarily memory-resident.

3.216 Marked Message

A STREAMs message on which a certain flag is set. Marking a message gives the application protocol-specific information. An application can use *ioctl*( ) to determine whether a given message is marked.

Note: The *ioctl*( ) function is defined in detail in the System Interfaces volume of POSIX.1-200x.

3.217 Matched

A state applying to a sequence of zero or more characters when the characters in the sequence correspond to a sequence of characters defined by a basic regular expression or extended regular expression pattern.

Note: Regular Expressions are defined in detail in Chapter 9 (on page 181).

3.218 Memory Mapped Files

A facility to allow applications to access files as part of the address space.

3.219 Memory Object

One of:

- A file (see Section 3.164, on page 59)
- A shared memory object (see Section 3.340, on page 88)
- A typed memory object (see Section 3.421, on page 101)

When used in conjunction with *mmap*( ), a memory object appears in the address space of the calling process.

Note: The *mmap*( ) function is defined in detail in the System Interfaces volume of POSIX.1-200x.

3.220 Memory-Resident

The process of managing the implementation in such a way as to provide an upper bound on memory access times.

3.221 Message

In the context of programmatic message passing, information that can be transferred between processes or threads by being added to and removed from a message queue. A message consists of a fixed-size message buffer.

3.222 Message Catalog

In the context of providing natural language messages to the user, a file or storage area containing program messages, command prompts, and responses to prompts for a particular native language, territory, and codeset.

3.223 Message Catalog Descriptor

In the context of providing natural language messages to the user, a per-process unique value used to identify an open message catalog. A message catalog descriptor may be implemented using a file descriptor.

3.224 Message Queue

In the context of programmatic message passing, an object to which messages can be added and removed. Messages may be removed in the order in which they were added or in priority order.

3.225 Mode

A collection of attributes that specifies a file's type and its access permissions.

Note: File Access Permissions are defined in detail in Section 4.4 (on page 108).

3.226 Monotonic Clock

A clock measuring real time, whose value cannot be set via *clock_settime*() and which cannot have negative clock jumps.

3.227 Mount Point

Either the system root directory or a directory for which the *st_dev* field of structure **stat** differs from that of its parent directory.

Note: The **stat** structure is defined in detail in **<sys/stat.h>**.

3.228 Multi-Character Collating Element

A sequence of two or more characters that collate as an entity. For example, in some coded character sets, an accented character is represented by a non-spacing accent, followed by the letter. Other examples are the Spanish elements *ch* and *ll*.

3.229 Mutex

A synchronization object used to allow multiple threads to serialize their access to shared data. The name derives from the capability it provides; namely, mutual-exclusion. The thread that has locked a mutex becomes its owner and remains the owner until that same thread unlocks the mutex.

3.230 Name

In the shell command language, a word consisting solely of underscores, digits, and alphabetics from the portable character set. The first character of a name is not a digit.

Note: The Portable Character Set is defined in detail in Section 6.1 (on page 125).

3.231 Named STREAM

A STREAMS-based file descriptor that is attached to a name in the file system name space. All subsequent operations on the named STREAM act on the STREAM that was associated with the file descriptor until the name is disassociated from the STREAM.

3.232 NaN (Not a Number)

A set of values that may be stored in a floating type but that are neither Inf nor valid floating-point numbers. Not all systems support NaN values.

3.233 Native Language

A computer user's spoken or written language, such as American English, British English, Danish, Dutch, French, German, Italian, Japanese, Norwegian, or Swedish.

3.234 Negative Response

An input string that matches one of the responses acceptable to the *LC_MESSAGES* category keyword **noexpr**, matching an extended regular expression in the current locale.

Note: The *LC_MESSAGES* category is defined in detail in Section 7.3.6 (on page 164).

3.235 Network

A collection of interconnected hosts.

Note: The term "network" in POSIX.1-200x is used to refer to the network of hosts. The term "batch system" is used to refer to the network of batch servers.

3.236 Network Address

A network-visible identifier used to designate specific endpoints in a network. Specific endpoints on host systems have addresses, and host systems may also have addresses.

3.237 Network Byte Order

The way of representing any integer type such that, when transmitted over a network via a network endpoint, the **int** type is transmitted as an appropriate number of octets with the most significant octet first, followed by any other octets in descending order of significance.

Note: This order is more commonly known as big-endian ordering. See also Section 4.9 (on page 110).

3.238 Newline Character (<newline>)

A character that in the output stream indicates that printing should start at the beginning of the next line. It is the character designated by `'\n'` in the C language. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the movement to the next line.

3.239 Nice Value

A number used as advice to the system to alter process scheduling. Numerically smaller values give a process additional preference when scheduling a process to run. Numerically larger values reduce the preference and make a process less likely to run. Typically, a process with a smaller nice value runs to completion more quickly than an equivalent process with a higher nice value. The symbol {NZERO} specifies the default nice value of the system.

3.240 Non-Blocking

A property of an open file description that causes function calls involving it to return without delay when it is detected that the requested action associated with the function call cannot be completed without unknown delay.

Note: The exact semantics are dependent on the type of file associated with the open file description. For data reads from devices such as ttys and FIFOs, this property causes the read to return immediately when no data was available. Similarly, for writes, it causes the call to return immediately when the thread would otherwise be delayed in the write operation; for example, because no space was available. For networking, it causes functions not to await protocol events (for example, acknowledgements) to occur. See also XSH Section 2.10.7 (on page 519).

3.241 Non-Spacing Characters

A character, such as a character representing a diacritical mark in the ISO/IEC 6937:2001 standard coded character set, which is used in combination with other characters to form composite graphic symbols.

3.242 NUL

A character with all bits set to zero.

3.243 Null Byte

A byte with all bits set to zero.

3.244 Null Pointer

A pointer obtained by converting an integer constant expression with the value 0, or such an expression cast to type **void** *, to a pointer type; for example, (**char** *)0. The C language guarantees that a null pointer compares unequal to a pointer to any object or function, so it is used by many functions that return pointers to indicate an error.

3.245 Null String

See *Empty String* in Section 3.146 (on page 56).

3.246 Null Wide-Character Code

A wide-character code with all bits set to zero.

3.247 Number-Sign Character (<number-sign>)

The character '#', also known as hash sign.

3.248 Object File

A regular file containing the output of a compiler, formatted as input to a linkage editor for linking with other object files into an executable form. The methods of linking are unspecified and may involve the dynamic linking of objects at runtime. The internal format of an object file is unspecified, but a conforming application cannot assume an object file is a text file.

3.249 Octet

Unit of data representation that consists of eight contiguous bits.

3.250 Offset Maximum

An attribute of an open file description representing the largest value that can be used as a file offset.

3.251 Opaque Address

An address such that the entity making use of it requires no details about its contents or format.

3.252 Open File

A file that is currently associated with a file descriptor.

3.253 Open File Description

A record of how a process or group of processes is accessing a file. Each file descriptor refers to exactly one open file description, but an open file description can be referred to by more than one file descriptor. The file offset, file status, and file access modes are attributes of an open file description.

3.254 Operand

An argument to a command that is generally used as an object supplying information to a utility necessary to complete its processing. Operands generally follow the options in a command line.

Note: Utility Argument Syntax is defined in detail in Section 12.1 (on page 213).

3.255 Operator

In the shell command language, either a control operator or a redirection operator.

3.256 Option

An argument to a command that is generally used to specify changes in the utility's default behavior.

Note: Utility Argument Syntax is defined in detail in Section 12.1 (on page 213).

3.257 Option-Argument

A parameter that follows certain options. In some cases an option-argument is included within the same argument string as the option—in most cases it is the next argument.

Note: Utility Argument Syntax is defined in detail in Section 12.1 (on page 213).

3.258 Orientation

A stream has one of three orientations: unoriented, byte-oriented, or wide-oriented.

Note: For further information, see XSH Section 2.5.2 (on page 493).

3.259 Orphaned Process Group

A process group in which the parent of every member is either itself a member of the group or is not a member of the group's session.

3.260 Page

The granularity of process memory mapping or locking.

Physical memory and memory objects can be mapped into the address space of a process on page boundaries and in integral multiples of pages. Process address space can be locked into memory (made memory-resident) on page boundaries and in integral multiples of pages.

3.261 Page Size

The size, in bytes, of the system unit of memory allocation, protection, and mapping. On systems that have segment rather than page-based memory architectures, the term "page" means a segment.

3.262 Parameter

In the shell command language, an entity that stores values. There are three types of parameters: variables (named parameters), positional parameters, and special parameters. Parameter expansion is accomplished by introducing a parameter with the '$' character.

Note: See also XCU Section 2.5 (on page 2301).

In the C language, an object declared as part of a function declaration or definition that acquires a value on entry to the function, or an identifier following the macro name in a function-like macro definition.

3.263 Parent Directory

When discussing a given directory, the directory that both contains a directory entry for the given directory and is represented by the pathname dot-dot in the given directory.

When discussing other types of files, a directory containing a directory entry for the file under discussion.

This concept does not apply to dot and dot-dot.

3.264 Parent Process

The process which created (or inherited) the process under discussion.

3.265 Parent Process ID

An attribute of a new process identifying the parent of the process. The parent process ID of a process is the process ID of its creator, for the lifetime of the creator. After the creator's lifetime has ended, the parent process ID is the process ID of an implementation-defined system process.

3.266 Pathname

A character string that is used to identify a file. In the context of POSIX.1-200x, a pathname may be limited to {PATH_MAX} bytes, including the terminating null byte. It has an optional beginning <slash>, followed by zero or more filenames separated by <slash> characters. A pathname may optionally contain one or more trailing <slash> characters. Multiple successive <slash> characters are considered to be the same as one <slash>, except for the case of exactly two leading <slash> characters.

Note: Pathname Resolution is defined in detail in Section 4.12 (on page 111).

3.267 Pathname Component

See *Filename* in Section 3.170 (on page 60).

3.268 Path Prefix

The part of a pathname up to, but not including, the last component and any trailing <slash> characters, unless the pathname consists entirely of <slash> characters, in which case the path prefix is `'//'` for a pathname containing either a single <slash> or three or more <slash> characters, and `'///'` for the pathname **//**. The path prefix of a pathname containing no <slash> characters is empty, but is treated as referring to the current working directory.

Note: The term is used both in the sense of identifying part of a pathname that forms the prefix and of joining a non-empty path prefix to a filename to form a pathname. In the latter case, the path prefix need not have a trailing <slash> (in which case the joining is done with a <slash> character).

3.269 Pattern

A sequence of characters used either with regular expression notation or for pathname expansion, as a means of selecting various character strings or pathnames, respectively.

Note: Regular Expressions are defined in detail in Chapter 9 (on page 181).

See also XCU Section 2.6.6 (on page 2311).

The syntaxes of the two types of patterns are similar, but not identical; POSIX.1-200x always indicates the type of pattern being referred to in the immediate context of the use of the term.

3.270 Period Character (<period>)

The character `'.'`. The term "period" is contrasted with dot (see also Section 3.136, on page 54), which is used to describe a specific directory entry.

3.271 Permissions

Attributes of an object that determine the privilege necessary to access or manipulate the object.

Note: File Access Permissions are defined in detail in Section 4.4 (on page 108).

3.272 Persistence

A mode for semaphores, shared memory, and message queues requiring that the object and its state (including data, if any) are preserved after the object is no longer referenced by any process.

Persistence of an object does not imply that the state of the object is maintained across a system crash or a system reboot.

3.273 Pipe

An object identical to a FIFO which has no links in the file hierarchy.

Note: The *pipe*( ) function is defined in detail in the System Interfaces volume of POSIX.1-200x.

3.274 Polling

A scheduling scheme whereby the local process periodically checks until the pre-specified events (for example, read, write) have occurred.

3.275 Portable Character Set

The collection of characters that are required to be present in all locales supported by conforming systems.

Note: The Portable Character Set is defined in detail in Section 6.1 (on page 125).

This term is contrasted against the smaller portable filename character set; see also Section 3.276.

3.276 Portable Filename Character Set

The set of characters from which portable filenames are constructed.

```
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
a b c d e f g h i j k l m n o p q r s t u v w x y z
0 1 2 3 4 5 6 7 8 9 . _ -
```

The last three characters are the <period>, <underscore>, and <hyphen> characters, respectively.

3.277 Positional Parameter

In the shell command language, a parameter denoted by a single digit or one or more digits in curly braces.

Note: For further information, see XCU Section 2.5.1 (on page 2301).

3.278 Preallocation

The reservation of resources in a system for a particular use.

Preallocation does not imply that the resources are immediately allocated to that use, but merely indicates that they are guaranteed to be available in bounded time when needed.

3.279 Preempted Process (or Thread)

A running thread whose execution is suspended due to another thread becoming runnable at a higher priority.

3.280 Previous Job

In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities if the current job exits. There is at most one previous job; see also Section 3.203 (on page 65).

3.281 Printable Character

One of the characters included in the **print** character classification of the *LC_CTYPE* category in the current locale.

Note: The *LC_CTYPE* category is defined in detail in Section 7.3.1 (on page 139).

3.282 Printable File

A text file consisting only of the characters included in the **print** and **space** character classifications of the *LC_CTYPE* category and the <backspace>, all in the current locale.

Note: The *LC_CTYPE* category is defined in detail in Section 7.3.1 (on page 139).

3.283 Priority

A non-negative integer associated with processes or threads whose value is constrained to a range defined by the applicable scheduling policy. Numerically higher values represent higher

2224 priorities.

2225 3.284 Priority Band

2226 The queuing order applied to normal priority STREAMS messages. High priority STREAMS
2227 messages are not grouped by priority bands. The only differentiation made by the STREAMS
2228 mechanism is between zero and non-zero bands, but specific protocol modules may differentiate
2229 between priority bands.

2230 3.285 Priority Inversion

2231 A condition in which a thread that is not voluntarily suspended (waiting for an event or time
2232 delay) is not running while a lower priority thread is running. Such blocking of the higher
2233 priority thread is often caused by contention for a shared resource.

2234 3.286 Priority Scheduling

2235 A performance and determinism improvement facility to allow applications to determine the
2236 order in which threads that are ready to run are granted access to processor resources.

2237 3.287 Priority-Based Scheduling

2238 Scheduling in which the selection of a running thread is determined by the priorities of the
2239 runnable processes or threads.

2240 3.288 Privilege

2241 See *Appropriate Privileges* in Section 3.20 (on page 36).

3.289 Process

An address space with one or more threads executing within that address space, and the required system resources for those threads.

Note: Many of the system resources defined by POSIX.1-200x are shared among all of the threads within a process. These include the process ID, the parent process ID, process group ID, session membership, real, effective, and saved set-user-ID, real, effective, and saved set-group-ID, supplementary group IDs, current working directory, root directory, file mode creation mask, and file descriptors.

3.290 Process Group

A collection of processes that permits the signaling of related processes. Each process in the system is a member of a process group that is identified by a process group ID. A newly created process joins the process group of its creator.

3.291 Process Group ID

The unique positive integer identifier representing a process group during its lifetime.

Note: See also *Process Group ID Reuse* defined in Section 4.13 (on page 112).

3.292 Process Group Leader

A process whose process ID is the same as its process group ID.

3.293 Process Group Lifetime

The period of time that begins when a process group is created and ends when the last remaining process in the group leaves the group, due either to the end of the lifetime of the last process or to the last remaining process calling the *setsid*( ) or *setpgid*( ) functions.

Note: The *setsid*( ) and *setpgid*( ) functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

3.294 Process ID

The unique positive integer identifier representing a process during its lifetime.

Note: See also *Process ID Reuse* defined in Section 4.13 (on page 112).

3.295 Process Lifetime

The period of time that begins when a process is created and ends when its process ID is returned to the system. After a process is created by *fork*( ), *posix_spawn*( ), or *posix_spawnp*( ), it is considered active. At least one thread of control and address space exist until it terminates. It then enters an inactive state where certain resources may be returned to the system, although some resources, such as the process ID, are still in use. When another process executes a *wait*( ), *waitid*( ), or *waitpid*( ) function for an inactive process, the remaining resources are returned to the system. The last resource to be returned to the system is the process ID. At this time, the lifetime of the process ends.

Note: The *fork*( ), *posix_spawn*( ), *posix_spawnp*( ), *wait*( ), *waitid*( ), and *waitpid*( ) functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

3.296 Process Memory Locking

A performance improvement facility to bind application programs into the high-performance random access memory of a computer system. This avoids potential latencies introduced by the operating system in storing parts of a program that were not recently referenced on secondary memory devices.

3.297 Process Termination

There are two kinds of process termination:

1. Normal termination occurs by a return from *main*( ), when requested with the *exit*( ), *_exit*( ), or *_Exit*( ) functions; or when the last thread in the process terminates by returning from its start function, by calling the *pthread_exit*( ) function, or through cancellation.
2. Abnormal termination occurs when requested by the *abort*( ) function or when some signals are received.

Note: The *_exit*( ), *_Exit*( ), *abort*( ), and *exit*( ) functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

3.298 Process-To-Process Communication

The transfer of data between processes.

3.299 Process Virtual Time

The measurement of time in units elapsed by the system clock while a process is executing.

3.300 Program

A prepared sequence of instructions to the system to accomplish a defined task. The term "program" in POSIX.1-200x encompasses applications written in the Shell Command Language, complex utility input languages (for example, *awk*, *lex*, *sed*, and so on), and high-level languages.

3.301 Protocol

A set of semantic and syntactic rules for exchanging information.

3.302 Pseudo-Terminal

A facility that provides an interface that is identical to the terminal subsystem, except where noted otherwise in POSIX.1-200x. A pseudo-terminal is composed of two devices: the "master device" and a "slave device". The slave device provides processes with an interface that is identical to the terminal interface, although there need not be hardware behind that interface. Anything written on the master device is presented to the slave as an input and anything written on the slave device is presented as an input on the master side.

3.303 Radix Character

The character that separates the integer part of a number from the fractional part.

3.304 Read-Only File System

A file system that has implementation-defined characteristics restricting modifications.

Note: File Times Update is described in detail in Section 4.8 (on page 109).

3.305 Read-Write Lock

Multiple readers, single writer (read-write) locks allow many threads to have simultaneous read-only access to data while allowing only one thread to have write access at any given time. They are typically used to protect data that is read-only more frequently than it is changed.

Read-write locks can be used to synchronize threads in the current process and other processes if they are allocated in memory that is writable and shared among the cooperating processes and have been initialized for this behavior.

3.306 Real Group ID

The attribute of a process that, at the time of process creation, identifies the group of the user who created the process; see also Section 3.188 (on page 63).

3.307 Real Time

Time measured as total units elapsed by the system clock without regard to which thread is executing.

3.308 Realtime Signal Extension

A determinism improvement facility to enable asynchronous signal notifications to an application to be queued without impacting compatibility with the existing signal functions.

3.309 Real User ID

The attribute of a process that, at the time of process creation, identifies the user who created the process; see also Section 3.428 (on page 102).

3.310 Record

A collection of related data units or words which is treated as a unit.

3.311 Redirection

In the shell command language, a method of associating files with the input or output of commands.

Note: For further information, see XCU Section 2.7 (on page 2312).

3.312 Redirection Operator

In the shell command language, a token that performs a redirection function. It is one of the following symbols:

< > >| << >> <& >& <<– <>

3.313 Referenced Shared Memory Object

A shared memory object that is open or has one or more mappings defined on it.

3.314 Refresh

To ensure that the information on the user's terminal screen is up-to-date.

3.315 Regular Expression

A pattern that selects specific strings from a set of character strings.

Note: Regular Expressions are described in detail in Chapter 9 (on page 181).

3.316 Region

In the context of the address space of a process, a sequence of addresses.

In the context of a file, a sequence of offsets.

3.317 Regular File

A file that is a randomly accessible sequence of bytes, with no further structure imposed by the system.

3.318 Relative Pathname

A pathname not beginning with a <slash> character.

Note: Pathname Resolution is defined in detail in Section 4.12 (on page 111).

3.319 Relocatable File

A file holding code or data suitable for linking with other object files to create an executable or a shared object file.

3.320 Relocation

The process of connecting symbolic references with symbolic definitions. For example, when a program calls a function, the associated call instruction transfers control to the proper destination address at execution.

3.321 Requested Batch Service

A service that is either rejected or performed prior to a response from the service to the requester.

3.322 (Time) Resolution

The minimum time interval that a clock can measure or whose passage a timer can detect.

3.323 Robust Mutex

A mutex with the *robust* attribute set.

Note: The *robust* attribute is defined in detail by the *pthread_mutexattr_getrobust*( ) function.

3.324 Root Directory

A directory, associated with a process, that is used in pathname resolution for pathnames that begin with a <slash> character.

3.325 Runnable Process (or Thread)

A thread that is capable of being a running thread, but for which no processor is available.

3.326 Running Process (or Thread)

A thread currently executing on a processor. On multi-processor systems there may be more than one such thread in a system at a time.

3.327 Saved Resource Limits

An attribute of a process that provides some flexibility in the handling of unrepresentable resource limits, as described in the *exec* family of functions and *setrlimit*( ).

Note: The *exec* and *setrlimit*( ) functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

3.328 Saved Set-Group-ID

An attribute of a process that allows some flexibility in the assignment of the effective group ID attribute, as described in the *exec* family of functions and *setgid*( ).

Note: The *exec* and *setgid*( ) functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

3.329 Saved Set-User-ID

An attribute of a process that allows some flexibility in the assignment of the effective user ID attribute, as described in the *exec* family of functions and *setuid*( ).

Note: The *exec* and *setuid*( ) functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

3.330 Scheduling

The application of a policy to select a runnable process or thread to become a running process or thread, or to alter one or more of the thread lists.

3.331 Scheduling Allocation Domain

The set of processors on which an individual thread can be scheduled at any given time.

3.332 Scheduling Contention Scope

A property of a thread that defines the set of threads against which that thread competes for resources.

For example, in a scheduling decision, threads sharing scheduling contention scope compete for processor resources. In POSIX.1-200x, a thread has scheduling contention scope of either PTHREAD_SCOPE_SYSTEM or PTHREAD_SCOPE_PROCESS.

3.333 Scheduling Policy

A set of rules that is used to determine the order of execution of processes or threads to achieve some goal.

Note: Scheduling Policy is defined in detail in Section 4.14 (on page 112).

3.334 Screen

A rectangular region of columns and lines on a terminal display. A screen may be a portion of a physical display device or may occupy the entire physical area of the display device.

3.335 Scroll

To move the representation of data vertically or horizontally relative to the terminal screen. There are two types of scrolling:

1. The cursor moves with the data.
2. The cursor remains stationary while the data moves.

3.336 Semaphore

A minimum synchronization primitive to serve as a basis for more complex synchronization mechanisms to be defined by the application program.

Note: Semaphores are defined in detail in Section 4.16 (on page 113).

3.337 Session

A collection of process groups established for job control purposes. Each process group is a member of a session. A process is considered to be a member of the session of which its process group is a member. A newly created process joins the session of its creator. A process can alter its session membership; see *setsid*( ). There can be multiple process groups in the same session.

Note: The *setsid*( ) function is defined in detail in the System Interfaces volume of POSIX.1-200x.

3.338 Session Leader

A process that has created a session.

Note: For further information, see the *setsid*( ) function defined in the System Interfaces volume of POSIX.1-200x.

3.339 Session Lifetime

The period between when a session is created and the end of the lifetime of all the process groups that remain as members of the session.

3.340 Shared Memory Object

An object that represents memory that can be mapped concurrently into the address space of more than one process.

3.341 Shell

A program that interprets sequences of text input as commands. It may operate on an input stream or it may interactively prompt and read commands from a terminal.

3.342 Shell, the

The Shell Command Language Interpreter; a specific instance of a shell.

Note: For further information, see the *sh* utility defined in the Shell and Utilities volume of POSIX.1-200x.

3.343 Shell Script

A file containing shell commands. If the file is made executable, it can be executed by specifying its name as a simple command. Execution of a shell script causes a shell to execute the commands within the script. Alternatively, a shell can be requested to execute the commands in a shell script by specifying the name of the shell script as the operand to the *sh* utility.

Note: Simple Commands are defined in detail in XCU Section 2.9.1 (on page 2316).

The *sh* utility is defined in detail in the Shell and Utilities volume of POSIX.1-200x.

3.344 Signal

A mechanism by which a process or thread may be notified of, or affected by, an event occurring in the system. Examples of such events include hardware exceptions and specific actions by processes. The term signal is also used to refer to the event itself.

3.345 Signal Stack

Memory established for a thread, in which signal handlers catching signals sent to that thread are executed.

3.346 Single-Quote Character

The character designated by `'\''` in the C language, also known as <apostrophe>.

3.347 Slash Character (<slash>)

The character `'/'`, also known as solidus.

3.348 Socket

A file of a particular type that is used as a communications endpoint for process-to-process communication as described in the System Interfaces volume of POSIX.1-200x.

3.349 Socket Address

An address associated with a socket or remote endpoint, including an address family identifier and addressing information specific to that address family. The address may include multiple parts, such as a network address associated with a host system and an identifier for a specific endpoint.

3.350 Soft Limit

A resource limitation established for each process that the process may set to any value less than or equal to the hard limit.

3.351 Source Code

When dealing with the Shell Command Language, input to the command language interpreter. The term "shell script" is synonymous with this meaning.

When dealing with an ISO/IEC-conforming programming language, source code is input to a compiler conforming to that ISO/IEC standard.

Source code also refers to the input statements prepared for the following standard utilities: *awk*, *bc*, *ed*, *lex*, *localedef*, *make*, *sed*, and *yacc*.

Source code can also refer to a collection of sources meeting any or all of these meanings.

Note: The *awk*, *bc*, *ed*, *lex*, *localedef*, *make*, *sed*, and *yacc* utilities are defined in detail in the Shell and Utilities volume of POSIX.1-200x.

3.352 Space Character (<space>)

The character defined in the portable character set as <space>. The <space> character is a member of the **space** character class of the current locale, but represents the single character, and not all of the possible members of the class; see also Section 3.434 (on page 103).

3.353 Spawn

A process creation primitive useful for systems that have difficulty with *fork*( ) and as an efficient replacement for *fork*( )/*exec*.

3.354 Special Built-In

See *Built-In Utility* in Section 3.83 (on page 46).

3.355 Special Parameter

In the shell command language, a parameter named by a single character from the following list:

`*  @  #  ?  !  -  $  0`

Note: For further information, see XCU Section 2.5.2 (on page 2302).

3.356 Spin Lock

A synchronization object used to allow multiple threads to serialize their access to shared data.

3.357 Sporadic Server

A scheduling policy for threads and processes that reserves a certain amount of execution capacity for processing aperiodic events at a given priority level.

3.358 Standard Error

An output stream usually intended to be used for diagnostic messages.

3.359 Standard Input

An input stream usually intended to be used for primary data input.

3.360 Standard Output

An output stream usually intended to be used for primary data output.

3.361 Standard Utilities

The utilities described in the Shell and Utilities volume of POSIX.1-200x.

3.362 Stream

Appearing in lowercase, a stream is a file access object that allows access to an ordered sequence of characters, as described by the ISO C standard. Such objects can be created by the *fdopen*(), *fmemopen*(), *fopen*(), *open_memstream*(), or *popen*() functions, and are associated with a file descriptor. A stream provides the additional services of user-selectable buffering and formatted input and output; see also Section 3.363.

Note: For further information, see XSH Section 2.5 (on page 490).

The *fdopen*(), *fmemopen*(), *fopen*(), *open_memstream*(), and *popen*() functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

3.363 STREAM

Appearing in uppercase, STREAM refers to a full-duplex connection between a process and an open device or pseudo-device. It optionally includes one or more intermediate processing modules that are interposed between the process end of the STREAM and the device driver (or pseudo-device driver) end of the STREAM; see also Section 3.362.

Note: For further information, see XSH Section 2.6 (on page 494).

3.364 STREAM End

The STREAM end is the driver end of the STREAM and is also known as the downstream end of the STREAM.

3.365 STREAM Head

The STREAM head is the beginning of the STREAM and is at the boundary between the system and the application process. This is also known as the upstream end of the STREAM.

3.366 STREAMS Multiplexor

A driver with multiple STREAMS connected to it. Multiplexing with STREAMS connected above is referred to as N-to-1, or "upper multiplexing". Multiplexing with STREAMS connected below is referred to as 1-to-N or "lower multiplexing".

3.367 String

A contiguous sequence of bytes terminated by and including the first null byte.

3.368 Subshell

A shell execution environment, distinguished from the main or current shell execution environment.

Note: For further information, see XCU Section 2.12 (on page 2331).

3.369 Successfully Transferred

For a write operation to a regular file, when the system ensures that all data written is readable on any subsequent open of the file (even one that follows a system or power failure) in the absence of a failure of the physical storage medium.

For a read operation, when an image of the data on the physical storage medium is available to the requesting process.

3.370 Supplementary Group ID

An attribute of a process used in determining file access permissions. A process has up to {NGROUPS_MAX} supplementary group IDs in addition to the effective group ID. The supplementary group IDs of a process are set to the supplementary group IDs of the parent process when the process is created.

3.371 Suspended Job

A job that has received a SIGSTOP, SIGTSTP, SIGTTIN, or SIGTTOU signal that caused the process group to stop. A suspended job is a background job, but a background job is not necessarily a suspended job.

3.372 Symbolic Constant

An object-like macro defined with a constant value.

Unless stated otherwise, the following shall apply to every symbolic constant:

- It expands to a compile-time constant expression with an integer type.
- It may be defined as another type of constant—e.g., an enumeration constant—as well as being a macro.
- It need not be usable in **#if** preprocessing directives.

3.373 Symbolic Link

A type of file with the property that when the file is encountered during pathname resolution, a string stored by the file is used to modify the pathname resolution. The stored string has a length of {SYMLINK_MAX} bytes or fewer.

Note: Pathname Resolution is defined in detail in Section 4.12 (on page 111).

3.374 Synchronized Input and Output

A determinism and robustness improvement mechanism to enhance the data input and output mechanisms, so that an application can ensure that the data being manipulated is physically present on secondary mass storage devices.

3.375 Synchronized I/O Completion

The state of an I/O operation that has either been successfully transferred or diagnosed as unsuccessful.

3.376 Synchronized I/O Data Integrity Completion

For read, when the operation has been completed or diagnosed if unsuccessful. The read is complete only when an image of the data has been successfully transferred to the requesting process. If there were any pending write requests affecting the data to be read at the time that the synchronized read operation was requested, these write requests are successfully transferred prior to reading the data.

For write, when the operation has been completed or diagnosed if unsuccessful. The write is complete only when the data specified in the write request is successfully transferred and all file system information required to retrieve the data is successfully transferred.

File attributes that are not necessary for data retrieval (access time, modification time, status change time) need not be successfully transferred prior to returning to the calling process.

3.377 Synchronized I/O File Integrity Completion

Identical to a synchronized I/O data integrity completion with the addition that all file attributes relative to the I/O operation (including access time, modification time, status change time) are successfully transferred prior to returning to the calling process.

3.378 Synchronized I/O Operation

An I/O operation performed on a file that provides the application assurance of the integrity of its data and files.

3.379 Synchronous I/O Operation

An I/O operation that causes the thread requesting the I/O to be blocked from further use of the processor until that I/O operation completes.

Note: A synchronous I/O operation does not imply synchronized I/O data integrity completion or synchronized I/O file integrity completion.

3.380 Synchronously-Generated Signal

A signal that is attributable to a specific thread.

For example, a thread executing an illegal instruction or touching invalid memory causes a synchronously-generated signal. Being synchronous is a property of how the signal was generated and not a property of the signal number.

3.381 System

An implementation of POSIX.1-200x.

3.382 System Boot

An unspecified sequence of events that may result in the loss of transitory data; that is, data that is not saved in permanent storage. For example, message queues, shared memory, semaphores, and processes.

3.383 System Clock

A clock with at least one second resolution that contains seconds since the Epoch.

3.384 System Console

A device that receives messages sent by the *syslog*() function, and the *fmtmsg*() function when the MM_CONSOLE flag is set.

Note: The *syslog*() and *fmtmsg*() functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

3.385 System Crash

An interval initiated by an unspecified circumstance that causes all processes (possibly other than special system processes) to be terminated in an undefined manner, after which any

changes to the state and contents of files created or written to by an application prior to the interval are undefined, except as required elsewhere in POSIX.1-200x.

3.386 System Databases

An implementation provides two system databases: the "group database" (see also Section 3.187, on page 63) and the "user database" (see also Section 3.427, on page 101).

3.387 System Documentation

All documentation provided with an implementation except for the conformance document. Electronically distributed documents for an implementation are considered part of the system documentation.

3.388 System Process

An object other than a process executing an application, that is provided by the system and has a process ID.

3.389 System Reboot

See *System Boot* defined in Section 3.382 (on page 95).

3.390 System Trace Event

A trace event that is generated by the implementation, in response either to a system-initiated action or to an application-requested action, except for a call to *posix_trace_event*( ). When supported by the implementation, a system-initiated action generates a process-independent system trace event and an application-requested action generates a process-dependent system trace event. For a system trace event not defined by POSIX.1-200x, the associated trace event type identifier is derived from the implementation-defined name for this trace event, and the associated data is of implementation-defined content and length.

3.391 System-Wide

Pertaining to events occurring in all processes existing in an implementation at a given point in time.

3.392 Tab Character (<tab>)

A character that in the output stream indicates that printing or displaying should start at the next horizontal tabulation position on the current line. It is the character designated by `'\t'` in the C language. If the current position is at or past the last defined horizontal tabulation position, the behavior is unspecified. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the tabulation.

3.393 Terminal (or Terminal Device)

A character special file that obeys the specifications of the general terminal interface.

Note: The General Terminal Interface is defined in detail in Chapter 11 (on page 199).

3.394 Text Column

A roughly rectangular block of characters capable of being laid out side-by-side next to other text columns on an output page or terminal screen. The widths of text columns are measured in column positions.

3.395 Text File

A file that contains characters organized into zero or more lines. The lines do not contain NUL characters and none can exceed {LINE_MAX} bytes in length, including the <newline> character. Although POSIX.1-200x does not distinguish between text files and binary files (see the ISO C standard), many utilities only produce predictable or meaningful output when operating on text files. The standard utilities that have such restrictions always specify "text files" in their STDIN or INPUT FILES sections.

3.396 Thread

A single flow of control within a process. Each thread has its own thread ID, scheduling priority and policy, *errno* value, thread-specific key/value bindings, and the required system resources to support a flow of control. Anything whose address may be determined by a thread, including but not limited to static variables, storage obtained via *malloc*(), directly addressable storage obtained through implementation-defined functions, and automatic variables, are accessible to all threads in the same process.

Note: The *malloc*() function is defined in detail in the System Interfaces volume of POSIX.1-200x.

3.397 Thread ID

Each thread in a process is uniquely identified during its lifetime by a value of type **pthread_t** called a thread ID.

3.398 Thread List

An ordered set of runnable threads that all have the same ordinal value for their priority.

The ordering of threads on the list is determined by a scheduling policy or policies. The set of thread lists includes all runnable threads in the system.

3.399 Thread-Safe

A function that may be safely invoked concurrently by multiple threads. Each function defined in the System Interfaces volume of POSIX.1-200x is thread-safe unless explicitly stated otherwise. Examples are any "pure" function, a function which holds a mutex locked while it is accessing static storage, or objects shared among threads.

3.400 Thread-Specific Data Key

A process global handle of type **pthread_key_t** which is used for naming thread-specific data.

Although the same key value may be used by different threads, the values bound to the key by *pthread_setspecific*() and accessed by *pthread_getspecific*() are maintained on a per-thread basis and persist for the life of the calling thread.

Note: The *pthread_getspecific*() and *pthread_setspecific*() functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

3.401 Tilde Character (<tilde>)

The character '~'.

3.402 Timeouts

A method of limiting the length of time an interface will block; see also Section 3.76 (on page 44).

3.403 Timer

A mechanism that can notify a thread when the time as measured by a particular clock has reached or passed a specified value, or when a specified amount of time has passed.

3.404 Timer Overrun

A condition that occurs each time a timer, for which there is already an expiration signal queued to the process, expires.

3.405 Token

In the shell command language, a sequence of characters that the shell considers as a single unit when reading input. A token is either an operator or a word.

Note: The rules for reading input are defined in detail in XCU Section 2.3 (on page 2299).

3.406 Trace Analyzer Process

A process that extracts trace events from a trace stream to retrieve information about the behavior of an application.

3.407 Trace Controller Process

A process that creates a trace stream for tracing a process.

3.408 Trace Event

A data object that represents an action executed by the system, and that is recorded in a trace stream.

3.409 Trace Event Type

A data object type that defines a class of trace event.

3.410 Trace Event Type Mapping

A one-to-one mapping between trace event types and trace event names.

3.411 Trace Filter

A filter that allows the trace controller process to specify those trace event types that are to be ignored; that is, not generated.

3.412 Trace Generation Version

A data object that is an implementation-defined character string, generated by the trace system and describing the origin and version of the trace system.

3.413 Trace Log

The flushed image of a trace stream, if the trace stream is created with a trace log.

3.414 Trace Point

An action that may cause a trace event to be generated.

3.415 Trace Stream

An opaque object that contains trace events plus internal data needed to interpret those trace events.

3.416 Trace Stream Identifier

A handle to manage tracing operations in a trace stream.

3.417 Trace System

A system that allows both system and user trace events to be generated into a trace stream. These trace events can be retrieved later.

3.418 Traced Process

A process for which at least one trace stream has been created. A traced process is also called a target process.

3.419 Tracing Status of a Trace Stream

A status that describes the state of an active trace stream. The tracing status of a trace stream can be retrieved from the trace stream attributes. An active trace stream can be in one of two states: running or suspended.

3.420 Typed Memory Name Space

A system-wide name space that contains the names of the typed memory objects present in the system. It is configurable for a given implementation.

3.421 Typed Memory Object

A combination of a typed memory pool and a typed memory port. The entire contents of the pool are accessible from the port. The typed memory object is identified through a name that belongs to the typed memory name space.

3.422 Typed Memory Pool

An extent of memory with the same operational characteristics. Typed memory pools may be contained within each other.

3.423 Typed Memory Port

A hardware access path to one or more typed memory pools.

3.424 Unbind

Remove the association between a network address and an endpoint.

3.425 Unit Data

See *Datagram* in Section 3.124 (on page 53).

3.426 Upshifting

The conversion of a lowercase character that has a single-character uppercase representation into this uppercase representation.

3.427 User Database

A system database that contains at least the following information for each user ID:

- User name
- Numerical user ID
- Initial numerical group ID
- Initial working directory
- Initial user program

The initial numerical group ID is used by the *newgrp* utility. Any other circumstances under which the initial values are operative are implementation-defined.

If the initial user program field is null, an implementation-defined program is used.

If the initial working directory field is null, the interpretation of that field is implementation-defined.

Note: The *newgrp* utility is defined in detail in the Shell and Utilities volume of POSIX.1-200x.

3.428 User ID

A non-negative integer that is used to identify a system user. When the identity of a user is associated with a process, a user ID value is referred to as a real user ID, an effective user ID, or a saved set-user-ID.

3.429 User Name

A string that is used to identify a user; see also Section 3.427 (on page 101). To be portable across systems conforming to POSIX.1-200x, the value is composed of characters from the portable filename character set. The <hyphen> character should not be used as the first character of a portable user name.

3.430 User Trace Event

A trace event that is generated explicitly by the application as a result of a call to *posix_trace_event*( ).

3.431 Utility

A program, excluding special built-in utilities provided as part of the Shell Command Language, that can be called by name from a shell to perform a specific task, or related set of tasks.

Note: For further information on special built-in utilities, see XCU Section 2.14 (on page 2334).

3.432 Variable

In the shell command language, a named parameter.

Note: For further information, see XCU Section 2.5 (on page 2301).

3.433 Vertical-Tab Character (<vertical-tab>)

A character that in the output stream indicates that printing should start at the next vertical tabulation position. It is the character designated by `'\v'` in the C language. If the current position is at or past the last defined vertical tabulation position, the behavior is unspecified. It is unspecified whether this character is the exact sequence transmitted to an output device by the system to accomplish the tabulation.

3.434 White Space

A sequence of one or more characters that belong to the **space** character class as defined via the *LC_CTYPE* category in the current locale.

In the POSIX locale, white space consists of one or more <blank> (<space> and <tab> characters), <newline>, <carriage-return>, <form-feed>, and <vertical-tab> characters.

3.435 Wide-Character Code (C Language)

An integer value corresponding to a single graphic symbol or control code.

Note: C Language Wide-Character Codes are defined in detail in Section 6.3 (on page 129).

3.436 Wide-Character Input/Output Functions

The functions that perform wide-oriented input from streams or wide-oriented output to streams: *fgetwc*( ), *fgetws*( ), *fputwc*( ), *fputws*( ), *fwprintf*( ), *fwscanf*( ), *getwc*( ), *getwchar*( ), *putwc*( ), *putwchar*( ), *ungetwc*( ), *vfwprintf*( ), *vfwscanf*( ), *vwprintf*( ), *vwscanf*( ), *wprintf*( ), and *wscanf*( ).

Note: These functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

3.437 Wide-Character String

A contiguous sequence of wide-character codes terminated by and including the first null wide-character code.

3.438 Word

In the shell command language, a token other than an operator. In some cases a word is also a portion of a word token: in the various forms of parameter expansion, such as ${*name–word*}, and variable assignment, such as *name=word*, the word is the portion of the token depicted by *word*. The concept of a word is no longer applicable following word expansions—only fields remain.

Note: For further information, see XCU Section 2.6.2 (on page 2306) and Section 2.6 (on page 2305).

3.439 Working Directory (or Current Working Directory)

A directory, associated with a process, that is used in pathname resolution for pathnames that do not begin with a <slash> character.

3.440 Worldwide Portability Interface

Functions for handling characters in a codeset-independent manner.

3.441 Write

To output characters to a file, such as standard output or standard error. Unless otherwise stated, standard output is the default output destination for all uses of the term "write"; see the distinction between display and write in Section 3.133 (on page 54).

3.442 XSI

The X/Open System Interfaces (XSI) option is the core application programming interface for C and *sh* programming for systems conforming to the Single UNIX Specification. This is a superset of the mandatory requirements for conformance to POSIX.1-200x.

3.443 XSI-Conformant

A system which allows an application to be built using a set of services that are consistent across all systems that conform to POSIX.1-200x and that support the XSI option.

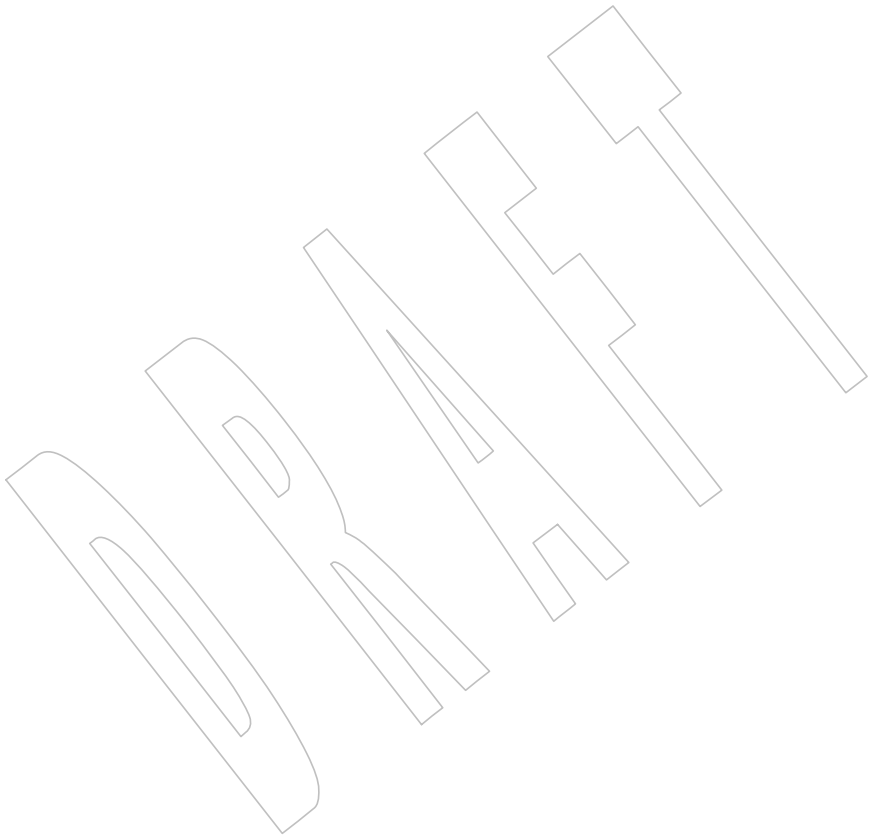
Note: See also Chapter 2 (on page 15).

3.444 Zombie Process

A process that has terminated and that is deleted when its exit status has been reported to another process which is waiting for that process to terminate.

3.445 ±0

The algebraic sign provides additional information about any variable that has the value zero when the representation allows the sign to be determined.



2849 *Chapter 4*

2850 # *General Concepts*

2851 For the purposes of POSIX.1-200x, the general concepts given in Chapter 4 apply.

2852 **Note:** No shading to denote extensions or options occurs in this chapter. Where the terms and
2853 definitions given in this chapter are used elsewhere in text related to extensions and options,
2854 they are shaded as appropriate.

2855 ## 4.1 Concurrent Execution

2856 Functions that suspend the execution of the calling thread shall not cause the execution of other
2857 threads to be indefinitely suspended.

2858 ## 4.2 Directory Protection

2859 If a directory is writable and the mode bit S_ISVTX is set on the directory, a process may remove
2860 or rename files within that directory only if one or more of the following is true:

2861 • The effective user ID of the process is the same as that of the owner ID of the file.

2862 • The effective user ID of the process is the same as that of the owner ID of the directory.

2863 • The process has appropriate privileges.

2864 • Optionally, the file is writable by the process. Whether or not files that are writable by the
2865 process can be removed or renamed is implementation-defined.

2866 If the S_ISVTX bit is set on a non-directory file, the behavior is unspecified.

2867 ## 4.3 Extended Security Controls

2868 An implementation may provide implementation-defined extended security controls (see
2869 Section 3.160, on page 58). These permit an implementation to provide security mechanisms to
2870 implement different security policies than those described in POSIX.1-200x. These mechanisms
2871 shall not alter or override the defined semantics of any of the interfaces in POSIX.1-200x.

4.4 File Access Permissions

The standard file access control mechanism uses the file permission bits, as described below.

Implementations may provide *additional* or *alternate* file access control mechanisms, or both. An additional access control mechanism shall only further restrict the access permissions defined by the file permission bits. An alternate file access control mechanism shall:

- Specify file permission bits for the file owner class, file group class, and file other class of that file, corresponding to the access permissions.
- Be enabled only by explicit user action, on a per-file basis by the file owner or a user with appropriate privileges.
- Be disabled for a file after the file permission bits are changed for that file with *chmod*(). The disabling of the alternate mechanism need not disable any additional mechanisms supported by an implementation.

Whenever a process requests file access permission for read, write, or execute/search, if no additional mechanism denies access, access shall be determined as follows:

- If a process has appropriate privileges:
  - — If read, write, or directory search permission is requested, access shall be granted.
  - — If execute permission is requested, access shall be granted if execute permission is granted to at least one user by the file permission bits or by an alternate access control mechanism; otherwise, access shall be denied.
- Otherwise:
  - — The file permission bits of a file contain read, write, and execute/search permissions for the file owner class, file group class, and file other class.
  - — Access shall be granted if an alternate access control mechanism is not enabled and the requested access permission bit is set for the class (file owner class, file group class, or file other class) to which the process belongs, or if an alternate access control mechanism is enabled and it allows the requested access; otherwise, access shall be denied.

POSIX.1-200x does not provide a way to open a directory for searching. It is unspecified whether directory search permission is granted based on the file access modes of the directory's file descriptor or on the mode of the directory at the time the directory is searched.

4.5 File Hierarchy

Files in the system are organized in a hierarchical structure in which all of the non-terminal nodes are directories and all of the terminal nodes are any other type of file. Since multiple directory entries may refer to the same file, the hierarchy is properly described as a "directed graph".

4.6 Filenames

Uppercase and lowercase letters shall retain their unique identities between conforming implementations.

4.7 Filename Portability

For a filename to be portable across implementations conforming to POSIX.1-200x, it shall consist only of the portable filename character set as defined in Section 3.276 (on page 77).

Portable filenames shall not have the <hyphen> character as the first character since this may cause problems when filenames are passed as command line arguments.

4.8 File Times Update

Each file has three distinct associated timestamps: the time of last data access, the time of last data modification, and the time the file status last changed. These values are returned in the file characteristics structure **struct stat**, as described in **<sys/stat.h>** (on page 388).

Each function or utility in POSIX.1-200x that reads or writes data (even if the data does not change) or performs an operation to change file status (even if the file status does not change) indicates which of the appropriate timestamps shall be marked for update. If an implementation of such a function or utility marks for update one of these timestamps in a place or time not specified by POSIX.1-200x, this shall be documented, except that any changes caused by pathname resolution need not be documented. For the other functions or utilities in POSIX.1-200x (those that are not explicitly required to read or write file data or change file status, but that in some implementations happen to do so), the effect is unspecified.

An implementation may update timestamps that are marked for update immediately, or it may update such timestamps periodically. At the point in time when an update occurs, any marked timestamps shall be set to the current time and the update marks shall be cleared. All timestamps that are marked for update shall be updated when the file ceases to be open by any process or before a *fstat*( ), *fstatat*( ), *fsync*( ), *futimens*( ), *lstat*( ), *stat*( ), *utime*( ), *utimensat*( ), or *utimes*( ) is successfully performed on the file. Other times at which updates are done are unspecified. Marks for update, and updates themselves, shall not be done for files on read-only file systems; see Section 3.304 (on page 82).

The resolution of timestamps of files in a file system is implementation-defined, but shall be no coarser than one-second resolution. The three timestamps shall always have values that are supported by the file system. Whenever any of a file's timestamps are to be set to a value V according to the rules of the preceding paragraphs of this section, the implementation shall immediately set the timestamp to the greatest value supported by the file system that is not greater than V.

4.9 Host and Network Byte Orders

When data is transmitted over the network, it is sent as a sequence of octets (8-bit unsigned values). If an entity (such as an address or a port number) can be larger than 8 bits, it needs to be stored in several octets. The convention is that all such values are stored with 8 bits in each octet, and with the first (lowest-addressed) octet holding the most-significant bits. This is called "network byte order".

Network byte order may not be convenient for processing actual values. For this, it is more sensible for values to be stored as ordinary integers. This is known as "host byte order". In host byte order:

- The most significant bit might not be stored in the first byte in address order.
- Bits might not be allocated to bytes in any obvious order at all.

8-bit values stored in **uint8_t** objects do not require conversion to or from host byte order, as they have the same representation. 16 and 32-bit values can be converted using the *htonl*(), *htons*(), *ntohl*(), and *ntohs*() functions. When reading data that is to be converted to host byte order, it should either be received directly into a **uint16_t** or **uint32_t** object or should be copied from an array of bytes using *memcpy*() or similar. Passing the data through other types could cause the byte order to be changed. Similar considerations apply when sending data.

4.10 Measurement of Execution Time

The mechanism used to measure execution time shall be implementation-defined. The implementation shall also define to whom the CPU time that is consumed by interrupt handlers and system services on behalf of the operating system will be charged. See Section 3.118 (on page 52).

4.11 Memory Synchronization

Applications shall ensure that access to any memory location by more than one thread of control (threads or processes) is restricted such that no thread of control can read or modify a memory location while another thread of control may be modifying it. Such access is restricted using functions that synchronize thread execution and also synchronize memory with respect to other threads. The following functions synchronize memory with respect to other threads:

fork()	*pthread_mutex_trylock*()	*pthread_rwlock_unlock*()
pthread_barrier_wait()	*pthread_mutex_unlock*()	*pthread_rwlock_wrlock*()
pthread_cond_broadcast()	*pthread_spin_lock*()	*sem_post*()
pthread_cond_signal()	*pthread_spin_trylock*()	*sem_timedwait*()
pthread_cond_timedwait()	*pthread_spin_unlock*()	*sem_trywait*()
pthread_cond_wait()	*pthread_rwlock_rdlock*()	*sem_wait*()
pthread_create()	*pthread_rwlock_timedrdlock*()	*semctl*()
pthread_join()	*pthread_rwlock_timedwrlock*()	*semop*()
pthread_mutex_lock()	*pthread_rwlock_tryrdlock*()	*wait*()
pthread_mutex_timedlock()	*pthread_rwlock_trywrlock*()	*waitpid*()

The *pthread_once*() function shall synchronize memory for the first call in each thread for a given **pthread_once_t** object.

The *pthread_mutex_lock*( ) function need not synchronize memory if the mutex type if PTHREAD_MUTEX_RECURSIVE and the calling thread already owns the mutex. The *pthread_mutex_unlock*( ) function need not synchronize memory if the mutex type is PTHREAD_MUTEX_RECURSIVE and the mutex has a lock count greater than one.

Unless explicitly stated otherwise, if one of the above functions returns an error, it is unspecified whether the invocation causes memory to be synchronized.

Applications may allow more than one thread of control to read a memory location simultaneously.

4.12 Pathname Resolution

Pathname resolution is performed for a process to resolve a pathname to a particular directory entry for a file in the file hierarchy. There may be multiple pathnames that resolve to the same directory entry, and multiple directory entries for the same file. When a process resolves a pathname of an existing directory entry, the entire pathname shall be resolved as described below. When a process resolves a pathname of a directory entry that is to be created immediately after the pathname is resolved, pathname resolution terminates when all components of the path prefix of the last component have been resolved. It is then the responsibility of the process to create the final component.

Each filename in the pathname is located in the directory specified by its predecessor (for example, in the pathname fragment **a/b**, file **b** is located in directory **a**). Pathname resolution shall fail if this cannot be accomplished. If the pathname begins with a <slash>, the predecessor of the first filename in the pathname shall be taken to be the root directory of the process (such pathnames are referred to as "absolute pathnames"). If the pathname does not begin with a <slash>, the predecessor of the first filename of the pathname shall be taken to be either the current working directory of the process or for certain interfaces the directory identified by a file descriptor passed to the interface (such pathnames are referred to as "relative pathnames").

The interpretation of a pathname component is dependent on the value of {NAME_MAX} and _POSIX_NO_TRUNC associated with the path prefix of that component. If any pathname component is longer than {NAME_MAX}, the implementation shall consider this an error.

A pathname that contains at least one non-<slash> character and that ends with one or more trailing <slash> characters shall not be resolved successfully unless the last pathname component before the trailing <slash> characters names an existing directory or a directory entry that is to be created for a directory immediately after the pathname is resolved. Interfaces using pathname resolution may specify additional constraints[6] when a pathname that does not name an existing directory contains at least one non-<slash> character and contains one or more trailing <slash> characters.

If a symbolic link is encountered during pathname resolution, the behavior shall depend on whether the pathname component is at the end of the pathname and on the function being performed. If all of the following are true, then pathname resolution is complete:

1. This is the last pathname component of the pathname.
2. The pathname has no trailing <slash>.

---

6. The only interfaces that further constrain pathnames in POSIX.1-200x are the *rename*( ) and *renameat*( ) functions (see XSH *rename*( )) and the *mv* utility (see XCU *mv*).

3. The function is required to act on the symbolic link itself, or certain arguments direct that the function act on the symbolic link itself.

In all other cases, the system shall prefix the remaining pathname, if any, with the contents of the symbolic link. If the combined length exceeds {PATH_MAX}, and the implementation considers this to be an error, *errno* shall be set to [ENAMETOOLONG] and an error indication shall be returned. Otherwise, the resolved pathname shall be the resolution of the pathname just created. If the resulting pathname does not begin with a <slash>, the predecessor of the first filename of the pathname is taken to be the directory containing the symbolic link.

If the system detects a loop in the pathname resolution process, it shall set *errno* to [ELOOP] and return an error indication. The same may happen if during the resolution process more symbolic links were followed than the implementation allows. This implementation-defined limit shall not be smaller than {SYMLOOP_MAX}.

The special filename dot shall refer to the directory specified by its predecessor. The special filename dot-dot shall refer to the parent directory of its predecessor directory. As a special case, in the root directory, dot-dot may refer to the root directory itself.

A pathname consisting of a single <slash> shall resolve to the root directory of the process. A null pathname shall not be successfully resolved. A pathname that begins with two successive <slash> characters may be interpreted in an implementation-defined manner, although more than two leading <slash> characters shall be treated as a single <slash> character.

Pathname resolution for a given pathname shall yield the same results when used by any interface in POSIX.1-200x as long as there are no changes to any files evaluated during pathname resolution for the given pathname between resolutions.

4.13 Process ID Reuse

A process group ID shall not be reused by the system until the process group lifetime ends.

A process ID shall not be reused by the system until the process lifetime ends. In addition, if there exists a process group whose process group ID is equal to that process ID, the process ID shall not be reused by the system until the process group lifetime ends. A process that is not a system process shall not have a process ID of 1.

4.14 Scheduling Policy

A scheduling policy affects process or thread ordering:

- When a process or thread is a running thread and it becomes a blocked thread
- When a process or thread is a running thread and it becomes a preempted thread
- When a process or thread is a blocked thread and it becomes a runnable thread
- When a running thread calls a function that can change the priority or scheduling policy of a process or thread
- In other scheduling policy-defined circumstances

Conforming implementations shall define the manner in which each of the scheduling policies may modify the priorities or otherwise affect the ordering of processes or threads at each of the occurrences listed above. Additionally, conforming implementations shall define in what other

circumstances and in what manner each scheduling policy may modify the priorities or affect the ordering of processes or threads.

4.15 Seconds Since the Epoch

A value that approximates the number of seconds that have elapsed since the Epoch. A Coordinated Universal Time name (specified in terms of seconds (*tm_sec*), minutes (*tm_min*), hours (*tm_hour*), days since January 1 of the year (*tm_yday*), and calendar year minus 1900 (*tm_year*)) is related to a time represented as seconds since the Epoch, according to the expression below.

If the year is <1970 or the value is negative, the relationship is undefined. If the year is ≥1970 and the value is non-negative, the value is related to a Coordinated Universal Time name according to the C-language expression, where *tm_sec*, *tm_min*, *tm_hour*, *tm_yday*, and *tm_year* are all integer types:

```
tm_sec + tm_min*60 + tm_hour*3600 + tm_yday*86400 +
    (tm_year-70)*31536000 + ((tm_year-69)/4)*86400 -
    ((tm_year-1)/100)*86400 + ((tm_year+299)/400)*86400
```

The relationship between the actual time of day and the current value for seconds since the Epoch is unspecified.

How any changes to the value of seconds since the Epoch are made to align to a desired relationship with the current actual time is implementation-defined. As represented in seconds since the Epoch, each and every day shall be accounted for by exactly 86 400 seconds.

Note: The last three terms of the expression add in a day for each year that follows a leap year starting with the first leap year since the Epoch. The first term adds a day every 4 years starting in 1973, the second subtracts a day back out every 100 years starting in 2001, and the third adds a day back in every 400 years starting in 2001. The divisions in the formula are integer divisions; that is, the remainder is discarded leaving only the integer quotient.

4.16 Semaphore

A minimum synchronization primitive to serve as a basis for more complex synchronization mechanisms to be defined by the application program.

For the semaphores associated with the Semaphores option, a semaphore is represented as a shareable resource that has a non-negative integer value. When the value is zero, there is a (possibly empty) set of threads awaiting the availability of the semaphore.

For the semaphores associated with the X/Open System Interfaces (XSI) option, a semaphore is a positive integer (0 through 32767). The *semget*( ) function can be called to create a set or array of semaphores. A semaphore set can contain one or more semaphores up to an implementation-defined value.

Semaphore Lock Operation

An operation that is applied to a semaphore. If, prior to the operation, the value of the semaphore is zero, the semaphore lock operation shall cause the calling thread to be blocked and added to the set of threads awaiting the semaphore; otherwise, the value shall be decremented.

Semaphore Unlock Operation

An operation that is applied to a semaphore. If, prior to the operation, there are any threads in the set of threads awaiting the semaphore, then some thread from that set shall be removed from the set and becomes unblocked; otherwise, the semaphore value shall be incremented.

4.17 Thread-Safety

Refer to XSH Section 2.9 (on page 507).

4.18 Tracing

The trace system allows a traced process to have a selection of events created for it. Traces consist of streams of trace event types.

A trace event type is identified on the one hand by a trace event type name, also referenced as a trace event name, and on the other hand by a trace event type identifier. A trace event name is a human-readable string. A trace event type identifier is an opaque identifier used by the trace system. There shall be a one-to-one relationship between trace event type identifiers and trace event names for a given trace stream and also for a given traced process. The trace event type identifier shall be generated automatically from a trace event name by the trace system either when a trace controller process invokes *posix_trace_trid_eventid_open*( ) or when an instrumented application process invokes *posix_trace_eventid_open*( ). Trace event type identifiers are used to filter trace event types, to allow interpretation of user data, and to identify the kind of trace point that generated a trace event.

Each trace event shall be of a particular trace event type, and associated with a trace event type identifier. The execution of a trace point shall generate a trace event if a trace stream has been created and started for the process that executed the trace point and if the corresponding trace event type identifier is not ignored by filtering.

A generated trace event shall be recorded in a trace stream, and optionally also in a trace log if a trace log is associated with the trace stream, except that:

- For a trace stream, if no resources are available for the event, the event is lost.
- For a trace log, if no resources are available for the event, or a flush operation does not succeed, the event is lost.

A trace event recorded in an active trace stream may be retrieved by an application having appropriate privileges.

A trace event recorded in a trace log may be retrieved by an application having appropriate privileges after opening the trace log as a pre-recorded trace stream, with the function *posix_trace_open*( ).

When a trace event is reported it is possible to retrieve the following:

- A trace event type identifier
- A timestamp
- The process ID of the traced process, if the trace event is process-dependent
- Any optional trace event data including its length
- If the Threads option is supported, the thread ID, if the trace event is process-dependent
- The program address at which the trace point was invoked

Trace events may be mapped from trace event types to trace event names. One such mapping shall be associated with each trace stream. An active trace stream is associated with a traced process, and also with its children if the Trace Inherit option is supported and also the inheritance policy is set to _POSIX_TRACE_INHERIT. Therefore each traced process has a mapping of the trace event names to trace event type identifiers that have been defined for that process.

Traces can be recorded into either trace streams or trace logs.

The implementation and format of a trace stream are unspecified. A trace stream need not be and generally is not persistent. A trace stream may be either active or pre-recorded:

- An active trace stream is a trace stream that has been created and has not yet been shut down. It can be of one of the two following classes:
  1. An active trace stream without a trace log that was created with the *posix_trace_create*( ) function
  2. If the Trace Log option is supported, an active trace stream with a trace log that was created with the *posix_trace_create_withlog*( ) function
- A pre-recorded trace stream is a trace stream that was opened from a trace log object using the *posix_trace_open*( ) function.

An active trace stream can loop. This behavior means that when the resources allocated by the trace system for the trace stream are exhausted, the trace system reuses the resources associated with the oldest recorded trace events to record new trace events.

If the Trace Log option is supported, an active trace stream with a trace log can be flushed. This operation causes the trace system to write trace events from the trace stream to the associated trace log, following the defined policies or using an explicit function call. After this operation, the trace system may reuse the resources associated with the flushed trace events.

An active trace stream with or without a trace log can be cleared. This operation shall cause all the resources associated with this trace stream to be reinitialized. The trace stream shall behave as if it was returning from its creation, except that the mapping of trace event type identifiers to trace event names shall not be cleared. If a trace log was associated with this trace stream, the trace log shall also be reinitialized.

A trace log shall be recorded when the *posix_trace_shutdown*( ) operation is invoked or during tracing, depending on the tracing strategy which is defined by a log policy. After the trace stream has been shut down, the trace information can be retrieved from the associated trace log using the same interface used to retrieve information from an active trace stream.

For a traced process, if the Trace Inherit option is supported and the trace stream's inheritance attribute is _POSIX_TRACE_INHERIT, the initial targeted traced process shall be traced together with all of its future children. The *posix_pid* member of each trace event in a trace stream shall be the process ID of the traced process.

Each trace point may be an implementation-defined action such as a context switch, or an

application-programmed action such as a call to a specific operating system service (for example, *fork*( )) or a call to *posix_trace_event*( ).

Trace points may be filtered. The operation of the filter is to filter out (ignore) selected trace events. By default, no trace events are filtered.

The results of the tracing operations can be analyzed and monitored by a trace controller process or a trace analyzer process.

Only the trace controller process has control of the trace stream it has created. The control of the operation of a trace stream is done using its corresponding trace stream identifier. The trace controller process is able to:

- Initialize the attributes of a trace stream
- Create the trace stream
- Start and stop tracing
- Know the mapping of the traced process
- If the Trace Event Filter option is supported, filter the type of trace events to be recorded
- Shut the trace stream down

A traced process may also be a trace controller process. Only the trace controller process can control its trace stream(s). A trace stream created by a trace controller process shall be shut down if its controller process terminates or executes another file.

A trace controller process may also be a trace analyzer process. Trace analysis can be done concurrently with the traced process or can be done off-line, in the same or in a different platform.

4.19 Treatment of Error Conditions for Mathematical Functions

For all the functions in the **<math.h>** header, an application wishing to check for error situations should set *errno* to 0 and call *feclearexcept*(FE_ALL_EXCEPT) before calling the function. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

The following error conditions are defined for all functions in the **<math.h>** header.

4.19.1 Domain Error

A "domain error" shall occur if an input argument is outside the domain over which the mathematical function is defined. The description of each function lists any required domain errors; an implementation may define additional domain errors, provided that such errors are consistent with the mathematical definition of the function.

On a domain error, the function shall return an implementation-defined value; if the integer expression (math_errhandling & MATH_ERRNO) is non-zero, *errno* shall be set to [EDOM]; if the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, the "invalid" floating-point exception shall be raised.

4.19.2 Pole Error

A "pole error" occurs if the mathematical result of the function is an exact infinity (for example, log(0.0)).

On a pole error, the function shall return the value of the macro HUGE_VAL, HUGE_VALF, or HUGE_VALL according to the return type, with the same sign as the correct value of the function; if the integer expression (math_errhandling & MATH_ERRNO) is non-zero, *errno* shall be set to [ERANGE]; if the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, the "divide-by-zero" floating-point exception shall be raised.

4.19.3 Range Error

A "range error" shall occur if the finite mathematical result of the function cannot be represented in an object of the specified type, due to extreme magnitude.

4.19.3.1 Result Overflows

A floating result overflows if the magnitude of the mathematical result is finite but so large that the mathematical result cannot be represented without extraordinary roundoff error in an object of the specified type. If a floating result overflows and default rounding is in effect, then the function shall return the value of the macro HUGE_VAL, HUGE_VALF, or HUGE_VALL according to the return type, with the same sign as the correct value of the function; if the integer expression (math_errhandling & MATH_ERRNO) is non-zero, *errno* shall be set to [ERANGE]; if the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, the "overflow" floating-point exception shall be raised.

4.19.3.2 Result Underflows

The result underflows if the magnitude of the mathematical result is so small that the mathematical result cannot be represented, without extraordinary roundoff error, in an object of the specified type. If the result underflows, the function shall return an implementation-defined value whose magnitude is no greater than the smallest normalized positive number in the specified type; if the integer expression (math_errhandling & MATH_ERRNO) is non-zero, whether *errno* is set to [ERANGE] is implementation-defined; if the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, whether the "underflow" floating-point exception is raised is implementation-defined.

4.20 Treatment of NaN Arguments for the Mathematical Functions

For functions called with a NaN argument, no errors shall occur and a NaN shall be returned, except where stated otherwise.

If a function with one or more NaN arguments returns a NaN result, the result should be the same as one of the NaN arguments (after possible type conversion), except perhaps for the sign.

On implementations that support the IEC 60559: 1989 standard floating point, functions with signaling NaN argument(s) shall be treated as if the function were called with an argument that is a required domain error and shall return a quiet NaN result, except where stated otherwise.

Note: The function might never see the signaling NaN, since it might trigger when the arguments are evaluated during the function call.

On implementations that support the IEC 60559: 1989 standard floating point, for those functions that do not have a documented domain error, the following shall apply:

These functions shall fail if:

Domain Error Any argument is a signaling NaN.

Either, the integer expression (math_errhandling & MATH_ERRNO) is non-zero and *errno* shall be set to [EDOM], or the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero and the invalid floating-point exception shall be raised.

4.21 Utility

A utility program shall be either an executable file, such as might be produced by a compiler or linker system from computer source code, or a file of shell source code, directly interpreted by the shell. The program may have been produced by the user, provided by the system implementor, or acquired from an independent distributor.

The system may implement certain utilities as shell functions (see XCU Section 2.9.5, on page 2324) or built-in utilities, but only an application that is aware of the command search order (as described in XCU Section 2.9.1.1, on page 2317) or of performance characteristics can discern differences between the behavior of such a function or built-in utility and that of an executable file.

4.22 Variable Assignment

In the shell command language, a word consisting of the following parts:

varname`=`*value*

When used in a context where assignment is defined to occur and at no other time, the *value* (representing a word or field) shall be assigned as the value of the variable denoted by *varname*.

Note: For further information, see XCU Section 2.9.1 (on page 2316).

The *varname* and *value* parts shall meet the requirements for a name and a word, respectively, except that they are delimited by the embedded unquoted <equals-sign>, in addition to other delimiters.

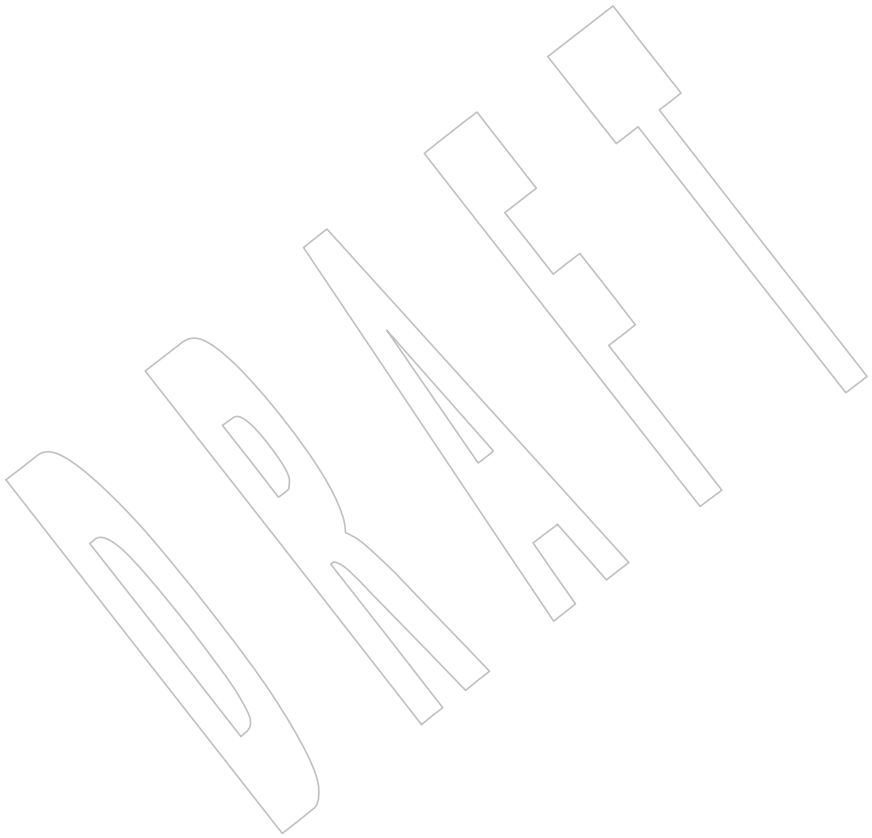
Note: Additional delimiters are described in XCU Section 2.3 (on page 2299).

When a variable assignment is done, the variable shall be created if it did not already exist. If *value* is not specified, the variable shall be given a null value.

Note: An alternative form of variable assignment:

```
symbol=value
```

(where *symbol* is a valid word delimited by an <equals-sign>, but not a valid name) produces unspecified results. The form *symbol=value* is used by the KornShell *name*[*expression*]=*value* syntax.



3288 *Chapter 5*

3289 # *File Format Notation*

3290 The STDIN, STDOUT, STDERR, INPUT FILES, and OUTPUT FILES sections of the utility
3291 descriptions use a syntax to describe the data organization within the files, when that
3292 organization is not otherwise obvious. The syntax is similar to that used by the System Interfaces
3293 volume of POSIX.1-200x *printf*( ) function, as described in this chapter. When used in STDIN or
3294 INPUT FILES sections of the utility descriptions, this syntax describes the format that could
3295 have been used to write the text to be read, not a format that could be used by the System
3296 Interfaces volume of POSIX.1-200x *scanf*( ) function to read the input file.

3297 The description of an individual record is as follows:

3298 `"<format>", [<arg1>, <arg2>,..., <argn>]`

3299 The *format* is a character string that contains three types of objects defined below:

3300 1. *Characters* that are not "escape sequences" or "conversion specifications", as described
3301 below, shall be copied to the output.

3302 2. *Escape Sequences* represent non-graphic characters.

3303 3. *Conversion Specifications* specify the output format of each argument; see below.

3304 The following characters have the following special meaning in the format string:

3305 `' '` (An empty character position.) Represents one or more <blank> characters.

3306 Δ Represents exactly one <space> character.

3307 Table 5-1 lists escape sequences and associated actions on display devices capable of the action.

3308 **Table 5-1** Escape Sequences and Associated Actions

3309 3310 3311 3312 3313 3314 3315 3316 3317 3318 3319 3320 3321 3322 3323 3324

Escape Sequence	Represents Character	Terminal Action
\\	<backslash>	Print the <backslash> character.
\a	<alert>	Attempt to alert the user through audible or visible notification.
\b	<backspace>	Move the printing position to one column before the current position, unless the current position is the start of a line.
\f	<form-feed>	Move the printing position to the initial printing position of the next logical page.
\n	<newline>	Move the printing position to the start of the next line.
\r	<carriage-return>	Move the printing position to the start of the current line.
\t	<tab>	Move the printing position to the next tab position on the current line. If there are no more tab positions remaining on the line, the behavior is undefined.
\v	<vertical-tab>	Move the printing position to the start of the next <vertical-tab> position. If there are no more <vertical-tab> positions left on the page, the behavior is undefined.

Each conversion specification is introduced by the <percent-sign> character (`'%'`). After the character `'%'`, the following shall appear in sequence:

flags Zero or more *flags*, in any order, that modify the meaning of the conversion specification.

field width An optional string of decimal digits to specify a minimum field width. For an output field, if the converted value has fewer bytes than the field width, it shall be padded on the left (or right, if the left-adjustment flag (`'-'`), described below, has been given) to the field width.

precision Gives the minimum number of digits to appear for the `d`, `o`, `i`, `u`, `x`, or `X` conversion specifiers (the field is padded with leading zeros), the number of digits to appear after the radix character for the `e` and `f` conversion specifiers, the maximum number of significant digits for the `g` conversion specifier; or the maximum number of bytes to be written from a string in the `s` conversion specifier. The precision shall take the form of a <period> (`'.'`) followed by a decimal digit string; a null digit string is treated as zero.

conversion specifier characters
A conversion specifier character (see below) that indicates the type of conversion to be applied.

The *flag* characters and their meanings are:

- The result of the conversion shall be left-justified within the field.

+ The result of a signed conversion shall always begin with a sign (`'+'` or `'-'`).

<space> If the first character of a signed conversion is not a sign, a <space> shall be prefixed to the result. This means that if the <space> and `'+'` flags both appear, the <space> flag shall be ignored.

The value shall be converted to an alternative form. For `c`, `d`, `i`, `u`, and `s` conversion specifiers, the behavior is undefined. For the `o` conversion specifier, it shall increase the precision to force the first digit of the result to be a zero. For `x` or `X` conversion specifiers, a non-zero result has 0x or 0X prefixed to it, respectively. For `a`, `A`, `e`, `E`, `f`, `F`, `g`, and `G` conversion specifiers, the result shall always contain a radix character, even if no digits follow the radix character. For `g` and `G` conversion specifiers, trailing zeros shall not be removed from the result as they usually are.

`0` For `a`, `A`, `d`, `e`, `E`, `f`, `F`, `g`, `G`, `i`, `o`, `u`, `x`, and `X` conversion specifiers, leading zeros (following any indication of sign or base) shall be used to pad to the field width rather than performing space padding, except when converting an infinity or NaN. If the `'0'` and `'-'` flags both appear, the `'0'` flag shall be ignored. For `d`, `i`, `o`, `u`, `x`, and `X` conversion specifiers, if a precision is specified, the `'0'` flag shall be ignored. For other conversion specifiers, the behavior is undefined.

Each conversion specifier character shall result in fetching zero or more arguments. The results are undefined if there are insufficient arguments for the format. If the format is exhausted while arguments remain, the excess arguments shall be ignored.

The conversion specifiers and their meanings are:

`a,A` The floating-point number argument representing a floating-point number shall be converted in the style `"[-]0x`*h*`.`*hhhh*`p±`*d*`"`, where there is one hexadecimal digit (which shall be non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point character and the number of hexadecimal digits after it is equal to the precision; if the precision is missing

and FLT_RADIX is a power of 2, then the precision shall be sufficient for an exact representation of the value; if the precision is missing and FLT_RADIX is not a power of 2, then the precision shall be sufficient to distinguish different floating-point values in the internal representation used by the utility, except that trailing zeros may be omitted; if the precision is zero and the # flag is not specified, no decimal-point character shall appear. The letters "abcdef" shall be used for a conversion and the letters "ABCDEF" for A conversion. The A conversion specifier produces a number with X and P instead of x and p. The exponent shall always contain at least one digit, and only as many more digits as necessary to represent the decimal exponent of 2. If the value is zero, the exponent shall be zero. A floating-point number argument representing an infinity or NaN shall be converted in the style of an f or F conversion specifier.

d,i,o,u,x,X — The integer argument shall be written as signed decimal (d or i), unsigned octal (o), unsigned decimal (u), or unsigned hexadecimal notation (x and X). The d and i specifiers shall convert to signed decimal in the style "[–]*dddd*". The x conversion specifier shall use the numbers and letters "0123456789abcdef" and the X conversion specifier shall use the numbers and letters "0123456789ABCDEF". The *precision* component of the argument shall specify the minimum number of digits to appear. If the value being converted can be represented in fewer digits than the specified minimum, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting a zero value with a precision of 0 shall be no characters. If both the field width and precision are omitted, the implementation may precede, follow, or precede and follow numeric arguments of types d, i, and u with <blank> characters; arguments of type o (octal) may be preceded with leading zeros.

f,F — The floating-point number argument shall be written in decimal notation in the style [–]*ddd.ddd*, where the number of digits after the radix character (shown here as a decimal point) shall be equal to the *precision* specification. The *LC_NUMERIC* locale category shall determine the radix character to use in this format. If the *precision* is omitted from the argument, six digits shall be written after the radix character; if the *precision* is explicitly 0, no radix character shall appear.

A floating-point number argument representing an infinity shall be converted in one of the styles "[–]inf" or "[–]infinity"; which style is implementation-defined. A floating-point number argument representing a NaN shall be converted in one of the styles "[–]nan(*n-char-sequence*)" or "[–]nan"; which style, and the meaning of any *n-char-sequence*, is implementation-defined. The F conversion specifier produces "INF", "INFINITY", or "NAN" instead of "inf", "infinity", or "nan", respectively.

e,E — The floating-point number argument shall be written in the style [–]*d.ddd*e±*dd* (the symbol '±' indicates either a <plus-sign> or minus-sign), where there is one digit before the radix character (shown here as a decimal point) and the number of digits after it is equal to the precision. The *LC_NUMERIC* locale category shall determine the radix character to use in this format. When the precision is missing, six digits shall be written after the radix character; if the precision is 0, no radix character shall appear. The E conversion specifier shall produce a number with E instead of e introducing the exponent. The exponent shall always contain at least two digits. However, if the value to be written requires an exponent greater than two digits, additional exponent digits shall be written as necessary.

A floating-point number argument representing an infinity or NaN shall be converted in the style of an f or F conversion specifier.

3421 g,G The floating-point number argument shall be written in style f or e (or in style F
3422 or E in the case of a G conversion specifier), with the precision specifying the
3423 number of significant digits. The style used depends on the value converted: style
3424 e (or E) shall be used only if the exponent resulting from the conversion is less
3425 than –4 or greater than or equal to the precision. Trailing zeros are removed from
3426 the result. A radix character shall appear only if it is followed by a digit.

3427 A floating-point number argument representing an infinity or NaN shall be
3428 converted in the style of an f or F conversion specifier.

3429 c The single-byte character argument shall be written.

3430 s The argument shall be taken to be a string and bytes from the string shall be
3431 written until the end of the string or the number of bytes indicated by the *precision*
3432 specification of the argument is reached. If the precision is omitted from the
3433 argument, it shall be taken to be infinite, so all bytes up to the end of the string
3434 shall be written.

3435 % Write a '%' character; no argument is converted.

3436 In no case does a nonexistent or insufficient field width cause truncation of a field; if the result of
3437 a conversion is wider than the field width, the field is simply expanded to contain the
3438 conversion result. The term "field width" should not be confused with the term "precision"
3439 used in the description of %s.

3440 **Examples**

3441 To represent the output of a program that prints a date and time in the form Sunday, July 3,
3442 10:02, where *weekday* and *month* are strings:

3443 `"%s,Δ%sΔ%d,Δ%d:%.2d\n" <weekday>, <month>, <day>, <hour>, <min>`

3444 To show 'π' written to 5 decimal places:

3445 `"piΔ=Δ%.5f\n",<value of π>`

3446 To show an input file format consisting of five <colon>-separated fields:

3447 `"%s:%s:%s:%s:%s\n", <arg1>, <arg2>, <arg3>, <arg4>, <arg5>`

Chapter 6

Character Set

6.1 Portable Character Set

Conforming implementations shall support one or more coded character sets. Each supported locale shall include the *portable character set*, which is the set of symbolic names for characters in Table 6-1. This is used to describe characters within the text of POSIX.1-200x. The first eight entries in Table 6-1 are defined in the ISO/IEC 6429:1992 standard and the rest of the characters are defined in the ISO/IEC 10646-1:2000 standard.

Table 6-1 Portable Character Set

Symbolic Name	Glyph	UCS	Description
<NUL>		<U0000>	NULL (NUL)
<alert>		<U0007>	BELL (BEL)
<backspace>		<U0008>	BACKSPACE (BS)
<tab>		<U0009>	CHARACTER TABULATION (HT)
<carriage-return>		<U000D>	CARRIAGE RETURN (CR)
<newline>		<U000A>	LINE FEED (LF)
<vertical-tab>		<U000B>	LINE TABULATION (VT)
<form-feed>		<U000C>	FORM FEED (FF)
<space>		<U0020>	SPACE
<exclamation-mark>	!	<U0021>	EXCLAMATION MARK
<quotation-mark>	"	<U0022>	QUOTATION MARK
<number-sign>	#	<U0023>	NUMBER SIGN
<dollar-sign>	$	<U0024>	DOLLAR SIGN
<percent-sign>	%	<U0025>	PERCENT SIGN
<ampersand>	&	<U0026>	AMPERSAND
<apostrophe>	'	<U0027>	APOSTROPHE
<left-parenthesis>	(	<U0028>	LEFT PARENTHESIS
<right-parenthesis>	)	<U0029>	RIGHT PARENTHESIS
<asterisk>	*	<U002A>	ASTERISK
<plus-sign>	+	<U002B>	PLUS SIGN
<comma>	,	<U002C>	COMMA
<hyphen-minus>	–	<U002D>	HYPHEN-MINUS
<hyphen>	-	<U002D>	HYPHEN-MINUS
<full-stop>	.	<U002E>	FULL STOP
<period>	.	<U002E>	FULL STOP
<slash>	/	<U002F>	SOLIDUS
<solidus>	/	<U002F>	SOLIDUS
<zero>	0	<U0030>	DIGIT ZERO
<one>	1	<U0031>	DIGIT ONE
<two>	2	<U0032>	DIGIT TWO

Symbolic Name	Glyph	UCS	Description
<three>	3	<U0033>	DIGIT THREE
<four>	4	<U0034>	DIGIT FOUR
<five>	5	<U0035>	DIGIT FIVE
<six>	6	<U0036>	DIGIT SIX
<seven>	7	<U0037>	DIGIT SEVEN
<eight>	8	<U0038>	DIGIT EIGHT
<nine>	9	<U0039>	DIGIT NINE
<colon>	:	<U003A>	COLON
<semicolon>	;	<U003B>	SEMICOLON
<less-than-sign>	<	<U003C>	LESS-THAN SIGN
<equals-sign>	=	<U003D>	EQUALS SIGN
<greater-than-sign>	>	<U003E>	GREATER-THAN SIGN
<question-mark>	?	<U003F>	QUESTION MARK
<commercial-at>	@	<U0040>	COMMERCIAL AT
<A>	A	<U0041>	LATIN CAPITAL LETTER A
<B>	B	<U0042>	LATIN CAPITAL LETTER B
<C>	C	<U0043>	LATIN CAPITAL LETTER C
<D>	D	<U0044>	LATIN CAPITAL LETTER D
<E>	E	<U0045>	LATIN CAPITAL LETTER E
<F>	F	<U0046>	LATIN CAPITAL LETTER F
<G>	G	<U0047>	LATIN CAPITAL LETTER G
<H>	H	<U0048>	LATIN CAPITAL LETTER H
<I>	I	<U0049>	LATIN CAPITAL LETTER I
<J>	J	<U004A>	LATIN CAPITAL LETTER J
<K>	K	<U004B>	LATIN CAPITAL LETTER K
<L>	L	<U004C>	LATIN CAPITAL LETTER L
<M>	M	<U004D>	LATIN CAPITAL LETTER M
<N>	N	<U004E>	LATIN CAPITAL LETTER N
<O>	O	<U004F>	LATIN CAPITAL LETTER O
<P>	P	<U0050>	LATIN CAPITAL LETTER P
<Q>	Q	<U0051>	LATIN CAPITAL LETTER Q
<R>	R	<U0052>	LATIN CAPITAL LETTER R
<S>	S	<U0053>	LATIN CAPITAL LETTER S
<T>	T	<U0054>	LATIN CAPITAL LETTER T
<U>	U	<U0055>	LATIN CAPITAL LETTER U
<V>	V	<U0056>	LATIN CAPITAL LETTER V
<W>	W	<U0057>	LATIN CAPITAL LETTER W
<X>	X	<U0058>	LATIN CAPITAL LETTER X
<Y>	Y	<U0059>	LATIN CAPITAL LETTER Y
<Z>	Z	<U005A>	LATIN CAPITAL LETTER Z
<left-square-bracket>	[	<U005B>	LEFT SQUARE BRACKET

<right-curly-bracket>	}	<U007D>	RIGHT CURLY BRACKET
<tilde>	~	<U007E>	TILDE

POSIX.1-200x uses character names other than the above, but only in an informative way; for example, in examples to illustrate the use of characters beyond the portable character set with the facilities of POSIX.1-200x.

Table 6-1 (on page 125) defines the characters in the portable character set and the corresponding symbolic character names used to identify each character in a character set description file. The table contains more than one symbolic character name for characters whose traditional name differs from the chosen name. Characters defined in Table 6-2 (on page 130) may also be used in character set description files.

POSIX.1-200x places only the following requirements on the encoded values of the characters in the portable character set:

- If the encoded values associated with each member of the portable character set are not invariant across all locales supported by the implementation, if an application accesses any pair of locales where the character encodings differ, or accesses data from an application running in a locale which has different encodings from the application's current locale, the results are unspecified.
- The encoded values associated with the digits 0 to 9 shall be such that the value of each character after 0 shall be one greater than the value of the previous character.

- A null character, NUL, which has all bits set to zero, shall be in the set of characters.
- The encoded values associated with the members of the portable character set are each represented in a single byte. Moreover, if the value is stored in an object of C-language type **char**, it is guaranteed to be positive (except the NUL, which is always zero).

Conforming implementations shall support certain character and character set attributes, as defined in Section 7.2 (on page 136).

6.2 Character Encoding

The POSIX locale contains the characters in Table 6-1 (on page 125), which have the properties listed in Section 7.3.1 (on page 139). In other locales, the presence, meaning, and representation of any additional characters are locale-specific.

In locales other than the POSIX locale, a character may have a state-dependent encoding. There are two types of these encodings:

- A single-shift encoding (where each character not in the initial shift state is preceded by a shift code) can be defined if each shift-code and character sequence is considered a multi-byte character. This is done using the concatenated-constant format in a character set description file, as described in Section 6.4 (on page 129). If the implementation supports a character encoding of this type, all of the standard utilities in the Shell and Utilities volume of POSIX.1-200x shall support it. Use of a single-shift encoding with any of the functions in the System Interfaces volume of POSIX.1-200x that do not specifically mention the effects of state-dependent encoding is implementation-defined.
- A locking-shift encoding (where the state of the character is determined by a shift code that may affect more than the single character following it) cannot be defined with the current character set description file format. Use of a locking-shift encoding with any of the standard utilities in the Shell and Utilities volume of POSIX.1-200x or with any of the functions in the System Interfaces volume of POSIX.1-200x that do not specifically mention the effects of state-dependent encoding is implementation-defined.

While in the initial shift state, all characters in the portable character set shall retain their usual interpretation and shall not alter the shift state. The interpretation for subsequent bytes in the sequence shall be a function of the current shift state. A byte with all bits zero shall be interpreted as the null character independent of shift state. Such a byte shall not occur as part of any other character.

The maximum allowable number of bytes in a character in the current locale shall be indicated by {MB_CUR_MAX}, defined in the **<stdlib.h>** header and by the **<mb_cur_max>** value in a character set description file; see Section 6.4 (on page 129). The implementation's maximum number of bytes in a character shall be defined by the C-language macro {MB_LEN_MAX}.

6.3 C Language Wide-Character Codes

In the shell, the standard utilities are written so that the encodings of characters are described by the locale's *LC_CTYPE* definition (see Section 7.3.1, on page 139) and there is no differentiation between characters consisting of single octets (8-bit bytes) or multiple bytes. However, in the C language, a differentiation is made. To ease the handling of variable length characters, the C language has introduced the concept of wide-character codes.

All wide-character codes in a given process consist of an equal number of bits. This is in contrast to characters, which can consist of a variable number of bytes. The byte or byte sequence that represents a character can also be represented as a wide-character code. Wide-character codes thus provide a uniform size for manipulating text data. A wide-character code having all bits zero is the null wide-character code (see Section 3.246, on page 72), and terminates wide-character strings (see Section 3.435, on page 103). The wide-character value for each member of the portable character set shall equal its value when used as the lone character in an integer character constant. Wide-character codes for other characters are locale and implementation-defined. State shift bytes shall not have a wide-character code representation. POSIX.1-200x provides no means of defining a wide-character codeset.

6.4 Character Set Description File

Implementations shall provide a character set description file for at least one coded character set supported by the implementation. These files are referred to elsewhere in POSIX.1-200x as *charmap* files. It is implementation-defined whether or not users or applications can provide additional character set description files.

POSIX.1-200x does not require that multiple character sets or codesets be supported. Although multiple charmap files are supported, it is the responsibility of the implementation to provide the file or files; if only one is provided, only that one is accessible using the *localedef* utility's **–f** option.

Each character set description file, except those that use the ISO/IEC 10646-1:2000 standard position values as the encoding values, shall define characteristics for the coded character set and the encoding for the characters specified in Table 6-1 (on page 125), and may define encoding for additional characters supported by the implementation. Other information about the coded character set may also be in the file. Coded character set character values shall be defined using symbolic character names followed by character encoding values.

Each symbolic name specified in Table 6-1 (on page 125) shall be included in the file and shall be mapped to a unique coding value, except as noted below. The glyphs represented by the C character constants `'{'`, `'}'`, `'_'`, `'-'`, `'/'`, `'\\'`, `'.'`, and `'^'` have more than one symbolic name; all symbolic names for each such glyph shall be included, each with identical encoding. If some or all of the control characters identified in Table 6-2 (on page 130) are supported by the implementation, the symbolic names and their corresponding encoding values shall be included in the file. Some of the encodings associated with the symbolic names in Table 6-2 (on page 130) may be the same as characters found in Table 6-1 (on page 125); both names shall be provided for each encoding.

Table 6-2 Control Character Set

<ACK>	<DC2>	<ENQ>	<FS>	<IS4>	<SOH>
<BEL>	<DC3>	<EOT>	<GS>	<LF>	<STX>
<BS>	<DC4>	<ESC>	<HT>	<NAK>	<SUB>
<CAN>	<DEL>	<ETB>	<IS1>	<RS>	<SYN>
<CR>	<DLE>	<ETX>	<IS2>	<SI>	<US>
<DC1>	<EM>	<FF>	<IS3>	<SO>	<VT>

The following declarations can precede the character definitions. Each shall consist of the symbol shown in the following list, starting in column 1, including the surrounding brackets, followed by one or more <blank> characters, followed by the value to be assigned to the symbol.

<code_set_name> The name of the coded character set for which the character set description file is defined. The characters of the name shall be taken from the set of characters with visible glyphs defined in Table 6-1 (on page 125).

<mb_cur_max> The maximum number of bytes in a multi-byte character. This shall default to 1.

<mb_cur_min> XSI An unsigned positive integer value that defines the minimum number of bytes in a character for the encoded character set. On XSI-conformant systems, **<mb_cur_min>** shall always be 1.

<escape_char> The character used to indicate that the characters following shall be interpreted in a special way, as defined later in this section. This shall default to <backslash> (`'\\'`), which is the character used in all the following text and examples, unless otherwise noted.

<comment_char> The character that, when placed in column 1 of a charmap line, is used to indicate that the line shall be ignored. The default character shall be the <number-sign> (`'#'`).

The character set mapping definitions shall be all the lines immediately following an identifier line containing the string `"CHARMAP"` starting in column 1, and preceding a trailer line containing the string `"END CHARMAP"` starting in column 1. Empty lines and lines containing a **<comment_char>** in the first column shall be ignored. Each non-comment line of the character set mapping definition (that is, between the `"CHARMAP"` and `"END CHARMAP"` lines of the file) shall be in either of two forms:

`"%s %s %s\n", <symbolic-name>, <encoding>, <comments>`

or:

```
"%s...%s %s %s\n", <symbolic-name>, <symbolic-name>,
    <encoding>, <comments>
```

In the first format, the line in the character set mapping definition shall define a single symbolic name and a corresponding encoding. A symbolic name is one or more characters from the set shown with visible glyphs in Table 6-1 (on page 125), enclosed between angle brackets. A character following an escape character is interpreted as itself; for example, the sequence `"<\\\>>"` represents the symbolic name `"\>"` enclosed between angle brackets.

In the second format, the line in the character set mapping definition shall define a range of one or more symbolic names. In this form, the symbolic names shall consist of zero or more non-numeric characters from the set shown with visible glyphs in Table 6-1 (on page 125), followed by an integer formed by one or more decimal digits. Both integers shall contain the same

number of digits. The characters preceding the integer shall be identical in the two symbolic names, and the integer formed by the digits in the second symbolic name shall be equal to or greater than the integer formed by the digits in the first name. This shall be interpreted as a series of symbolic names formed from the common part and each of the integers between the first and the second integer, inclusive. As an example, <j0101>...<j0104> is interpreted as the symbolic names <j0101>, <j0102>, <j0103>, and <j0104>, in that order.

A character set mapping definition line shall exist for all symbolic names specified in Table 6-1 (on page 125), and shall define the coded character value that corresponds to the character indicated in the table, or the coded character value that corresponds to the control character symbolic name. If the control characters commonly associated with the symbolic names in Table 6-2 (on page 130) are supported by the implementation, the symbolic name and the corresponding encoding value shall be included in the file. Additional unique symbolic names may be included. A coded character value can be represented by more than one symbolic name.

The encoding part is expressed as one (for single-byte character values) or more concatenated decimal, octal, or hexadecimal constants in the following formats:

```
"%cd%u", <escape_char>, <decimal byte value>
"%cx%x", <escape_char>, <hexadecimal byte value>
"%c%o", <escape_char>, <octal byte value>
```

Decimal constants shall be represented by two or three decimal digits, preceded by the escape character and the lowercase letter 'd'; for example, "\d05", "\d97", or "\d143". Hexadecimal constants shall be represented by two hexadecimal digits, preceded by the escape character and the lowercase letter 'x'; for example, "\x05", "\x61", or "\x8f". Octal constants shall be represented by two or three octal digits, preceded by the escape character; for example, "\05", "\141", or "\217". In a portable charmap file, each constant represents an 8-bit byte. When constants are concatenated for multi-byte character values, they shall be of the same type, and interpreted in sequence from from first to last with the first byte of the multi-byte character specified by the first byte in the sequence. The manner in which these constants are represented in the character stored in the system is implementation-defined. (This notation was chosen for reasons of portability. There is no requirement that the internal representation in the computer memory be in this same order.) Omitting bytes from a multi-byte character definition produces undefined results.

In lines defining ranges of symbolic names, the encoded value shall be the value for the first symbolic name in the range (the symbolic name preceding the ellipsis). Subsequent symbolic names defined by the range shall have encoding values in increasing order. Bytes shall be treated as unsigned octets, and carry shall be propagated between the bytes as necessary to represent the range. However, because this causes a null byte in the second or subsequent bytes of a character, such a declaration should not be specified. For example, the line:

```
<j0101>...<j0104>  \d129\d254
```

is interpreted as:

```
<j0101>            \d129\d254
<j0102>            \d129\d255
<j0103>            \d130\d00
<j0104>            \d130\d01
```

The expanded declaration of the symbol <j0103> in the above example is an invalid specification, because it contains a null byte in the second byte of a character.

The comment is optional.

POSIX.1-200x provides no means of defining a wide-character codeset.

The following declarations can follow the character set mapping definitions (after the "END CHARMAP" statement). Each shall consist of the keyword shown in the following list, starting in column 1, followed by the value(s) to be associated to the keyword, as defined below.

WIDTH A non-negative integer value defining the column width (see Section 3.103, on page 50) for the printable characters in the coded character set specified in Table 6-1 (on page 125) and Table 6-2 (on page 130). Coded character set character values shall be defined using symbolic character names followed by column width values. Defining a character with more than one **WIDTH** produces undefined results. The **END WIDTH** keyword shall be used to terminate the **WIDTH** definitions. Specifying the width of a non-printable character in a **WIDTH** declaration produces undefined results.

WIDTH_DEFAULT
A non-negative integer value defining the default column width for any printable character not listed by one of the **WIDTH** keywords. If no **WIDTH_DEFAULT** keyword is included in the charmap, the default character width shall be 1.

Example

After the "END CHARMAP" statement, a syntax for a width definition would be:

```
WIDTH
<A> 1
<B> 1
<C>...<Z> 1
...
<foo1>...<foon> 2
...
END WIDTH
```

In this example, the numerical code point values represented by the symbols **<A>** and **<B>** are assigned a width of 1. The code point values **<C>** to **<Z>** inclusive (**<C>**, **<D>**, **<E>**, and so on) are also assigned a width of 1. Using **<A>**...**<Z>** would have required fewer lines, but the alternative was shown to demonstrate flexibility. The keyword **WIDTH_DEFAULT** could have been added as appropriate.

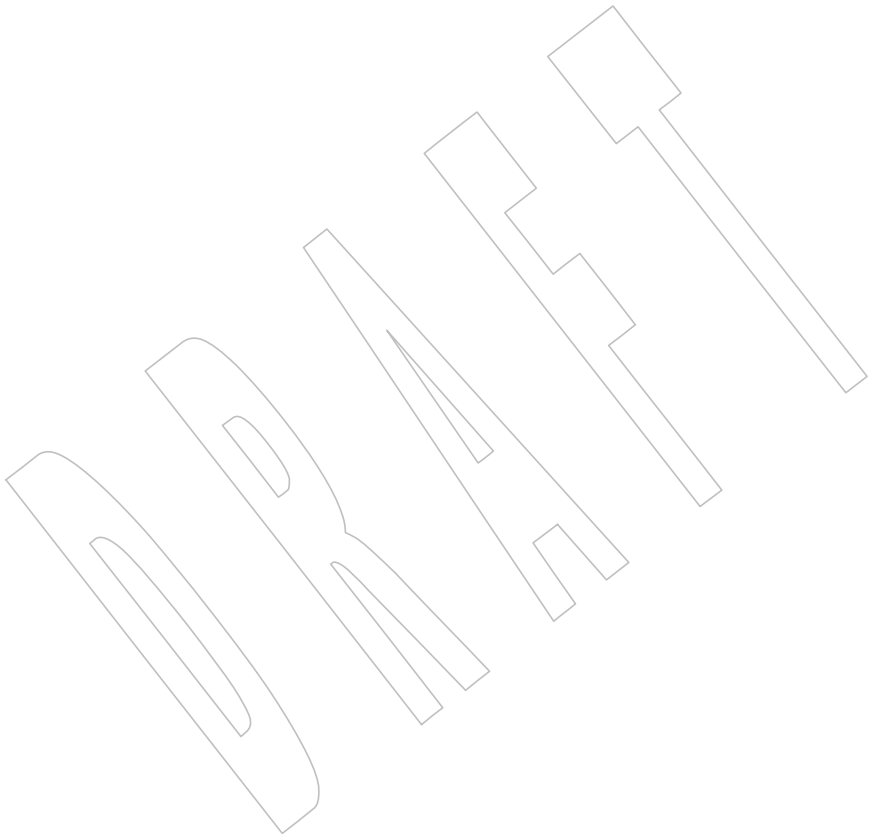
6.4.1 State-Dependent Character Encodings

This section addresses the use of state-dependent character encodings (that is, those in which the encoding of a character is dependent on one or more shift codes that may precede it).

A single-shift encoding (where each character not in the initial shift state is preceded by a shift code) can be defined in the charmap format if each shift-code/character sequence is considered a multi-byte character, defined using the concatenated-constant format described in Section 6.4 (on page 129). If the implementation supports a character encoding of this type, all of the standard utilities shall support it. A locking-shift encoding (where the state of the character is determined by a shift code that may affect more than the single character following it) could be defined with an extension to the charmap format described in Section 6.4 (on page 129). If the implementation supports a character encoding of this type, any of the standard utilities that describe character (*versus* byte) or text-file manipulation shall have the following characteristics:

1. The utility shall process the statefully encoded data as a concatenation of state-independent characters. The presence of redundant locking shifts shall not affect the comparison of two statefully encoded strings.

2. A utility that divides, truncates, or extracts substrings from statefully encoded data shall produce output that contains locking shifts at the beginning or end of the resulting data, if appropriate, to retain correct state information.



3803 *Chapter 7*

3804 # *Locale*

3805 ## 7.1 General

3806 A locale is the definition of the subset of a user's environment that depends on language and
3807 cultural conventions. It is made up from one or more categories. Each category is identified by
3808 its name and controls specific aspects of the behavior of components of the system. Category
3809 names correspond to the following environment variable names:

3810 *LC_CTYPE* Character classification and case conversion.

3811 *LC_COLLATE* Collation order.

3812 *LC_MONETARY* Monetary formatting.

3813 *LC_NUMERIC* Numeric, non-monetary formatting.

3814 *LC_TIME* Date and time formats.

3815 *LC_MESSAGES* Formats of informative and diagnostic messages and interactive responses.

3816 The standard utilities in the Shell and Utilities volume of POSIX.1-200x shall base their behavior
3817 on the current locale, as defined in the ENVIRONMENT VARIABLES section for each utility.
3818 The behavior of some of the C-language functions defined in the System Interfaces volume of
3819 POSIX.1-200x shall also be modified based on the current locale, as defined by the last call to
3820 *setlocale*( ).

3821 Locales other than those supplied by the implementation can be created via the *localedef* utility,
3822 provided that the _POSIX2_LOCALEDEF symbol is defined on the system. Even if *localedef* is
3823 not provided, all implementations conforming to the System Interfaces volume of POSIX.1-200x
3824 shall provide one or more locales that behave as described in this chapter. The input to the
3825 utility is described in Section 7.3 (on page 136). The value that is used to specify a locale when
3826 using environment variables shall be the string specified as the *name* operand to the *localedef*
3827 utility when the locale was created. The strings `"C"` and `"POSIX"` are reserved as identifiers for
3828 the POSIX locale (see Section 7.2, on page 136). When the value of a locale environment variable
3829 begins with a <slash> (`'/'`), it shall be interpreted as the pathname of the locale definition; the
3830 type of file (regular, directory, and so on) used to store the locale definition is implementation-
3831 defined. If the value does not begin with a <slash>, the mechanism used to locate the locale is
3832 implementation-defined.

3833 If different character sets are used by the locale categories, the results achieved by an application
3834 utilizing these categories are undefined. Likewise, if different codesets are used for the data
3835 being processed by interfaces whose behavior is dependent on the current locale, or the codeset
3836 is different from the codeset assumed when the locale was created, the result is also undefined.

3837 Applications can select the desired locale by invoking the *setlocale*( ) function (or equivalent)
3838 with the appropriate value. If the function is invoked with an empty string, such as:

3839 ```
setlocale(LC_ALL, "");
```

3840 the value of the corresponding environment variable is used. If the environment variable is
```

unset or is set to the empty string, the implementation shall set the appropriate environment as defined in Chapter 8 (on page 173).

7.2 POSIX Locale

Conforming systems shall provide a POSIX locale, also known as the C locale. The behavior of standard utilities and functions in the POSIX locale shall be as if the locale was defined via the *localedef* utility with input data from the POSIX locale tables in Section 7.3.

The tables in Section 7.3 describe the characteristics and behavior of the POSIX locale for data consisting entirely of characters from the portable character set and the control character set. For other characters, the behavior is unspecified. For C-language programs, the POSIX locale shall be the default locale when the *setlocale*( ) function is not called.

The POSIX locale can be specified by assigning to the appropriate environment variables the values `"C"` or `"POSIX"`.

All implementations shall define a locale as the default locale, to be invoked when no environment variables are set, or set to the empty string. This default locale can be the POSIX locale or any other implementation-defined locale. Some implementations may provide facilities for local installation administrators to set the default locale, customizing it for each location. POSIX.1-200x does not require such a facility.

7.3 Locale Definition

The capability to specify additional locales to those provided by an implementation is optional, denoted by the _POSIX2_LOCALEDEF symbol. If the option is not supported, only implementation-supplied locales are available. Such locales shall be documented using the format specified in this section.

Locales can be described with the file format presented in this section. The file format is that accepted by the *localedef* utility. For the purposes of this section, the file is referred to as the "locale definition file", but no locales shall be affected by this file unless it is processed by *localedef* or some similar mechanism. Any requirements in this section imposed upon the utility shall apply to *localedef* or to any other similar utility used to install locale information using the locale definition file format described here.

The locale definition file shall contain one or more locale category source definitions, and shall not contain more than one definition for the same locale category. If the file contains source definitions for more than one category, implementation-defined categories, if present, shall appear after the categories defined by Section 7.1 (on page 135). A category source definition contains either the definition of a category or a **copy** directive. For a description of the **copy** directive, see *localedef*. In the event that some of the information for a locale category, as specified in this volume of POSIX.1-200x, is missing from the locale source definition, the behavior of that category, if it is referenced, is unspecified.

A category source definition shall consist of a category header, a category body, and a category trailer. A category header shall consist of the character string naming of the category, beginning with the characters *LC_*. The category trailer shall consist of the string `"END"`, followed by one or more <blank> characters and the string used in the corresponding category header.

The category body shall consist of one or more lines of text. Each line shall contain an identifier, optionally followed by one or more operands. Identifiers shall be either keywords, identifying a

particular locale element, or collating elements. In addition to the keywords defined in this volume of POSIX.1-200x, the source can contain implementation-defined keywords. Each keyword within a locale shall have a unique name (that is, two categories cannot have a commonly-named keyword); no keyword shall start with the characters *LC_*. Identifiers shall be separated from the operands by one or more <blank> characters.

Operands shall be characters, collating elements, or strings of characters. Strings shall be enclosed in double-quotes. Literal double-quotes within strings shall be preceded by the <*escape character*>, described below. When a keyword is followed by more than one operand, the operands shall be separated by <semicolon> characters; <blank> characters shall be allowed both before and after a <semicolon>.

The first category header in the file can be preceded by a line modifying the comment character. It shall have the following format, starting in column 1:

```
"comment_char %c\n", <comment character>
```

The comment character shall default to the <number-sign> (`'#'`). Blank lines and lines containing the <*comment character*> in the first position shall be ignored.

The first category header in the file can be preceded by a line modifying the escape character to be used in the file. It shall have the following format, starting in column 1:

```
"escape_char %c\n", <escape character>
```

The escape character shall default to <backslash>, which is the character used in all examples shown in this volume of POSIX.1-200x.

A line can be continued by placing an escape character as the last character on the line; this continuation character shall be discarded from the input. Although the implementation need not accept any one portion of a continued line with a length exceeding {LINE_MAX} bytes, it shall place no limits on the accumulated length of the continued line. Comment lines shall not be continued on a subsequent line using an escaped <newline>.

Individual characters, characters in strings, and collating elements shall be represented using symbolic names, as defined below. In addition, characters can be represented using the characters themselves or as octal, hexadecimal, or decimal constants. When non-symbolic notation is used, the resultant locale definitions are in many cases not portable between systems. The left angle bracket (`'<'`) is a reserved symbol, denoting the start of a symbolic name; when used to represent itself it shall be preceded by the escape character. The following rules apply to character representation:

1. A character can be represented via a symbolic name, enclosed within angle brackets `'<'` and `'>'`. The symbolic name, including the angle brackets, shall exactly match a symbolic name defined in the charmap file specified via the *localedef* **–f** option, and it shall be replaced by a character value determined from the value associated with the symbolic name in the charmap file. The use of a symbolic name not found in the charmap file shall constitute an error, unless the category is *LC_CTYPE* or *LC_COLLATE*, in which case it shall constitute a warning condition (see *localedef* for a description of actions resulting from errors and warnings). The specification of a symbolic name in a **collating-element** or **collating-symbol** section that duplicates a symbolic name in the charmap file (if present) shall be an error. Use of the escape character or a right angle bracket within a symbolic name is invalid unless the character is preceded by the escape character.

   For example:

   ```
   <c>;<c-cedilla>  "<M><a><y>"
   ```

2. A character in the portable character set can be represented by the character itself, in which case the value of the character is implementation-defined. (Implementations may allow other characters to be represented as themselves, but such locale definitions are not portable.) Within a string, the double-quote character, the escape character, and the right angle bracket character shall be escaped (preceded by the escape character) to be interpreted as the character itself. Outside strings, the characters:

   `,` `;` `<` `>` *escape_char*

   shall be escaped to be interpreted as the character itself.

   For example:

   ```
   c    "May"
   ```

3. A character can be represented as an octal constant. An octal constant shall be specified as the escape character followed by two or three octal digits. Each constant shall represent a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

   For example:

   ```
   \143;\347;\143\150   "\115\141\171"
   ```

4. A character can be represented as a hexadecimal constant. A hexadecimal constant shall be specified as the escape character followed by an `'x'` followed by two hexadecimal digits. Each constant shall represent a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

   For example:

   ```
   \x63;\xe7;\x63\x68   "\x4d\x61\x79"
   ```

5. A character can be represented as a decimal constant. A decimal constant shall be specified as the escape character followed by a `'d'` followed by two or three decimal digits. Each constant represents a byte value. Multi-byte values can be represented by concatenated constants specified in byte order with the last constant specifying the least significant byte of the character.

   For example:

   ```
   \d99;\d231;\d99\d104  "\d77\d97\d121"
   ```

Implementations may accept single-digit octal, decimal, or hexadecimal constants following the escape character. Only characters existing in the character set for which the locale definition is created shall be specified, whether using symbolic names, the characters themselves, or octal, decimal, or hexadecimal constants. If a charmap file is present, only characters defined in the charmap can be specified using octal, decimal, or hexadecimal constants. Symbolic names not present in the charmap file can be specified and shall be ignored, as specified under item 1 above.

7.3.1 LC_CTYPE

The *LC_CTYPE* category shall define character classification, case conversion, and other character attributes. In addition, a series of characters can be represented by three adjacent <period> characters representing an ellipsis symbol ("..."). The ellipsis specification shall be interpreted as meaning that all values between the values preceding and following it represent valid characters. The ellipsis specification shall be valid only within a single encoded character set; that is, within a group of characters of the same size. An ellipsis shall be interpreted as including in the list all characters with an encoded value higher than the encoded value of the character preceding the ellipsis and lower than the encoded value of the character following the ellipsis.

For example:

```
\x30;...;\x39;
```

includes in the character class all characters with encoded values between the endpoints.

The following keywords shall be recognized. In the descriptions, the term "automatically included" means that it shall not be an error either to include or omit any of the referenced characters; the implementation provides them if missing (even if the entire keyword is missing) and accepts them silently if present. When the implementation automatically includes a missing character, it shall have an encoded value dependent on the charmap file in effect (see the description of the *localedef* **–f** option); otherwise, it shall have a value derived from an implementation-defined character mapping.

The character classes **digit**, **xdigit**, **lower**, **upper**, and **space** have a set of automatically included characters. These only need to be specified if the character values (that is, encoding) differ from the implementation default values. It is not possible to define a locale without these automatically included characters unless some implementation extension is used to prevent their inclusion. Such a definition would not be a proper superset of the C or POSIX locale and, thus, it might not be possible for conforming applications to work properly.

copy Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

upper Define characters to be classified as uppercase letters.

In the POSIX locale, the 26 uppercase letters shall be included:

```
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
```

In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** shall be specified. The uppercase letters <A> to <Z>, as defined in Section 6.4 (on page 129) (the portable character set), are automatically included in this class.

lower Define characters to be classified as lowercase letters.

In the POSIX locale, the 26 lowercase letters shall be included:

```
a b c d e f g h i j k l m n o p q r s t u v w x y z
```

In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** shall be specified. The lowercase letters <a> to <z> of the portable character set are automatically included in this class.

alpha Define characters to be classified as letters.

In the POSIX locale, all characters in the classes **upper** and **lower** shall be included.

In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** shall be specified. Characters classified as either **upper** or **lower** are automatically included in this class.

digit Define the characters to be classified as numeric digits.

In the POSIX locale, only:

```
0 1 2 3 4 5 6 7 8 9
```

shall be included.

In a locale definition file, only the digits <zero>, <one>, <two>, <three>, <four>, <five>, <six>, <seven>, <eight>, and <nine> shall be specified, and in contiguous ascending sequence by numerical value. The digits <zero> to <nine> of the portable character set are automatically included in this class.

alnum Define characters to be classified as letters and numeric digits. Only the characters specified for the **alpha** and **digit** keywords shall be specified. Characters specified for the keywords **alpha** and **digit** are automatically included in this class.

space Define characters to be classified as white-space characters.

In the POSIX locale, exactly <space>, <form-feed>, <newline>, <carriage-return>, <tab>, and <vertical-tab> shall be included.

In a locale definition file, no character specified for the keywords **upper**, **lower**, **alpha**, **digit**, **graph**, or **xdigit** shall be specified. The <space>, <form-feed>, <newline>, <carriage-return>, <tab>, and <vertical-tab> of the portable character set, and any characters included in the class **blank** are automatically included in this class.

cntrl Define characters to be classified as control characters.

In the POSIX locale, no characters in classes **alpha** or **print** shall be included.

In a locale definition file, no character specified for the keywords **upper**, **lower**, **alpha**, **digit**, **punct**, **graph**, **print**, or **xdigit** shall be specified.

punct Define characters to be classified as punctuation characters.

In the POSIX locale, neither the <space> nor any characters in classes **alpha**, **digit**, or **cntrl** shall be included.

In a locale definition file, no character specified for the keywords **upper**, **lower**, **alpha**, **digit**, **cntrl**, **xdigit**, or as the <space> shall be specified.

graph Define characters to be classified as printable characters, not including the <space>.

In the POSIX locale, all characters in classes **alpha**, **digit**, and **punct** shall be included; no characters in class **cntrl** shall be included.

In a locale definition file, characters specified for the keywords **upper**, **lower**, **alpha**, **digit**, **xdigit**, and **punct** are automatically included in this class. No character specified for the keyword **cntrl** shall be specified.

print Define characters to be classified as printable characters, including the <space>.

In the POSIX locale, all characters in class **graph** shall be included; no characters in class **cntrl** shall be included.

In a locale definition file, characters specified for the keywords **upper**, **lower**, **alpha**, **digit**, **xdigit**, **punct, graph**, and the <space> are automatically included in this class. No character specified for the keyword **cntrl** shall be specified.

xdigit Define the characters to be classified as hexadecimal digits.

In the POSIX locale, only:

```
0 1 2 3 4 5 6 7 8 9 A B C D E F a b c d e f
```

shall be included.

In a locale definition file, only the characters defined for the class **digit** shall be specified, in contiguous ascending sequence by numerical value, followed by one or more sets of six characters representing the hexadecimal digits 10 to 15 inclusive, with each set in ascending order (for example, <A>, <B>, <C>, <D>, <E>, <F>, <a>, <b>, <c>, <d>, <e>, <f>). The digits <zero> to <nine>, the uppercase letters <A> to <F>, and the lowercase letters <a> to <f> of the portable character set are automatically included in this class.

blank Define characters to be classified as <blank> characters.

In the POSIX locale, only the <space> and <tab> shall be included.

In a locale definition file, the <space> and <tab> are automatically included in this class.

charclass Define one or more locale-specific character class names as strings separated by <semicolon> characters. Each named character class can then be defined subsequently in the *LC_CTYPE* definition. A character class name shall consist of at least one and at most {CHARCLASS_NAME_MAX} bytes of alphanumeric characters from the portable filename character set. The first character of a character class name shall not be a digit. The name shall not match any of the *LC_CTYPE* keywords defined in this volume of POSIX.1-200x. Future versions of this standard will not specify any *LC_CTYPE* keywords containing uppercase letters.

charclass-name Define characters to be classified as belonging to the named locale-specific character class. In the POSIX locale, locale-specific named character classes need not exist.

If a class name is defined by a **charclass** keyword, but no characters are subsequently assigned to it, this is not an error; it represents a class without any characters belonging to it.

The *charclass-name* can be used as the *property* argument to the *wctype*() function, in regular expression and shell pattern-matching bracket expressions, and by the *tr* command.

toupper Define the mapping of lowercase letters to uppercase letters.

In the POSIX locale, at a minimum, the 26 lowercase characters:

```
a b c d e f g h i j k l m n o p q r s t u v w x y z
```

shall be mapped to the corresponding 26 uppercase characters:

```
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
```

In a locale definition file, the operand shall consist of character pairs, separated by <semicolon> characters. The characters in each character pair shall be separated by a <comma> and the pair enclosed by parentheses. The

first character in each pair is the lowercase letter, the second the corresponding uppercase letter. Only characters specified for the keywords **lower** and **upper** shall be specified. The lowercase letters <a> to <z>, and their corresponding uppercase letters <A> to <Z>, of the portable character set are automatically included in this mapping, but only when the **toupper** keyword is omitted from the locale definition.

tolower Define the mapping of uppercase letters to lowercase letters.

In the POSIX locale, at a minimum, the 26 uppercase characters:

```
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
```

shall be mapped to the corresponding 26 lowercase characters:

```
a b c d e f g h i j k l m n o p q r s t u v w x y z
```

In a locale definition file, the operand shall consist of character pairs, separated by <semicolon> characters. The characters in each character pair shall be separated by a <comma> and the pair enclosed by parentheses. The first character in each pair is the uppercase letter, the second the corresponding lowercase letter. Only characters specified for the keywords **lower** and **upper** shall be specified. If the **tolower** keyword is omitted from the locale definition, the mapping is the reverse mapping of the one specified for **toupper**.

The following table shows the character class combinations allowed:

Table 7-1 Valid Character Class Combinations

	Can Also Belong To										
In Class	**upper**	**lower**	**alpha**	**digit**	**space**	**cntrl**	**punct**	**graph**	**print**	**xdigit**	**blank**
upper		—	A	x	x	x	x	A	A	—	x
lower	—		A	x	x	x	x	A	A	—	x
alpha	—	—		x	x	x	x	A	A	—	x
digit	x	x	x		x	x	x	A	A	A	x
space	x	x	x	x		—	*	*	*	x	—
cntrl	x	x	x	x	—		x	x	x	x	—
punct	x	x	x	x	—	x		A	A	x	—
graph	—	—	—	—	—	x	—		A	—	—
print	—	—	—	—	—	x	—	—		—	—
xdigit	—	—	—	—	x	x	x	A	A		x
blank	x	x	x	x	A	—	*	*	*	x	

Notes:

1. Explanation of codes:

   A Automatically included; see text.

   — Permitted.

   x Mutually-exclusive.

   * See note 2.

2. The <space>, which is part of the **space** and **blank** classes, cannot belong to **punct** or **graph**, but shall automatically belong to the **print** class. Other **space** or **blank** characters can be classified as any of **punct**, **graph**, or **print**.

7.3.1.1 *LC_CTYPE Category in the POSIX Locale*

The character classifications for the POSIX locale follow; the code listing depicts the *localedef* input, and the table represents the same information, sorted by character.

```
LC_CTYPE
# The following is the POSIX locale LC_CTYPE.
# "alpha" is by default "upper" and "lower"
# "alnum" is by definition "alpha" and "digit"
# "print" is by default "alnum", "punct", and the <space>
# "graph" is by default "alnum" and "punct"
#
upper    <A>;<B>;<C>;<D>;<E>;<F>;<G>;<H>;<I>;<J>;<K>;<L>;<M>;\

7.3.2 LC_COLLATE

The *LC_COLLATE* category provides a collation sequence definition for numerous utilities in the Shell and Utilities volume of POSIX.1-200x (*sort*, *uniq*, and so on), regular expression matching (see Chapter 9, on page 181), and the *strcoll*( ), *strxfrm*( ), *wcscoll*( ), and *wcsxfrm*( ) functions in the System Interfaces volume of POSIX.1-200x.

A collation sequence definition shall define the relative order between collating elements (characters and multi-character collating elements) in the locale. This order is expressed in terms of collation values; that is, by assigning each element one or more collation values (also known as collation weights). This does not imply that implementations shall assign such values, but that ordering of strings using the resultant collation definition in the locale behaves as if such assignment is done and used in the collation process. At least the following capabilities are provided:

1. **Multi-character collating elements**. Specification of multi-character collating elements (that is, sequences of two or more characters to be collated as an entity).

2. **User-defined ordering of collating elements**. Each collating element shall be assigned a collation value defining its order in the character (or basic) collation sequence. This ordering is used by regular expressions and pattern matching and, unless collation weights are explicitly specified, also as the collation weight to be used in sorting.
3. **Multiple weights and equivalence classes**. Collating elements can be assigned one or more (up to the limit {COLL_WEIGHTS_MAX}, as defined in **<limits.h>**) collating weights for use in sorting. The first weight is hereafter referred to as the primary weight.
4. **One-to-many mapping**. A single character is mapped into a string of collating elements.
5. **Equivalence class definition**. Two or more collating elements have the same collation value (primary weight).
6. **Ordering by weights**. When two strings are compared to determine their relative order, the two strings are first broken up into a series of collating elements; the elements in each successive pair of elements are then compared according to the relative primary weights for the elements. If equal, and more than one weight has been assigned, then the pairs of collating elements are re-compared according to the relative subsequent weights, until either a pair of collating elements compare unequal or the weights are exhausted.

The following keywords shall be recognized in a collation sequence definition. They are described in detail in the following sections.

copy Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

collating-element Define a collating-element symbol representing a multi-character collating element. This keyword is optional.

collating-symbol Define a collating symbol for use in collation order statements. This keyword is optional.

order_start Define collation rules. This statement shall be followed by one or more collation order statements, assigning character collation values and collation weights to collating elements.

order_end Specify the end of the collation-order statements.

7.3.2.1 *The collating-element Keyword*

In addition to the collating elements in the character set, the **collating-element** keyword can be used to define multi-character collating elements. The syntax is as follows:

```
"collating-element %s from \"%s\"\n", <collating-symbol>, <string>
```

The <*collating-symbol*> operand shall be a symbolic name, enclosed between angle brackets (`'<'` and `'>'`), and shall not duplicate any symbolic name in the current charmap file (if any), or any other symbolic name defined in this collation definition. The string operand is a string of two or more characters that collates as an entity. A <*collating-element*> defined via this keyword is only recognized with the *LC_COLLATE* category.

For example:

```
collating-element <ch> from "<c><h>"
collating-element <e-acute> from "<acute><e>"
collating-element <ll> from "ll"
```

4382 *7.3.2.2 The collating-symbol Keyword*

4383 This keyword shall be used to define symbols for use in collation sequence statements; that is,
4384 between the **order_start** and the **order_end** keywords. The syntax is as follows:

4385 `"collating-symbol %s\n", <collating-symbol>`

4386 The <*collating-symbol*> shall be a symbolic name, enclosed between angle brackets (`'<'` and
4387 `'>'`), and shall not duplicate any symbolic name in the current charmap file (if any), or any
4388 other symbolic name defined in this collation definition. A <*collating-symbol*> defined via this
4389 keyword is only recognized within the *LC_COLLATE* category.

4390 For example:

4391 `collating-symbol <UPPER_CASE>`
4392 `collating-symbol <HIGH>`

4393 The **collating-symbol** keyword defines a symbolic name that can be associated with a relative
4394 position in the character order sequence. While such a symbolic name does not represent any
4395 collating element, it can be used as a weight.

4396 *7.3.2.3 The order_start Keyword*

4397 The **order_start** keyword shall precede collation order entries and also define the number of
4398 weights for this collation sequence definition and other collation rules. The syntax is as follows:

4399 `"order_start %s;%s;...;%s\n", <sort-rules>, <sort-rules> ...`

4400 The operands to the **order_start** keyword are optional. If present, the operands define rules to be
4401 applied when strings are compared. The number of operands define how many weights each
4402 element is assigned; if no operands are present, one **forward** operand is assumed. If present, the
4403 first operand defines rules to be applied when comparing strings using the first (primary)
4404 weight; the second when comparing strings using the second weight, and so on. Operands shall
4405 be separated by <semicolon> characters (`';'`). Each operand shall consist of one or more
4406 collation directives, separated by <comma> characters (`','`). If the number of operands exceeds
4407 the {COLL_WEIGHTS_MAX} limit, the utility shall issue a warning message. The following
4408 directives shall be supported:

4409 **forward** Specifies that comparison operations for the weight level shall proceed from start
4410 of string towards the end of string.

4411 **backward** Specifies that comparison operations for the weight level shall proceed from end of
4412 string towards the beginning of string.

4413 **position** Specifies that comparison operations for the weight level shall consider the relative
4414 position of elements in the strings not subject to **IGNORE**. The string containing
4415 an element not subject to **IGNORE** after the fewest collating elements subject to
4416 **IGNORE** from the start of the compare shall collate first. If both strings contain a
4417 character not subject to **IGNORE** in the same relative position, the collating values
4418 assigned to the elements shall determine the ordering. In case of equality,
4419 subsequent characters not subject to **IGNORE** shall be considered in the same
4420 manner.

4421 The directives **forward** and **backward** are mutually-exclusive.

4422 If no operands are specified, a single **forward** operand shall be assumed.

For example:

```
order_start     forward;backward
```

7.3.2.4 Collation Order

The **order_start** keyword shall be followed by collating identifier entries. The syntax for the collating element entries is as follows:

```
"%s %s;%s;...;%s\n", <collating-identifier>, <weight>, <weight>, ...
```

Each *collating-identifier* shall consist of either a character (in any of the forms defined in Section 7.3, on page 136), a <*collating-element*>, a <*collating-symbol*>, an ellipsis, or the special symbol **UNDEFINED**. The order in which collating elements are specified determines the character order sequence, such that each collating element shall compare less than the elements following it.

A <*collating-element*> shall be used to specify multi-character collating elements, and indicates that the character sequence specified via the <*collating-element*> is to be collated as a unit and in the relative order specified by its place.

A <*collating-symbol*> can be used to define a position in the relative order for use in weights. No weights shall be specified with a <*collating-symbol*>.

The ellipsis symbol specifies that a sequence of characters shall collate according to their encoded character values. It shall be interpreted as indicating that all characters with a coded character set value higher than the value of the character in the preceding line, and lower than the coded character set value for the character in the following line, in the current coded character set, shall be placed in the character collation order between the previous and the following character in ascending order according to their coded character set values. An initial ellipsis shall be interpreted as if the preceding line specified the NUL character, and a trailing ellipsis as if the following line specified the highest coded character set value in the current coded character set. An ellipsis shall be treated as invalid if the preceding or following lines do not specify characters in the current coded character set. The use of the ellipsis symbol ties the definition to a specific coded character set and may preclude the definition from being portable between implementations.

The symbol **UNDEFINED** shall be interpreted as including all coded character set values not specified explicitly or via the ellipsis symbol. Such characters shall be inserted in the character collation order at the point indicated by the symbol, and in ascending order according to their coded character set values. If no **UNDEFINED** symbol is specified, and the current coded character set contains characters not specified in this section, the utility shall issue a warning message and place such characters at the end of the character collation order.

The optional operands for each collation-element shall be used to define the primary, secondary, or subsequent weights for the collating element. The first operand specifies the relative primary weight, the second the relative secondary weight, and so on. Two or more collation-elements can be assigned the same weight; they belong to the same "equivalence class" if they have the same primary weight. Collation shall behave as if, for each weight level, elements subject to **IGNORE** are removed, unless the **position** collation directive is specified for the corresponding level with the **order_start** keyword. Then each successive pair of elements shall be compared according to the relative weights for the elements. If the two strings compare equal, the process shall be repeated for the next weight level, up to the limit {COLL_WEIGHTS_MAX}.

Weights shall be expressed as characters (in any of the forms specified in Section 7.3, on page 136), <*collating-symbol*>s, <*collating-element*>s, an ellipsis, or the special symbol **IGNORE**. A single character, a <*collating-symbol*>, or a <*collating-element*> shall represent the relative position

in the character collating sequence of the character or symbol, rather than the character or characters themselves. Thus, rather than assigning absolute values to weights, a particular weight is expressed using the relative order value assigned to a collating element based on its order in the character collation sequence.

One-to-many mapping is indicated by specifying two or more concatenated characters or symbolic names. For example, if the <eszet> is given the string `"<s><s>"` as a weight, comparisons are performed as if all occurrences of the <eszet> are replaced by `"<s><s>"` (assuming that `"<s>"` has the collating weight `"<s>"`). If it is necessary to define <eszet> and `"<s><s>"` as an equivalence class, then a collating element must be defined for the string `"ss"`.

All characters specified via an ellipsis shall by default be assigned unique weights, equal to the relative order of characters. Characters specified via an explicit or implicit **UNDEFINED** special symbol shall by default be assigned the same primary weight (that is, they belong to the same equivalence class). An ellipsis symbol as a weight shall be interpreted to mean that each character in the sequence shall have unique weights, equal to the relative order of their character in the character collation sequence. The use of the ellipsis as a weight shall be treated as an error if the collating element is neither an ellipsis nor the special symbol **UNDEFINED**.

The special keyword **IGNORE** as a weight shall indicate that when strings are compared using the weights at the level where **IGNORE** is specified, the collating element shall be ignored; that is, as if the string did not contain the collating element. In regular expressions and pattern matching, all characters that are subject to **IGNORE** in their primary weight form an equivalence class.

An empty operand shall be interpreted as the collating element itself.

For example, the order statement:

```
<a>     <a>;<a>
```

is equal to:

```
<a>
```

An ellipsis can be used as an operand if the collating element was an ellipsis, and shall be interpreted as the value of each character defined by the ellipsis.

The collation order as defined in this section affects the interpretation of bracket expressions in regular expressions (see Section 9.3.5, on page 184).

For example:

```
order_start  forward;backward
UNDEFINED    IGNORE;IGNORE
<LOW>
<space>      <LOW>;<space>
...          <LOW>;...
<a>          <a>;<a>
<a-acute>    <a>;<a-acute>
<a-grave>    <a>;<a-grave>
<A>          <a>;<A>
<A-acute>    <a>;<A-acute>
<A-grave>    <a>;<A-grave>
<ch>         <ch>;<ch>
<Ch>         <ch>;<Ch>
<s>          <s>;<s>
<eszet>      "<s><s>";"<eszet><eszet>"
order_end
```

This example is interpreted as follows:

1. The **UNDEFINED** means that all characters not specified in this definition (explicitly or via the ellipsis) shall be ignored for collation purposes.
2. All characters between <space> and `'a'` shall have the same primary equivalence class and individual secondary weights based on their ordinal encoded values.
3. All characters based on the uppercase or lowercase character `'a'` belong to the same primary equivalence class.
4. The multi-character collating element <ch> is represented by the collating symbol <ch> and belongs to the same primary equivalence class as the multi-character collating element <Ch>.

7.3.2.5 *The order_end Keyword*

The collating order entries shall be terminated with an **order_end** keyword.

7.3.2.6 *LC_COLLATE Category in the POSIX Locale*

The collation sequence definition of the POSIX locale follows; the code listing depicts the *localedef* input.

```

7.3.3 LC_MONETARY

The *LC_MONETARY* category shall define the rules and symbols that are used to format monetary numeric information.

This information is available through the *localeconv*() function and is used by the *strfmon*() function.

Some of the information is also available in an alternative form via the *nl_langinfo*() function (see CRNCYSTR in **<langinfo.h>**).

The following items are defined in this category of the locale. The item names are the keywords recognized by the *localedef* utility when defining a locale. They are also similar to the member names of the **lconv** structure defined in **<locale.h>**; see **<locale.h>** for the exact symbols in the header. The *localeconv*() function returns {CHAR_MAX} for unspecified integer items and the empty string ("") for unspecified or size zero string items.

In a locale definition file, the operands are strings, formatted as indicated by the grammar in Section 7.4 (on page 165). For some keywords, the strings can contain only integers. Keywords that are not provided, string values set to the empty string (""), or integer keywords set to –1, are used to indicate that the value is not available in the locale. The following keywords shall be recognized:

copy Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

Note: This is a *localedef* utility keyword, unavailable through *localeconv*().

int_curr_symbol The international currency symbol. The operand shall be a four-character string, with the first three characters containing the alphabetic international currency symbol. The international currency symbol should be chosen in accordance with those specified in the ISO 4217 standard. The fourth character shall be the character used to separate the international currency symbol from the monetary quantity.

currency_symbol The string that shall be used as the local currency symbol.

mon_decimal_point The operand is a string containing the symbol that shall be used as the decimal delimiter (radix character) in monetary formatted quantities.

mon_thousands_sep The operand is a string containing the symbol that shall be used as a separator for groups of digits to the left of the decimal delimiter in formatted monetary quantities.

mon_grouping Define the size of each group of digits in formatted monetary quantities. The operand is a sequence of integers separated by <semicolon> characters. Each integer specifies the number of digits in each group, with the initial integer defining the size of the group immediately preceding the decimal delimiter, and the following integers defining the preceding groups. If the last integer is not –1, then the size of the previous group (if any) shall be repeatedly used for the remainder of the digits. If the last integer is –1, then no further grouping shall be performed.

positive_sign A string that shall be used to indicate a non-negative-valued formatted monetary quantity.

negative_sign A string that shall be used to indicate a negative-valued formatted monetary quantity.

int_frac_digits An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using **int_curr_symbol**.

frac_digits An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using **currency_symbol**.

p_cs_precedes An integer set to 1 if the **currency_symbol** precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.

p_sep_by_space Set to a value indicating the separation of the **currency_symbol**, the sign string, and the value for a non-negative formatted monetary quantity.

The values of **p_sep_by_space**, **n_sep_by_space**, **int_p_sep_by_space**, and **int_n_sep_by_space** are interpreted according to the following:

0 No <space> separates the currency symbol and value.

1 If the currency symbol and sign string are adjacent, a <space> separates them from the value; otherwise, a <space> separates the currency symbol from the value.

2 If the currency symbol and sign string are adjacent, a <space> separates them; otherwise, a <space> separates the sign string from the value.

n_cs_precedes An integer set to 1 if the **currency_symbol** precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.

n_sep_by_space Set to a value indicating the separation of the **currency_symbol**, the sign string, and the value for a negative formatted monetary quantity.

p_sign_posn An integer set to a value indicating the positioning of the **positive_sign** for a monetary quantity with a non-negative value. The following integer values shall be recognized for **int_n_sign_posn**, **int_p_sign_posn**, **n_sign_posn**, and **p_sign_posn**:

0 Parentheses enclose the quantity and the **currency_symbol**.

1 The sign string precedes the quantity and the **currency_symbol**.

2 The sign string succeeds the quantity and the **currency_symbol**.

3 The sign string precedes the **currency_symbol**.

4 The sign string succeeds the **currency_symbol**.

n_sign_posn An integer set to a value indicating the positioning of the **negative_sign** for a negative formatted monetary quantity.

int_p_cs_precedes An integer set to 1 if the **int_curr_symbol** precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.

int_n_cs_precedes An integer set to 1 if the **int_curr_symbol** precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.

int_p_sep_by_space Set to a value indicating the separation of the **int_curr_symbol**, the sign string, and the value for a non-negative internationally formatted monetary quantity.

int_n_sep_by_space Set to a value indicating the separation of the **int_curr_symbol**, the sign string, and the value for a negative internationally formatted monetary quantity.

int_p_sign_posn An integer set to a value indicating the positioning of the **positive_sign** for a positive monetary quantity formatted with the international format.

int_n_sign_posn An integer set to a value indicating the positioning of the **negative_sign** for a negative monetary quantity formatted with the international format.

7.3.3.1 *LC_MONETARY Category in the POSIX Locale*

The monetary formatting definitions for the POSIX locale follow; the code listing depicting the *localedef* input, the table representing the same information with the addition of *localeconv*( ) and *nl_langinfo*( ) formats. All values are unspecified in the POSIX locale.

```

int_p_sign_posn	—	N/A	{CHAR_MAX}	–1
int_n_sign_posn	—	N/A	{CHAR_MAX}	–1

The entry N/A indicates that the value is not available in the POSIX locale.

7.3.4 LC_NUMERIC

The *LC_NUMERIC* category shall define the rules and symbols that are used to format non-monetary numeric information. This information is available through the *localeconv*( ) function.

Some of the information is also available in an alternative form via the *nl_langinfo*( ) function.

The following items are defined in this category of the locale. The item names are the keywords recognized by the *localedef* utility when defining a locale. They are also similar to the member names of the **lconv** structure defined in **<locale.h>**; see **<locale.h>** for the exact symbols in the header. The *localeconv*( ) function returns {CHAR_MAX} for unspecified integer items and the empty string ("") for unspecified or size zero string items.

In a locale definition file, the operands are strings, formatted as indicated by the grammar in Section 7.4 (on page 165). For some keywords, the strings can only contain integers. Keywords that are not provided, string values set to the empty string (""), or integer keywords set to –1, shall be used to indicate that the value is not available in the locale. The following keywords shall be recognized:

copy Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

Note: This is a *localedef* utility keyword, unavailable through *localeconv*( ).

decimal_point The operand is a string containing the symbol that shall be used as the decimal delimiter (radix character) in numeric, non-monetary formatted quantities. This keyword cannot be omitted and cannot be set to the empty string. In contexts where standards limit the **decimal_point** to a single byte, the result of specifying a multi-byte operand shall be unspecified.

thousands_sep The operand is a string containing the symbol that shall be used as a separator for groups of digits to the left of the decimal delimiter in numeric, non-monetary formatted monetary quantities. In contexts where standards limit the **thousands_sep** to a single byte, the result of specifying a multi-byte operand shall be unspecified.

grouping Define the size of each group of digits in formatted non-monetary quantities. The operand is a sequence of integers separated by <semicolon> characters. Each integer specifies the number of digits in each group, with the initial integer defining the size of the group immediately preceding the decimal delimiter, and the following integers defining the preceding groups. If the last integer is not –1, then the size of the previous group (if any) shall be repeatedly used for the remainder of the digits. If the last integer is –1, then no further grouping shall be performed.

7.3.4.1 *LC_NUMERIC Category in the POSIX Locale*

The non-monetary numeric formatting definitions for the POSIX locale follow; the code listing depicting the *localedef* input, the table representing the same information with the addition of *localeconv*( ) values, and *nl_langinfo*( ) constants.

```
LC_NUMERIC
# This is the POSIX locale definition for
# the LC_NUMERIC category.
#
decimal_point    "<period>"
thousands_sep    ""
grouping         -1
#
END LC_NUMERIC
```

Item	langinfo Constant	POSIX Locale Value	localeconv( ) Value	localedef Value
decimal_point	RADIXCHAR	"."	"."	.
thousands_sep	THOUSEP	N/A	""	""
grouping	—	N/A	""	–1

The entry N/A indicates that the value is not available in the POSIX locale.

7.3.5 LC_TIME

The *LC_TIME* category shall define the interpretation of the conversion specifications supported by the *date* utility and shall affect the behavior of the *strftime*( ), *wcsftime*( ), *strptime*( ), and *nl_langinfo*( ) functions. Since the interfaces for C-language access and locale definition differ significantly, they are described separately.

7.3.5.1 *LC_TIME Locale Definition*

In a locale definition, the following mandatory keywords shall be recognized:

copy Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

abday Define the abbreviated weekday names, corresponding to the %a conversion specification (conversion specification in the *strftime*(), *wcsftime*(), and *strptime*() functions). The operand shall consist of seven <semicolon>-separated strings, each surrounded by double-quotes. The first string shall be the abbreviated name of the day corresponding to Sunday, the second the abbreviated name of the day corresponding to Monday, and so on.

day Define the full weekday names, corresponding to the %A conversion specification. The operand shall consist of seven <semicolon>-separated strings, each surrounded by double-quotes. The first string is the full name of the day corresponding to Sunday, the second the full name of the day corresponding to Monday, and so on.

abmon Define the abbreviated month names, corresponding to the %b conversion specification. The operand shall consist of twelve <semicolon>-separated strings, each surrounded by double-quotes. The first string shall be the abbreviated name of the first month of the year (January), the second the abbreviated name of the second month, and so on.

mon Define the full month names, corresponding to the %B conversion specification. The operand shall consist of twelve <semicolon>-separated strings, each surrounded by double-quotes. The first string shall be the full name of the first month of the year (January), the second the full name of the second month, and so on.

d_t_fmt Define the appropriate date and time representation, corresponding to the %c conversion specification. The operand shall consist of a string containing any combination of characters and conversion specifications. In addition, the string can contain escape sequences defined in the table in Table 5-1 (on page 121) (`'\\'`,`'\a'`,`'\b'`,`'\f'`,`'\n'`,`'\r'`,`'\t'`,`'\v'`).

d_fmt Define the appropriate date representation, corresponding to the %x conversion specification. The operand shall consist of a string containing any combination of characters and conversion specifications. In addition, the string can contain escape sequences defined in Table 5-1 (on page 121).

t_fmt Define the appropriate time representation, corresponding to the %X conversion specification. The operand shall consist of a string containing any combination of characters and conversion specifications. In addition, the string can contain escape sequences defined in Table 5-1 (on page 121).

am_pm Define the appropriate representation of the *ante-meridiem* and *post-meridiem* strings, corresponding to the %p conversion specification. The operand shall consist of two strings, separated by a <semicolon>, each surrounded by double-quotes. The first string shall represent the *ante-meridiem* designation, the last string the *post-meridiem* designation.

t_fmt_ampm Define the appropriate time representation in the 12-hour clock format with **am_pm**, corresponding to the %r conversion specification. The operand shall consist of a string and can contain any combination of characters and conversion specifications. If the string is empty, the 12-hour format is not supported in the locale.

era Define how years are counted and displayed for each era in a locale. The operand shall consist of <semicolon>-separated strings. Each string shall be an era description segment with the format:

direction:*offset*:*start_date*:*end_date*:*era_name*:*era_format*

according to the definitions below. There can be as many era description segments as are necessary to describe the different eras.

Note: The start of an era might not be the earliest point in the era—it may be the latest. For example, the Christian era BC starts on the day before January 1, AD 1, and increases with earlier time.

direction Either a '+' or a '−' character. The '+' character shall indicate that years closer to the *start_date* have lower numbers than those closer to the *end_date*. The '−' character shall indicate that years closer to the *start_date* have higher numbers than those closer to the *end_date*.

offset The number of the year closest to the *start_date* in the era, corresponding to the %Ey conversion specification.

start_date A date in the form *yyyy*/*mm*/*dd*, where *yyyy*, *mm*, and *dd* are the year, month, and day numbers respectively of the start of the era. Years prior to AD 1 shall be represented as negative numbers.

end_date The ending date of the era, in the same format as the *start_date*, or one of the two special values "−*" or "+*". The value "−*" shall indicate that the ending date is the beginning of time. The value "+*" shall indicate that the ending date is the end of time.

era_name A string representing the name of the era, corresponding to the %EC conversion specification.

era_format A string for formatting the year in the era, corresponding to the %EY conversion specification.

era_d_fmt Define the format of the date in alternative era notation, corresponding to the %Ex conversion specification.

era_t_fmt Define the locale's appropriate alternative time format, corresponding to the %EX conversion specification.

era_d_t_fmt Define the locale's appropriate alternative date and time format, corresponding to the %Ec conversion specification.

alt_digits Define alternative symbols for digits, corresponding to the %O modified conversion specification. The operand shall consist of <semicolon>-separated strings, each surrounded by double-quotes. The first string shall be the alternative symbol corresponding with zero, the second string the symbol corresponding with one, and so on. Up to 100 alternative symbol strings can be specified. The %O modifier shall indicate that the string corresponding to the value specified via the conversion specification shall be used instead of the value.

7.3.5.2 *LC_TIME C-Language Access*

The following constants used to identify items of *langinfo* data can be used as arguments to the *nl_langinfo*() function to access information in the *LC_TIME* category. These constants are defined in the **<langinfo.h>** header.

ABDAY_*x* The abbreviated weekday names (for example, Sun), where *x* is a number from 1 to 7.

DAY_*x* The full weekday names (for example, Sunday), where *x* is a number from 1 to 7.

ABMON_*x* The abbreviated month names (for example, Jan), where *x* is a number from 1 to 12.

MON_*x* The full month names (for example, January), where *x* is a number from 1 to 12.

D_T_FMT The appropriate date and time representation.

D_FMT The appropriate date representation.

T_FMT The appropriate time representation.

AM_STR The appropriate ante-meridiem affix.

PM_STR The appropriate post-meridiem affix.

T_FMT_AMPM The appropriate time representation in the 12-hour clock format with AM_STR and PM_STR.

ERA The era description segments, which describe how years are counted and displayed for each era in a locale. Each era description segment shall have the format:

direction:*offset*:*start_date*:*end_date*:*era_name*:*era_format*

according to the definitions below. There can be as many era description segments as are necessary to describe the different eras. Era description segments are separated by <semicolon> characters.

direction Either a '+' or a '−' character. The '+' character shall indicate that years closer to the *start_date* have lower numbers than those closer to the *end_date*. The '−' character shall indicate that years closer to the *start_date* have higher numbers than those closer to the *end_date*.

offset The number of the year closest to the *start_date* in the era.

start_date A date in the form *yyyy*/*mm*/*dd*, where *yyyy*, *mm*, and *dd* are the year, month, and day numbers respectively of the start of the era. Years prior to AD 1 shall be represented as negative numbers.

end_date The ending date of the era, in the same format as the *start_date*, or one of the two special values "−*" or "+*". The value "−*" shall indicate that the ending date is the beginning of time. The value "+*" shall indicate that the ending date is the end of time.

era_name The era, corresponding to the %EC conversion specification.

era_format The format of the year in the era, corresponding to the %EY conversion specification.

ERA_D_FMT The era date format.

ERA_T_FMT The locale's appropriate alternative time format, corresponding to the %EX conversion specification.

ERA_D_T_FMT The locale's appropriate alternative date and time format, corresponding to the %Ec conversion specification.

ALT_DIGITS The alternative symbols for digits, corresponding to the %O conversion specification modifier. The value consists of <semicolon>-separated symbols. The first is the alternative symbol corresponding to zero, the second is the symbol corresponding to one, and so on. Up to 100 alternative symbols may be specified.

7.3.5.3 *LC_TIME Category in the POSIX Locale*

The *LC_TIME* category definition of the POSIX locale follows; the code listing depicts the *localedef* input; the table represents the same information with the addition of *localedef* keywords, conversion specifiers used by the *date* utility and the *strftime*(), *wcsftime*(), and *strptime*() functions, and *nl_langinfo*() constants.

```
LC_TIME
# This is the POSIX locale definition for
# the LC_TIME category.
#
# Abbreviated weekday names (%a)
abday       "<S><u><n>";"<M><o><n>";"<T><u><e>";"<W><e><d>";\
            "<T><h><u>";"<F><r><i>";"<S><a><t>"
#
# Full weekday names (%A)
day         "<S><u><n><d><a><y>";"<M><o><n><d><a><y>";\

7.3.6 LC_MESSAGES

The *LC_MESSAGES* category shall define the format and values used by various utilities for affirmative and negative responses. This information is available through the *nl_langinfo*( ) function.

The message catalog used by the standard utilities and selected by the *catopen*( ) function shall be determined by the setting of *NLSPATH*; see Chapter 8 (on page 173). The *LC_MESSAGES* category can be specified as part of an *NLSPATH* substitution field.

The following keywords shall be recognized as part of the locale definition file.

copy Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

Note: This is a *localedef* keyword, unavailable through *nl_langinfo*( ).

yesexpr The operand consists of an extended regular expression (see Section 9.4, on page 188) that describes the acceptable affirmative response to a question expecting an affirmative or negative response.

noexpr The operand consists of an extended regular expression that describes the acceptable negative response to a question expecting an affirmative or negative response.

7.3.6.1 *LC_MESSAGES Category in the POSIX Locale*

The format and values for affirmative and negative responses of the POSIX locale follow; the code listing depicting the *localedef* input, the table representing the same information with the addition of *nl_langinfo*( ) constants.

```
LC_MESSAGES
# This is the POSIX locale definition for
# the LC_MESSAGES category.
#
yesexpr "<circumflex><left-square-bracket><y><Y><right-square-bracket>"
#
noexpr  "<circumflex><left-square-bracket><n><N><right-square-bracket>"
#
END LC_MESSAGES
```

localedef Keyword	langinfo Constant	POSIX Locale Value
yesexpr	YESEXPR	"^[yY]"
noexpr	NOEXPR	"^[nN]"

7.4 Locale Definition Grammar

The grammar and lexical conventions in this section shall together describe the syntax for the locale definition source. The general conventions for this style of grammar are described in XCU Section 1.3 (on page 2287). The grammar shall take precedence over the text in this chapter.

7.4.1 Locale Lexical Conventions

The lexical conventions for the locale definition grammar are described in this section.

The following tokens shall be processed (in addition to those string constants shown in the grammar):

LOC_NAME A string of characters representing the name of a locale.

CHAR Any single character.

NUMBER A decimal number, represented by one or more decimal digits.

COLLSYMBOL A symbolic name, enclosed between angle brackets. The string cannot duplicate any charmap symbol defined in the current charmap (if any), or a **COLLELEMENT** symbol.

COLLELEMENT A symbolic name, enclosed between angle brackets, which cannot duplicate either any charmap symbol or a **COLLSYMBOL** symbol.

CHARCLASS A string of alphanumeric characters from the portable character set, the first of which is not a digit, consisting of at least one and at most {CHARCLASS_NAME_MAX} bytes, and optionally surrounded by double-quotes.

CHARSYMBOL A symbolic name, enclosed between angle brackets, from the current charmap (if any).

OCTAL_CHAR One or more octal representations of the encoding of each byte in a single character. The octal representation consists of an escape character (normally a <backslash>) followed by two or more octal digits.

HEX_CHAR One or more hexadecimal representations of the encoding of each byte in a single character. The hexadecimal representation consists of an escape character followed by the constant *x* and two or more hexadecimal digits.

DECIMAL_CHAR One or more decimal representations of the encoding of each byte in a single character. The decimal representation consists of an escape character followed by a character 'd' and two or more decimal digits.

ELLIPSIS	The string "...".
EXTENDED_REG_EXP	An extended regular expression as defined in the grammar in Section 9.5 (on page 191).
EOL	The line termination character <newline>.

7.4.2 Locale Grammar

This section presents the grammar for the locale definition.

```
%token              LOC_NAME
%token              CHAR
%token              NUMBER

5444 *Chapter 8*

5445 # *Environment Variables*

5446 ## 8.1 Environment Variable Definition

5447 Environment variables defined in this chapter affect the operation of multiple utilities, functions,
5448 and applications. There are other environment variables that are of interest only to specific
5449 utilities. Environment variables that apply to a single utility only are defined as part of the
5450 utility description. See the ENVIRONMENT VARIABLES section of the utility descriptions in
5451 the Shell and Utilities volume of POSIX.1-200x for information on environment variable usage.

5452 The value of an environment variable is a string of characters. For a C-language program, an
5453 array of strings called the environment shall be made available when a process begins. The array
5454 is pointed to by the external variable *environ*, which is defined as:

5455 ```
extern char **environ;
```

5456 These strings have the form *name*=*value*; *name*s shall not contain the character '='. For values to
5457 be portable across systems conforming to POSIX.1-200x, the value shall be composed of
5458 characters from the portable character set (except NUL and as indicated below). There is no
5459 meaning associated with the order of strings in the environment. If more than one string in an
5460 environment of a process has the same *name*, the consequences are undefined.

5461 Environment variable names used by the utilities in the Shell and Utilities volume of
5462 POSIX.1-200x consist solely of uppercase letters, digits, and the <underscore> ('_') from the
5463 characters defined in Table 6-1 (on page 125) and do not begin with a digit. Other characters may
5464 be permitted by an implementation; applications shall tolerate the presence of such names.
5465 Uppercase and lowercase letters shall retain their unique identities and shall not be folded
5466 together. The name space of environment variable names containing lowercase letters is
5467 reserved for applications. Applications can define any environment variables with names from
5468 this name space without modifying the behavior of the standard utilities.

5469 **Note:** Other applications may have difficulty dealing with environment variable names that start with
5470 a digit. For this reason, use of such names is not recommended anywhere.

5471 The *values* that the environment variables may be assigned are not restricted except that they are
5472 considered to end with a null byte and the total space used to store the environment and the
5473 arguments to the process is limited to {ARG_MAX} bytes.

5474 Other *name*=*value* pairs may be placed in the environment by, for example, calling any of the
5475 XSI *setenv*(), *unsetenv*(), or *putenv*() functions, manipulating the *environ* variable, or by using *envp*
5476 arguments when creating a process; see *exec* in the System Interfaces volume of POSIX.1-200x.

5477 It is unwise to conflict with certain variables that are frequently exported by widely used
5478 command interpreters and applications:
```

ARFLAGS	*IFS*	*MAILPATH*	*PS1*

If the variables in the following two sections are present in the environment during the execution of an application or utility, they shall be given the meaning described below. Some are placed into the environment by the implementation at the time the user logs in; all can be added or changed by the user or any ancestor of the current process. The implementation adds or changes environment variables named in POSIX.1-200x only as specified in POSIX.1-200x. If they are defined in the application's environment, the utilities in the Shell and Utilities volume of POSIX.1-200x and the functions in the System Interfaces volume of POSIX.1-200x assume they have the specified meaning. Conforming applications shall not set these environment variables to have meanings other than as described. See *getenv*( ) (on page 1008) and XCU Section 2.12 (on page 2331) for methods of accessing these variables.

8.2 Internationalization Variables

This section describes environment variables that are relevant to the operation of internationalized interfaces described in POSIX.1-200x.

Users may use the following environment variables to announce specific localization requirements to applications. Applications can retrieve this information using the *setlocale*( ) function to initialize the correct behavior of the internationalized interfaces. The descriptions of the internationalization environment variables describe the resulting behavior only when the application locale is initialized in this way. The use of the internationalization variables by utilities described in the Shell and Utilities volume of POSIX.1-200x is described in the ENVIRONMENT VARIABLES section for those utilities in addition to the global effects described in this section.

LANG This variable shall determine the locale category for native language, local customs, and coded character set in the absence of the *LC_ALL* and other *LC_** (*LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*) environment variables. This can be used by applications to determine the language to use for error messages and instructions, collating sequences, date formats, and so on.

LC_ALL This variable shall determine the values for all locale categories. The value of the *LC_ALL* environment variable has precedence over any of the other environment variables starting with *LC_* (*LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*) and the *LANG* environment variable.

LC_COLLATE This variable shall determine the locale category for character collation. It determines collation information for regular expressions and sorting, including equivalence classes and multi-character collating elements, in various utilities and the *strcoll*( ) and *strxfrm*( ) functions. Additional semantics of this variable, if any, are implementation-defined.

LC_CTYPE This variable shall determine the locale category for character handling functions, such as *tolower*( ), *toupper*( ), and *isalpha*( ). This environment variable determines the interpretation of sequences of bytes of text data as characters (for example, single as opposed to multi-byte characters), the classification of characters (for example, alpha, digit, graph), and the behavior of character classes. Additional semantics of this variable, if any, are implementation-defined.

LC_MESSAGES This variable shall determine the locale category for processing affirmative and negative responses and the language and cultural conventions in which messages should be written. It also affects the behavior of the *catopen*( ) function in determining the message catalog. Additional semantics of this variable, if any, are implementation-defined. The language and cultural conventions of diagnostic and informative messages whose format is unspecified by POSIX.1-200x should be affected by the setting of *LC_MESSAGES*.

LC_MONETARY This variable shall determine the locale category for monetary-related numeric formatting information. Additional semantics of this variable, if any, are implementation-defined.

LC_NUMERIC This variable shall determine the locale category for numeric formatting (for example, thousands separator and radix character) information in various utilities as well as the formatted I/O operations in *printf*( ) and *scanf*( ) and the string conversion functions in *strtod*( ). Additional semantics of this variable, if any, are implementation-defined.

LC_TIME This variable shall determine the locale category for date and time formatting information. It affects the behavior of the time functions in *strftime*( ). Additional semantics of this variable, if any, are implementation-defined.

NLSPATH This variable shall contain a sequence of templates that the *catopen*( ) function uses when attempting to locate message catalogs. Each template consists of an optional prefix, one or more conversion specifications, a filename, and an optional suffix.

For example:

```
NLSPATH="/system/nlslib/%N.cat"
```

defines that *catopen*( ) should look for all message catalogs in the directory **/system/nlslib**, where the catalog name should be constructed from the *name* parameter passed to *catopen*( ) (`%N`), with the suffix **.cat**.

Conversion specifications consist of a `'%'` symbol, followed by a single-letter keyword. The following keywords are currently defined:

`%N` The value of the *name* parameter passed to *catopen*( ).

`%L` The value of the *LC_MESSAGES* category.

`%l` The *language* element from the *LC_MESSAGES* category.

`%t` The *territory* element from the *LC_MESSAGES* category.

`%c` The *codeset* element from the *LC_MESSAGES* category.

`%%` A single `'%'` character.

An empty string is substituted if the specified value is not currently defined. The separators <underscore> (`'_'`) and <period> (`'.'`) are not included in the `%t` and `%c` conversion specifications.

Templates defined in *NLSPATH* are separated by <colon> characters (`':'`). A leading or two adjacent <colon> characters (`"::"`) is equivalent to specifying `%N`. For example:

```
NLSPATH=":%N.cat:/nlslib/%L/%N.cat"
```

indicates to *catopen*( ) that it should look for the requested message catalog in *name*, *name***.cat**, and **/nlslib/***category***/***name***.cat**, where *category* is the value of the *LC_MESSAGES* category of the current locale.

Users should not set the *NLSPATH* variable unless they have a specific reason to override the default system path. Setting *NLSPATH* to override the default system path produces undefined results in the standard utilities and in applications with appropriate privileges.

The environment variables *LANG*, *LC_ALL*, *LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*, and *NLSPATH* provide for the support of internationalized applications. The standard utilities shall make use of these environment variables as described in this section and the individual ENVIRONMENT VARIABLES sections for the utilities. If these variables specify locale categories that are not based upon the same underlying codeset, the results are unspecified.

The values of locale categories shall be determined by a precedence order; the first condition met below determines the value:

1. If the *LC_ALL* environment variable is defined and is not null, the value of *LC_ALL* shall be used.
2. If the *LC_** environment variable (*LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*) is defined and is not null, the value of the environment variable shall be used to initialize the category that corresponds to the environment variable.
3. If the *LANG* environment variable is defined and is not null, the value of the *LANG* environment variable shall be used.
4. If the *LANG* environment variable is not set or is set to the empty string, the implementation-defined default locale shall be used.

If the locale value is `"C"` or `"POSIX"`, the POSIX locale shall be used and the standard utilities behave in accordance with the rules in Section 7.2 (on page 136) for the associated category.

If the locale value begins with a <slash>, it shall be interpreted as the pathname of a file that was created in the output format used by the *localedef* utility; see OUTPUT FILES under *localedef*. Referencing such a pathname shall result in that locale being used for the indicated category.

XSI If the locale value has the form:

***language*[_*territory*][.*codeset*]**

it refers to an implementation-provided locale, where settings of language, territory, and codeset are implementation-defined.

LC_COLLATE, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, and *LC_TIME* are defined to accept an additional field *@modifier*, which allows the user to select a specific instance of localization data within a single category (for example, for selecting the dictionary as opposed to the character ordering of data). The syntax for these environment variables is thus defined as:

[*language*[_*territory*][.*codeset*][@*modifier*]]

For example, if a user wanted to interact with the system in French, but required to sort German text files, *LANG* and *LC_COLLATE* could be defined as:

```
LANG=Fr_FR
LC_COLLATE=De_DE
```

This could be extended to select dictionary collation (say) by use of the *@modifier* field; for example:

```
LC_COLLATE=De_DE@dict
```

An implementation may support other formats.

If the locale value is not recognized by the implementation, the behavior is unspecified.

At runtime, these values are bound to the locale of a process by calling the *setlocale*( ) function.

Additional criteria for determining a valid locale name are implementation-defined.

8.3 Other Environment Variables

COLUMNS This variable shall represent a decimal integer >0 used to indicate the user's preferred width in column positions for the terminal screen or window; see Section 3.103 (on page 50). If this variable is unset or null, the implementation determines the number of columns, appropriate for the terminal or window, in an unspecified manner. When *COLUMNS* is set, any terminal-width information implied by *TERM* is overridden. Users and conforming applications should not set *COLUMNS* unless they wish to override the system selection and produce output unrelated to the terminal characteristics.

Users should not need to set this variable in the environment unless there is a specific reason to override the implementation's default behavior, such as to display data in an area arbitrarily smaller than the terminal or window.

XSI *DATEMSK* Indicates the pathname of the template file used by *getdate*( ).

HOME The system shall initialize this variable at the time of login to be a pathname of the user's home directory. See **<pwd.h>**.

LINES This variable shall represent a decimal integer >0 used to indicate the user's preferred number of lines on a page or the vertical screen or window size in lines. A line in this case is a vertical measure large enough to hold the tallest character in the character set being displayed. If this variable is unset or null, the implementation determines the number of lines, appropriate for the

terminal or window (size, terminal baud rate, and so on), in an unspecified manner. When *LINES* is set, any terminal-height information implied by *TERM* is overridden. Users and conforming applications should not set *LINES* unless they wish to override the system selection and produce output unrelated to the terminal characteristics.

Users should not need to set this variable in the environment unless there is a specific reason to override the implementation's default behavior, such as to display data in an area arbitrarily smaller than the terminal or window.

LOGNAME The system shall initialize this variable at the time of login to be the user's login name. See **<pwd.h>**. For a value of *LOGNAME* to be portable across implementations of POSIX.1-200x, the value should be composed of characters from the portable filename character set.

XSI *MSGVERB* Describes which message components shall be used in writing messages by *fmtmsg*( ).

PATH This variable shall represent the sequence of path prefixes that certain functions and utilities apply in searching for an executable file known only by a filename. The prefixes shall be separated by a <colon> (':'). When a non-zero-length prefix is applied to this filename, a <slash> shall be inserted between the prefix and the filename. A zero-length prefix is a legacy feature that indicates the current working directory. It appears as two adjacent <colon> characters ("::"), as an initial <colon> preceding the rest of the list, or as a trailing <colon> following the rest of the list. A strictly conforming application shall use an actual pathname (such as .) to represent the current working directory in *PATH*. The list shall be searched from beginning to end, applying the filename to each prefix, until an executable file with the specified name and appropriate execution permissions is found. If the pathname being sought contains a <slash>, the search through the path prefixes shall not be performed. If the pathname begins with a <slash>, the specified path is resolved (see Section 4.12, on page 111). If *PATH* is unset or is set to null, the path search is implementation-defined.

PWD This variable shall represent an absolute pathname of the current working directory. It shall not contain any components that are dot or dot-dot. The value is set by the *cd* utility, and by the *sh* utility during initialization.

SHELL This variable shall represent a pathname of the user's preferred command language interpreter. If this interpreter does not conform to the Shell Command Language in XCU Chapter 2 (on page 2297), utilities may behave differently from those described in POSIX.1-200x.

TMPDIR This variable shall represent a pathname of a directory made available for programs that need a place to create temporary files.

TERM This variable shall represent the terminal type for which output is to be prepared. This information is used by utilities and application programs wishing to exploit special capabilities specific to a terminal. The format and allowable values of this environment variable are unspecified.

TZ This variable shall represent timezone information. The contents of the environment variable named *TZ* shall be used by the *ctime*( ), *ctime_r*( ), *localtime*( ), *localtime_r*( ) *strftime*( ), *mktime*( ), functions, and by various utilities, to override the default timezone. The value of *TZ* has one of the two forms (spaces inserted for clarity):

5704 `:characters`

5705 or:

5706 `std offset dst offset, rule`

5707 If *TZ* is of the first format (that is, if the first character is a <colon>), the
5708 characters following the <colon> are handled in an implementation-defined
5709 manner.

5710 The expanded format (for all *TZ*s whose value does not have a <colon> as the
5711 first character) is as follows:

5712 `stdoffset[dst[offset][,start[/time],end[/time]]]`

5713 Where:

5714 *std* and *dst* Indicate no less than three, nor more than {TZNAME_MAX},
5715 bytes that are the designation for the standard (*std*) or the
5716 alternative (*dst*—such as Daylight Savings Time) timezone. Only
5717 *std* is required; if *dst* is missing, then the alternative time does
5718 not apply in this locale.

5719 Each of these fields may occur in either of two formats quoted or
5720 unquoted:

5721 — In the quoted form, the first character shall be the <less-
5722 than-sign> (`'<'`) character and the last character shall be
5723 the <greater-than-sign> (`'>'`) character. All characters
5724 between these quoting characters shall be alphanumeric
5725 characters from the portable character set in the current
5726 locale, the <plus-sign> (`'+'`) character, or the minus-sign
5727 (`'-'`) character. The *std* and *dst* fields in this case shall not
5728 include the quoting characters.

5729 — In the unquoted form, all characters in these fields shall be
5730 alphabetic characters from the portable character set in the
5731 current locale.

5732 The interpretation of these fields is unspecified if either field is
5733 less than three bytes (except for the case when *dst* is missing),
5734 more than {TZNAME_MAX} bytes, or if they contain characters
5735 other than those specified.

5736 *offset* Indicates the value added to the local time to arrive at
5737 Coordinated Universal Time. The *offset* has the form:

5738 `hh[:mm[:ss]]`

5739 The minutes (*mm*) and seconds (*ss*) are optional. The hour (*hh*)
5740 shall be required and may be a single digit. The *offset* following
5741 *std* shall be required. If no *offset* follows *dst*, the alternative time
5742 is assumed to be one hour ahead of standard time. One or more
5743 digits may be used; the value is always interpreted as a decimal
5744 number. The hour shall be between zero and 24, and the minutes
5745 (and seconds)—if present—between zero and 59. The result of
5746 using values outside of this range is unspecified. If preceded by
5747 a `'-'`, the timezone shall be east of the Prime Meridian;
5748 otherwise, it shall be west (which may be indicated by an
5749 optional preceding `'+'`).

rule Indicates when to change to and back from the alternative time. The *rule* has the form:

`date[/time],date[/time]`

where the first *date* describes when the change from standard to alternative time occurs and the second *date* describes when the change back happens. Each *time* field describes when, in current local time, the change to the other time is made.

The format of *date* is one of the following:

J*n* The Julian day *n* ($1 \le n \le 365$). Leap days shall not be counted. That is, in all years—including leap years—February 28 is day 59 and March 1 is day 60. It is impossible to refer explicitly to the occasional February 29.

n The zero-based Julian day ($0 \le n \le 365$). Leap days shall be counted, and it is possible to refer to February 29.

M*m.n.d* The *d*'th day ($0 \le d \le 6$) of week *n* of month *m* of the year ($1 \le n \le 5$, $1 \le m \le 12$, where week 5 means "the last *d* day in month *m*" which may occur in either the fourth or the fifth week). Week 1 is the first week in which the *d*'th day occurs. Day zero is Sunday.

The *time* has the same format as *offset* except that no leading sign (`'-'` or `'+'`) is allowed. The default, if *time* is not given, shall be 02:00:00.

5773 *Chapter 9*

5774 # *Regular Expressions*

5775 Regular Expressions (REs) provide a mechanism to select specific strings from a set of character
5776 strings.

5777 Regular expressions are a context-independent syntax that can represent a wide variety of
5778 character sets and character set orderings, where these character sets are interpreted according
5779 to the current locale. While many regular expressions can be interpreted differently depending
5780 on the current locale, many features, such as character class expressions, provide for contextual
5781 invariance across locales.

5782 The Basic Regular Expression (BRE) notation and construction rules in Section 9.3 (on page 183)
5783 shall apply to most utilities supporting regular expressions. Some utilities, instead, support the
5784 Extended Regular Expressions (ERE) described in Section 9.4 (on page 188); any exceptions for
5785 both cases are noted in the descriptions of the specific utilities using regular expressions. Both
5786 BREs and EREs are supported by the Regular Expression Matching interface in the System
5787 Interfaces volume of POSIX.1-200x under *regcomp*( ), *regexec*( ), and related functions.

5788 ## 9.1 Regular Expression Definitions

5789 For the purposes of this section, the following definitions shall apply:

5790 **entire regular expression**
5791 The concatenated set of one or more BREs or EREs that make up the pattern specified for
5792 string selection.

5793 **matched**
5794 A sequence of zero or more characters shall be said to be matched by a BRE or ERE when
5795 the characters in the sequence correspond to a sequence of characters defined by the
5796 pattern.

5797 Matching shall be based on the bit pattern used for encoding the character, not on the
5798 graphic representation of the character. This means that if a character set contains two or
5799 more encodings for a graphic symbol, or if the strings searched contain text encoded in
5800 more than one codeset, no attempt is made to search for any other representation of the
5801 encoded symbol. If that is required, the user can specify equivalence classes containing all
5802 variations of the desired graphic symbol.

5803 The search for a matching sequence starts at the beginning of a string and stops when the
5804 first sequence matching the expression is found, where "first" is defined to mean "begins
5805 earliest in the string". If the pattern permits a variable number of matching characters and
5806 thus there is more than one such sequence starting at that point, the longest such sequence
5807 is matched. For example, the BRE `"bb*"` matches the second to fourth characters of the
5808 string `"abbbc"`, and the ERE `"(wee|week)(knights|night)"` matches all ten
5809 characters of the string `"weeknights"`.

5810 Consistent with the whole match being the longest of the leftmost matches, each subpattern,
5811 from left to right, shall match the longest possible string. For this purpose, a null string shall
5812 be considered to be longer than no match at all. For example, matching the BRE

"\(.*\).*" against "abcdef", the subexpression "(\1)" is "abcdef", and matching the BRE "\(a*\)*" against "bc", the subexpression "(\1)" is the null string.

When a multi-character collating element in a bracket expression (see Section 9.3.5, on page 184) is involved, the longest sequence shall be measured in characters consumed from the string to be matched; that is, the collating element counts not as one element, but as the number of characters it matches.

BRE (ERE) matching a single character
A BRE or ERE that shall match either a single character or a single collating element.

Only a BRE or ERE of this type that includes a bracket expression (see Section 9.3.5, on page 184) can match a collating element.

BRE (ERE) matching multiple characters
A BRE or ERE that shall match a concatenation of single characters or collating elements.

Such a BRE or ERE is made up from a BRE (ERE) matching a single character and BRE (ERE) special characters.

invalid
This section uses the term "invalid" for certain constructs or conditions. Invalid REs shall cause the utility or function using the RE to generate an error condition. When invalid is not used, violations of the specified syntax or semantics for REs produce undefined results: this may entail an error, enabling an extended syntax for that RE, or using the construct in error as literal characters to be matched. For example, the BRE construct "\{1,2,3\}" does not comply with the grammar. A conforming application cannot rely on it producing an error nor matching the literal characters "\{1,2,3\}".

9.2 Regular Expression General Requirements

The requirements in this section shall apply to both basic and extended regular expressions.

The use of regular expressions is generally associated with text processing. REs (BREs and EREs) operate on text strings; that is, zero or more characters followed by an end-of-string delimiter (typically NUL). Some utilities employing regular expressions limit the processing to lines; that is, zero or more characters followed by a <newline>. In the regular expression processing described in POSIX.1-200x, the <newline> is regarded as an ordinary character and both a <period> and a non-matching list can match one. The Shell and Utilities volume of POSIX.1-200x specifies within the individual descriptions of those standard utilities employing regular expressions whether they permit matching of <newline> characters; if not stated otherwise, the use of literal <newline> characters or any escape sequence equivalent produces undefined results. Those utilities (like *grep*) that do not allow <newline> characters to match are responsible for eliminating any <newline> from strings before matching against the RE. The *regcomp*() function in the System Interfaces volume of POSIX.1-200x, however, can provide support for such processing without violating the rules of this section.

The interfaces specified in POSIX.1-200x do not permit the inclusion of a NUL character in an RE or in the string to be matched. If during the operation of a standard utility a NUL is included in the text designated to be matched, that NUL may designate the end of the text string for the purposes of matching.

When a standard utility or function that uses regular expressions specifies that pattern matching shall be performed without regard to the case (uppercase or lowercase) of either data or patterns, then when each character in the string is matched against the pattern, not only the

5857 character, but also its case counterpart (if any), shall be matched. This definition of case-
5858 insensitive processing is intended to allow matching of multi-character collating elements as
5859 well as characters, as each character in the string is matched using both its cases. For example, in
5860 a locale where `"Ch"` is a multi-character collating element and where a matching list expression
5861 matches such elements, the RE `"[[.Ch.]]"` when matched against the string `"char"` is in
5862 reality matched against `"ch"`, `"Ch"`, `"cH"`, and `"CH"`.

5863 The implementation shall support any regular expression that does not exceed 256 bytes in
5864 length.

5865 9.3 Basic Regular Expressions

5866 9.3.1 BREs Matching a Single Character or Collating Element

5867 A BRE ordinary character, a special character preceded by a <backslash>, or a <period> shall
5868 match a single character. A bracket expression shall match a single character or a single collating
5869 element.

5870 9.3.2 BRE Ordinary Characters

5871 An ordinary character is a BRE that matches itself: any character in the supported character set,
5872 except for the BRE special characters listed in Section 9.3.3.

5873 The interpretation of an ordinary character preceded by a <backslash> (`'\\'`) is undefined,
5874 except for:

5875 • The characters `')'`, `'('`, `'{'`, and `'}'`

5876 • The digits 1 to 9 inclusive (see Section 9.3.6, on page 186)

5877 • A character inside a bracket expression

5878 9.3.3 BRE Special Characters

5879 A BRE special character has special properties in certain contexts. Outside those contexts, or
5880 when preceded by a <backslash>, such a character is a BRE that matches the special character
5881 itself. The BRE special characters and the contexts in which they have their special meaning are
5882 as follows:

5883 `.[\` The <period>, <left-square-bracket>, and <backslash> shall be special except when
5884 used in a bracket expression (see Section 9.3.5, on page 184). An expression containing
5885 a `'['` that is not preceded by a <backslash> and is not part of a bracket expression
5886 produces undefined results.

5887 * The <asterisk> shall be special except when used:

5888 — In a bracket expression

5889 — As the first character of an entire BRE (after an initial `'^'`, if any)

— As the first character of a subexpression (after an initial '^', if any); see Section 9.3.6 (on page 186)

^ The <circumflex> shall be special when used as:

— An anchor (see Section 9.3.8, on page 187)

— The first character of a bracket expression (see Section 9.3.5)

$ The <dollar-sign> shall be special when used as an anchor.

9.3.4 Periods in BREs

A <period> ('.'), when used outside a bracket expression, is a BRE that shall match any character in the supported character set except NUL.

9.3.5 RE Bracket Expression

A bracket expression (an expression enclosed in square brackets, "[]") is an RE that shall match a single collating element contained in the non-empty set of collating elements represented by the bracket expression.

The following rules and definitions apply to bracket expressions:

1. A bracket expression is either a matching list expression or a non-matching list expression. It consists of one or more expressions: collating elements, collating symbols, equivalence classes, character classes, or range expressions. The <right-square-bracket> (']') shall lose its special meaning and represent itself in a bracket expression if it occurs first in the list (after an initial <circumflex> ('^'), if any). Otherwise, it shall terminate the bracket expression, unless it appears in a collating symbol (such as "[.].]") or is the ending <right-square-bracket> for a collating symbol, equivalence class, or character class. The special characters '.', '*', '[', and '\\' (<period>, <asterisk>, <left-square-bracket>, and <backslash>, respectively) shall lose their special meaning within a bracket expression.

   The character sequences "[.", "[=", and "[:" (<left-square-bracket> followed by a <period>, <equals-sign>, or <colon>) shall be special inside a bracket expression and are used to delimit collating symbols, equivalence class expressions, and character class expressions. These symbols shall be followed by a valid expression and the matching terminating sequence ".]", "=]", or ":]", as described in the following items.

2. A matching list expression specifies a list that shall match any single-character collating element in any of the expressions represented in the list. The first character in the list shall not be the <circumflex>; for example, "[abc]" is an RE that matches any of the characters 'a', 'b', or 'c'. It is unspecified whether a matching list expression matches a multi-character collating element that is matched by one of the expressions.

3. A non-matching list expression begins with a <circumflex> ('^'), and specifies a list that shall match any single-character collating element except for the expressions represented in the list after the leading <circumflex>. For example, "[^abc]" is an RE that matches any character except the characters 'a', 'b', or 'c'. It is unspecified whether a non-matching list expression matches a multi-character collating element that is not matched by any of the expressions. The <circumflex> shall have this special meaning only when it occurs first in the list, immediately following the <left-square-bracket>.

4. A collating symbol is a collating element enclosed within bracket-period ("[." and ".]") delimiters. Collating elements are defined as described in Section 7.3.2.4 (on page 149). Conforming applications shall represent multi-character collating elements as collating symbols when it is necessary to distinguish them from a list of the individual characters that make up the multi-character collating element. For example, if the string "ch" is a collating element defined using the line:

   ```
   collating-element <ch-digraph> from "<c><h>"
   ```

   in the locale definition, the expression "[[.ch.]]" shall be treated as an RE containing the collating symbol 'ch', while "[ch]" shall be treated as an RE matching 'c' or 'h'. Collating symbols are recognized only inside bracket expressions. If the string is not a collating element in the current locale, the expression is invalid.

5. An equivalence class expression shall represent the set of collating elements belonging to an equivalence class, as described in Section 7.3.2.4 (on page 149). Only primary equivalence classes shall be recognized. The class shall be expressed by enclosing any one of the collating elements in the equivalence class within bracket-equal ("[=" and "=]") delimiters. For example, if 'a', 'à', and 'â' belong to the same equivalence class, then "[[=a=]b]", "[[=à=]b]", and "[[=â=]b]" are each equivalent to "[aàâb]". If the collating element does not belong to an equivalence class, the equivalence class expression shall be treated as a collating symbol.

6. A character class expression shall represent the union of two sets:

   a. The set of single-character collating elements whose characters belong to the character class, as defined in the *LC_CTYPE* category in the current locale.

   b. An unspecified set of multi-character collating elements.

   All character classes specified in the current locale shall be recognized. A character class expression is expressed as a character class name enclosed within bracket-<colon> ("[:" and ":]") delimiters.

   The following character class expressions shall be supported in all locales:

   ```
   [:alnum:]   [:cntrl:]   [:lower:]   [:space:]
   [:alpha:]   [:digit:]   [:print:]   [:upper:]
   [:blank:]   [:graph:]   [:punct:]   [:xdigit:]
   ```

   In addition, character class expressions of the form:

   ```
   [:name:]
   ```

   are recognized in those locales where the *name* keyword has been given a **charclass** definition in the *LC_CTYPE* category.

7. In the POSIX locale, a range expression represents the set of collating elements that fall between two elements in the collation sequence, inclusive. In other locales, a range expression has unspecified behavior: strictly conforming applications shall not rely on whether the range expression is valid, or on the set of collating elements matched. A range expression shall be expressed as the starting point and the ending point separated by a <hyphen> ('-').

   In the following, all examples assume the POSIX locale.

   The starting range point and the ending range point shall be a collating element or collating symbol. An equivalence class expression used as a starting or ending point of a range expression produces unspecified results. An equivalence class can be used portably within a bracket expression, but only outside the range. If the represented set of collating

elements is empty, it is unspecified whether the expression matches nothing, or is treated as invalid.

The interpretation of range expressions where the ending range point is also the starting range point of a subsequent range expression (for example, "[a–m–o]") is undefined.

The <hyphen> character shall be treated as itself if it occurs first (after an initial '^', if any) or last in the list, or as an ending range point in a range expression. As examples, the expressions "[–ac]" and "[ac–]" are equivalent and match any of the characters 'a', 'c', or '–'; "[^–ac]" and "[^ac–]" are equivalent and match any characters except 'a', 'c', or '–'; the expression "[%––]" matches any of the characters between '%' and '–' inclusive; the expression "[––@]" matches any of the characters between '–' and '@' inclusive; and the expression "[a––@]" is either invalid or equivalent to '@', because the letter 'a' follows the symbol '–' in the POSIX locale. To use a <hyphen> as the starting range point, it shall either come first in the bracket expression or be specified as a collating symbol; for example, "[][.–.]–0]", which matches either a <right-square-bracket> or any character or collating element that collates between <hyphen> and 0, inclusive.

If a bracket expression specifies both '–' and ']', the ']' shall be placed first (after the '^', if any) and the '–' last within the bracket expression.

9.3.6 BREs Matching Multiple Characters

The following rules can be used to construct BREs matching multiple characters from BREs matching a single character:

1. The concatenation of BREs shall match the concatenation of the strings matched by each component of the BRE.

2. A subexpression can be defined within a BRE by enclosing it between the character pairs "\(" and "\)". Such a subexpression shall match whatever it would have matched without the "\(" and "\)", except that anchoring within subexpressions is optional behavior; see Section 9.3.8 (on page 187). Subexpressions can be arbitrarily nested.

3. The back-reference expression '\n' shall match the same (possibly empty) string of characters as was matched by a subexpression enclosed between "\(" and "\)" preceding the '\n'. The character 'n' shall be a digit from 1 through 9, specifying the *n*th subexpression (the one that begins with the *n*th "\(" from the beginning of the pattern and ends with the corresponding paired "\)"). The expression is invalid if less than *n* subexpressions precede the '\n'. The string matched by a contained subexpression shall be within the string matched by the containing subexpression. If the containing subexpression does not match, or if there is no match for the contained subexpression within the string matched by the containing subexpression, then back-reference expressions corresponding to the contained subexpression shall not match. When a subexpression matches more than one string, a back-reference expression corresponding to the subexpression shall refer to the last matched string. For example, the expression "^\(.*\)\1$" matches lines consisting of two adjacent appearances of the same string, and the expression "\(a\)*\1" fails to match 'a', the expression "\(a\(b\)*\)*\2" fails to match 'abab', and the expression "^\(ab*\)*\1$" matches 'abababbab', but fails to match 'abababab'.

4. When a BRE matching a single character, a subexpression, or a back-reference is followed by the special character <asterisk> ('*'), together with that <asterisk> it shall match what zero or more consecutive occurrences of the BRE would match. For example, "[ab]*" and "[ab][ab]" are equivalent when matching the string "ab".

5. When a BRE matching a single character, a subexpression, or a back-reference is followed by an interval expression of the format `"\{m\}"`, `"\{m,\}"`, or `"\{m,n\}"`, together with that interval expression it shall match what repeated consecutive occurrences of the BRE would match. The values of *m* and *n* are decimal integers in the range 0 ≤*m*≤*n*≤{RE_DUP_MAX}, where *m* specifies the exact or minimum number of occurrences and *n* specifies the maximum number of occurrences. The expression `"\{m\}"` shall match exactly *m* occurrences of the preceding BRE, `"\{m,\}"` shall match at least *m* occurrences, and `"\{m,n\}"` shall match any number of occurrences between *m* and *n*, inclusive.

   For example, in the string `"abababccccccd"` the BRE `"c\{3\}"` is matched by characters seven to nine, the BRE `"\(ab\)\{4,\}"` is not matched at all, and the BRE `"c\{1,3\}d"` is matched by characters ten to thirteen.

The behavior of multiple adjacent duplication symbols (`'*'` and intervals) produces undefined results.

A subexpression repeated by an <asterisk> (`'*'`) or an interval expression shall not match a null expression unless this is the only match for the repetition or it is necessary to satisfy the exact or minimum number of occurrences for the interval expression.

9.3.7 BRE Precedence

The order of precedence shall be as shown in the following table:

BRE Precedence (from high to low)	
Collation-related bracket symbols	`[==] [::] [..]`
Escaped characters	`\<special character>`
Bracket expression	`[]`
Subexpressions/back-references	`\(\) \n`
Single-character-BRE duplication	`* \{m,n\}`
Concatenation	
Anchoring	`^ $`

9.3.8 BRE Expression Anchoring

A BRE can be limited to matching strings that begin or end a line; this is called "anchoring". The <circumflex> and <dollar-sign> special characters shall be considered BRE anchors in the following contexts:

1. A <circumflex> (`'^'`) shall be an anchor when used as the first character of an entire BRE. The implementation may treat the <circumflex> as an anchor when used as the first character of a subexpression. The <circumflex> shall anchor the expression (or optionally subexpression) to the beginning of a string; only sequences starting at the first character of a string shall be matched by the BRE. For example, the BRE `"^ab"` matches `"ab"` in the string `"abcdef"`, but fails to match in the string `"cdefab"`. The BRE `"\(^ab\)"` may match the former string. A portable BRE shall escape a leading <circumflex> in a subexpression to match a literal circumflex.

2. A <dollar-sign> (`'$'`) shall be an anchor when used as the last character of an entire BRE. The implementation may treat a <dollar-sign> as an anchor when used as the last character of a subexpression. The <dollar-sign> shall anchor the expression (or optionally subexpression) to the end of the string being matched; the <dollar-sign> can be said to match the end-of-string following the last character.

3. A BRE anchored by both `'^'` and `'$'` shall match only an entire string. For example, the BRE `"^abcdef$"` matches strings consisting only of `"abcdef"`.

9.4 Extended Regular Expressions

The extended regular expression (ERE) notation and construction rules shall apply to utilities defined as using extended regular expressions; any exceptions to the following rules are noted in the descriptions of the specific utilities using EREs.

9.4.1 EREs Matching a Single Character or Collating Element

An ERE ordinary character, a special character preceded by a <backslash,> or a <period> shall match a single character. A bracket expression shall match a single character or a single collating element. An ERE matching a single character enclosed in parentheses shall match the same as the ERE without parentheses would have matched.

9.4.2 ERE Ordinary Characters

An ordinary character is an ERE that matches itself. An ordinary character is any character in the supported character set, except for the ERE special characters listed in Section 9.4.3. The interpretation of an ordinary character preceded by a <backslash> (`'\\'`) is undefined.

9.4.3 ERE Special Characters

An ERE special character has special properties in certain contexts. Outside those contexts, or when preceded by a <backslash>, such a character shall be an ERE that matches the special character itself. The extended regular expression special characters and the contexts in which they shall have their special meaning are as follows:

`. [ \ (` The <period>, <left-square-bracket>, <backslash>, and <left-parenthesis> shall be special except when used in a bracket expression (see Section 9.3.5, on page 184). Outside a bracket expression, a <left-parenthesis> immediately followed by a <right-parenthesis> produces undefined results.

`)` The <right-parenthesis> shall be special when matched with a preceding <left-parenthesis>, both outside a bracket expression.

`* + ? {` The <asterisk>, <plus-sign>, <question-mark>, and <left-brace> shall be special except when used in a bracket expression (see Section 9.3.5, on page 184). Any of the following uses produce undefined results:

- If these characters appear first in an ERE, or immediately following a <vertical-line>, <circumflex>, or <left-parenthesis>
- If a <left-brace> is not part of a valid interval expression (see Section 9.4.6, on page 189)

`|` The <vertical-line> is special except when used in a bracket expression (see Section 9.3.5, on page 184). A <vertical-line> appearing first or last in an ERE, or immediately following a <vertical-line> or a <left-parenthesis>, or immediately preceding a <right-parenthesis>, produces undefined results.

^ The <circumflex> shall be special when used as:

— An anchor (see Section 9.4.9, on page 190)

— The first character of a bracket expression (see Section 9.3.5, on page 184)

$ The <dollar-sign> shall be special when used as an anchor.

9.4.4 Periods in EREs

A <period> (`'.'`), when used outside a bracket expression, is an ERE that shall match any character in the supported character set except NUL.

9.4.5 ERE Bracket Expression

The rules for ERE Bracket Expressions are the same as for Basic Regular Expressions; see Section 9.3.5 (on page 184).

9.4.6 EREs Matching Multiple Characters

The following rules shall be used to construct EREs matching multiple characters from EREs matching a single character:

1. A concatenation of EREs shall match the concatenation of the character sequences matched by each component of the ERE. A concatenation of EREs enclosed in parentheses shall match whatever the concatenation without the parentheses matches. For example, both the ERE `"cd"` and the ERE `"(cd)"` are matched by the third and fourth character of the string `"abcdefabcdef"`.

2. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character <plus-sign> (`'+'`), together with that <plus-sign> it shall match what one or more consecutive occurrences of the ERE would match. For example, the ERE `"b+(bc)"` matches the fourth to seventh characters in the string `"acabbbcde"`. And, `"[ab]+"` and `"[ab][ab]*"` are equivalent.

3. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character <asterisk> (`'*'`), together with that <asterisk> it shall match what zero or more consecutive occurrences of the ERE would match. For example, the ERE `"b*c"` matches the first character in the string `"cabbbcde"`, and the ERE `"b*cd"` matches the third to seventh characters in the string `"cabbbcdebbbbbbcdbc"`. And, `"[ab]*"` and `"[ab][ab]"` are equivalent when matching the string `"ab"`.

4. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character <question-mark> (`'?'`), together with that <question-mark> it shall match what zero or one consecutive occurrences of the ERE would match. For example, the ERE `"b?c"` matches the second character in the string `"acabbbcde"`.

5. When an ERE matching a single character or an ERE enclosed in parentheses is followed by an interval expression of the format `"{m}"`, `"{m,}"`, or `"{m,n}"`, together with that interval expression it shall match what repeated consecutive occurrences of the ERE would match. The values of *m* and *n* are decimal integers in the range $0 \le m \le n \le \{RE\_DUP\_MAX\}$, where *m* specifies the exact or minimum number of occurrences and *n* specifies the maximum number of occurrences. The expression `"{m}"` matches exactly *m* occurrences of the preceding ERE, `"{m,}"` matches at least *m* occurrences, and `"{m,n}"` matches any number of occurrences between *m* and *n*, inclusive.

For example, in the string "abababccccccd" the ERE "c{3}" is matched by characters seven to nine and the ERE "(ab){2,}" is matched by characters one to six.

The behavior of multiple adjacent duplication symbols ('+', '*', '?', and intervals) produces undefined results.

An ERE matching a single character repeated by an '*', '?', or an interval expression shall not match a null expression unless this is the only match for the repetition or it is necessary to satisfy the exact or minimum number of occurrences for the interval expression.

9.4.7 ERE Alternation

Two EREs separated by the special character <vertical-line> ('|') shall match a string that is matched by either. For example, the ERE "a((bc)|d)" matches the string "abc" and the string "ad". Single characters, or expressions matching single characters, separated by the <vertical-line> and enclosed in parentheses, shall be treated as an ERE matching a single character.

9.4.8 ERE Precedence

The order of precedence shall be as shown in the following table:

ERE Precedence (from high to low)	
Collation-related bracket symbols	[==] [::] [..]
Escaped characters	\<special character>
Bracket expression	[]
Grouping	()
Single-character-ERE duplication	* + ? {m,n}
Concatenation	
Anchoring	^ $
Alternation	|

For example, the ERE "abba|cde" matches either the string "abba" or the string "cde" (rather than the string "abbade" or "abbcde", because concatenation has a higher order of precedence than alternation).

9.4.9 ERE Expression Anchoring

An ERE can be limited to matching strings that begin or end a line; this is called "anchoring". The <circumflex> and <dollar-sign> special characters shall be considered ERE anchors when used anywhere outside a bracket expression. This shall have the following effects:

1. A <circumflex> ('^') outside a bracket expression shall anchor the expression or subexpression it begins to the beginning of a string; such an expression or subexpression can match only a sequence starting at the first character of a string. For example, the EREs "^ab" and "(^ab)" match "ab" in the string "abcdef", but fail to match in the string "cdefab", and the ERE "a^b" is valid, but can never match because the 'a' prevents the expression "^b" from matching starting at the first character.

2. A <dollar-sign> ('$') outside a bracket expression shall anchor the expression or subexpression it ends to the end of a string; such an expression or subexpression can match only a sequence ending at the last character of a string. For example, the EREs "ef$" and "(ef$)" match "ef" in the string "abcdef", but fail to match in the string

"cdefab", and the ERE "e$f" is valid, but can never match because the 'f' prevents the expression "e$" from matching ending at the last character.

9.5 Regular Expression Grammar

Grammars describing the syntax of both basic and extended regular expressions are presented in this section. The grammar takes precedence over the text. See XCU Section 1.3 (on page 2287).

9.5.1 BRE/ERE Grammar Lexical Conventions

The lexical conventions for regular expressions are as described in this section.

Except as noted, the longest possible token or delimiter beginning at a given point is recognized.

The following tokens are processed (in addition to those string constants shown in the grammar):

COLL_ELEM_SINGLE Any single-character collating element, unless it is a **META_CHAR**.

COLL_ELEM_MULTI Any multi-character collating element.

BACKREF Applicable only to basic regular expressions. The character string consisting of a <backslash> character followed by a single-digit numeral, '1' to '9'.

DUP_COUNT Represents a numeric constant. It shall be an integer in the range 0 ≤**DUP_COUNT** ≤{RE_DUP_MAX}. This token is only recognized when the context of the grammar requires it. At all other times, digits not preceded by a <backslash> character are treated as **ORD_CHAR**.

META_CHAR One of the characters:

^ When found first in a bracket expression

– When found anywhere but first (after an initial '^', if any) or last in a bracket expression, or as the ending range point in a range expression

] When found anywhere but first (after an initial '^', if any) in a bracket expression

L_ANCHOR Applicable only to basic regular expressions. The character '^' when it appears as the first character of a basic regular expression and when not **QUOTED_CHAR**. The '^' may be recognized as an anchor elsewhere; see Section 9.3.8 (on page 187).

ORD_CHAR A character, other than one of the special characters in **SPEC_CHAR**.

QUOTED_CHAR In a BRE, one of the character sequences:

```
\^    \.    \*    \[    \$    \\
```

In an ERE, one of the character sequences:

```
\^    \.    \[    \$    \(    \)    \|
\*    \+    \?    \{    \\
```

R_ANCHOR (Applicable only to basic regular expressions.) The character '$' when it appears as the last character of a basic regular expression and when not **QUOTED_CHAR**. The '$' may be recognized as an anchor elsewhere; see Section 9.3.8 (on page 187).

SPEC_CHAR For basic regular expressions, one of the following special characters:

.	Anywhere outside bracket expressions
\	Anywhere outside bracket expressions
[	Anywhere outside bracket expressions
^	When used as an anchor (see Section 9.3.8, on page 187) or when first in a bracket expression
$	When used as an anchor
*	Anywhere except first in an entire RE, anywhere in a bracket expression, directly following "\(", directly following an anchoring '^'

For extended regular expressions, shall be one of the following special characters found anywhere outside bracket expressions:

```
^    .    [    $    (    )    |
*    +    ?    {    \
```

(The close-parenthesis shall be considered special in this context only if matched with a preceding open-parenthesis.)

9.5.2 RE and Bracket Expression Grammar

This section presents the grammar for basic regular expressions, including the bracket expression grammar that is common to both BREs and EREs.

```

6306                       | follow_list '-'
6307                       ;
6308        follow_list    :             expression_term
6309                       | follow_list expression_term
6310                       ;
6311        expression_term : single_expression
6312                       | range_expression
6313                       ;
```

```
single_expression : end_range
                  | character_class
                  | equivalence_class
                  ;
range_expression : start_range end_range
                  | start_range '-'
                  ;
start_range     : end_range '-'
                  ;
end_range       : COLL_ELEM_SINGLE
                  | collating_symbol
                  ;
collating_symbol : Open_dot COLL_ELEM_SINGLE Dot_close
                  | Open_dot COLL_ELEM_MULTI Dot_close
                  | Open_dot META_CHAR Dot_close
                  ;
equivalence_class : Open_equal COLL_ELEM_SINGLE Equal_close
                  | Open_equal COLL_ELEM_MULTI Equal_close
                  ;
character_class : Open_colon class_name Colon_close
                  ;
```

The BRE grammar does not permit **L_ANCHOR** or **R_ANCHOR** inside "\(" and "\)" (which implies that '^' and '$' are ordinary characters). This reflects the semantic limits on the application, as noted in Section 9.3.8 (on page 187). Implementations are permitted to extend the language to interpret '^' and '$' as anchors in these locations, and as such, conforming applications cannot use unescaped '^' and '$' in positions inside "\(" and "\)" that might be interpreted as anchors.

9.5.3 ERE Grammar

This section presents the grammar for extended regular expressions, excluding the bracket expression grammar.

Note: The bracket expression grammar and the associated **%token** lines are identical between BREs and EREs. It has been omitted from the ERE section to avoid unnecessary editorial duplication.

```
%token  ORD_CHAR QUOTED_CHAR DUP_COUNT
%start  extended_reg_exp
%%

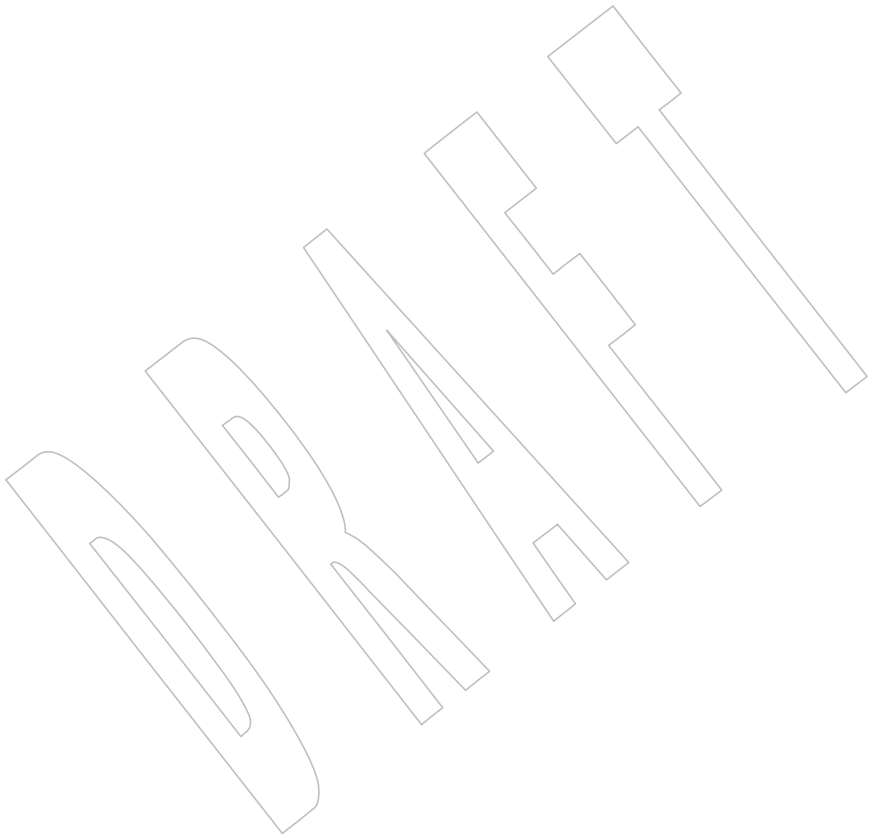
/* ----------------------------------------
   Extended Regular Expression
   ----------------------------------------
*/
extended_reg_exp   :                      ERE_branch
                   | extended_reg_exp '|' ERE_branch
                   ;
ERE_branch         :            ERE_expression
                   | ERE_branch ERE_expression
                   ;
ERE_expression     : one_char_or_coll_elem_ERE
                   | '^'
                   | '$'
```

```
                    | '(' extended_reg_exp ')'
                    | ERE_expression ERE_dupl_symbol
                    ;
one_char_or_coll_elem_ERE  : ORD_CHAR
                    | QUOTED_CHAR
                    | '.'
                    | bracket_expression
                    ;
ERE_dupl_symbol     : '*'
                    | '+'
                    | '?'
                    | '{' DUP_COUNT               '}'
                    | '{' DUP_COUNT ','           '}'
                    | '{' DUP_COUNT ',' DUP_COUNT '}'
                    ;
```

The ERE grammar does not permit several constructs that previous sections specify as having undefined results:

- **ORD_CHAR** preceded by a <backslash> character
- One or more *ERE_dupl_symbol*s appearing first in an ERE, or immediately following '|', '^', or '('
- '{' not part of a valid *ERE_dupl_symbol*
- '|' appearing first or last in an ERE, or immediately following '|' or '(', or immediately preceding ')'

Implementations are permitted to extend the language to allow these. Conforming applications cannot use such constructs.



6387 *Chapter 10*

6388 # *Directory Structure and Devices*

6389 ## 10.1 Directory Structure and Files

6390 The following directories shall exist on conforming systems and conforming applications shall
6391 make use of them only as described. Strictly conforming applications shall not assume the
6392 ability to create files in any of these directories, unless specified below.

6393 **/** The root directory.

6394 **/dev** Contains **/dev/console**, **/dev/null**, and **/dev/tty**, described below.

6395 The following directory shall exist on conforming systems and shall be used as described:

6396 **/tmp** A directory made available for applications that need a place to create temporary
6397 files. Applications shall be allowed to create files in this directory, but shall not
6398 assume that such files are preserved between invocations of the application.

6399 The following files shall exist on conforming systems and shall be both readable and writable:

6400 **/dev/null** An infinite data source and data sink. Data written to **/dev/null** shall be discarded.
6401 Reads from **/dev/null** shall always return end-of-file (EOF).

6402 **/dev/tty** In each process, a synonym for the controlling terminal associated with the process
6403 group of that process, if any. It is useful for programs or shell procedures that wish
6404 to be sure of writing messages to or reading data from the terminal no matter how
6405 output has been redirected. It can also be used for applications that demand the
6406 name of a file for output, when typed output is desired and it is tiresome to find
6407 out what terminal is currently in use.

6408 The following file shall exist on conforming systems and need not be readable or writable:

6409 **/dev/console** The **/dev/console** file is a generic name given to the system console (see Section
6410 3.384, on page 95). It is usually linked to an implementation-defined special file. It
6411 shall provide an interface to the system console conforming to the requirements of
6412 Chapter 11 (on page 199).

10.2 Output Devices and Terminal Types

The utilities in the Shell and Utilities volume of POSIX.1-200x historically have been implemented on a wide range of terminal types, but a conforming implementation need not support all features of all utilities on every conceivable terminal. POSIX.1-200x states which features are optional for certain classes of terminals in the individual utility description sections. The implementation shall document in the system documentation which terminal types it supports and which of these features and utilities are not supported by each terminal.

When a feature or utility is not supported on a specific terminal type, as allowed by POSIX.1-200x, and the implementation considers such a condition to be an error preventing use of the feature or utility, the implementation shall indicate such conditions through diagnostic messages or exit status values or both (as appropriate to the specific utility description) that inform the user that the terminal type lacks the appropriate capability.

POSIX.1-200x uses a notational convention based on historical practice that identifies some of the control characters defined in Section 7.3.1 (on page 139) in a manner easily remembered by users on many terminals. The correspondence between this "<control>-*char*" notation and the actual control characters is shown in the following table. When POSIX.1-200x refers to a character by its <control>-*name*, it is referring to the actual control character shown in the Value column of the table, which is not necessarily the exact control key sequence on all terminals. Some terminals have keyboards that do not allow the direct transmission of all the non-alphanumeric characters shown. In such cases, the system documentation shall describe which data sequences transmitted by the terminal are interpreted by the system as representing the special characters.

Table 10-1 Control Character Names

Name	Value	Symbolic Name	Name	Value	Symbolic Name
<control>-A	<SOH>	<SOH>	<control>-Q	<DC1>	<DC1>
<control>-B	<STX>	<STX>	<control>-R	<DC2>	<DC2>
<control>-C	<ETX>	<ETX>	<control>-S	<DC3>	<DC3>
<control>-D	<EOT>	<EOT>	<control>-T	<DC4>	<DC4>
<control>-E	<ENQ>	<ENQ>	<control>-U	<NAK>	<NAK>
<control>-F	<ACK>	<ACK>	<control>-V	<SYN>	<SYN>
<control>-G	<BEL>	<alert>	<control>-W	<ETB>	<ETB>
<control>-H	<BS>	<backspace>	<control>-X	<CAN>	<CAN>
<control>-I	<HT>	<tab>	<control>-Y	<EM>	<EM>
<control>-J	<LF>	<linefeed>	<control>-Z	<SUB>	<SUB>
<control>-K	<VT>	<vertical-tab>	<control>-[	<ESC>	<ESC>
<control>-L	<FF>	<form-feed>	<control>-\	<FS>	<FS>
<control>-M	<CR>	<carriage-return>	<control>-]	<GS>	<GS>
<control>-N	<SO>	<SO>	<control>-^	<RS>	<RS>
<control>-O	<SI>	<SI>	<control>-_	<US>	<US>
<control>-P	<DLE>	<DLE>	<control>-?	<DEL>	<DEL>

Note: The notation uses uppercase letters for arbitrary editorial reasons. There is no implication that the keystrokes represent control-shift-letter sequences.

6455 *Chapter 11*

6456 # *General Terminal Interface*

6457 This chapter describes a general terminal interface that shall be provided. It shall be supported
6458 on any asynchronous communications ports if the implementation provides them. It is
6459 implementation-defined whether it supports network connections or synchronous ports, or
6460 both.

6461 ## 11.1 Interface Characteristics

6462 -

6463 ### 11.1.1 Opening a Terminal Device File

6464 When a terminal device file is opened, it normally causes the thread to wait until a connection is
6465 established. In practice, application programs seldom open these files; they are opened by
6466 special programs and become an application's standard input, output, and error files.

6467 Cases where applications do open a terminal device are as follows:

6468 1. Opening **/dev/tty**, or the pathname returned by *ctermid*( ), in order to obtain a file
6469 descriptor for the controlling terminal; see Section 11.1.3 (on page 200).

6470 2. Opening the slave side of a pseudo-terminal; see XSH *ptsname*( ).

6471 3. Opening a modem or similar piece of equipment connected by a serial line. In this case,
6472 the terminal parameters (see Section 11.2, on page 205) may be initialized to default
6473 settings by the implementation in between the last close of the device by any process and
6474 the next open of the device, or they may persist from one use to the next. The terminal
6475 parameters can be set to values that ensure the terminal behaves in a conforming manner
6476 by means of the O_TTY_INIT open flag when opening a terminal device that is not
6477 already open in any process, or by executing the *stty* utility with the operand **sane**.

6478 As described in *open*( ), opening a terminal device file with the O_NONBLOCK flag clear shall
6479 cause the thread to block until the terminal device is ready and available. If CLOCAL mode is
6480 not set, this means blocking until a connection is established. If CLOCAL mode is set in the
6481 terminal, or the O_NONBLOCK flag is specified in the *open*( ), the *open*( ) function shall return a
6482 file descriptor without waiting for a connection to be established.

11.1.2 Process Groups

A terminal may have a foreground process group associated with it. This foreground process group plays a special role in handling signal-generating input characters, as discussed in Section 11.1.9 (on page 203).

A command interpreter process supporting job control can allocate the terminal to different jobs, or process groups, by placing related processes in a single process group and associating this process group with the terminal. A terminal's foreground process group may be set or examined by a process, assuming the permission requirements are met; see *tcgetpgrp*( ) and *tcsetpgrp*( ). The terminal interface aids in this allocation by restricting access to the terminal by processes that are not in the current process group; see Section 11.1.4 (on page 201).

When there is no longer any process whose process ID or process group ID matches the foreground process group ID, the terminal shall have no foreground process group. It is unspecified whether the terminal has a foreground process group when there is a process whose process ID matches the foreground process group ID, but whose process group ID does not. No actions defined in POSIX.1-200x, other than allocation of a controlling terminal or a successful call to *tcsetpgrp*( ), shall cause a process group to become the foreground process group of the terminal.

11.1.3 The Controlling Terminal

A terminal may belong to a process as its controlling terminal. Each process of a session that has a controlling terminal has the same controlling terminal. A terminal may be the controlling terminal for at most one session. The controlling terminal for a session is allocated by the session leader in an implementation-defined manner. If a session leader has no controlling terminal, and opens a terminal device file that is not already associated with a session without using the O_NOCTTY option (see *open*( )), it is implementation-defined whether the terminal becomes the controlling terminal of the session leader. If a process which is not a session leader opens a terminal file, or the O_NOCTTY option is used on *open*( ), then that terminal shall not become the controlling terminal of the calling process. When a controlling terminal becomes associated with a session, its foreground process group shall be set to the process group of the session leader.

The controlling terminal is inherited by a child process during a *fork*( ) function call. A process relinquishes its controlling terminal when it creates a new session with the *setsid*( ) function; other processes remaining in the old session that had this terminal as their controlling terminal continue to have it. Upon the close of the last file descriptor in the system (whether or not it is in the current session) associated with the controlling terminal, it is unspecified whether all processes that had that terminal as their controlling terminal cease to have any controlling terminal. Whether and how a session leader can reacquire a controlling terminal after the controlling terminal has been relinquished in this fashion is unspecified. A process does not relinquish its controlling terminal simply by closing all of its file descriptors associated with the controlling terminal if other processes continue to have it open.

When a controlling process terminates, the controlling terminal is dissociated from the current session, allowing it to be acquired by a new session leader. Subsequent access to the terminal by other processes in the earlier session may be denied, with attempts to access the terminal treated as if a modem disconnect had been sensed.

11.1.4 Terminal Access Control

If a process is in the foreground process group of its controlling terminal, read operations shall be allowed, as described in Section 11.1.5. Any attempts by a process in a background process group to read from its controlling terminal cause its process group to be sent a SIGTTIN signal unless one of the following special cases applies: if the reading process is ignoring or blocking the SIGTTIN signal, or if the process group of the reading process is orphaned, the *read*( ) shall return –1, with *errno* set to [EIO] and no signal shall be sent. The default action of the SIGTTIN signal shall be to stop the process to which it is sent. See **<signal.h>**.

If a process is in the foreground process group of its controlling terminal, write operations shall be allowed as described in Section 11.1.8 (on page 203). Attempts by a process in a background process group to write to its controlling terminal shall cause the process group to be sent a SIGTTOU signal unless one of the following special cases applies: if TOSTOP is not set, or if TOSTOP is set and the process is ignoring or blocking the SIGTTOU signal, the process is allowed to write to the terminal and the SIGTTOU signal is not sent. If TOSTOP is set, and the process group of the writing process is orphaned, and the writing process is not ignoring or blocking the SIGTTOU signal, the *write*( ) shall return –1, with *errno* set to [EIO] and no signal shall be sent.

Certain calls that set terminal parameters are treated in the same fashion as *write*( ), except that TOSTOP is ignored; that is, the effect is identical to that of terminal writes when TOSTOP is set (see Section 11.2.5 (on page 210), *tcdrain*( ), *tcflow*( ), *tcflush*( ), *tcsendbreak*( ), *tcsetattr*( ), and *tcsetpgrp*( )).

11.1.5 Input Processing and Reading Data

A terminal device associated with a terminal device file may operate in full-duplex mode, so that data may arrive even while output is occurring. Each terminal device file has an input queue associated with it, into which incoming data is stored by the system before being read by a process. The system may impose a limit, {MAX_INPUT}, on the number of bytes that may be stored in the input queue. The behavior of the system when this limit is exceeded is implementation-defined.

Two general kinds of input processing are available, determined by whether the terminal device file is in canonical mode or non-canonical mode. These modes are described in Section 11.1.6 (on page 202) and Section 11.1.7 (on page 202). Additionally, input characters are processed according to the *c_iflag* (see Section 11.2.2, on page 206) and *c_lflag* (see Section 11.2.5, on page 210) fields. Such processing can include "echoing", which in general means transmitting input characters immediately back to the terminal when they are received from the terminal. This is useful for terminals that can operate in full-duplex mode.

The manner in which data is provided to a process reading from a terminal device file is dependent on whether the terminal file is in canonical or non-canonical mode, and on whether or not the O_NONBLOCK flag is set by *open*( ) or *fcntl*( ).

If the O_NONBLOCK flag is clear, then the read request shall be blocked until data is available or a signal has been received. If the O_NONBLOCK flag is set, then the read request shall be completed, without blocking, in one of three ways:

1. If there is enough data available to satisfy the entire request, the *read*( ) shall complete successfully and shall return the number of bytes read.
2. If there is not enough data available to satisfy the entire request, the *read*( ) shall complete successfully, having read as much data as possible, and shall return the number of bytes it was able to read.

3. If there is no data available, the *read*( ) shall return –1, with *errno* set to [EAGAIN].

When data is available depends on whether the input processing mode is canonical or non-canonical. Section 11.1.6 and Section 11.1.7 describe each of these input processing modes.

11.1.6 Canonical Mode Input Processing

In canonical mode input processing, terminal input is processed in units of lines. A line is delimited by a <newline> character (NL), an end-of-file character (EOF), or an end-of-line (EOL) character. See Section 11.1.9 (on page 203) for more information on EOF and EOL. This means that a read request shall not return until an entire line has been typed or a signal has been received. Also, no matter how many bytes are requested in the *read*( ) call, at most one line shall be returned. It is not, however, necessary to read a whole line at once; any number of bytes, even one, may be requested in a *read*( ) without losing information.

If {MAX_CANON} is defined for this terminal device, it shall be a limit on the number of bytes in a line. The behavior of the system when this limit is exceeded is implementation-defined. If {MAX_CANON} is not defined, there shall be no such limit; see *pathconf*( ).

Erase and kill processing occur when either of two special characters, the ERASE and KILL characters (see Section 11.1.9, on page 203), is received. This processing shall affect data in the input queue that has not yet been delimited by an NL, EOF, or EOL character. This un-delimited data makes up the current line. The ERASE character shall delete the last character in the current line, if there is one. The KILL character shall delete all data in the current line, if there is any. The ERASE and KILL characters shall have no effect if there is no data in the current line. The ERASE and KILL characters themselves shall not be placed in the input queue.

11.1.7 Non-Canonical Mode Input Processing

In non-canonical mode input processing, input bytes are not assembled into lines, and erase and kill processing shall not occur. The values of the MIN and TIME members of the *c_cc* array are used to determine how to process the bytes received. POSIX.1-200x does not specify whether the setting of O_NONBLOCK takes precedence over MIN or TIME settings. Therefore, if O_NONBLOCK is set, *read*( ) may return immediately, regardless of the setting of MIN or TIME. Also, if no data is available, *read*( ) may either return 0, or return –1 with *errno* set to [EAGAIN].

MIN represents the minimum number of bytes that should be received when the *read*( ) function returns successfully. TIME is a timer of 0.1 second granularity that is used to time out bursty and short-term data transmissions. If MIN is greater than {MAX_INPUT}, the response to the request is undefined. The four possible values for MIN and TIME and their interactions are described below.

Case A: MIN>0, TIME>0

In case A, TIME serves as an inter-byte timer which shall be activated after the first byte is received. Since it is an inter-byte timer, it shall be reset after a byte is received. The interaction between MIN and TIME is as follows. As soon as one byte is received, the inter-byte timer shall be started. If MIN bytes are received before the inter-byte timer expires (remember that the timer is reset upon receipt of each byte), the read shall be satisfied. If the timer expires before MIN bytes are received, the characters received to that point shall be returned to the user. Note that if TIME expires at least one byte shall be returned because the timer would not have been enabled unless a byte was received. In this case (MIN>0, TIME>0) the read shall block until the MIN and TIME mechanisms are activated by the receipt of the first byte, or a signal is received. If data is in the buffer at the time of the *read*( ), the result shall be as if data has been received immediately

after the *read*( ).

Case B: MIN>0, TIME=0

In case B, since the value of TIME is zero, the timer plays no role and only MIN is significant. A pending read shall not be satisfied until MIN bytes are received (that is, the pending read shall block until MIN bytes are received), or a signal is received. A program that uses case B to read record-based terminal I/O may block indefinitely in the read operation.

Case C: MIN=0, TIME>0

In case C, since MIN=0, TIME no longer represents an inter-byte timer. It now serves as a read timer that shall be activated as soon as the *read*( ) function is processed. A read shall be satisfied as soon as a single byte is received or the read timer expires. Note that in case C if the timer expires, no bytes shall be returned. If the timer does not expire, the only way the read can be satisfied is if a byte is received. If bytes are not received, the read shall not block indefinitely waiting for a byte; if no byte is received within TIME*0.1 seconds after the read is initiated, the *read*( ) shall return a value of zero, having read no data. If data is in the buffer at the time of the *read*( ), the timer shall be started as if data has been received immediately after the *read*( ).

Case D: MIN=0, TIME=0

The minimum of either the number of bytes requested or the number of bytes currently available shall be returned without waiting for more bytes to be input. If no characters are available, *read*( ) shall return a value of zero, having read no data.

11.1.8 Writing Data and Output Processing

When a process writes one or more bytes to a terminal device file, they are processed according to the *c_oflag* field (see Section 11.2.3, on page 207). The implementation may provide a buffering mechanism; as such, when a call to *write*( ) completes, all of the bytes written have been scheduled for transmission to the device, but the transmission has not necessarily completed. See *write*( ) for the effects of O_NONBLOCK on *write*( ).

11.1.9 Special Characters

Certain characters have special functions on input or output or both. These functions are summarized as follows:

INTR Special character on input, which is recognized if the ISIG flag is set. Generates a SIGINT signal which is sent to all processes in the foreground process group for which the terminal is the controlling terminal. If ISIG is set, the INTR character shall be discarded when processed.

QUIT Special character on input, which is recognized if the ISIG flag is set. Generates a SIGQUIT signal which is sent to all processes in the foreground process group for which the terminal is the controlling terminal. If ISIG is set, the QUIT character shall be discarded when processed.

ERASE Special character on input, which is recognized if the ICANON flag is set. Erases the last character in the current line; see Section 11.1.6 (on page 202). It shall not erase beyond the start of a line, as delimited by an NL, EOF, or EOL character. If ICANON is set, the ERASE character shall be discarded when processed.

KILL Special character on input, which is recognized if the ICANON flag is set. Deletes the entire line, as delimited by an NL, EOF, or EOL character. If ICANON is set, the KILL character shall be discarded when processed.

EOF Special character on input, which is recognized if the ICANON flag is set. When received, all the bytes waiting to be read are immediately passed to the process without waiting for a <newline>, and the EOF is discarded. Thus, if there are no bytes waiting (that is, the EOF occurred at the beginning of a line), a byte count of zero shall be returned from the *read*(), representing an end-of-file indication. If ICANON is set, the EOF character shall be discarded when processed.

NL Special character on input, which is recognized if the ICANON flag is set. It is the line delimiter <newline>. It cannot be changed.

EOL Special character on input, which is recognized if the ICANON flag is set. It is an additional line delimiter, like NL.

SUSP If the ISIG flag is set, receipt of the SUSP character shall cause a SIGTSTP signal to be sent to all processes in the foreground process group for which the terminal is the controlling terminal, and the SUSP character shall be discarded when processed.

STOP Special character on both input and output, which is recognized if the IXON (output control) or IXOFF (input control) flag is set. Can be used to suspend output temporarily. It is useful with CRT terminals to prevent output from disappearing before it can be read. If IXON is set, the STOP character shall be discarded when processed.

START Special character on both input and output, which is recognized if the IXON (output control) or IXOFF (input control) flag is set. Can be used to resume output that has been suspended by a STOP character. If IXON is set, the START character shall be discarded when processed.

CR Special character on input, which is recognized if the ICANON flag is set; it is the carriage-return character. When ICANON and ICRNL are set and IGNCR is not set, this character shall be translated into an NL, and shall have the same effect as an NL character.

The NL and CR characters cannot be changed. It is implementation-defined whether the START and STOP characters can be changed. The values for INTR, QUIT, ERASE, KILL, EOF, EOL, and SUSP shall be changeable to suit individual tastes. Special character functions associated with changeable special control characters can be disabled individually.

If two or more special characters have the same value, the function performed when that character is received is undefined.

A special character is recognized not only by its value, but also by its context; for example, an implementation may support multi-byte sequences that have a meaning different from the meaning of the bytes when considered individually. Implementations may also support additional single-byte functions. These implementation-defined multi-byte or single-byte functions shall be recognized only if the IEXTEN flag is set; otherwise, data is received without interpretation, except as required to recognize the special characters defined in this section.

XSI If IEXTEN is set, the ERASE, KILL, and EOF characters can be escaped by a preceding <backslash> character, in which case no special function shall occur.

11.1.10 Modem Disconnect

If a modem disconnect is detected by the terminal interface for a controlling terminal, and if CLOCAL is not set in the *c_cflag* field for the terminal (see Section 11.2.4, on page 209), the SIGHUP signal shall be sent to the controlling process for which the terminal is the controlling terminal. Unless other arrangements have been made, this shall cause the controlling process to terminate (see *exit*( )). Any subsequent read from the terminal device shall return the value of zero, indicating end-of-file; see *read*( ). Thus, processes that read a terminal file and test for end-of-file can terminate appropriately after a disconnect. If the EIO condition as specified in *read*( ) also exists, it is unspecified whether on EOF condition or [EIO] is returned. Any subsequent *write*( ) to the terminal device shall return –1, with *errno* set to [EIO], until the device is closed.

11.1.11 Closing a Terminal Device File

The last process to close a terminal device file shall cause any output to be sent to the device and any input to be discarded. If HUPCL is set in the control modes and the communications port supports a disconnect function, the terminal device shall perform a disconnect.

11.2 Parameters that Can be Set

-

11.2.1 The termios Structure

Routines that need to control certain terminal I/O characteristics shall do so by using the **termios** structure as defined in the **<termios.h>** header.

Since the **termios** structure may include additional members, and the standard members may include both standard and non-standard modes, the structure should never be initialized directly by the application as this may cause the terminal to behave in a non-conforming manner. When opening a terminal device (other than a pseudo-terminal) that is not already open in any process, it should be opened with the O_TTY_INIT flag before initializing the structure using *tcgetattr*( ) to ensure that any non-standard elements of the **termios** structure are set to values that result in conforming behavior of the terminal interface.

The members of the **termios** structure include (but are not limited to):

Member Type	Array Size	Member Name	Description
tcflag_t		*c_iflag*	Input modes.
tcflag_t		*c_oflag*	Output modes.
tcflag_t		*c_cflag*	Control modes.
tcflag_t		*c_lflag*	Local modes.
cc_t	NCCS	*c_cc*[ ]	Control characters.

The **tcflag_t** and **cc_t** types are defined in the **<termios.h>** header. They shall be unsigned integer types.

11.2.2 Input Modes

Values of the *c_iflag* field describe the basic terminal input control, and are composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in **<termios.h>**:

Mask Name	Description
BRKINT	Signal interrupt on break.
ICRNL	Map CR to NL on input.
IGNBRK	Ignore break condition.
IGNCR	Ignore CR.
IGNPAR	Ignore characters with parity errors.
INLCR	Map NL to CR on input.
INPCK	Enable input parity check.
ISTRIP	Strip character.
IXANY	Enable any character to restart output.
IXOFF	Enable start/stop input control.
IXON	Enable start/stop output control.
PARMRK	Mark parity errors.

In the context of asynchronous serial data transmission, a break condition shall be defined as a sequence of zero-valued bits that continues for more than the time to send one byte. The entire sequence of zero-valued bits is interpreted as a single break condition, even if it continues for a time equivalent to more than one byte. In contexts other than asynchronous serial data transmission, the definition of a break condition is implementation-defined.

If IGNBRK is set, a break condition detected on input shall be ignored; that is, not put on the input queue and therefore not read by any process. If IGNBRK is not set and BRKINT is set, the break condition shall flush the input and output queues, and if the terminal is the controlling terminal of a foreground process group, the break condition shall generate a single SIGINT signal to that foreground process group. If neither IGNBRK nor BRKINT is set, a break condition shall be read as a single 0x00, or if PARMRK is set, as 0xff 0x00 0x00.

If IGNPAR is set, a byte with a framing or parity error (other than break) shall be ignored.

If PARMRK is set, and IGNPAR is not set, a byte with a framing or parity error (other than break) shall be given to the application as the three-byte sequence 0xff 0x00 X, where 0xff 0x00 is a two-byte flag preceding each sequence and X is the data of the byte received in error. To avoid ambiguity in this case, if ISTRIP is not set, a valid byte of 0xff is given to the application as 0xff 0xff. If neither PARMRK nor IGNPAR is set, a framing or parity error (other than break) shall be given to the application as a single byte 0x00.

If INPCK is set, input parity checking shall be enabled. If INPCK is not set, input parity checking shall be disabled, allowing output parity generation without input parity errors. Note that whether input parity checking is enabled or disabled is independent of whether parity detection is enabled or disabled (see Section 11.2.4, on page 209). If parity detection is enabled but input parity checking is disabled, the hardware to which the terminal is connected shall recognize the parity bit, but the terminal special file shall not check whether or not this bit is correctly set.

If ISTRIP is set, valid input bytes shall first be stripped to seven bits; otherwise, all eight bits shall be processed.

If INLCR is set, a received NL character shall be translated into a CR character. If IGNCR is set, a received CR character shall be ignored (not read). If IGNCR is not set and ICRNL is set, a received CR character shall be translated into an NL character.

If IXANY is set, any input character shall restart output that has been suspended.

If IXON is set, start/stop output control shall be enabled. A received STOP character shall suspend output and a received START character shall restart output. When IXON is set, START and STOP characters are not read, but merely perform flow control functions. When IXON is not set, the START and STOP characters shall be read.

If IXOFF is set, start/stop input control shall be enabled. The system shall transmit STOP characters, which are intended to cause the terminal device to stop transmitting data, as needed to prevent the input queue from overflowing and causing implementation-defined behavior, and shall transmit START characters, which are intended to cause the terminal device to resume transmitting data, as soon as the device can continue transmitting data without risk of overflowing the input queue. The precise conditions under which STOP and START characters are transmitted are implementation-defined.

The initial input control value after *open*( ) is implementation-defined.

11.2.3 Output Modes

The *c_oflag* field specifies the terminal interface's treatment of output, and is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in the following table are defined in **<termios.h>**:

Mask Name	Description
OPOST	Perform output processing.
ONLCR	Map NL to CR-NL on output.
OCRNL	Map CR to NL on output.
ONOCR	No CR output at column 0.
ONLRET	NL performs CR function.
OFILL	Use fill characters for delay.
OFDEL	Fill is DEL, else NUL.
NLDLY	Select newline delays:
NL0	Newline character type 0.
NL1	Newline character type 1.
CRDLY	Select carriage-return delays:
CR0	Carriage-return delay type 0.
CR1	Carriage-return delay type 1.
CR2	Carriage-return delay type 2.
CR3	Carriage-return delay type 3.
TABDLY	Select horizontal-tab delays:
TAB0	Horizontal-tab delay type 0.
TAB1	Horizontal-tab delay type 1.
TAB2	Horizontal-tab delay type 2.
TAB3	Expand tabs to spaces.
BSDLY	Select backspace delays:
BS0	Backspace-delay type 0.
BS1	Backspace-delay type 1.
VTDLY	Select vertical-tab delays:
VT0	Vertical-tab delay type 0.
VT1	Vertical-tab delay type 1.
FFDLY	Select form-feed delays:
FF0	Form-feed delay type 0.
FF1	Form-feed delay type 1.

If OPOST is set, output data shall be post-processed as described below, so that lines of text are modified to appear appropriately on the terminal device; otherwise, characters shall be transmitted without change.

XSI If ONLCR is set, the NL character shall be transmitted as the CR-NL character pair. If OCRNL is set, the CR character shall be transmitted as the NL character. If ONOCR is set, no CR character shall be transmitted when at column 0 (first position). If ONLRET is set, the NL character is assumed to do the carriage-return function; the column pointer shall be set to 0 and the delays specified for CR shall be used. Otherwise, the NL character is assumed to do just the line-feed function; the column pointer remains unchanged. The column pointer shall also be set to 0 if the CR character is actually transmitted.

The delay bits specify how long transmission stops to allow for mechanical or other movement when certain characters are sent to the terminal. In all cases a value of 0 shall indicate no delay. If OFILL is set, fill characters shall be transmitted for delay instead of a timed delay. This is useful for high baud rate terminals which need only a minimal delay. If OFDEL is set, the fill character shall be DEL; otherwise, NUL.

If a <form-feed> or <vertical-tab> delay is specified, it shall last for about 2 seconds.

Newline delay shall last about 0.10 seconds. If ONLRET is set, the carriage-return delays shall be used instead of the newline delays. If OFILL is set, two fill characters shall be transmitted.

Carriage-return delay type 1 shall be dependent on the current column position, type 2 shall be

about 0.10 seconds, and type 3 shall be about 0.15 seconds. If OFILL is set, delay type 1 shall transmit two fill characters, and type 2 four fill characters.

Horizontal-tab delay type 1 shall be dependent on the current column position. Type 2 shall be about 0.10 seconds. Type 3 specifies that <tab> characters shall be expanded into <space> characters. If OFILL is set, two fill characters shall be transmitted for any delay.

Backspace delay shall last about 0.05 seconds. If OFILL is set, one fill character shall be transmitted.

The actual delays depend on line speed and system load.

The initial output control value after *open*( ) is implementation-defined.

11.2.4 Control Modes

The *c_cflag* field describes the hardware control of the terminal, and is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in **<termios.h>**; not all values specified are required to be supported by the underlying hardware (if any). If the terminal is a pseudo-terminal, it is unspecified whether non-default values are unsupported, or are supported and emulated in software, or are handled by *tcsetattr*( ), *tcgetattr*( ), and the *stty* utility as if they are supported but have no effect on the behavior of the terminal interface.

Mask Name	Description
CLOCAL	Ignore modem status lines.
CREAD	Enable receiver.
CSIZE	Number of bits transmitted or received per byte:
CS5	5 bits
CS6	6 bits
CS7	7 bits
CS8	8 bits.
CSTOPB	Send two stop bits, else one.
HUPCL	Hang up on last close.
PARENB	Parity enable.
PARODD	Odd parity, else even.

In addition, the input and output baud rates are stored in the **termios** structure. The symbols in the following table are defined in **<termios.h>**. Not all values specified are required to be supported by the underlying hardware (if any). For pseudo-terminals, the input and output baud rates set in the **termios** structure need not affect the speed of data transmission through the terminal interface.

Note: The term "baud" is used historically here, but is not technically correct. This is properly "bits per second", which may not be the same as baud. However, the term is used because of the historical usage and understanding.

Name	Description	Name	Description
B0	Hang up	B600	600 baud
B50	50 baud	B1200	1200 baud
B75	75 baud	B1800	1800 baud
B110	110 baud	B2400	2400 baud
B134	134.5 baud	B4800	4800 baud
B150	150 baud	B9600	9600 baud
B200	200 baud	B19200	19200 baud
B300	300 baud	B38400	38400 baud

The following functions are provided for getting and setting the values of the input and output baud rates in the **termios** structure: *cfgetispeed*( ), *cfgetospeed*( ), *cfsetispeed*( ), and *cfsetospeed*( ). The effects on the terminal device shall not become effective and not all errors need be detected until the *tcsetattr*( ) function is successfully called.

The CSIZE bits shall specify the number of transmitted or received bits per byte. If ISTRIP is not set, the value of all the other bits is unspecified. If ISTRIP is set, the value of all but the 7 low-order bits shall be zero, but the value of any other bits beyond CSIZE is unspecified when read. CSIZE shall not include the parity bit, if any. If CSTOPB is set, two stop bits shall be used; otherwise, one stop bit. For example, at 110 baud, two stop bits are normally used.

If CREAD is set, the receiver shall be enabled; otherwise, no characters shall be received.

If PARENB is set, parity generation and detection shall be enabled and a parity bit is added to each byte. If parity is enabled, PARODD shall specify odd parity if set; otherwise, even parity shall be used.

If HUPCL is set, the modem control lines for the port shall be lowered when the last process with the port open closes the port or the process terminates. The modem connection shall be broken.

If CLOCAL is set, a connection shall not depend on the state of the modem status lines. If CLOCAL is clear, the modem status lines shall be monitored.

Under normal circumstances, a call to the *open*( ) function shall wait for the modem connection to complete. However, if the O_NONBLOCK flag is set (see *open*( )) or if CLOCAL has been set, the *open*( ) function shall return immediately without waiting for the connection.

If the object for which the control modes are set is not an asynchronous serial connection, some of the modes may be ignored; for example, if an attempt is made to set the baud rate on a network connection to a terminal on another host, the baud rate need not be set on the connection between that terminal and the machine to which it is directly connected.

The initial hardware control value after *open*( ) is implementation-defined.

11.2.5 Local Modes

The *c_lflag* field of the argument structure is used to control various functions. It is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in **<termios.h>**.

Mask Name	Description
ECHO	Enable echo.
ECHOE	Echo ERASE as an error correcting backspace.
ECHOK	Echo KILL.
ECHONL	Echo <newline>.
ICANON	Canonical input (erase and kill processing).
IEXTEN	Enable extended (implementation-defined) functions.
ISIG	Enable signals.
NOFLSH	Disable flush after interrupt, quit, or suspend.
TOSTOP	Send SIGTTOU for background output.

If ECHO is set, input characters shall be echoed back to the terminal. If ECHO is clear, input characters shall not be echoed.

If ECHOE and ICANON are set, the ERASE character shall cause the terminal to erase, if possible, the last character in the current line from the display. If there is no character to erase, an implementation may echo an indication that this was the case, or do nothing.

If ECHOK and ICANON are set, the KILL character shall either cause the terminal to erase the line from the display or shall echo the <newline> character after the KILL character.

If ECHONL and ICANON are set, the <newline> character shall be echoed even if ECHO is not set.

If ICANON is set, canonical processing shall be enabled. This enables the erase and kill edit functions, and the assembly of input characters into lines delimited by NL, EOF, and EOL, as described in Section 11.1.6 (on page 202).

If ICANON is not set, read requests shall be satisfied directly from the input queue. A read shall not be satisfied until at least MIN bytes have been received or the timeout value TIME expired between bytes. The time value represents tenths of a second. See Section 11.1.7 (on page 202) for more details.

If IEXTEN is set, implementation-defined functions shall be recognized from the input data. It is implementation-defined how IEXTEN being set interacts with ICANON, ISIG, IXON, or IXOFF. If IEXTEN is not set, implementation-defined functions shall not be recognized and the corresponding input characters are processed as described for ICANON, ISIG, IXON, and IXOFF.

If ISIG is set, each input character shall be checked against the special control characters INTR, QUIT, and SUSP. If an input character matches one of these control characters, the function associated with that character shall be performed. If ISIG is not set, no checking shall be done. Thus these special input functions are possible only if ISIG is set.

If NOFLSH is set, the normal flush of the input and output queues associated with the INTR, QUIT, and SUSP characters shall not be done.

If TOSTOP is set, the signal SIGTTOU shall be sent to the process group of a process that tries to write to its controlling terminal if it is not in the foreground process group for that terminal. This signal, by default, stops the members of the process group. Otherwise, the output generated by that process shall be output to the current output stream. Processes that are blocking or ignoring SIGTTOU signals are excepted and allowed to produce output, and the SIGTTOU signal shall not be sent.

The initial local control value after *open*( ) is implementation-defined.

11.2.6 Special Control Characters

The special control character values shall be defined by the array *c_cc*. The subscript name and description for each element in both canonical and non-canonical modes are as follows:

Subscript Usage		
Canonical Mode	**Non-Canonical Mode**	**Description**
VEOF		EOF character
VEOL		EOL character
VERASE		ERASE character
VINTR	VINTR	INTR character
VKILL		KILL character
	VMIN	MIN value
VQUIT	VQUIT	QUIT character
VSUSP	VSUSP	SUSP character
	VTIME	TIME value
VSTART	VSTART	START character
VSTOP	VSTOP	STOP character

The subscript values are unique, except that the VMIN and VTIME subscripts may have the same values as the VEOF and VEOL subscripts, respectively.

Implementations that do not support changing the START and STOP characters may ignore the character values in the *c_cc* array indexed by the VSTART and VSTOP subscripts when *tcsetattr*( ) is called, but shall return the value in use when *tcgetattr*( ) is called.

The initial values of all control characters are implementation-defined.

If the value of one of the changeable special control characters (see Section 11.1.9, on page 203) is _POSIX_VDISABLE, that function shall be disabled; that is, no input data is recognized as the disabled special character. If ICANON is not set, the value of _POSIX_VDISABLE has no special meaning for the VMIN and VTIME entries of the *c_cc* array.

6993 *Chapter 12*

6994 # *Utility Conventions*

6995 ## 12.1 Utility Argument Syntax

6996 This section describes the argument syntax of the standard utilities and introduces terminology
6997 used throughout POSIX.1-200x for describing the arguments processed by the utilities.

6998 Within POSIX.1-200x, a special notation is used for describing the syntax of a utility's
6999 arguments. Unless otherwise noted, all utility descriptions use this notation, which is illustrated
7000 by this example (see XCU Section 2.9.1, on page 2316):

7001 ```
utility_name[–a][–b][–c option_argument]
7002   [–d|–e][–f[option_argument]][operand...]
```

7003 The notation used for the SYNOPSIS sections imposes requirements on the implementors of the
7004 standard utilities and provides a simple reference for the application developer or system user.

7005 1. The utility in the example is named *utility_name*. It is followed by options, option-
7006 arguments, and operands. The arguments that consist of <hyphen> characters and single
7007 letters or digits, such as `'a'`, are known as "options" (or, historically, "flags"). Certain
7008 options are followed by an "option-argument", as shown with [**–c** *option_argument*]. The
7009 arguments following the last options and option-arguments are named "operands".

7010 2. Option-arguments are shown separated from their options by <blank> characters, except
7011 when the option-argument is enclosed in the `'['` and `']'` notation to indicate that it is
7012 optional. This reflects the situation in which an optional option-argument (if present) is
7013 included within the same argument string as the option; for a mandatory option-
7014 argument, it is the next argument. The Utility Syntax Guidelines in Section 12.2 (on page
7015 215) require that the option be a separate argument from its option-argument and that
7016 option-arguments not be optional, but there are some exceptions in POSIX.1-200x to
7017 ensure continued operation of historical applications:

7018 a. If the SYNOPSIS of a standard utility shows an option with a mandatory option-
7019 argument (as with [**–c** *option_argument*] in the example), a conforming application
7020 shall use separate arguments for that option and its option-argument. However, a
7021 conforming implementation shall also permit applications to specify the option
7022 and option-argument in the same argument string without intervening <blank>
7023 characters.

7024 b. If the SYNOPSIS shows an optional option-argument (as with
7025 [**–f**[*option_argument*]] in the example), a conforming application shall place any
7026 option-argument for that option directly adjacent to the option in the same
7027 argument string, without intervening <blank> characters. If the utility receives an
7028 argument containing only the option, it shall behave as specified in its description
7029 for an omitted option-argument; it shall not treat the next argument (if any) as the
7030 option-argument for that option.
```

3. Options are usually listed in alphabetical order unless this would make the utility description more confusing. There are no implied relationships between the options based upon the order in which they appear, unless otherwise stated in the OPTIONS section, or unless the exception in Guideline 11 of Section 12.2 (on page 215) applies. If an option that does not have option-arguments is repeated, the results are undefined, unless otherwise stated.

4. Frequently, names of parameters that require substitution by actual values are shown with embedded <underscore> characters. Alternatively, parameters are shown as follows:

   <parameter name>

   The angle brackets are used for the symbolic grouping of a phrase representing a single parameter and conforming applications shall not include them in data submitted to the utility.

5. When a utility has only a few permissible options, they are sometimes shown individually, as in the example. Utilities with many flags generally show all of the individual flags (that do not take option-arguments) grouped, as in:

   utility_name [–abcDxyz**][**–p *arg***][***operand***]**

   Utilities with very complex arguments may be shown as follows:

   utility_name [options**][***operands***]**

6. Unless otherwise specified, whenever an operand or option-argument is, or contains, a numeric value:

   - The number is interpreted as a decimal integer.
   - Numerals in the range 0 to 2 147 483 647 are syntactically recognized as numeric values.
   - When the utility description states that it accepts negative numbers as operands or option-arguments, numerals in the range –2 147 483 647 to 2 147 483 647 are syntactically recognized as numeric values.
   - Ranges greater than those listed here are allowed.

   This does not mean that all numbers within the allowable range are necessarily semantically correct. A standard utility that accepts an option-argument or operand that is to be interpreted as a number, and for which a range of values smaller than that shown above is permitted by the POSIX.1-200x, describes that smaller range along with the description of the option-argument or operand. If an error is generated, the utility's diagnostic message shall indicate that the value is out of the supported range, not that it is syntactically incorrect.

7. Arguments or option-arguments enclosed in the '[' and ']' notation are optional and can be omitted. Conforming applications shall not include the '[' and ']' symbols in data submitted to the utility.

8. Arguments separated by the '|' (<vertical-line>) bar notation are mutually-exclusive. Conforming applications shall not include the '|' symbol in data submitted to the utility. Alternatively, mutually-exclusive options and operands may be listed with multiple synopsis lines.

For example:

```
utility_name –d[–a][–c option_argument][operand...]
utility_name[–a][–b][operand...]
```

When multiple synopsis lines are given for a utility, it is an indication that the utility has mutually-exclusive arguments. These mutually-exclusive arguments alter the functionality of the utility so that only certain other arguments are valid in combination with one of the mutually-exclusive arguments. Only one of the mutually-exclusive arguments is allowed for invocation of the utility. Unless otherwise stated in an accompanying OPTIONS section, the relationships between arguments depicted in the SYNOPSIS sections are mandatory requirements placed on conforming applications. The use of conflicting mutually-exclusive arguments produces undefined results, unless a utility description specifies otherwise. When an option is shown without the '[' and ']' brackets, it means that option is required for that version of the SYNOPSIS. However, it is not required to be the first argument, as shown in the example above, unless otherwise stated.

9. Ellipses ("...") are used to denote that one or more occurrences of an operand are allowed. When an option or an operand followed by ellipses is enclosed in brackets, zero or more options or operands can be specified. The form:

   ```
   utility_name [–g option_argument]...[operand...]
   ```

   indicates that multiple occurrences of the option and its option-argument preceding the ellipses are valid, with semantics as indicated in the OPTIONS section of the utility. (See also Guideline 11 in Section 12.2.)

   The form:

   ```
   utility_name –f option_argument [–f option_argument]... [operand...]
   ```

   indicates that the **–f** option is required to appear at least once and may appear multiple times.

10. When the synopsis line is too long to be printed on a single line in the Shell and Utilities volume of POSIX.1-200x, the indented lines following the initial line are continuation lines. An actual use of the command would appear on a single logical line.

12.2 Utility Syntax Guidelines

The following guidelines are established for the naming of utilities and for the specification of options, option-arguments, and operands. The *getopt*() function in the System Interfaces volume of POSIX.1-200x assists utilities in handling options and operands that conform to these guidelines.

Operands and option-arguments can contain characters not specified in the portable character set.

The guidelines are intended to provide guidance to the authors of future utilities, such as those written specific to a local system or that are components of a larger application. Some of the standard utilities do not conform to all of these guidelines; in those cases, the OPTIONS sections describe the deviations.

Guideline 1: Utility names should be between two and nine characters, inclusive.

Guideline 2: Utility names should include lowercase letters (the **lower** character classification) and digits only from the portable character set.

Guideline 3: Each option name should be a single alphanumeric character (the **alnum** character classification) from the portable character set. The **–W** (capital-W) option shall be reserved for vendor options.

Multi-digit options should not be allowed.

Guideline 4: All options should be preceded by the '–' delimiter character.

Guideline 5: Options without option-arguments should be accepted when grouped behind one '–' delimiter.

Guideline 6: Each option and option-argument should be a separate argument, except as noted in Section 12.1 (on page 213), item (2).

Guideline 7: Option-arguments should not be optional.

Guideline 8: When multiple option-arguments are specified to follow a single option, they should be presented as a single argument, using <comma> characters within that argument or <blank> characters within that argument to separate them.

Guideline 9: All options should precede operands on the command line.

Guideline 10: The first –– argument that is not an option-argument should be accepted as a delimiter indicating the end of options. Any following arguments should be treated as operands, even if they begin with the '–' character.

Guideline 11: The order of different options relative to one another should not matter, unless the options are documented as mutually-exclusive and such an option is documented to override any incompatible options preceding it. If an option that has option-arguments is repeated, the option and option-argument combinations should be interpreted in the order specified on the command line.

Guideline 12: The order of operands may matter and position-related interpretations should be determined on a utility-specific basis.

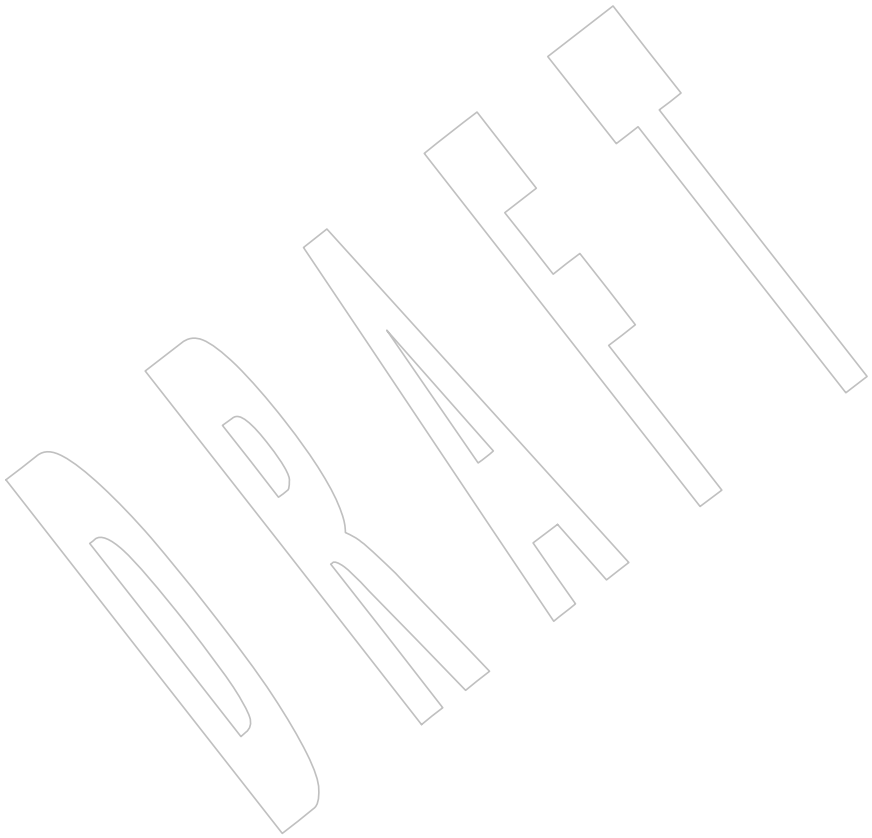
Guideline 13: For utilities that use operands to represent files to be opened for either reading or writing, the '–' operand should be used to mean only standard input (or standard output when it is clear from context that an output file is being specified) or a file named –.

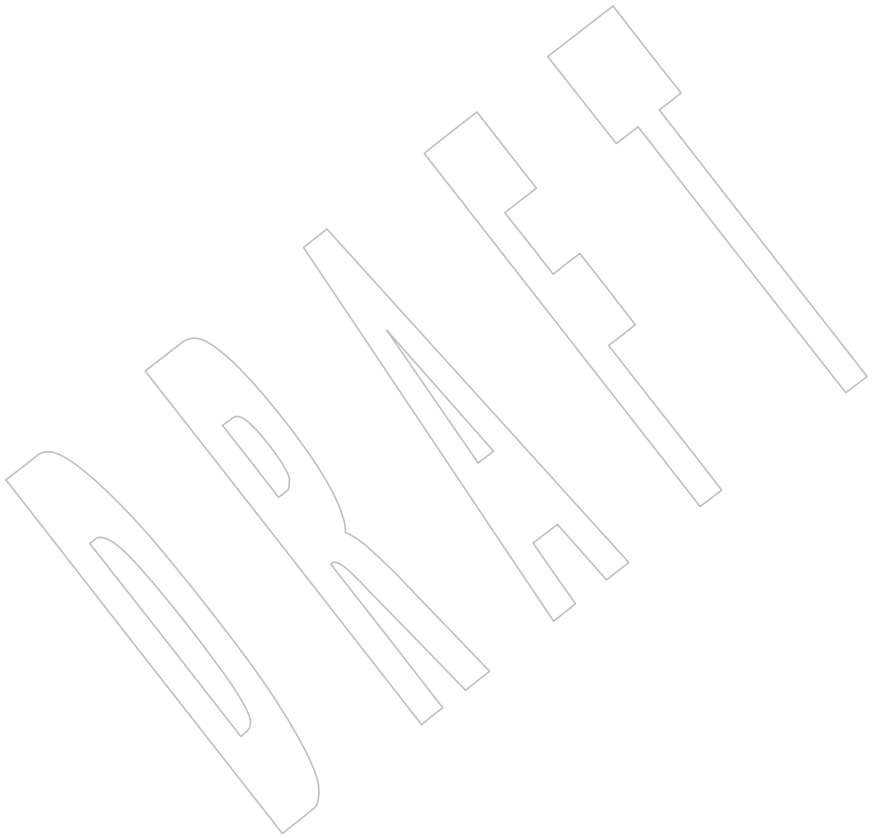
Guideline 14: If an argument can be identified according to Guidelines 3 through 10 as an option, or as a group of options without option-arguments behind one '–' delimiter, then it should be treated as such.

The utilities in the Shell and Utilities volume of POSIX.1-200x that claim conformance to these guidelines shall conform completely to these guidelines as if these guidelines contained the term "shall" instead of "should". On some implementations, the utilities accept usage in violation of these guidelines for backwards-compatibility as well as accepting the required form.

Where a utility described in the Shell and Utilities volume of POSIX.1-200x as conforming to these guidelines is required to accept, or not to accept, the operand '–' to mean standard input or output, this usage is explained in the OPERANDS section. Otherwise, if such a utility uses operands to represent files, it is implementation-defined whether the operand '–' stands for standard input (or standard output), or for a file named –.

It is recommended that all future utilities and applications use these guidelines to enhance user portability. The fact that some historical utilities could not be changed (to avoid breaking existing applications) should not deter this future goal.





7159 *Chapter 13*

7160 # *Headers*

7161 This chapter describes the contents of headers.

7162 Headers contain function prototypes, the definition of symbolic constants, common structures,
7163 preprocessor macros, and defined types. Each function in the System Interfaces volume of
7164 POSIX.1-200x specifies the headers that an application shall include in order to use that function.
7165 In most cases, only one header is required. These headers are present on an application
7166 development system; they need not be present on the target execution system.

7167 **Format of Entries**

7168 The entries in this chapter are based on a common format as follows. The only sections relating
7169 to conformance are the SYNOPSIS and DESCRIPTION.

7170 **NAME**

7171 This section gives the name or names of the entry and briefly states its purpose.

7172 **SYNOPSIS**

7173 This section summarizes the use of the entry being described.

7174 **DESCRIPTION**

7175 This section describes the functionality of the header.

7176 **APPLICATION USAGE**

7177 This section is informative. This section gives warnings and advice to application
7178 developers about the entry. In the event of conflict between warnings and advice and a
7179 normative part of this volume of POSIX.1-200x, the normative material is to be taken as
7180 correct.

7181 **RATIONALE**

7182 This section is informative. This section contains historical information concerning the
7183 contents of this volume of POSIX.1-200x and why features were included or discarded
7184 by the standard developers.

7185 **FUTURE DIRECTIONS**

7186 This section is informative. This section provides comments which should be used as a
7187 guide to current thinking; there is not necessarily a commitment to adopt these future
7188 directions.

7189 **SEE ALSO**

7190 This section is informative. This section gives references to related information.

7191 **CHANGE HISTORY**

7192 This section is informative. This section shows the derivation of the entry and any
7193 significant changes that have been made to it.

NAME

aio.h — asynchronous input and output (**REALTIME**)

SYNOPSIS

```
#include <aio.h>
```

DESCRIPTION

The **<aio.h>** header shall define the **aiocb** structure, which shall include at least the following members:

```
int              aio_fildes      File descriptor.
off_t            aio_offset      File offset.
volatile void   *aio_buf         Location of buffer.
size_t           aio_nbytes      Length of transfer.
int              aio_reqprio     Request priority offset.
struct sigevent  aio_sigevent    Signal number and value.
int              aio_lio_opcode  Operation to be performed.
```

The **<aio.h>** header shall define the **off_t**, **pthread_attr_t**, **size_t**, and **ssize_t** types as described in **<sys/types.h>**.

The **<aio.h>** header shall define the **struct timespec** structure as described in **<time.h>**.

The tag **sigevent** shall be declared as naming an incomplete structure type, the contents of which are described in the **<signal.h>** header.

The **<aio.h>** header shall define the following symbolic constants:

AIO_ALLDONE
: A return value indicating that none of the requested operations could be canceled since they are already complete.

AIO_CANCELED
: A return value indicating that all requested operations have been canceled.

AIO_NOTCANCELED
: A return value indicating that some of the requested operations could not be canceled since they are in progress.

LIO_NOP
: A *lio_listio*() element operation option indicating that no transfer is requested.

LIO_NOWAIT
: A *lio_listio*() synchronization operation indicating that the calling thread is to continue execution while the *lio_listio*() operation is being performed, and no notification is given when the operation is complete.

LIO_READ
: A *lio_listio*() element operation option requesting a read.

LIO_WAIT
: A *lio_listio*() synchronization operation indicating that the calling thread is to suspend until the *lio_listio*() operation is complete.

LIO_WRITE
: A *lio_listio*() element operation option requesting a write.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int      aio_cancel(int, struct aiocb *);
int      aio_error(const struct aiocb *);
int      aio_fsync(int, struct aiocb *);
int      aio_read(struct aiocb *);
ssize_t  aio_return(struct aiocb *);
int      aio_suspend(const struct aiocb *const [], int,
```

```
                const struct timespec *);
int     aio_write(struct aiocb *);
int     lio_listio(int, struct aiocb *restrict const [restrict], int,
                struct sigevent *restrict);
```

Inclusion of the **<aio.h>** header may make visible symbols defined in the headers **<fcntl.h>**, **<signal.h>**, and **<time.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The **<aio.h>** header is marked as part of the Asynchronous Input and Output option.

The description of the constants is expanded.

The **restrict** keyword is added to the prototype for *lio_listio*( ).

Issue 7

The **<aio.h>** header is moved from the Asynchronous Input and Output option to the Base.

This reference page is clarified with respect to macros and symbolic constants, and type and structure declarations are added.

7264 **NAME**

7265 arpa/inet.h — definitions for internet operations

7266 **SYNOPSIS**

7267 `#include <arpa/inet.h>`

7268 **DESCRIPTION**

7269 The **<arpa/inet.h>** header shall define the **in_port_t** and **in_addr_t** types as described in
7270 **<netinet/in.h>**.

7271 The **<arpa/inet.h>** header shall define the **in_addr** structure as described in **<netinet/in.h>**.

7272 IP6 The **<arpa/inet.h>** header shall define the INET_ADDRSTRLEN and INET6_ADDRSTRLEN
7273 macros as described in **<netinet/in.h>**.

7274 The following shall be declared as functions, or defined as macros, or both. If functions are
7275 declared, function prototypes shall be provided.

```
7276 uint32_t htonl(uint32_t);
7277 uint16_t htons(uint16_t);
7278 uint32_t ntohl(uint32_t);
7279 uint16_t ntohs(uint16_t);
```

7280 The **<arpa_inet.h>** header shall define the **uint32_t** and **uint16_t** types as described in
7281 **<inttypes.h>**.

7282 The following shall be declared as functions and may also be defined as macros. Function
7283 prototypes shall be provided.

```
7284 in_addr_t    inet_addr(const char *);
7285 char        *inet_ntoa(struct in_addr);
7286 const char  *inet_ntop(int, const void *restrict, char *restrict,
7287                     socklen_t);
7288 int          inet_pton(int, const char *restrict, void *restrict);
```

7289 Inclusion of the **<arpa/inet.h>** header may also make visible all symbols from **<netinet/in.h>**
7290 and **<inttypes.h>**.

7291 **APPLICATION USAGE**

7292 None.

7293 **RATIONALE**

7294 None.

7295 **FUTURE DIRECTIONS**

7296 None.

7297 **SEE ALSO**

7298 **<inttypes.h>**, **<netinet/in.h>**

7299 XSH *htonl*( ), *inet_addr*( ),

7300 **CHANGE HISTORY**

7301 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

7302 The **restrict** keyword is added to the prototypes for *inet_ntop*( ) and *inet_pton*( ).

7303 **Issue 7**

7304 SD5-XBD-ERN-6 is applied.

NAME

assert.h — verify program assertion

SYNOPSIS

```
#include <assert.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The **<assert.h>** header shall define the *assert*() macro. It refers to the macro NDEBUG which is not defined in the header. If NDEBUG is defined as a macro name before the inclusion of this header, the *assert*() macro shall be defined simply as:

```
#define assert(ignore)((void) 0)
```

Otherwise, the macro behaves as described in *assert*().

The *assert*() macro shall be redefined according to the current state of NDEBUG each time **<assert.h>** is included.

The *assert*() macro shall be implemented as a macro, not as a function. If the macro definition is suppressed in order to access an actual function, the behavior is undefined.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XSH *assert*()

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The definition of the *assert*() macro is changed for alignment with the ISO/IEC 9899:1999 standard.

NAME

complex.h — complex arithmetic

SYNOPSIS

```
#include <complex.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The **<complex.h>** header shall define the following macros:

complex	Expands to **_Complex**.
_Complex_I	Expands to a constant expression of type **const float _Complex**, with the value of the imaginary unit (that is, a number i such that $i^2=-1$).
imaginary	Expands to **_Imaginary**.
_Imaginary_I	Expands to a constant expression of type **const float _Imaginary** with the value of the imaginary unit.
I	Expands to either _Imaginary_I or _Complex_I. If _Imaginary_I is not defined, I expands to _Complex_I.

The macros imaginary and _Imaginary_I shall be defined if and only if the implementation supports imaginary types.

An application may undefine and then, perhaps, redefine the complex, imaginary, and I macros.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
double                cabs(double complex);
float                 cabsf(float complex);
long double           cabsl(long double complex);
double complex        cacos(double complex);
float complex         cacosf(float complex);
double complex        cacosh(double complex);
float complex         cacoshf(float complex);
long double complex   cacoshl(long double complex);
long double complex   cacosl(long double complex);
double                carg(double complex);
float                 cargf(float complex);
long double           cargl(long double complex);
double complex        casin(double complex);
float complex         casinf(float complex);
double complex        casinh(double complex);
float complex         casinhf(float complex);
long double complex   casinhl(long double complex);
long double complex   casinl(long double complex);
double complex        catan(double complex);
float complex         catanf(float complex);
double complex        catanh(double complex);
float complex         catanhf(float complex);
long double complex   catanhl(long double complex);
long double complex   catanl(long double complex);
```

```
double complex       ccos(double complex);
float complex        ccosf(float complex);
double complex       ccosh(double complex);
float complex        ccoshf(float complex);
long double complex  ccoshl(long double complex);
long double complex  ccosl(long double complex);
double complex       cexp(double complex);
float complex        cexpf(float complex);
long double complex  cexpl(long double complex);
double               cimag(double complex);
float                cimagf(float complex);
long double          cimagl(long double complex);
double complex       clog(double complex);
float complex        clogf(float complex);
long double complex  clogl(long double complex);
double complex       conj(double complex);
float complex        conjf(float complex);
long double complex  conjl(long double complex);
double complex       cpow(double complex, double complex);
float complex        cpowf(float complex, float complex);
long double complex  cpowl(long double complex, long double complex);
double complex       cproj(double complex);
float complex        cprojf(float complex);
long double complex  cprojl(long double complex);
double               creal(double complex);
float                crealf(float complex);
long double          creall(long double complex);
double complex       csin(double complex);
float complex        csinf(float complex);
double complex       csinh(double complex);
float complex        csinhf(float complex);
long double complex  csinhl(long double complex);
long double complex  csinl(long double complex);
double complex       csqrt(double complex);
float complex        csqrtf(float complex);
long double complex  csqrtl(long double complex);
double complex       ctan(double complex);
float complex        ctanf(float complex);
double complex       ctanh(double complex);
float complex        ctanhf(float complex);
long double complex  ctanhl(long double complex);
long double complex  ctanl(long double complex);
```

APPLICATION USAGE

Values are interpreted as radians, not degrees.

RATIONALE

The choice of *I* instead of *i* for the imaginary unit concedes to the widespread use of the identifier *i* for other purposes. The application can use a different identifier, say *j*, for the imaginary unit by following the inclusion of the **<complex.h>** header with:

```
#undef I
#define j _Imaginary_I
```

An *I* suffix to designate imaginary constants is not required, as multiplication by *I* provides a sufficiently convenient and more generally useful notation for imaginary terms. The corresponding real type for the imaginary unit is **float**, so that use of *I* for algorithmic or notational convenience will not result in widening types.

On systems with imaginary types, the application has the ability to control whether use of the macro I introduces an imaginary type, by explicitly defining I to be _Imaginary_I or _Complex_I. Disallowing imaginary types is useful for some applications intended to run on implementations without support for such types.

The macro _Imaginary_I provides a test for whether imaginary types are supported.

The *cis*( ) function (*cos*(*x*) + *I***sin*(*x*)) was considered but rejected because its implementation is easy and straightforward, even though some implementations could compute sine and cosine more efficiently in tandem.

FUTURE DIRECTIONS

The following function names and the same names suffixed with *f* or *l* are reserved for future use, and may be added to the declarations in the **<complex.h>** header.

cerf( )	*cexpm1*( )	*clog2*( )
cerfc( )	*clog10*( )	*clgamma*( )
cexp2( )	*clog1p*( )	*ctgamma*( )

CHANGE HISTORY

First released in Issue 6. Included for alignment with the ISO/IEC 9899: 1999 standard.

NAME

cpio.h — cpio archive values

SYNOPSIS

```
#include <cpio.h>
```

DESCRIPTION

The **<cpio.h>** header shall define the symbolic constants needed by the *c_mode* field of the *cpio* archive format, with the names and values given in the following table:

Name	Description	Value (Octal)
C_IRUSR	Read by owner.	0000400
C_IWUSR	Write by owner.	0000200
C_IXUSR	Execute by owner.	0000100
C_IRGRP	Read by group.	0000040
C_IWGRP	Write by group.	0000020
C_IXGRP	Execute by group.	0000010
C_IROTH	Read by others.	0000004
C_IWOTH	Write by others.	0000002
C_IXOTH	Execute by others.	0000001
C_ISUID	Set user ID.	0004000
C_ISGID	Set group ID.	0002000
C_ISVTX	On directories, restricted deletion flag.	0001000
C_ISDIR	Directory.	0040000
C_ISFIFO	FIFO.	0010000
C_ISREG	Regular file.	0100000
C_ISBLK	Block special.	0060000
C_ISCHR	Character special.	0020000
C_ISCTG	Reserved.	0110000
C_ISLNK	Symbolic link.	0120000
C_ISSOCK	Socket.	0140000

The **<cpio.h>** header shall define the following symbolic constant as a string:

```
MAGIC     "070707"
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XCU *pax*

CHANGE HISTORY

First released in the Headers Interface, Issue 3 specification. Derived from the POSIX.1-1988 standard.

Issue 6

The SEE ALSO is updated to refer to *pax*.

Issue 7

The **<cpio.h>** header is moved from the XSI option to the Base.

This reference page is clarified with respect to macros and symbolic constants.

NAME

ctype.h — character types

SYNOPSIS

```
#include <ctype.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to enable the visibility of these symbols in this header.

The **<ctype.h>** header shall define the **locale_t** type as described in **<locale.h>**, representing a locale object.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with ISO C standard compilers.

```
int   isalnum(int);
CX int   isalnum_l(int, locale_t);
int   isalpha(int);
CX int   isalpha_l(int, locale_t);
OB XSI int   isascii(int);
int   isblank(int);
CX int   isblank_l(int, locale_t);
int   iscntrl(int);
CX int   iscntrl_l(int, locale_t);
int   isdigit(int);
CX int   isdigit_l(int, locale_t);
int   isgraph(int);
CX int   isgraph_l(int, locale_t);
int   islower(int);
CX int   islower_l(int, locale_t);
int   isprint(int);
CX int   isprint_l(int, locale_t);
int   ispunct(int);
CX int   ispunct_l(int, locale_t);
int   isspace(int);
CX int   isspace_l(int, locale_t);
int   isupper(int);
CX int   isupper_l(int, locale_t);
int   isxdigit(int);
CX int   isxdigit_l(int, locale_t);
OB XSI int   toascii(int);
int   tolower(int);
CX int   tolower_l(int, locale_t);
int   toupper(int);
CX int   toupper_l(int, locale_t);
```

The **<ctype.h>** header shall define the following as macros:

```
OB XSI int   _toupper(int);
int   _tolower(int);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XSH Section 2.2 (on page 468), *isalnum*( ), *isalpha*( ), *isascii*( ), *isblank*( ), *iscntrl*( ), *isdigit*( ), *isgraph*( ), *islower*( ), *isprint*( ), *ispunct*( ), *isspace*( ), *isupper*( ), *isxdigit*( ), *mblen*( ), *mbstowcs*( ), *mbtowc*( ), *setlocale*( ), *toascii*( ), *tolower*( ), *_tolower*( ), *toupper*( ), *_toupper*( ), *wcstombs*( ), *wctomb*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

Issue 7

SD5-XBD-ERN-6 is applied, updating the wording regarding the function declarations for consistency.

The **_l*( ) functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

dirent.h — format of directory entries

SYNOPSIS

```
#include <dirent.h>
```

DESCRIPTION

The internal format of directories is unspecified.

The **<dirent.h>** header shall define the following type:

DIR A type representing a directory stream. The **DIR** type may be an incomplete type.

It shall also define the structure **dirent** which shall include the following members:

XSI

```
ino_t   d_ino       File serial number.
char    d_name[]    Name of entry.
```

XSI The **<dirent.h>** header shall define the **ino_t** type as described in **<sys/types.h>**.

The character array *d_name* is of unspecified size, but the number of bytes preceding the terminating null byte shall not exceed {NAME_MAX}.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int            alphasort(const struct dirent **, const struct dirent **);
int            closedir(DIR *);
int            dirfd(DIR *);
DIR           *fdopendir(int);
DIR           *opendir(const char *);
struct dirent *readdir(DIR *);
int            readdir_r(DIR *restrict, struct dirent *restrict,
                   struct dirent **restrict);
void           rewinddir(DIR *);
int            scandir(const char *, struct dirent ***,
                   int (*)(const struct dirent *),
                   int (*)(const struct dirent **,
                   const struct dirent **));
```

XSI

```
void           seekdir(DIR *, long);
long           telldir(DIR *);
```

APPLICATION USAGE

None.

RATIONALE

Information similar to that in the **<dirent.h>** header is contained in a file **<sys/dir.h>** in 4.2 BSD and 4.3 BSD. The equivalent in these implementations of **struct dirent** from this volume of POSIX.1-200x is **struct direct**. The filename was changed because the name **<sys/dir.h>** was also used in earlier implementations to refer to definitions related to the older access method; this produced name conflicts. The name of the structure was changed because this volume of POSIX.1-200x does not completely define what is in the structure, so it could be different on some implementations from **struct direct**.

The name of an array of **char** of an unspecified size should not be used as an lvalue. Use of:

```
sizeof(d_name)
```

is incorrect; use:

`strlen(d_name)`

instead.

The array of **char** *d_name* is not a fixed size. Implementations may need to declare **struct dirent** with an array size for *d_name* of 1, but the actual number of characters provided matches (or only slightly exceeds) the length of the filename.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>

XSH *alphasort*( ), *closedir*( ), *dirfd*( ), *fdopendir*( ), *readdir*( ), *rewinddir*( ), *seekdir*( ), *telldir*( )

CHANGE HISTORY

First released in Issue 2.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The Open Group Corrigendum U026/7 is applied, correcting the prototype for *readdir_r*( ).

The **restrict** keyword is added to the prototype for *readdir_r*( ).

Issue 7

The *alphasort*( ), *dirfd*( ), and *scandir*( ) functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

The *fopendir*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Austin Group Interpretation 1003.1-2001 #110 is applied, clarifying the definition of the **DIR** type.

NAME

dlfcn.h — dynamic linking

SYNOPSIS

```
#include <dlfcn.h>
```

DESCRIPTION

The **<dlfcn.h>** header shall define at least the following symbolic constants for use in the construction of a *dlopen*( ) *mode* argument:

RTLD_LAZY	Relocations are performed at an implementation-defined time.
RTLD_NOW	Relocations are performed when the object is loaded.
RTLD_GLOBAL	All symbols are available for relocation processing of other modules.
RTLD_LOCAL	All symbols are not made available for relocation processing by other modules.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int    dlclose(void *);
char  *dlerror(void);
void  *dlopen(const char *, int);
void  *dlsym(void *restrict, const char *restrict);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XSH *dlclose*( ), *dlerror*( ), *dlopen*( ), *dlsym*( )

CHANGE HISTORY

First released in Issue 5.

Issue 6

The **restrict** keyword is added to the prototype for *dlsym*( ).

Issue 7

The **<dlfcn.h>** header is moved from the XSI option to the Base.

This reference page is clarified with respect to macros and symbolic constants.

NAME

errno.h — system error numbers

SYNOPSIS

```
#include <errno.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The ISO C standard only requires the symbols [EDOM], [EILSEQ], and [ERANGE] to be defined.

The **<errno.h>** header shall provide a declaration or definition for *errno*. The symbol *errno* shall expand to a modifiable lvalue of type **int**. It is unspecified whether *errno* is a macro or an identifier declared with external linkage. If a macro definition is suppressed in order to access an actual object, or a program defines an identifier with the name *errno*, the behavior is undefined.

The **<errno.h>** header shall define the following macros which shall expand to integer constant expressions with type **int**, distinct positive values (except as noted below), and which shall be suitable for use in **#if** preprocessing directives:

[E2BIG]	Argument list too long.
[EACCES]	Permission denied.
[EADDRINUSE]	Address in use.
[EADDRNOTAVAIL]	Address not available.
[EAFNOSUPPORT]	Address family not supported.
[EAGAIN]	Resource unavailable, try again (may be the same value as [EWOULDBLOCK]).
[EALREADY]	Connection already in progress.
[EBADF]	Bad file descriptor.
[EBADMSG]	Bad message.
[EBUSY]	Device or resource busy.
[ECANCELED]	Operation canceled.
[ECHILD]	No child processes.
[ECONNABORTED]	Connection aborted.
[ECONNREFUSED]	Connection refused.
[ECONNRESET]	Connection reset.
[EDEADLK]	Resource deadlock would occur.
[EDESTADDRREQ]	Destination address required.
[EDOM]	Mathematics argument out of domain of function.
[EDQUOT]	Reserved.
[EEXIST]	File exists.

7703 [EFAULT] Bad address.
7704 [EFBIG] File too large.
7705 [EHOSTUNREACH] Host is unreachable.
7706 [EIDRM] Identifier removed.
7707 [EILSEQ] Illegal byte sequence.
7708 [EINPROGRESS] Operation in progress.
7709 [EINTR] Interrupted function.
7710 [EINVAL] Invalid argument.
7711 [EIO] I/O error.
7712 [EISCONN] Socket is connected.
7713 [EISDIR] Is a directory.
7714 [ELOOP] Too many levels of symbolic links.
7715 [EMFILE] File descriptor value too large.
7716 [EMLINK] Too many links.
7717 [EMSGSIZE] Message too large.
7718 [EMULTIHOP] Reserved.
7719 [ENAMETOOLONG] Filename too long.
7720 [ENETDOWN] Network is down.
7721 [ENETRESET] Connection aborted by network.
7722 [ENETUNREACH] Network unreachable.
7723 [ENFILE] Too many files open in system.
7724 [ENOBUFS] No buffer space available.
7725 OB XSR [ENODATA] No message is available on the STREAM head read queue.
7726 [ENODEV] No such device.
7727 [ENOENT] No such file or directory.
7728 [ENOEXEC] Executable file format error.
7729 [ENOLCK] No locks available.
7730 [ENOLINK] Reserved.
7731 [ENOMEM] Not enough space.
7732 [ENOMSG] No message of the desired type.
7733 [ENOPROTOOPT] Protocol not available.
7734 [ENOSPC] No space left on device.
7735 OB XSR [ENOSR] No STREAM resources.

7736	OB XSR	[ENOSTR]	Not a STREAM.
7737		[ENOSYS]	Function not supported.
7738		[ENOTCONN]	The socket is not connected.
7739		[ENOTDIR]	Not a directory.
7740		[ENOTEMPTY]	Directory not empty.
7741		[ENOTRECOVERABLE]	
7742			State not recoverable.
7743		[ENOTSOCK]	Not a socket.
7744		[ENOTSUP]	Not supported (may be the same value as [EOPNOTSUPP]).
7745		[ENOTTY]	Inappropriate I/O control operation.
7746		[ENXIO]	No such device or address.
7747		[EOPNOTSUPP]	Operation not supported on socket (may be the same value as
7748			[ENOTSUP]).
7749		[EOVERFLOW]	Value too large to be stored in data type.
7750		[EOWNERDEAD]	Previous owner died.
7751		[EPERM]	Operation not permitted.
7752		[EPIPE]	Broken pipe.
7753		[EPROTO]	Protocol error.
7754		[EPROTONOSUPPORT]	
7755			Protocol not supported.
7756		[EPROTOTYPE]	Protocol wrong type for socket.
7757		[ERANGE]	Result too large.
7758		[EROFS]	Read-only file system.
7759		[ESPIPE]	Invalid seek.
7760		[ESRCH]	No such process.
7761		[ESTALE]	Reserved.
7762	OB XSR	[ETIME]	Stream *ioctl*() timeout.
7763		[ETIMEDOUT]	Connection timed out.
7764		[ETXTBSY]	Text file busy.
7765		[EWOULDBLOCK]	Operation would block (may be the same value as [EAGAIN]).
7766		[EXDEV]	Cross-device link.

APPLICATION USAGE

Additional error numbers may be defined on conforming systems; see the System Interfaces volume of POSIX.1-200x.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XSH Section 2.3 (on page 477)

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Updated for alignment with the POSIX Realtime Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The majority of the error conditions previously marked as extensions are now mandatory, except for the STREAMS-related error conditions.

Values for *errno* are now required to be distinct positive values rather than non-zero values. This change is for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #050 is applied, allowing [ENOTSUP] and [EOPNOTSUPP] to be the same values.

The [ENOTRECOVERABLE] and [EOWNERDEAD] errors are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Functionality relating to the XSI STREAMS option is marked obsolescent.

Functionality relating to the Threads option is moved to the Base.

This reference page is clarified with respect to macros and symbolic constants.

NAME

fcntl.h — file control options

SYNOPSIS

```
#include <fcntl.h>
```

DESCRIPTION

The **<fcntl.h>** header shall define the following symbolic constants for the *cmd* argument used by *fcntl*(). The values shall be unique and shall be suitable for use in **#if** preprocessing directives.

F_DUPFD Duplicate file descriptor.

F_DUPFD_CLOEXEC
Duplicate file descriptor with the close-on-*exec* flag FD_CLOEXEC set.

F_GETFD Get file descriptor flags.

F_SETFD Set file descriptor flags.

F_GETFL Get file status flags and file access modes.

F_SETFL Set file status flags.

F_GETLK Get record locking information.

F_SETLK Set record locking information.

F_SETLKW Set record locking information; wait if blocked.

F_GETOWN Get process or process group ID to receive SIGURG signals.

F_SETOWN Set process or process group ID to receive SIGURG signals.

The **<fcntl.h>** header shall define the following symbolic constant used for the *fcntl*() file descriptor flags, which shall be suitable for use in **#if** preprocessing directives.

FD_CLOEXEC Close the file descriptor upon execution of an *exec* family function.

The **<fcntl.h>** header shall also define the following symbolic constants for the *l_type* argument used for record locking with *fcntl*(). The values shall be unique and shall be suitable for use in **#if** preprocessing directives.

F_RDLCK Shared or read lock.

F_UNLCK Unlock.

F_WRLCK Exclusive or write lock.

The **<fcntl.h>** header shall define the values used for *l_whence*, SEEK_SET, SEEK_CUR, and SEEK_END as described in **<stdio.h>**.

The **<fcntl.h>** header shall define the following symbolic constants as file creation flags for use in the *oflag* value to *open*() and *openat*(). The values shall be bitwise-distinct and shall be suitable for use in **#if** preprocessing directives.

O_CREAT Create file if it does not exist.

O_EXCL Exclusive use flag.

O_NOCTTY Do not assign controlling terminal.

O_TRUNC Truncate flag.

O_TTY_INIT Set the **termios** structure terminal parameters to a state that provides conforming behavior; see Section 11.2 (on page 205).

The O_TTY_INIT flag can have the value zero and in this case it need not be bitwise-distinct from the other flags.

The **<fcntl.h>** header shall define the following symbolic constants for use as file status flags for *open*( ), *openat*( ), and *fcntl*( ). The values shall be suitable for use in **#if** preprocessing directives.

O_APPEND Set append mode.

SIO O_DSYNC Write according to synchronized I/O data integrity completion.

O_NONBLOCK Non-blocking mode.

SIO O_RSYNC Synchronized read I/O operations.

O_SYNC Write according to synchronized I/O file integrity completion.

The **<fcntl.h>** header shall define the following symbolic constant for use as the mask for file access modes. The value shall be suitable for use in **#if** preprocessing directives.

O_ACCMODE Mask for file access modes.

The **<fcntl.h>** header shall define the following symbolic constants for use as the file access modes for *open*( ), *openat*( ), and *fcntl*( ). The values shall be suitable for use in **#if** preprocessing directives.

O_EXEC Open for execute only (non-directory files). The result is unspecified if this flag is applied to a directory.

O_RDONLY Open for reading only.

O_RDWR Open for reading and writing.

O_SEARCH Open directory for search only. The result is unspecified if this flag is applied to a non-directory file.

O_WRONLY Open for writing only.

The **<fcntl.h>** header shall define the symbolic constants for file modes for use as values of **mode_t** as described in **<sys/stat.h>**.

The **<fcntl.h>** header shall define the following symbolic constant as a special value used in place of a file descriptor for the **at*( ) functions which take a directory file descriptor as a parameter:

AT_FDCWD Use the current working directory to determine the target of relative file paths.

The **<fcntl.h>** header shall define the following symbolic constant as a value for the *flag* used by *faccessat*( ):

AT_EACCESS Check access using effective user and group ID.

The **<fcntl.h>** header shall define the following symbolic constant as a value for the *flag* used by *fstatat*( ), *fchmodat*( ), *fchownat*( ), and *utimensat*( ):

AT_SYMLINK_NOFOLLOW
Do not follow symbolic links.

The **<fcntl.h>** header shall define the following symbolic constant as a value for the flag used by *linkat*( ):

AT_SYMLINK_FOLLOW
Follow symbolic link.

The **<fcntl.h>** header shall define the following symbolic constants as values for the flag used by *open*( ) and *openat*( ):

O_CLOEXEC The FD_CLOEXEC flag associated with the new descriptor shall be set to close the file descriptor upon execution of an *exec* family function.

O_DIRECTORY Fail if not a directory.

O_NOFOLLOW Do not follow symbolic links.

The **<fcntl.h>** header shall define the following symbolic constant as a value for the flag used by *unlinkat*( ):

AT_REMOVEDIR
Remove directory instead of file.

ADV The **<fcntl.h>** header shall define the following symbolic constants for the *advice* argument used by *posix_fadvise*( ):

POSIX_FADV_DONTNEED
The application expects that it will not access the specified data in the near future.

POSIX_FADV_NOREUSE
The application expects to access the specified data once and then not reuse it thereafter.

POSIX_FADV_NORMAL
The application has no advice to give on its behavior with respect to the specified data. It is the default characteristic if no advice is given for an open file.

POSIX_FADV_RANDOM
The application expects to access the specified data in a random order.

POSIX_FADV_SEQUENTIAL
The application expects to access the specified data sequentially from lower offsets to higher offsets.

POSIX_FADV_WILLNEED
The application expects to access the specified data in the near future.

The **<fcntl.h>** header shall define the **flock** structure describing a file lock. It shall include the following members:

`short`	`l_type`	Type of lock; F_RDLCK, F_WRLCK, F_UNLCK.
`short`	`l_whence`	Flag for starting offset.
`off_t`	`l_start`	Relative offset in bytes.
`off_t`	`l_len`	Size; if 0 then until EOF.
`pid_t`	`l_pid`	Process ID of the process holding the lock; returned with F_GETLK.

The **<fcntl.h>** header shall define the **mode_t**, **off_t**, and **pid_t** types as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int  creat(const char *, mode_t);
int  fcntl(int, int, ...);
int  open(const char *, int, ...);
```

```
int  openat(int, const char *, int, ...);
ADV int  posix_fadvise(int, off_t, off_t, int);
int  posix_fallocate(int, off_t, off_t);
```

Inclusion of the **<fcntl.h>** header may also make visible all symbols from **<sys/stat.h>** and **<unistd.h>**.

APPLICATION USAGE

Although no existing implementation defines AT_SYMLINK_FOLLOW and AT_SYMLINK_NOFOLLOW as the same numeric value, POSIX.1-200x does not prohibit that as the two constants are not used with the same interfaces.

RATIONALE

While many of the symbolic constants introduced in the **<fcntl.h>** header do not strictly need to be used in **#if** preprocessor directives, widespread historic practice has defined them as macros that are usable in such constructs, and examination of existing applications has shown that they are occasionally used in such a way. Therefore it was decided to retain this requirement on an implementation in POSIX.1-200x.

FUTURE DIRECTIONS

None.

SEE ALSO

XSH *creat*( ), *exec*, *fcntl*( ), *futimens*( ), *open*( ), *posix_fadvise*( ), *posix_fallocate*( ), *posix_madvise*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Issue 6

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- O_DSYNC and O_RSYNC are marked as part of the Synchronized Input and Output option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The definition of the **mode_t**, **off_t**, and **pid_t** types is mandated.

The F_GETOWN and F_SETOWN values are added for sockets.

The *posix_fadvise*( ), *posix_fallocate*( ), and *posix_madvise*( ) functions are added for alignment with IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #102 is applied, moving the prototype for *posix_madvise*( ) to **<sys/mman.h>**.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/18 is applied, updating the prototypes for *posix_fadvise*( ) and *posix_fallocate*( ) to be large file-aware, using **off_t** instead of **size_t**.

Issue 7

Austin Group Interpretation 1003.1-2001 #144 is applied, adding the O_TTY_INIT flag.

Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the FD_CLOEXEC flag atomically at *open*( ), and adding the F_DUPFD_CLOEXEC flag.

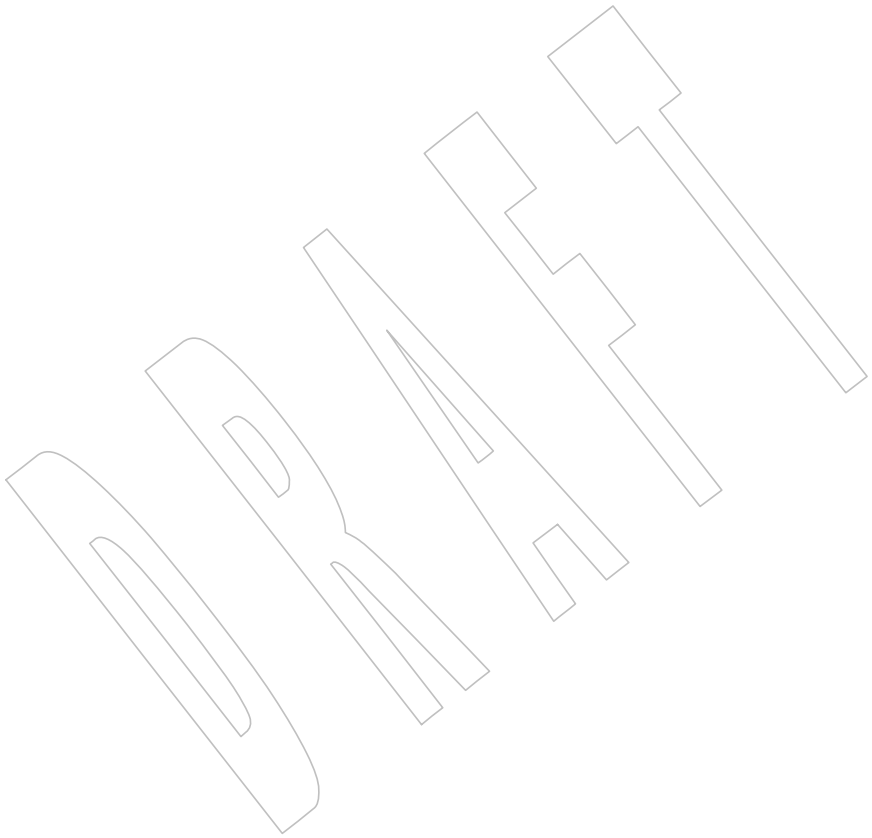
The *openat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Additional flags are added to support *faccessat*( ), *fchmodat*( ), *fchownat*( ), *fstatat*( ), *linkat*( ), *open*( ), *openat*( ), and *unlinkat*( ).

This reference page is clarified with respect to macros and symbolic constants.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.



NAME

fenv.h — floating-point environment

SYNOPSIS

```
#include <fenv.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The **<fenv.h>** header shall define the following data types through **typedef**:

fenv_t Represents the entire floating-point environment. The floating-point environment refers collectively to any floating-point status flags and control modes supported by the implementation.

fexcept_t Represents the floating-point status flags collectively, including any status the implementation associates with the flags. A floating-point status flag is a system variable whose value is set (but never cleared) when a floating-point exception is raised, which occurs as a side-effect of exceptional floating-point arithmetic to provide auxiliary information. A floating-point control mode is a system variable whose value may be set by the user to affect the subsequent behavior of floating-point arithmetic.

The **<fenv.h>** header shall define each of the following macros if and only if the implementation supports the floating-point exception by means of the floating-point functions *feclearexcept*(), *fegetexceptflag*(), *feraiseexcept*(), *fesetexceptflag*(), and *fetestexcept*(). The defined macros shall expand to integer constant expressions with values that are bitwise-distinct.

FE_DIVBYZERO
FE_INEXACT
FE_INVALID
FE_OVERFLOW
FE_UNDERFLOW

MX If the implementation supports the IEC 60559 Floating-Point option, all five macros shall be defined. Additional implementation-defined floating-point exceptions with macros beginning with FE_ and an uppercase letter may also be specified by the implementation.

The **<fenv.h>** header shall define the macro FE_ALL_EXCEPT as the bitwise-inclusive OR of all floating-point exception macros defined by the implementation, if any. If no such macros are defined, then the macro FE_ALL_EXCEPT shall be defined as zero.

The **<fenv.h>** header shall define each of the following macros if and only if the implementation supports getting and setting the represented rounding direction by means of the *fegetround*() and *fesetround*() functions. The defined macros shall expand to integer constant expressions whose values are distinct non-negative values.

FE_DOWNWARD
FE_TONEAREST
FE_TOWARDZERO
FE_UPWARD

MX If the implementation supports the IEC 60559 Floating-Point option, all four macros shall be defined. Additional implementation-defined rounding directions with macros beginning with FE_ and an uppercase letter may also be specified by the implementation.

The **<fenv.h>** header shall define the following macro, which represents the default floating-point environment (that is, the one installed at program startup) and has type pointer to const-qualified **fenv_t**. It can be used as an argument to the functions within the **<fenv.h>** header that manage the floating-point environment.

FE_DFL_ENV

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int  feclearexcept(int);
int  fegetenv(fenv_t *);
int  fegetexceptflag(fexcept_t *, int);
int  fegetround(void);
int  feholdexcept(fenv_t *);
int  feraiseexcept(int);
int  fesetenv(const fenv_t *);
int  fesetexceptflag(const fexcept_t *, int);
int  fesetround(int);
int  fetestexcept(int);
int  feupdateenv(const fenv_t *);
```

The FENV_ACCESS pragma provides a means to inform the implementation when an application might access the floating-point environment to test floating-point status flags or run under non-default floating-point control modes. The pragma shall occur either outside external declarations or preceding all explicit declarations and statements inside a compound statement. When outside external declarations, the pragma takes effect from its occurrence until another FENV_ACCESS pragma is encountered, or until the end of the translation unit. When inside a compound statement, the pragma takes effect from its occurrence until another FENV_ACCESS pragma is encountered (including within a nested compound statement), or until the end of the compound statement; at the end of a compound statement the state for the pragma is restored to its condition just before the compound statement. If this pragma is used in any other context, the behavior is undefined. If part of an application tests floating-point status flags, sets floating-point control modes, or runs under non-default mode settings, but was translated with the state for the FENV_ACCESS pragma off, the behavior is undefined. The default state (on or off) for the pragma is implementation-defined. (When execution passes from a part of the application translated with FENV_ACCESS off to a part translated with FENV_ACCESS on, the state of the floating-point status flags is unspecified and the floating-point control modes have their default settings.)

APPLICATION USAGE

This header is designed to support the floating-point exception status flags and directed-rounding control modes required by the IEC 60559: 1989 standard, and other similar floating-point state information. Also it is designed to facilitate code portability among all systems.

Certain application programming conventions support the intended model of use for the floating-point environment:

- A function call does not alter its caller's floating-point control modes, clear its caller's floating-point status flags, nor depend on the state of its caller's floating-point status flags unless the function is so documented.
- A function call is assumed to require default floating-point control modes, unless its documentation promises otherwise.

- A function call is assumed to have the potential for raising floating-point exceptions, unless its documentation promises otherwise.

With these conventions, an application can safely assume default floating-point control modes (or be unaware of them). The responsibilities associated with accessing the floating-point environment fall on the application that does so explicitly.

Even though the rounding direction macros may expand to constants corresponding to the values of FLT_ROUNDS, they are not required to do so.

For example:

```
#include <fenv.h>
void f(double x)
{
    #pragma STDC FENV_ACCESS ON
    void g(double);
    void h(double);
    /* ... */
    g(x + 1);
    h(x + 1);
    /* ... */
}
```

If the function *g*() might depend on status flags set as a side-effect of the first *x*+1, or if the second *x*+1 might depend on control modes set as a side-effect of the call to function *g*(), then the application shall contain an appropriately placed invocation as follows:

```
#pragma STDC FENV_ACCESS ON
```

RATIONALE

The fexcept_t Type

fexcept_t does not have to be an integer type. Its values must be obtained by a call to *fegetexceptflag*(), and cannot be created by logical operations from the exception macros. An implementation might simply implement **fexcept_t** as an **int** and use the representations reflected by the exception macros, but is not required to; other representations might contain extra information about the exceptions. **fexcept_t** might be a **struct** with a member for each exception (that might hold the address of the first or last floating-point instruction that caused that exception). The ISO/IEC 9899: 1999 standard makes no claims about the internals of an **fexcept_t**, and so the user cannot inspect it.

Exception and Rounding Macros

Macros corresponding to unsupported modes and rounding directions are not defined by the implementation and must not be defined by the application. An application might use **#ifdef** to test for this.

FUTURE DIRECTIONS

None.

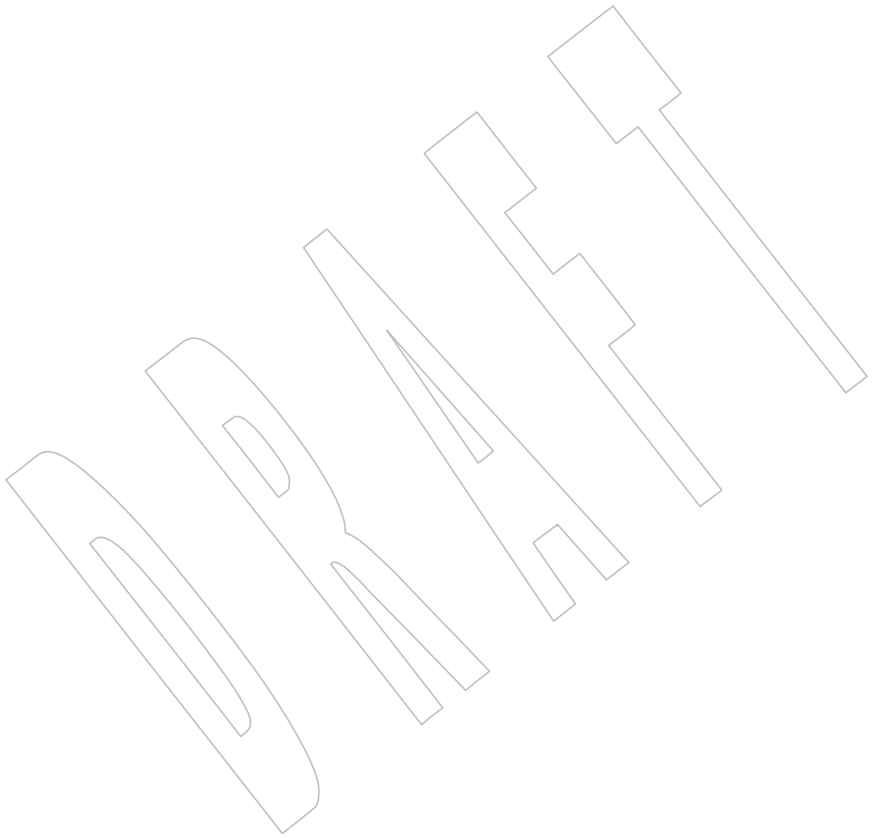
8105 This reference page is clarified with respect to macros and symbolic constants.



NAME

float.h — floating types

SYNOPSIS

```
#include <float.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The characteristics of floating types are defined in terms of a model that describes a representation of floating-point numbers and values that provide information about an implementation's floating-point arithmetic.

The following parameters are used to define the model for each floating-point type:

s Sign (±1).

b Base or radix of exponent representation (an integer >1).

e Exponent (an integer between a minimum e_{min} and a maximum e_{max}).

p Precision (the number of base–*b* digits in the significand).

f_k Non-negative integers less than *b* (the significand digits).

A floating-point number *x* is defined by the following model:

$$x = sb^e \sum_{k=1}^{p} f_k\, b^{-k},\ e_{min} \le e \le e_{max}$$

In addition to normalized floating-point numbers ($f_1>0$ if $x\neq0$), floating types may be able to contain other kinds of floating-point numbers, such as subnormal floating-point numbers ($x\neq0$, $e=e_{min}$, $f_1=0$) and unnormalized floating-point numbers ($x\neq0$, $e>e_{min}$, $f_1=0$), and values that are not floating-point numbers, such as infinities and NaNs. A *NaN* is an encoding signifying Not-a-Number. A *quiet NaN* propagates through almost every arithmetic operation without raising a floating-point exception; a *signaling NaN* generally raises a floating-point exception when occurring as an arithmetic operand.

An implementation may give zero and non-numeric values, such as infinities and NaNs, a sign, or may leave them unsigned. Wherever such values are unsigned, any requirement in POSIX.1-200x to retrieve the sign shall produce an unspecified sign and any requirement to set the sign shall be ignored.

The accuracy of the floating-point operations (`'+'`, `'-'`, `'*'`, `'/'`) and of the functions in **<math.h>** and **<complex.h>** that return floating-point results is implementation-defined, as is the accuracy of the conversion between floating-point internal representations and string representations performed by the functions in **<stdio.h>**, **<stdlib.h>**, and **<wchar.h>**. The implementation may state that the accuracy is unknown.

All integer values in the **<float.h>** header, except FLT_ROUNDS, shall be constant expressions suitable for use in **#if** preprocessing directives; all floating values shall be constant expressions. All except DECIMAL_DIG, FLT_EVAL_METHOD, FLT_RADIX, and FLT_ROUNDS have separate names for all three floating-point types. The floating-point model representation is provided for all values except FLT_EVAL_METHOD and FLT_ROUNDS.

The rounding mode for floating-point addition is characterized by the implementation-defined

value of FLT_ROUNDS:

–1 Indeterminable.

0 Toward zero.

1 To nearest.

2 Toward positive infinity.

3 Toward negative infinity.

All other values for FLT_ROUNDS characterize implementation-defined rounding behavior.

The values of operations with floating operands and values subject to the usual arithmetic conversions and of floating constants are evaluated to a format whose range and precision may be greater than required by the type. The use of evaluation formats is characterized by the implementation-defined value of FLT_EVAL_METHOD:

–1 Indeterminable.

0 Evaluate all operations and constants just to the range and precision of the type.

1 Evaluate operations and constants of type **float** and **double** to the range and precision of the **double** type; evaluate **long double** operations and constants to the range and precision of the **long double** type.

2 Evaluate all operations and constants to the range and precision of the **long double** type.

All other negative values for FLT_EVAL_METHOD characterize implementation-defined behavior.

The **<float.h>** header shall define the following values as constant expressions with implementation-defined values that are greater or equal in magnitude (absolute value) to those shown, with the same sign.

- Radix of exponent representation, *b*.

  FLT_RADIX 2

- Number of base-FLT_RADIX digits in the floating-point significand, *p*.

  FLT_MANT_DIG

  DBL_MANT_DIG

  LDBL_MANT_DIG

- Number of decimal digits, *n*, such that any floating-point number in the widest supported floating type with p_{max} radix *b* digits can be rounded to a floating-point number with *n* decimal digits and back again without change to the value.

$$\begin{cases} p_{max} \log_{10} b & \text{if } b \textit{ is a power of } 10 \\ \left\lceil 1 + p_{max} \log_{10} b \right\rceil & \textit{otherwise} \end{cases}$$

DECIMAL_DIG 10

- Number of decimal digits, q, such that any floating-point number with q decimal digits can be rounded into a floating-point number with p radix b digits and back again without change to the q decimal digits.

$$\begin{cases} p \log_{10} b & \text{if } b \textit{ is a power of } 10 \\ \left\lfloor (p-1) \log_{10} b \right\rfloor & \textit{otherwise} \end{cases}$$

FLT_DIG 6

DBL_DIG 10

LDBL_DIG 10

- Minimum negative integer such that FLT_RADIX raised to that power minus 1 is a normalized floating-point number, $e_{\min}$.

FLT_MIN_EXP

DBL_MIN_EXP

LDBL_MIN_EXP

- Minimum negative integer such that 10 raised to that power is in the range of normalized floating-point numbers.

$$\left\lceil \log_{10} b^{e_{\min}-1} \right\rceil$$

FLT_MIN_10_EXP –37

DBL_MIN_10_EXP –37

LDBL_MIN_10_EXP –37

- Maximum integer such that FLT_RADIX raised to that power minus 1 is a representable finite floating-point number, $e_{\max}$.

FLT_MAX_EXP

DBL_MAX_EXP

LDBL_MAX_EXP

- Maximum integer such that 10 raised to that power is in the range of representable finite floating-point numbers.

$$\left\lfloor \log_{10}((1 - b^{-p})\, b^{e_{\max}}) \right\rfloor$$

FLT_MAX_10_EXP +37

DBL_MAX_10_EXP +37

8203 LDBL_MAX_10_EXP +37

8204 The **<float.h>** header shall define the following values as constant expressions with
8205 implementation-defined values that are greater than or equal to those shown:

8206 • Maximum representable finite floating-point number.

$$(1 - b^{-p})\, b^{e_{max}}$$

8207 FLT_MAX 1E+37

8208 DBL_MAX 1E+37

8209 LDBL_MAX 1E+37

8210 The **<float.h>** header shall define the following values as constant expressions with
8211 implementation-defined (positive) values that are less than or equal to those shown:

8212 • The difference between 1 and the least value greater than 1 that is representable in the
8213 given floating-point type, b^{1-p}.

8214 FLT_EPSILON 1E–5

8215 DBL_EPSILON 1E–9

8216 LDBL_EPSILON 1E–9

8217 • Minimum normalized positive floating-point number, $b^{e_{min}-1}$.

8218 FLT_MIN 1E–37

8219 DBL_MIN 1E–37

8220 LDBL_MIN 1E–37

NAME

fmtmsg.h — message display structures

SYNOPSIS

XSI
```
#include <fmtmsg.h>
```

DESCRIPTION

The **<fmtmsg.h>** header shall define the following symbolic constants:

MM_HARD	Source of the condition is hardware.
MM_SOFT	Source of the condition is software.
MM_FIRM	Source of the condition is firmware.
MM_APPL	Condition detected by application.
MM_UTIL	Condition detected by utility.
MM_OPSYS	Condition detected by operating system.
MM_RECOVER	Recoverable error.
MM_NRECOV	Non-recoverable error.
MM_HALT	Error causing application to halt.
MM_ERROR	Application has encountered a non-fatal fault.
MM_WARNING	Application has detected unusual non-error condition.
MM_INFO	Informative message.
MM_NOSEV	No severity level provided for the message.
MM_PRINT	Display message on standard error.
MM_CONSOLE	Display message on system console.

The table below indicates the null values and identifiers for *fmtmsg*() arguments. The **<fmtmsg.h>** header shall define the symbolic constants in the **Identifier** column, which shall have the type indicated in the **Type** column:

Argument	Type	Null-Value	Identifier
label	**char ***	(**char***)0	MM_NULLLBL
severity	**int**	0	MM_NULLSEV
class	**long**	**0L**	MM_NULLMC
text	**char ***	(**char***)0	MM_NULLTXT
action	**char ***	(**char***)0	MM_NULLACT
tag	**char ***	(**char***)0	MM_NULLTAG

The **<fmtmsg.h>** header shall also define the following symbolic constants for use as return values for *fmtmsg*():

MM_OK	The function succeeded.
MM_NOTOK	The function failed completely.
MM_NOMSG	The function was unable to generate a message on standard error, but otherwise succeeded.

MM_NOCON The function was unable to generate a console message, but otherwise succeeded.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided.

```
int fmtmsg(long, const char *, int,
    const char *, const char *, const char *);
```

APPLICATION USAGE

None.

NAME

fnmatch.h — filename-matching types

SYNOPSIS

```
#include <fnmatch.h>
```

DESCRIPTION

The **<fnmatch.h>** header shall define the following symbolic constants:

FNM_NOMATCH	The string does not match the specified pattern.
FNM_PATHNAME	<slash> in *string* only matches <slash> in *pattern*.
FNM_PERIOD	Leading <period> in *string* must be exactly matched by <period> in *pattern*.
FNM_NOESCAPE	Disable backslash escaping.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided.

```
int fnmatch(const char *, const char *, int);
```

APPLICATION USAGE

None.

The FNM_NOSYS constant is marked obsolescent.

Issue 7

The obsolescent FNM_NOSYS constant is removed.

This reference page is clarified with respect to macros and symbolic constants.

NAME

ftw.h — file tree traversal

SYNOPSIS

XSI
```
#include <ftw.h>
```

DESCRIPTION

The **<ftw.h>** header shall define the **FTW** structure, which shall include at least the following members:

```
int  base
int  level
```

The **<ftw.h>** header shall define the following symbolic constants for use as values of the third argument to the application-supplied function that is passed as the second argument to *ftw*() and *nftw*():

FTW_F	File.
FTW_D	Directory.
FTW_DNR	Directory without read permission.
FTW_DP	Directory with subdirectories visited.
FTW_NS	Unknown type; *stat*() failed.
FTW_SL	Symbolic link.
FTW_SLN	Symbolic link that names a nonexistent file.

The **<ftw.h>** header shall define the following symbolic constants for use as values of the fourth argument to *nftw*():

FTW_PHYS	Physical walk, does not follow symbolic links. Otherwise, *nftw*() follows links but does not walk down any path that crosses itself.
FTW_MOUNT	The walk does not cross a mount point.
FTW_DEPTH	All subdirectories are visited before the directory itself.
FTW_CHDIR	The walk changes to each directory before reading it.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

OB
```
int ftw(const char *, int (*)(const char *, const struct stat *,
    int), int);
int nftw(const char *, int (*)(const char *, const struct stat *,
    int, struct FTW *), int, int);
```

The **<ftw.h>** header shall define the **stat** structure and the symbolic names for *st_mode* and the file type test macros as described in **<sys/stat.h>**.

Inclusion of the **<ftw.h>** header may also make visible all symbols from **<sys/stat.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

The *ftw*( ) function is marked obsolescent.

This reference page is clarified with respect to macros and symbolic constants.

NAME

glob.h — pathname pattern-matching types

SYNOPSIS

```
#include <glob.h>
```

DESCRIPTION

The **<glob.h>** header shall define the structures and symbolic constants used by the *glob*( ) function.

The **<glob.h>** header shall define the **glob_t** structure type, which shall include at least the following members:

```
size_t   gl_pathc  Count of paths matched by pattern.
char    **gl_pathv  Pointer to a list of matched pathnames.
size_t   gl_offs   Slots to reserve at the beginning of gl_pathv.
```

The **<glob.h>** header shall define the **size_t** type as described in **<sys/types.h>**.

The **<glob.h>** header shall define the following symbolic constants as values for the *flags* argument:

GLOB_APPEND — Append generated pathnames to those previously obtained.

GLOB_DOOFFS — Specify how many null pointers to add to the beginning of *gl_pathv*.

GLOB_ERR — Cause *glob*( ) to return on error.

GLOB_MARK — Each pathname that is a directory that matches *pattern* has a <slash> appended.

GLOB_NOCHECK — If *pattern* does not match any pathname, then return a list consisting of only *pattern*.

GLOB_NOESCAPE — Disable backslash escaping.

GLOB_NOSORT — Do not sort the pathnames returned.

The **<glob.h>** header shall define the following symbolic constants as error return values:

GLOB_ABORTED — The scan was stopped because GLOB_ERR was set or (**errfunc*)( ) returned non-zero.

GLOB_NOMATCH — The pattern does not match any existing pathname, and GLOB_NOCHECK was not set in *flags*.

GLOB_NOSPACE — An attempt to allocate memory failed.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int  glob(const char *restrict, int, int(*)(const char *, int),
         glob_t *restrict);
void globfree(glob_t *);
```

8407 **APPLICATION USAGE**
8408 None.

8409 **RATIONALE**
8410 None.

8411 **FUTURE DIRECTIONS**
8412 None.

8413 **SEE ALSO**
8414 **<sys/types.h>**

8415 XSH *glob*( )

8416 **CHANGE HISTORY**
8417 First released in Issue 4. Derived from the ISO POSIX-2 standard.

8418 **Issue 6**
8419 The **restrict** keyword is added to the prototype for *glob*( ).

8420 The GLOB_NOSYS constant is marked obsolescent.

8421 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/8 is applied, correcting the *glob*( )
8422 prototype definition by removing the **restrict** qualifier from the function pointer argument.

8423 **Issue 7**
8424 SD5-XBD-ERN-56 is applied, adding a reference to **<sys/types.h>** for the **size_t**

8425 The obsolescent GLOB_NOSYS constant is removed.

8426 This reference page is clarified with respect to macros and symbolic constants.

NAME

grp.h — group structure

SYNOPSIS

```
#include <grp.h>
```

DESCRIPTION

The **<grp.h>** header shall declare the **group** structure, which shall include the following members:

`char *gr_name`	The name of the group.
`gid_t gr_gid`	Numerical group ID.
`char **gr_mem`	Pointer to a null-terminated array of character pointers to member names.

The **<grp.h>** header shall define the **gid_t** and **size_t** types as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
void           endgrent(void);                                          +
struct group  *getgrent(void);                                          +
struct group  *getgrgid(gid_t);
int            getgrgid_r(gid_t, struct group *, char *,                -
                   size_t, struct group **);
struct group  *getgrnam(const char *);                                  +
int            getgrnam_r(const char *, struct group *, char *,
                   size_t , struct group **);
XSI void           setgrent(void);                                      -
```

CHANGE HISTORY

First released in Issue 1.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The definition of **gid_t** is mandated.
- The *getgrgid_r*( ) and *getgrnam_r*( ) functions are marked as part of the Thread-Safe Functions option.

Issue 7

SD5-XBD-ERN-56 is applied, adding a reference to **<sys/types.h>** for the **size_t** type.

NAME

iconv.h — codeset conversion facility

SYNOPSIS

```
#include <iconv.h>
```

DESCRIPTION

The **<iconv.h>** header shall define the following types:

iconv_t Identifies the conversion from one codeset to another.

size_t As described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
size_t  iconv(iconv_t, char **restrict, size_t *restrict,
            char **restrict, size_t *restrict);
int     iconv_close(iconv_t);
iconv_t iconv_open(const char *, const char *);
```

The **<iconv.h>** header is moved from the XSI option to the Base.

NAME

inttypes.h — fixed size integer types

SYNOPSIS

```
#include <inttypes.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to enable the visibility of these symbols in this header.

The **<inttypes.h>** header shall include the **<stdint.h>** header.

The **<inttypes.h>** header shall define at least the following type:

imaxdiv_t Structure type that is the type of the value returned by the *imaxdiv*( ) function.

The **<inttypes.h>** header shall define the following macros. Each expands to a character string literal containing a conversion specifier, possibly modified by a length modifier, suitable for use within the *format* argument of a formatted input/output function when converting the corresponding integer type. These macros have the general form of PRI (character string literals for the *fprintf*( ) and *fwprintf*( ) family of functions) or SCN (character string literals for the *fscanf*( ) and *fwscanf*( ) family of functions), followed by the conversion specifier, followed by a name corresponding to a similar type name in **<stdint.h>**. In these names, *N* represents the width of the type as described in **<stdint.h>**. For example, *PRIdFAST32* can be used in a format string to print the value of an integer of type **int_fast32_t**.

The *fprintf*( ) macros for signed integers are:

PRId*N*	PRIdLEAST*N*	PRIdFAST*N*	PRIdMAX	PRIdPTR
PRIi*N*	PRIiLEAST*N*	PRIiFAST*N*	PRIiMAX	PRIiPTR

The *fprintf*( ) macros for unsigned integers are:

PRIo*N*	PRIoLEAST*N*	PRIoFAST*N*	PRIoMAX	PRIoPTR
PRIu*N*	PRIuLEAST*N*	PRIuFAST*N*	PRIuMAX	PRIuPTR
PRIx*N*	PRIxLEAST*N*	PRIxFAST*N*	PRIxMAX	PRIxPTR
PRIX*N*	PRIXLEAST*N*	PRIXFAST*N*	PRIXMAX	PRIXPTR

The *fscanf*( ) macros for signed integers are:

SCNd*N*	SCNdLEAST*N*	SCNdFAST*N*	SCNdMAX	SCNdPTR
SCNi*N*	SCNiLEAST*N*	SCNiFAST*N*	SCNiMAX	SCNiPTR

The *fscanf*( ) macros for unsigned integers are:

SCNo*N*	SCNoLEAST*N*	SCNoFAST*N*	SCNoMAX	SCNoPTR
SCNu*N*	SCNuLEAST*N*	SCNuFAST*N*	SCNuMAX	SCNuPTR
SCNx*N*	SCNxLEAST*N*	SCNxFAST*N*	SCNxMAX	SCNxPTR

For each type that the implementation provides in **<stdint.h>**, the corresponding *fprintf*( ) and *fwprintf*( ) macros shall be defined and the corresponding *fscanf*( ) and *fwscanf*( ) macros shall be defined unless the implementation does not have a suitable modifier for the type.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
intmax_t  imaxabs(intmax_t);
imaxdiv_t imaxdiv(intmax_t, intmax_t);
```

```
intmax_t  strtoimax(const char *restrict, char **restrict, int);
uintmax_t strtoumax(const char *restrict, char **restrict, int);
intmax_t  wcstoimax(const wchar_t *restrict, wchar_t **restrict, int);
uintmax_t wcstoumax(const wchar_t *restrict, wchar_t **restrict, int);
```

EXAMPLES

```
#include <inttypes.h>
#include <wchar.h>
int main(void)
{
    uintmax_t i = UINTMAX_MAX; // This type always exists.
    wprintf(L"The largest integer value is %020"
        PRIxMAX "\n", i);
    return 0;
}
```

APPLICATION USAGE

The purpose of **<inttypes.h>** is to provide a set of integer types whose definitions are consistent across machines and independent of operating systems and other implementation idiosyncrasies. It defines, through **typedef**, integer types of various sizes. Implementations are free to **typedef** them as ISO C standard integer types or extensions that they support. Consistent use of this header will greatly increase the portability of applications across platforms.

RATIONALE

The ISO/IEC 9899:1990 standard specified that the language should support four signed and unsigned integer data types—**char**, **short**, **int**, and **long**—but placed very little requirement on their size other than that **int** and **short** be at least 16 bits and **long** be at least as long as **int** and not smaller than 32 bits. For 16-bit systems, most implementations assigned 8, 16, 16, and 32 bits to **char**, **short**, **int**, and **long**, respectively. For 32-bit systems, the common practice has been to assign 8, 16, 32, and 32 bits to these types. This difference in **int** size can create some problems for users who migrate from one system to another which assigns different sizes to integer types, because the ISO C standard integer promotion rule can produce silent changes unexpectedly. The need for defining an extended integer type increased with the introduction of 64-bit systems.

FUTURE DIRECTIONS

Macro names beginning with PRI or SCN followed by any lowercase letter or `'X'` may be added to the macros defined in the **<inttypes.h>** header.

CHANGE HISTORY

First released in Issue 5.

Issue 6

The Open Group Base Resolution bwg97-006 is applied.

This reference page is updated to align with the ISO/IEC 9899:1999 standard.

NAME

iso646.h — alternative spellings

SYNOPSIS

```
#include <iso646.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The **<iso646.h>** header shall define the following eleven macros (on the left) that expand to the corresponding tokens (on the right):

and	&&
and_eq	&=
bitand	&
bitor	|
compl	~
not	!
not_eq	!=
or	||
or_eq	|=
xor	^
xor_eq	^=

CHANGE HISTORY

First released in Issue 5. Derived from ISO/IEC 9899: 1990/Amendment 1: 1995 (E).

<langinfo.h>

NAME

langinfo.h — language information constants

SYNOPSIS

```
#include <langinfo.h>
```

DESCRIPTION

The **<langinfo.h>** header shall define the symbolic constants used to identify items of *langinfo* data (see *nl_langinfo*( )).

The **<langinfo.h>** header shall define the **locale_t** type as described in **<locale.h>**.

The **<langinfo.h>** header shall define the **nl_item** type as described in **<nl/types.h>**.

The **<langinfo.h>** header shall define the following symbolic constants with type **nl_item**. The entries under **Category** indicate in which *setlocale*( ) category each item is defined.

Constant	Category	Meaning
CODESET	*LC_CTYPE*	Codeset name.
D_T_FMT	*LC_TIME*	String for formatting date and time.
D_FMT	*LC_TIME*	Date format string.
T_FMT	*LC_TIME*	Time format string.
T_FMT_AMPM	*LC_TIME*	a.m. or p.m. time format string.
AM_STR	*LC_TIME*	Ante-meridiem affix.
PM_STR	*LC_TIME*	Post-meridiem affix.
DAY_1	*LC_TIME*	Name of the first day of the week (for example, Sunday).
DAY_2	*LC_TIME*	Name of the second day of the week (for example, Monday).
DAY_3	*LC_TIME*	Name of the third day of the week (for example, Tuesday).
DAY_4	*LC_TIME*	Name of the fourth day of the week (for example, Wednesday).
DAY_5	*LC_TIME*	Name of the fifth day of the week (for example, Thursday).
DAY_6	*LC_TIME*	Name of the sixth day of the week (for example, Friday).
DAY_7	*LC_TIME*	Name of the seventh day of the week (for example, Saturday).
ABDAY_1	*LC_TIME*	Abbreviated name of the first day of the week.
ABDAY_2	*LC_TIME*	Abbreviated name of the second day of the week.
ABDAY_3	*LC_TIME*	Abbreviated name of the third day of the week.
ABDAY_4	*LC_TIME*	Abbreviated name of the fourth day of the week.
ABDAY_5	*LC_TIME*	Abbreviated name of the fifth day of the week.
ABDAY_6	*LC_TIME*	Abbreviated name of the sixth day of the week.
ABDAY_7	*LC_TIME*	Abbreviated name of the seventh day of the week.
MON_1	*LC_TIME*	Name of the first month of the year.
MON_2	*LC_TIME*	Name of the second month.
MON_3	*LC_TIME*	Name of the third month.
MON_4	*LC_TIME*	Name of the fourth month.
MON_5	*LC_TIME*	Name of the fifth month.
MON_6	*LC_TIME*	Name of the sixth month.
MON_7	*LC_TIME*	Name of the seventh month.
MON_8	*LC_TIME*	Name of the eighth month.
MON_9	*LC_TIME*	Name of the ninth month.
MON_10	*LC_TIME*	Name of the tenth month.
MON_11	*LC_TIME*	Name of the eleventh month.
MON_12	*LC_TIME*	Name of the twelfth month.
ABMON_1	*LC_TIME*	Abbreviated name of the first month.

Constant	Category	Meaning
ABMON_2	*LC_TIME*	Abbreviated name of the second month.
ABMON_3	*LC_TIME*	Abbreviated name of the third month.
ABMON_4	*LC_TIME*	Abbreviated name of the fourth month.
ABMON_5	*LC_TIME*	Abbreviated name of the fifth month.
ABMON_6	*LC_TIME*	Abbreviated name of the sixth month.
ABMON_7	*LC_TIME*	Abbreviated name of the seventh month.
ABMON_8	*LC_TIME*	Abbreviated name of the eighth month.
ABMON_9	*LC_TIME*	Abbreviated name of the ninth month.
ABMON_10	*LC_TIME*	Abbreviated name of the tenth month.
ABMON_11	*LC_TIME*	Abbreviated name of the eleventh month.
ABMON_12	*LC_TIME*	Abbreviated name of the twelfth month.
ERA	*LC_TIME*	Era description segments.
ERA_D_FMT	*LC_TIME*	Era date format string.
ERA_D_T_FMT	*LC_TIME*	Era date and time format string.
ERA_T_FMT	*LC_TIME*	Era time format string.
ALT_DIGITS	*LC_TIME*	Alternative symbols for digits.
RADIXCHAR	*LC_NUMERIC*	Radix character.
THOUSEP	*LC_NUMERIC*	Separator for thousands.
YESEXPR	*LC_MESSAGES*	Affirmative response expression.
NOEXPR	*LC_MESSAGES*	Negative response expression.
CRNCYSTR	*LC_MONETARY*	Local currency symbol, preceded by '−' if the symbol should appear before the value, '+' if the symbol should appear after the value, or '.' if the symbol should replace the radix character. If the local currency symbol is the empty string, implementations may return the empty string ("").

If the locale's values for **p_cs_precedes** and **n_cs_precedes** do not match, the value of *nl_langinfo*(CRNCYSTR) and *nl_langinfo_l*(CRNCYSTR,loc) is unspecified.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided.

```
char *nl_langinfo(nl_item);
char *nl_langinfo_l(nl_item, locale_t);
```

Inclusion of the **<langinfo.h>** header may also make visible all symbols from **<nl_types.h>**.

APPLICATION USAGE

Wherever possible, users are advised to use functions compatible with those in the ISO C standard to access items of *langinfo* data. In particular, the *strftime*() function should be used to access date and time information defined in category *LC_TIME*. The *localeconv*() function should be used to access information corresponding to RADIXCHAR, THOUSEP, and CRNCYSTR.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

Chapter 7 (on page 135), **<locale.h>**, **<nl_types.h>**

XSH *nl_langinfo*(), *localeconv*(), *strfmon*(), *strftime*()

CHANGE HISTORY

First released in Issue 2.

Issue 5

The constants YESSTR and NOSTR are marked LEGACY.

Issue 6

The constants YESSTR and NOSTR are removed.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/9 is applied, adding a sentence to the"Meaning" column entry for the CRNCYSTR constant. This change is to accommodate historic practice.

Issue 7

The **<langinfo.h>** header is moved from the XSI option to the Base.

The *nl_langinfo_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

This reference page is clarified with respect to macros and symbolic constants, and a declaration for the **locale_t** type is added.

NAME

libgen.h — definitions for pattern matching functions

SYNOPSIS

XSI

```
#include <libgen.h>
```

DESCRIPTION

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
char  *basename(char *);
char  *dirname(char *);
```

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

The function prototypes for *basename*( ) and *dirname*( ) are changed to indicate that the first argument is of type **char *** rather than **const char ***.

Issue 6

The **__loc1** symbol and the *regcmp*( ) and *regex*( ) functions are removed.

NAME

limits.h — implementation-defined constants

SYNOPSIS

```
#include <limits.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to enable the visibility of these symbols in this header.

Many of the symbols listed here are not defined by the ISO/IEC 9899:1999 standard. Such symbols are not shown as CX shaded.

The **<limits.h>** header shall define macros and symbolic constants for various limits. Different categories of limits are described below, representing various limits on resources that the implementation imposes on applications. All macros and symbolic constants defined in this header shall be suitable for use in **#if** preprocessing directives.

Implementations may choose any appropriate value for each limit, provided it is not more restrictive than the Minimum Acceptable Values listed below. Symbolic constant names beginning with _POSIX may be found in **<unistd.h>**.

Applications should not assume any particular value for a limit. To achieve maximum portability, an application should not require more resource than the Minimum Acceptable Value quantity. However, an application wishing to avail itself of the full amount of a resource available on an implementation may make use of the value given in **<limits.h>** on that particular implementation, by using the macros and symbolic constants listed below. It should be noted, however, that many of the listed limits are not invariant, and at runtime, the value of the limit may differ from those given in this header, for the following reasons:

- The limit is pathname-dependent.
- The limit differs between the compile and runtime machines.

For these reasons, an application may use the *fpathconf*( ), *pathconf*( ), and *sysconf*( ) functions to determine the actual value of a limit at runtime.

The items in the list ending in _MIN give the most negative values that the mathematical types are guaranteed to be capable of representing. Numbers of a more negative value may be supported on some implementations, as indicated by the **<limits.h>** header on the implementation, but applications requiring such numbers are not guaranteed to be portable to all implementations. For positive constants ending in _MIN, this indicates the minimum acceptable value.

Runtime Invariant Values (Possibly Indeterminate)

A definition of one of the symbolic constants in the following list shall be omitted from **<limits.h>** on specific implementations where the corresponding value is equal to or greater than the stated minimum, but is unspecified.

This indetermination might depend on the amount of available memory space on a specific instance of a specific implementation. The actual value supported by a specific instance shall be provided by the *sysconf*( ) function.

{AIO_LISTIO_MAX}
Maximum number of I/O operations in a single list I/O call supported by the implementation.
Minimum Acceptable Value: {_POSIX_AIO_LISTIO_MAX}

{AIO_MAX}
Maximum number of outstanding asynchronous I/O operations supported by the implementation.
Minimum Acceptable Value: {_POSIX_AIO_MAX}

{AIO_PRIO_DELTA_MAX}
The maximum amount by which a process can decrease its asynchronous I/O priority level from its own scheduling priority.
Minimum Acceptable Value: 0

{ARG_MAX}
Maximum length of argument to the *exec* functions including environment data.
Minimum Acceptable Value: {_POSIX_ARG_MAX}

{ATEXIT_MAX}
Maximum number of functions that may be registered with *atexit*( ).
Minimum Acceptable Value: 32

{CHILD_MAX}
Maximum number of simultaneous processes per real user ID.
Minimum Acceptable Value: {_POSIX_CHILD_MAX}

{DELAYTIMER_MAX}
Maximum number of timer expiration overruns.
Minimum Acceptable Value: {_POSIX_DELAYTIMER_MAX}

{HOST_NAME_MAX}
Maximum length of a host name (not including the terminating null) as returned from the *gethostname*( ) function.
Minimum Acceptable Value: {_POSIX_HOST_NAME_MAX}

XSI {IOV_MAX}
Maximum number of **iovec** structures that one process has available for use with *readv*( ) or *writev*( ).
Minimum Acceptable Value: {_XOPEN_IOV_MAX}

{LOGIN_NAME_MAX}
Maximum length of a login name.
Minimum Acceptable Value: {_POSIX_LOGIN_NAME_MAX}

MSG {MQ_OPEN_MAX}
The maximum number of open message queue descriptors a process may hold.
Minimum Acceptable Value: {_POSIX_MQ_OPEN_MAX}

MSG {MQ_PRIO_MAX}
The maximum number of message priorities supported by the implementation.
Minimum Acceptable Value: {_POSIX_MQ_PRIO_MAX}

{OPEN_MAX}
A value one greater than the maximum value that the system may assign to a newly-created file descriptor.
Minimum Acceptable Value: {_POSIX_OPEN_MAX}

{PAGESIZE}
Size in bytes of a page.
Minimum Acceptable Value: 1

8837 XSI {PAGE_SIZE}
8838 Equivalent to {PAGESIZE}. If either {PAGESIZE} or {PAGE_SIZE} is defined, the other is
8839 defined with the same value.

8840 {PTHREAD_DESTRUCTOR_ITERATIONS}
8841 Maximum number of attempts made to destroy a thread's thread-specific data values on
8842 thread exit.
8843 Minimum Acceptable Value: {_POSIX_THREAD_DESTRUCTOR_ITERATIONS}

8844 {PTHREAD_KEYS_MAX}
8845 Maximum number of data keys that can be created by a process.
8846 Minimum Acceptable Value: {_POSIX_THREAD_KEYS_MAX}

8847 {PTHREAD_STACK_MIN}
8848 Minimum size in bytes of thread stack storage.
8849 Minimum Acceptable Value: 0

8850 {PTHREAD_THREADS_MAX}
8851 Maximum number of threads that can be created per process.
8852 Minimum Acceptable Value: {_POSIX_THREAD_THREADS_MAX}

8853 {RE_DUP_MAX}
8854 Maximum number of repeated occurrences of a BRE or ERE interval expression; see Section
8855 9.3.6 (on page 186) and Section 9.4.6 (on page 189).
8856 Minimum Acceptable Value: {_POSIX2_RE_DUP_MAX}

8857 {RTSIG_MAX}
8858 Maximum number of realtime signals reserved for application use in this implementation.
8859 Minimum Acceptable Value: {_POSIX_RTSIG_MAX}

8860 {SEM_NSEMS_MAX}
8861 Maximum number of semaphores that a process may have.
8862 Minimum Acceptable Value: {_POSIX_SEM_NSEMS_MAX}

8863 {SEM_VALUE_MAX}
8864 The maximum value a semaphore may have.
8865 Minimum Acceptable Value: {_POSIX_SEM_VALUE_MAX}

8866 {SIGQUEUE_MAX}
8867 Maximum number of queued signals that a process may send and have pending at the
8868 receiver(s) at any time.
8869 Minimum Acceptable Value: {_POSIX_SIGQUEUE_MAX}

8870 SS | TSP {SS_REPL_MAX}
8871 The maximum number of replenishment operations that may be simultaneously pending
8872 for a particular sporadic server scheduler.
8873 Minimum Acceptable Value: {_POSIX_SS_REPL_MAX}

8874 {STREAM_MAX}
8875 Maximum number of streams that one process can have open at one time. If defined, it has
8876 the same value as {FOPEN_MAX} (see **<stdio.h>**).
8877 Minimum Acceptable Value: {_POSIX_STREAM_MAX}

8878 {SYMLOOP_MAX}
8879 Maximum number of symbolic links that can be reliably traversed in the resolution of a
8880 pathname in the absence of a loop.
8881 Minimum Acceptable Value: {_POSIX_SYMLOOP_MAX}

{TIMER_MAX}
Maximum number of timers per process supported by the implementation.
Minimum Acceptable Value: {_POSIX_TIMER_MAX}

OB TRC {TRACE_EVENT_NAME_MAX}
Maximum length of the trace event name (not including the terminating null).
Minimum Acceptable Value: {_POSIX_TRACE_EVENT_NAME_MAX}

OB TRC {TRACE_NAME_MAX}
Maximum length of the trace generation version string or of the trace stream name (not including the terminating null).
Minimum Acceptable Value: {_POSIX_TRACE_NAME_MAX}

OB TRC {TRACE_SYS_MAX}
Maximum number of trace streams that may simultaneously exist in the system.
Minimum Acceptable Value: {_POSIX_TRACE_SYS_MAX}

OB TRC {TRACE_USER_EVENT_MAX}
Maximum number of user trace event type identifiers that may simultaneously exist in a traced process, including the predefined user trace event POSIX_TRACE_UNNAMED_USER_EVENT.
Minimum Acceptable Value: {_POSIX_TRACE_USER_EVENT_MAX}

{TTY_NAME_MAX}
Maximum length of terminal device name.
Minimum Acceptable Value: {_POSIX_TTY_NAME_MAX}

{TZNAME_MAX}
Maximum number of bytes supported for the name of a timezone (not of the *TZ* variable).
Minimum Acceptable Value: {_POSIX_TZNAME_MAX}

Note: The length given by {TZNAME_MAX} does not include the quoting characters mentioned in Section 8.3 (on page 177).

Pathname Variable Values

The values in the following list may be constants within an implementation or may vary from one pathname to another. For example, file systems or directories may have different characteristics.

A definition of one of the symbolic constants in the following list shall be omitted from the **<limits.h>** header on specific implementations where the corresponding value is equal to or greater than the stated minimum, but where the value can vary depending on the file to which it is applied. The actual value supported for a specific pathname shall be provided by the *pathconf*( ) function.

{FILESIZEBITS}
Minimum number of bits needed to represent, as a signed integer value, the maximum size of a regular file allowed in the specified directory.
Minimum Acceptable Value: 32

{LINK_MAX}
Maximum number of links to a single file.
Minimum Acceptable Value: {_POSIX_LINK_MAX}

{MAX_CANON}
Maximum number of bytes in a terminal canonical input line.
Minimum Acceptable Value: {_POSIX_MAX_CANON}

{MAX_INPUT}
Minimum number of bytes for which space is available in a terminal input queue; therefore, the maximum number of bytes a conforming application may require to be typed as input before reading them.
Minimum Acceptable Value: {_POSIX_MAX_INPUT}

{NAME_MAX}
Maximum number of bytes in a filename (not including the terminating null).
Minimum Acceptable Value: {_POSIX_NAME_MAX}
XSI Minimum Acceptable Value: {_XOPEN_NAME_MAX}

{PATH_MAX}
Maximum number of bytes the implementation will store as a pathname in a user-supplied buffer of unspecified size, including the terminating null character. Minimum number the implementation will accept as the maximum number of bytes in a pathname.
Minimum Acceptable Value: {_POSIX_PATH_MAX}
XSI Minimum Acceptable Value: {_XOPEN_PATH_MAX}

{PIPE_BUF}
Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
Minimum Acceptable Value: {_POSIX_PIPE_BUF}

ADV {POSIX_ALLOC_SIZE_MIN}
Minimum number of bytes of storage actually allocated for any portion of a file.
Minimum Acceptable Value: Not specified.

ADV {POSIX_REC_INCR_XFER_SIZE}
Recommended increment for file transfer sizes between the {POSIX_REC_MIN_XFER_SIZE} and {POSIX_REC_MAX_XFER_SIZE} values.
Minimum Acceptable Value: Not specified.

ADV {POSIX_REC_MAX_XFER_SIZE}
Maximum recommended file transfer size.
Minimum Acceptable Value: Not specified.

ADV {POSIX_REC_MIN_XFER_SIZE}
Minimum recommended file transfer size.
Minimum Acceptable Value: Not specified.

ADV {POSIX_REC_XFER_ALIGN}
Recommended file transfer buffer alignment.
Minimum Acceptable Value: Not specified.

{SYMLINK_MAX}
Maximum number of bytes in a symbolic link.
Minimum Acceptable Value: {_POSIX_SYMLINK_MAX}

Runtime Increasable Values

The magnitude limitations in the following list shall be fixed by specific implementations. An application should assume that the value of the symbolic constant defined by **<limits.h>** in a specific implementation is the minimum that pertains whenever the application is run under that implementation. A specific instance of a specific implementation may increase the value relative to that supplied by **<limits.h>** for that implementation. The actual value supported by a specific instance shall be provided by the *sysconf*( ) function.

{BC_BASE_MAX}
Maximum *obase* values allowed by the *bc* utility.
Minimum Acceptable Value: {_POSIX2_BC_BASE_MAX}

{BC_DIM_MAX}
Maximum number of elements permitted in an array by the *bc* utility.
Minimum Acceptable Value: {_POSIX2_BC_DIM_MAX}

{BC_SCALE_MAX}
Maximum *scale* value allowed by the *bc* utility.
Minimum Acceptable Value: {_POSIX2_BC_SCALE_MAX}

{BC_STRING_MAX}
Maximum length of a string constant accepted by the *bc* utility.
Minimum Acceptable Value: {_POSIX2_BC_STRING_MAX}

{CHARCLASS_NAME_MAX}
Maximum number of bytes in a character class name.
Minimum Acceptable Value: {_POSIX2_CHARCLASS_NAME_MAX}

{COLL_WEIGHTS_MAX}
Maximum number of weights that can be assigned to an entry of the *LC_COLLATE* **order** keyword in the locale definition file; see Chapter 7 (on page 135).
Minimum Acceptable Value: {_POSIX2_COLL_WEIGHTS_MAX}

{EXPR_NEST_MAX}
Maximum number of expressions that can be nested within parentheses by the *expr* utility.
Minimum Acceptable Value: {_POSIX2_EXPR_NEST_MAX}

{LINE_MAX}
Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <newline>.
Minimum Acceptable Value: {_POSIX2_LINE_MAX}

{NGROUPS_MAX}
Maximum number of simultaneous supplementary group IDs per process.
Minimum Acceptable Value: {_POSIX_NGROUPS_MAX}

{RE_DUP_MAX}
Maximum number of repeated occurrences of a regular expression permitted when using the interval notation \{*m*,*n*\}; see Chapter 9 (on page 181).
Minimum Acceptable Value: {_POSIX2_RE_DUP_MAX}

Maximum Values

The **<limits.h>** header shall define the following symbolic constants with the values shown. These are the most restrictive values for certain features on an implementation. A conforming implementation shall provide values no larger than these values. A conforming application must not require a smaller value for correct operation.

{_POSIX_CLOCKRES_MIN}
The resolution of the CLOCK_REALTIME clock, in nanoseconds.
Value: 20 000 000

MON If the Monotonic Clock option is supported, the resolution of the CLOCK_MONOTONIC clock, in nanoseconds, is represented by {_POSIX_CLOCKRES_MIN}.

Minimum Values

The **<limits.h>** header shall define the following symbolic constants with the values shown. These are the most restrictive values for certain features on an implementation conforming to this volume of POSIX.1-200x. Related symbolic constants are defined elsewhere in this volume of POSIX.1-200x which reflect the actual implementation and which need not be as restrictive. A conforming implementation shall provide values at least this large. A strictly conforming application must not require a larger value for correct operation.

{_POSIX_AIO_LISTIO_MAX}
The number of I/O operations that can be specified in a list I/O call.
Value: 2

{_POSIX_AIO_MAX}
The number of outstanding asynchronous I/O operations.
Value: 1

{_POSIX_ARG_MAX}
Maximum length of argument to the *exec* functions including environment data.
Value: 4 096

{_POSIX_CHILD_MAX}
Maximum number of simultaneous processes per real user ID.
Value: 25

{_POSIX_DELAYTIMER_MAX}
The number of timer expiration overruns.
Value: 32

{_POSIX_HOST_NAME_MAX}
Maximum length of a host name (not including the terminating null) as returned from the *gethostname*( ) function.
Value: 255

{_POSIX_LINK_MAX}
Maximum number of links to a single file.
Value: 8

{_POSIX_LOGIN_NAME_MAX}
The size of the storage required for a login name, in bytes (including the terminating null).
Value: 9

{_POSIX_MAX_CANON}
Maximum number of bytes in a terminal canonical input queue.
Value: 255

{_POSIX_MAX_INPUT}
Maximum number of bytes allowed in a terminal input queue.
Value: 255

MSG {_POSIX_MQ_OPEN_MAX}
The number of message queues that can be open for a single process.
Value: 8

MSG {_POSIX_MQ_PRIO_MAX}
The maximum number of message priorities supported by the implementation.
Value: 32

{_POSIX_NAME_MAX}
Maximum number of bytes in a filename (not including the terminating null).
Value: 14

{_POSIX_NGROUPS_MAX}
Maximum number of simultaneous supplementary group IDs per process.
Value: 8

{_POSIX_OPEN_MAX}
Maximum number of files that one process can have open at any one time.
Value: 20

{_POSIX_PATH_MAX}
Minimum number the implementation will accept as the maximum number of bytes in a pathname.
Value: 256

{_POSIX_PIPE_BUF}
Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
Value: 512

{_POSIX_RE_DUP_MAX}
The number of repeated occurrences of a BRE permitted by the *regexec*( ) and *regcomp*( ) functions when using the interval notation {\(*m*,*n*\}; see Section 9.3.6 (on page 186).
Value: 255

{_POSIX_RTSIG_MAX}
The number of realtime signal numbers reserved for application use.
Value: 8

{_POSIX_SEM_NSEMS_MAX}
The number of semaphores that a process may have.
Value: 256

{_POSIX_SEM_VALUE_MAX}
The maximum value a semaphore may have.
Value: 32 767

{_POSIX_SIGQUEUE_MAX}
The number of queued signals that a process may send and have pending at the receiver(s) at any time.
Value: 32

{_POSIX_SSIZE_MAX}
The value that can be stored in an object of type **ssize_t**.
Value: 32 767

SS | TSP {_POSIX_SS_REPL_MAX}
The number of replenishment operations that may be simultaneously pending for a particular sporadic server scheduler.
Value: 4

{_POSIX_STREAM_MAX}
The number of streams that one process can have open at one time.
Value: 8

{_POSIX_SYMLINK_MAX}
The number of bytes in a symbolic link.
Value: 255

{_POSIX_SYMLOOP_MAX}
The number of symbolic links that can be traversed in the resolution of a pathname in the absence of a loop.
Value: 8

{_POSIX_THREAD_DESTRUCTOR_ITERATIONS}
The number of attempts made to destroy a thread's thread-specific data values on thread exit.
Value: 4

{_POSIX_THREAD_KEYS_MAX}
The number of data keys per process.
Value: 128

{_POSIX_THREAD_THREADS_MAX}
The number of threads per process.
Value: 64

{_POSIX_TIMER_MAX}
The per-process number of timers.
Value: 32

OB TRC {_POSIX_TRACE_EVENT_NAME_MAX}
The length in bytes of a trace event name (not including the terminating null).
Value: 30

OB TRC {_POSIX_TRACE_NAME_MAX}
The length in bytes of a trace generation version string or a trace stream name (not including the terminating null).
Value: 8

OB TRC {_POSIX_TRACE_SYS_MAX}
The number of trace streams that may simultaneously exist in the system.
Value: 8

OB TRC {_POSIX_TRACE_USER_EVENT_MAX}
The number of user trace event type identifiers that may simultaneously exist in a traced process, including the predefined user trace event POSIX_TRACE_UNNAMED_USER_EVENT.
Value: 32

{_POSIX_TTY_NAME_MAX}
The size of the storage required for a terminal device name, in bytes (including the terminating null).
Value: 9

{_POSIX_TZNAME_MAX}
Maximum number of bytes supported for the name of a timezone (not of the *TZ* variable).
Value: 6

Note: The length given by {_POSIX_TZNAME_MAX} does not include the quoting characters mentioned in Section 8.3 (on page 177).

{_POSIX2_BC_BASE_MAX}
Maximum *obase* values allowed by the *bc* utility.
Value: 99

{_POSIX2_BC_DIM_MAX}
Maximum number of elements permitted in an array by the *bc* utility.
Value: 2 048

{_POSIX2_BC_SCALE_MAX}
Maximum *scale* value allowed by the *bc* utility.
Value: 99

{_POSIX2_BC_STRING_MAX}
Maximum length of a string constant accepted by the *bc* utility.
Value: 1 000

{_POSIX2_CHARCLASS_NAME_MAX}
Maximum number of bytes in a character class name.
Value: 14

{_POSIX2_COLL_WEIGHTS_MAX}
Maximum number of weights that can be assigned to an entry of the *LC_COLLATE* **order** keyword in the locale definition file; see Chapter 7 (on page 135).
Value: 2

{_POSIX2_EXPR_NEST_MAX}
Maximum number of expressions that can be nested within parentheses by the *expr* utility.
Value: 32

{_POSIX2_LINE_MAX}
Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <newline>.
Value: 2 048

{_POSIX2_RE_DUP_MAX]
Maximum number of repeated occurrences of a regular expression permitted when using the interval notation \{*m*,*n*\}; see Chapter 9 (on page 181).
Value: 255

XSI {_XOPEN_IOV_MAX}
Maximum number of **iovec** structures that one process has available for use with *readv*( ) or *writev*( ).
Value: 16

XSI {_XOPEN_NAME_MAX}
Maximum number of bytes in a filename (not including the terminating null).
Value: 255

XSI {_XOPEN_PATH_MAX}
Minimum number the implementation will accept as the maximum number of bytes in a pathname.
Value: 1 024

Numerical Limits

The **<limits.h>** header shall define the following macros and, except for {CHAR_BIT}, {LONG_BIT}, {MB_LEN_MAX}, and {WORD_BIT}, they shall be replaced by expressions that have the same type as would an expression that is an object of the corresponding type converted according to the integer promotions.

If the value of an object of type **char** is treated as a signed integer when used in an expression, the value of {CHAR_MIN} is the same as that of {SCHAR_MIN} and the value of {CHAR_MAX} is the same as that of {SCHAR_MAX}. Otherwise, the value of {CHAR_MIN} is 0 and the value of {CHAR_MAX} is the same as that of {UCHAR_MAX}.

{CHAR_BIT}
Number of bits in a type **char**.
CX Value: 8

{CHAR_MAX}
Maximum value for an object of type **char**.
Value: {UCHAR_MAX} or {SCHAR_MAX}

{CHAR_MIN}
Minimum value for an object of type **char**.
Value: {SCHAR_MIN} or 0

{INT_MAX}
Maximum value for an object of type **int**.
CX Minimum Acceptable Value: 2 147 483 647

{INT_MIN}
Minimum value for an object of type **int**.
CX Maximum Acceptable Value: –2 147 483 647

{LLONG_MAX}
Maximum value for an object of type **long long**.
Minimum Acceptable Value: +9 223 372 036 854 775 807

{LLONG_MIN}
Minimum value for an object of type **long long**.
Maximum Acceptable Value: –9 223 372 036 854 775 807

{LONG_BIT}
Number of bits in an object of type **long**.
Minimum Acceptable Value: 32

{LONG_MAX}
Maximum value for an object of type **long**.
Minimum Acceptable Value: +2 147 483 647

{LONG_MIN}
Minimum value for an object of type **long**.
Maximum Acceptable Value: –2 147 483 647

{MB_LEN_MAX}
Maximum number of bytes in a character, for any supported locale.
Minimum Acceptable Value: 1

{SCHAR_MAX}
Maximum value for an object of type **signed char**.

CX Value: +127

{SCHAR_MIN}
Minimum value for an object of type **signed char**.
CX Value: –128

{SHRT_MAX}
Maximum value for an object of type **short**.
Minimum Acceptable Value: +32 767

{SHRT_MIN}
Minimum value for an object of type **short**.
Maximum Acceptable Value: –32 767

{SSIZE_MAX}
Maximum value for an object of type **ssize_t**.
Minimum Acceptable Value: {_POSIX_SSIZE_MAX}

{UCHAR_MAX}
Maximum value for an object of type **unsigned char**.
CX Value: 255

{UINT_MAX}
Maximum value for an object of type **unsigned**.
CX Minimum Acceptable Value: 4 294 967 295

{ULLONG_MAX}
Maximum value for an object of type **unsigned long long**.
Minimum Acceptable Value: 18 446 744 073 709 551 615

{ULONG_MAX}
Maximum value for an object of type **unsigned long**.
Minimum Acceptable Value: 4 294 967 295

{USHRT_MAX}
Maximum value for an object of type **unsigned short**.
Minimum Acceptable Value: 65 535

{WORD_BIT}
Number of bits in an object of type **int**.
Minimum Acceptable Value: 32

Other Invariant Values

The **<limits.h>** header shall define the following symbolic constants:

{NL_ARGMAX}
Maximum value of *n* in conversion specifications using the "%*n*$" sequence in calls to the *printf*( ) and *scanf*( ) families of functions.
Minimum Acceptable Value: 9

XSI {NL_LANGMAX}
Maximum number of bytes in a *LANG* name.
Minimum Acceptable Value: 14

{NL_MSGMAX}
Maximum message number.
Minimum Acceptable Value: 32 767

{NL_SETMAX}
Maximum set number.
Minimum Acceptable Value: 255

{NL_TEXTMAX}
Maximum number of bytes in a message string.
Minimum Acceptable Value: {_POSIX2_LINE_MAX}

XSI {NZERO}
Default process priority.
Minimum Acceptable Value: 20

APPLICATION USAGE

None.

RATIONALE

A request was made to reduce the value of {_POSIX_LINK_MAX} from the value of 8 specified for it in the POSIX.1-1990 standard to 2. The standard developers decided to deny this request for several reasons:

- They wanted to avoid making any changes to the standard that could break conforming applications, and the requested change could have that effect.
- The use of multiple hard links to a file cannot always be replaced with use of symbolic links. Symbolic links are semantically different from hard links in that they associate a pathname with another pathname rather than a pathname with a file. This has implications for access control, file permanence, and transparency.
- The original standard developers had considered the issue of allowing for implementations that did not in general support hard links, and decided that this would reduce consensus on the standard.

Systems that support historical versions of the development option of the ISO POSIX-2 standard retain the name {_POSIX2_RE_DUP_MAX} as an alias for {_POSIX_RE_DUP_MAX}.

{PATH_MAX}
IEEE PASC Interpretation 1003.1 #15 addressed the inconsistency in the standard with the definition of pathname and the description of {PATH_MAX}, allowing application developers to allocate either {PATH_MAX} or {PATH_MAX}+1 bytes. The inconsistency has been removed by correction to the {PATH_MAX} definition to include the null character. With this change, applications that previously allocated {PATH_MAX} bytes will continue to succeed.

{SYMLINK_MAX}
This symbol refers to space for data that is stored in the file system, as opposed to {PATH_MAX} which is the length of a name that can be passed to a function. In some existing implementations, the filenames pointed to by symbolic links are stored in the *inode*s of the links, so it is important that {SYMLINK_MAX} not be constrained to be as large as {PATH_MAX}.

FUTURE DIRECTIONS

None.

XSH Section 2.2 (on page 468), *fpathconf( )*, *sysconf( )*

CHANGE HISTORY

First released in Issue 1.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

{FILESIZEBITS} is added for the Large File Summit extensions.

The minimum acceptable values for {INT_MAX}, {INT_MIN}, and {UINT_MAX} are changed to make 32-bit values the minimum requirement.

The entry is restructured to improve readability.

Issue 6

The Open Group Corrigendum U033/4 is applied. The wording is made clear for {CHAR_MIN}, {INT_MIN}, {LONG_MIN}, {SCHAR_MIN}, and {SHRT_MIN} that these are maximum acceptable values.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The minimum value for {CHILD_MAX} is 25. This is a FIPS requirement.
- The minimum value for {OPEN_MAX} is 20. This is a FIPS requirement.
- The minimum value for {NGROUPS_MAX} is 8. This is also a FIPS requirement.

Symbolic constants are added for {_POSIX_SYMLINK_MAX}, {_POSIX_SYMLOOP_MAX}, {_POSIX_RE_DUP_MAX}, {RE_DUP_MAX}, {SYMLOOP_MAX}, and {SYMLINK_MAX}.

The following values are added for alignment with IEEE Std 1003.1d-1999:

{_POSIX_SS_REPL_MAX}
{SS_REPL_MAX}
{POSIX_ALLOC_SIZE_MIN}
{POSIX_REC_INCR_XFER_SIZE}
{POSIX_REC_MAX_XFER_SIZE}
{POSIX_REC_MIN_XFER_SIZE}
{POSIX_REC_XFER_ALIGN}

Reference to CLOCK_MONOTONIC is added in the description of {_POSIX_CLOCKRES_MIN} for alignment with IEEE Std 1003.1j-2000.

The constants {LLONG_MIN}, {LLONG_MAX}, and {ULLONG_MAX} are added for alignment with the ISO/IEC 9899: 1999 standard.

The following values are added for alignment with IEEE Std 1003.1q-2000:

{_POSIX_TRACE_EVENT_NAME_MAX}
{_POSIX_TRACE_NAME_MAX}
{_POSIX_TRACE_SYS_MAX}
{_POSIX_TRACE_USER_EVENT_MAX}
{TRACE_EVENT_NAME_MAX}
{TRACE_NAME_MAX}
{TRACE_SYS_MAX}
{TRACE_USER_EVENT_MAX}

The new limits {_XOPEN_NAME_MAX} and {_XOPEN_PATH_MAX} are added as minimum

values for {PATH_MAX} and {NAME_MAX} limits on XSI-conformant systems.

The LEGACY symbols {PASS_MAX} and {TMP_MAX} are removed.

The values for the limits {CHAR_BIT}, {SCHAR_MAX}, and {UCHAR_MAX} are now required to be 8, +127, and 255, respectively.

The value for the limit {CHAR_MAX} is now {UCHAR_MAX} or {SCHAR_MAX}.

The value for the limit {CHAR_MIN} is now {SCHAR_MIN} or zero.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/10 is applied, correcting the value of {_POSIX_CHILD_MAX} from 6 to 25. This is for FIPS 151-2 alignment.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/19 is applied, updating the values for {INT_MAX}, {UINT_MAX}, and {INT_MIN} to be CX extensions over the ISO C standard, and correcting {WORD_BIT} from 16 to 32.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/20 is applied, removing {CHARCLASS_NAME_MAX} from the "Other Invariant Values" section (it also occurs under "Runtime Increasable Values").

Issue 7

Austin Group Interpretations 1003.1-2001 #143 and #160 are applied.

Austin Group Interpretation 1003.1-2001 #173 is applied, updating the descriptions of {TRACE_EVENT_NAME_MAX} and {TRACE_NAME_MAX} to not include the terminating null.

SD5-XBD-ERN-36 is applied, changing the description of {RE_DUP_MAX}.

SD5-XBD-ERN-90 is applied.

{NL_NMAX} is removed; it should have been removed in Issue 6.

The Trace option values are marked obsolescent.

The {ATEXIT_MAX}, {LONG_BIT}, {NL_MSGMAX}, {NL_SETMAX}, {NL_TEXTMAX}, and {WORD_BIT} values are moved from the XSI option to the Base.

The AIO_* and _POSIX_AIO_* values are moved from the Asynchronous Input and Output option to the Base.

The {_POSIX_RTSIG_MAX}, {_POSIX_SIGQUEUE_MAX}, {RTSIG_MAX}, and {SIGQUEUE_MAX} values are moved from the Realtime Signals Extension option to the Base.

Functionality relating to the Threads and Timers options is moved to the Base.

This reference page is clarified with respect to macros and symbolic constants.

NAME

locale.h — category macros

SYNOPSIS

```
#include <locale.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to enable the visibility of these symbols in this header.

The **<locale.h>** header shall define the **lconv** structure, which shall include at least the following members. (See the definitions of *LC_MONETARY* in Section 7.3.3 (on page 154) and Section 7.3.4 (on page 157).)

```
char    *currency_symbol
char    *decimal_point
char     frac_digits
char    *grouping
char    *int_curr_symbol
char     int_frac_digits
char     int_n_cs_precedes
char     int_n_sep_by_space
char     int_n_sign_posn
char     int_p_cs_precedes
char     int_p_sep_by_space
char     int_p_sign_posn
char    *mon_decimal_point
char    *mon_grouping
char    *mon_thousands_sep
char    *negative_sign
char     n_cs_precedes
char     n_sep_by_space
char     n_sign_posn
char    *positive_sign
char     p_cs_precedes
char     p_sep_by_space
char     p_sign_posn
char    *thousands_sep
```

The **<locale.h>** header shall define NULL (as described in **<stddef.h>**) and at least the following as macros:

LC_ALL
LC_COLLATE
LC_CTYPE
CX *LC_MESSAGES*
LC_MONETARY
LC_NUMERIC
LC_TIME

which shall expand to integer constant expressions with distinct values for use as the first argument to the *setlocale*( ) function.

Implementations may add additional masks using the form *LC_** and an uppercase letter.

9439 CX The **<locale.h>** header shall contain at least the following macros representing bitmasks for use
9440 with the *newlocale*( ) function for each supported locale category:

9441 LC_COLLATE_MASK
9442 LC_CTYPE_MASK
9443 LC_MESSAGES_MASK
9444 LC_MONETARY_MASK
9445 LC_NUMERIC_MASK
9446 LC_TIME_MASK

9447 Implementations may add additional masks using the form LC_*_MASK.

9448 In addition, a macro to set the bits for all categories set shall be defined:

9449 LC_ALL_MASK

9450 The **<locale.h>** header shall define LC_GLOBAL_LOCALE, a special locale object descriptor
9451 used by the *uselocale*( ) function.

9452 The **<locale.h>** header shall define the **locale_t** type, representing a locale object.

9453 The following shall be declared as functions and may also be defined as macros. Function
9454 prototypes shall be provided for use with ISO C standard compilers.

```
9455 CX  locale_t      duplocale(locale_t);                                  -
9456     void          freelocale(locale_t);
9457     struct lconv *localeconv(void);                                     +
9458 CX  locale_t      newlocale(int, const char *, locale_t);
9459     char         *setlocale(int, const char *);
9460 CX  locale_t      uselocale (locale_t);
```

9461 **APPLICATION USAGE**

9462 None.

9463 **RATIONALE**

9464 None.

9465 **FUTURE DIRECTIONS**

9466 None.

9467 **SEE ALSO**

9468 Chapter 8 (on page 173), **<stddef.h>**

9469 XSH *duplocale*( ), *freelocale*( ), *localeconv*( ), *newlocale*( ), *setlocale*( ), *uselocale*( )

9470 **CHANGE HISTORY**

9471 First released in Issue 3.

9472 Included for alignment with the ISO C standard.

9473 **Issue 6**

9474 The **lconv** structure is expanded with new members (**int_n_cs_precedes**, **int_n_sep_by_space**,
9475 **int_n_sign_posn**, **int_p_cs_precedes**, **int_p_sep_by_space**, and **int_p_sign_posn**) for alignment
9476 with the ISO/IEC 9899: 1999 standard.

9477 Extensions beyond the ISO C standard are marked.

Issue 7

The *duplocale*(), *freelocale*(), *newlocale*(), and *uselocale*() functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

This reference page is clarified with respect to macros and symbolic constants.

NAME

math.h — mathematical declarations

SYNOPSIS

```
#include <math.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to enable the visibility of these symbols in this header.

The **<math.h>** header shall define at least the following types:

float_t A real-floating type at least as wide as **float**.

double_t A real-floating type at least as wide as **double**, and at least as wide as **float_t**.

If FLT_EVAL_METHOD equals 0, **float_t** and **double_t** shall be **float** and **double**, respectively; if FLT_EVAL_METHOD equals 1, they shall both be **double**; if FLT_EVAL_METHOD equals 2, they shall both be **long double**; for other values of FLT_EVAL_METHOD, they are otherwise implementation-defined.

The **<math.h>** header shall define the following macros, where real-floating indicates that the argument shall be an expression of real-floating type:

```
int fpclassify(real-floating x);
int isfinite(real-floating x);
int isgreater(real-floating x, real-floating y);                    -
int isgreaterequal(real-floating x, real-floating y);
int isinf(real-floating x);                                         +
int isless(real-floating x, real-floating y);
int islessequal(real-floating x, real-floating y);
int islessgreater(real-floating x, real-floating y);
int isnan(real-floating x);                                         +
int isnormal(real-floating x);                                      +
int isunordered(real-floating x, real-floating y);
int signbit(real-floating x);                                       +
```

The **<math.h>** header shall define the following symbolic constants. The values shall have type **double** and shall be accurate within the precision of the **double** type.

XSI	M_E	Value of e
XSI	M_LOG2E	Value of $\log_2 e$
XSI	M_LOG10E	Value of $\log_{10} e$
XSI	M_LN2	Value of $\log_e 2$
XSI	M_LN10	Value of $\log_e 10$
XSI	M_PI	Value of π
XSI	M_PI_2	Value of $\pi/2$
XSI	M_PI_4	Value of $\pi/4$
XSI	M_1_PI	Value of $1/\pi$
XSI	M_2_PI	Value of $2/\pi$

9523 XSI M_2_SQRTPI Value of $2/\sqrt{\pi}$

9524 XSI M_SQRT2 Value of $\sqrt{2}$

9525 XSI M_SQRT1_2 Value of $1/\sqrt{2}$

9526 The **<math.h>** header shall define the following symbolic constant:

9527 OB XSI MAXFLOAT Same value as FLT_MAX in **<float.h>**.

9528 The **<math.h>** header shall define the following macros:

9529 HUGE_VAL A positive **double** constant expression, not necessarily representable as a
9530 **float**. Used as an error value returned by the mathematics library.
9531 HUGE_VAL evaluates to +infinity on systems supporting IEEE Std 754-1985.

9532 HUGE_VALF A positive **float** constant expression. Used as an error value returned by the
9533 mathematics library. HUGE_VALF evaluates to +infinity on systems
9534 supporting IEEE Std 754-1985.

9535 HUGE_VALL A positive **long double** constant expression. Used as an error value returned
9536 by the mathematics library. HUGE_VALL evaluates to +infinity on systems
9537 supporting IEEE Std 754-1985.

9538 INFINITY A constant expression of type **float** representing positive or unsigned infinity,
9539 if available; else a positive constant of type **float** that overflows at translation
9540 time.

9541 NAN A constant expression of type **float** representing a quiet NaN. This macro is
9542 only defined if the implementation supports quiet NaNs for the **float** type.

9543 The following macros shall be defined for number classification. They represent the mutually-
9544 exclusive kinds of floating-point values. They expand to integer constant expressions with
9545 distinct values. Additional implementation-defined floating-point classifications, with macro
9546 definitions beginning with FP_ and an uppercase letter, may also be specified by the
9547 implementation.

9548 FP_INFINITE
9549 FP_NAN
9550 FP_NORMAL
9551 FP_SUBNORMAL
9552 FP_ZERO

9553 The following optional macros indicate whether the *fma*( ) family of functions are fast compared
9554 with direct code:

9555 FP_FAST_FMA
9556 FP_FAST_FMAF
9557 FP_FAST_FMAL

9558 If defined, the FP_FAST_FMA macro shall expand to the integer constant 1 and shall indicate
9559 that the *fma*( ) function generally executes about as fast as, or faster than, a multiply and an add
9560 of **double** operands. If undefined, the speed of execution is unspecified. The other macros have
9561 the equivalent meaning for the **float** and **long double** versions.

9562 The following macros shall expand to integer constant expressions whose values are returned by
9563 *ilogb*(*x*) if *x* is zero or NaN, respectively. The value of FP_ILOGB0 shall be either {INT_MIN} or
9564 −{INT_MAX}. The value of FP_ILOGBNAN shall be either {INT_MAX} or {INT_MIN}.

FP_ILOGB0
FP_ILOGBNAN

The following macros shall expand to the integer constants 1 and 2, respectively;

MATH_ERRNO
MATH_ERREXCEPT

The following macro shall expand to an expression that has type **int** and the value MATH_ERRNO, MATH_ERREXCEPT, or the bitwise-inclusive OR of both:

math_errhandling

The value of math_errhandling is constant for the duration of the program. It is unspecified whether math_errhandling is a macro or an identifier with external linkage. If a macro definition is suppressed or a program defines an identifier with the name math_errhandling , the behavior is undefined. If the expression (math_errhandling & MATH_ERREXCEPT) can be non-zero, the implementation shall define the macros FE_DIVBYZERO, FE_INVALID, and FE_OVERFLOW in **<fenv.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
double      acos(double);
float       acosf(float);
double      acosh(double);
float       acoshf(float);
long double acoshl(long double);
long double acosl(long double);
double      asin(double);
float       asinf(float);
double      asinh(double);
float       asinhf(float);
long double asinhl(long double);
long double asinl(long double);
double      atan(double);
double      atan2(double, double);
float       atan2f(float, float);
long double atan2l(long double, long double);
float       atanf(float);
double      atanh(double);
float       atanhf(float);
long double atanhl(long double);
long double atanl(long double);
double      cbrt(double);
float       cbrtf(float);
long double cbrtl(long double);
double      ceil(double);
float       ceilf(float);
long double ceill(long double);
double      copysign(double, double);
float       copysignf(float, float);
long double copysignl(long double, long double);
double      cos(double);
```

```
9612        float       cosf(float);
9613        double      cosh(double);
9614        float       coshf(float);
9615        long double coshl(long double);
9616        long double cosl(long double);
9617        double      erf(double);
9618        double      erfc(double);
9619        float       erfcf(float);
9620        long double erfcl(long double);
9621        float       erff(float);
9622        long double erfl(long double);
9623        double      exp(double);
9624        double      exp2(double);
9625        float       exp2f(float);
9626        long double exp2l(long double);
9627        float       expf(float);
9628        long double expl(long double);
9629        double      expm1(double);
9630        float       expm1f(float);
9631        long double expm1l(long double);
9632        double      fabs(double);
9633        float       fabsf(float);
9634        long double fabsl(long double);
9635        double      fdim(double, double);
9636        float       fdimf(float, float);
9637        long double fdiml(long double, long double);
9638        double      floor(double);
9639        float       floorf(float);
9640        long double floorl(long double);
9641        double      fma(double, double, double);
9642        float       fmaf(float, float, float);
9643        long double fmal(long double, long double, long double);
9644        double      fmax(double, double);
9645        float       fmaxf(float, float);
9646        long double fmaxl(long double, long double);
9647        double      fmin(double, double);
9648        float       fminf(float, float);
9649        long double fminl(long double, long double);
9650        double      fmod(double, double);
9651        float       fmodf(float, float);
9652        long double fmodl(long double, long double);
9653        double      frexp(double, int *);
9654        float       frexpf(float, int *);
9655        long double frexpl(long double, int *);
9656        double      hypot(double, double);
9657        float       hypotf(float, float);
9658        long double hypotl(long double, long double);
9659        int         ilogb(double);
9660        int         ilogbf(float);
9661        int         ilogbl(long double);
9662 XSI    double      j0(double);
9663        double      j1(double);
```

```

```

```
9716        double      remainder(double, double);
9717        float       remainderf(float, float);
9718        long double remainderl(long double, long double);
9719        double      remquo(double, double, int *);
9720        float       remquof(float, float, int *);
9721        long double remquol(long double, long double, int *);
9722        double      rint(double);
9723        float       rintf(float);
9724        long double rintl(long double);
9725        double      round(double);
9726        float       roundf(float);
9727        long double roundl(long double);
9728        double      scalbln(double, long);
9729        float       scalblnf(float, long);
9730        long double scalblnl(long double, long);
9731        double      scalbn(double, int);
9732        float       scalbnf(float, int);
9733        long double scalbnl(long double, int);
9734        double      sin(double);
9735        float       sinf(float);
9736        double      sinh(double);
9737        float       sinhf(float);
9738        long double sinhl(long double);
9739        long double sinl(long double);
9740        double      sqrt(double);
9741        float       sqrtf(float);
9742        long double sqrtl(long double);
9743        double      tan(double);
9744        float       tanf(float);
9745        double      tanh(double);
9746        float       tanhf(float);
9747        long double tanhl(long double);
9748        long double tanl(long double);
9749        double      tgamma(double);
9750        float       tgammaf(float);
9751        long double tgammal(long double);
9752        double      trunc(double);
9753        float       truncf(float);
9754        long double truncl(long double);
9755  XSI   double      y0(double);
9756        double      y1(double);
9757        double      yn(int, double);
```

9758 The following external variable shall be defined:

```
9759  XSI   extern int signgam;
```

9760 The behavior of each of the functions defined in **<math.h>** is specified in the System Interfaces
9761 volume of POSIX.1-200x for all representable values of its input arguments, except where stated
9762 otherwise. Each function shall execute as if it were a single operation without generating any
9763 externally visible exceptional conditions.

APPLICATION USAGE

The FP_CONTRACT pragma can be used to allow (if the state is on) or disallow (if the state is off) the implementation to contract expressions. Each pragma can occur either outside external declarations or preceding all explicit declarations and statements inside a compound statement. When outside external declarations, the pragma takes effect from its occurrence until another FP_CONTRACT pragma is encountered, or until the end of the translation unit. When inside a compound statement, the pragma takes effect from its occurrence until another FP_CONTRACT pragma is encountered (including within a nested compound statement), or until the end of the compound statement; at the end of a compound statement the state for the pragma is restored to its condition just before the compound statement. If this pragma is used in any other context, the behavior is undefined. The default state (on or off) for the pragma is implementation-defined.

Applications should use FLT_MAX as described in the **<float.h>** header instead of the obsolescent MAXFLOAT.

RATIONALE

Before the ISO/IEC 9899:1999 standard, the math library was defined only for the floating type **double**. All the names formed by appending `'f'` or `'l'` to a name in **<math.h>** were reserved to allow for the definition of **float** and **long double** libraries; and the ISO/IEC 9899:1999 standard provides for all three versions of math functions.

The functions *ecvt*(), *fcvt*(), and *gcvt*() have been dropped from the ISO C standard since their capability is available through *sprintf*().

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1.

Issue 6

This reference page is updated to align with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/21 is applied, making it clear that the meaning of the FP_FAST_FMA macro is unspecified if the macro is undefined.

Issue 7

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #47 (SD5-XBD-ERN-52) is applied, clarifying the wording of the FP_FAST_FMA macro.

The MAXFLOAT constant is marked obsolescent.

This reference page is clarified with respect to macros and symbolic constants.

NAME

monetary.h — monetary types

SYNOPSIS

```
#include <monetary.h>
```

DESCRIPTION

The **<monetary.h>** header shall define the **locale_t** type as described in **<locale.h>**.

The **<monetary.h>** header shall define the **size_t** type as described in **<stddef.h>**.

The **<monetary.h>** header shall define the **ssize_t** type as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with ISO C standard compilers.

```
ssize_t  strfmon(char *restrict, size_t, const char *restrict, ...);
ssize_t  strfmon_l(char *restrict, size_t, locale_t,
             const char *restrict, ...);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<locale.h>, **<stddef.h>**, **<sys/types.h>**

XSH *strfmon*( )

CHANGE HISTORY

First released in Issue 4.

Issue 6

The **restrict** keyword is added to the prototype for *strfmon*( ).

Issue 7

The **<monetary.h>** header is moved from the XSI option to the Base.

The *strmon_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

A declaration for the **locale_t** type is added.

NAME

mqueue.h — message queues (**REALTIME**)

SYNOPSIS

MSG

```
#include <mqueue.h>
```

DESCRIPTION

The **<mqueue.h>** header shall define the **mqd_t** type, which is used for message queue descriptors. This is not an array type.

The **<mqueue.h>** header shall define the **pthread_attr_t**, **size_t**, and **ssize_t** types as described in **<sys/types.h>**.

The **<mqueue.h>** header shall define the **struct timespec** structure as described in **<time.h>**.

The tag **sigevent** shall be declared as naming an incomplete structure type, the contents of which are described in the **<signal.h>** header.

The **<mqueue.h>** header shall define the **mq_attr** structure, which is used in getting and setting the attributes of a message queue. Attributes are initially set when the message queue is created. An **mq_attr** structure shall have at least the following fields:

`long`	`mq_flags`	Message queue flags.
`long`	`mq_maxmsg`	Maximum number of messages.
`long`	`mq_msgsize`	Maximum message size.
`long`	`mq_curmsgs`	Number of messages currently queued.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int      mq_close(mqd_t);
int      mq_getattr(mqd_t, struct mq_attr *);
int      mq_notify(mqd_t, const struct sigevent *);
mqd_t    mq_open(const char *, int, ...);
ssize_t  mq_receive(mqd_t, char *, size_t, unsigned *);
int      mq_send(mqd_t, const char *, size_t, unsigned);
int      mq_setattr(mqd_t, const struct mq_attr *restrict,
             struct mq_attr *restrict);
ssize_t  mq_timedreceive(mqd_t, char *restrict, size_t,
             unsigned *restrict, const struct timespec *restrict);
int      mq_timedsend(mqd_t, const char *, size_t, unsigned,
             const struct timespec *);
int      mq_unlink(const char *);
```

Inclusion of the **<mqueue.h>** header may make visible symbols defined in the headers **<fcntl.h>**, **<signal.h>**, and **<time.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<fcntl.h>, **<signal.h>**, **<sys/types.h>**, **<time.h>**

XSH *mq_close*( ), *mq_getattr*( ), *mq_notify*( ), *mq_open*( ), *mq_receive*( ), *mq_send*( ), *mq_setattr*( ), *mq_unlink*( )

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The **<mqueue.h>** header is marked as part of the Message Passing option.

The *mq_timedreceive*( ) and *mq_timedsend*( ) functions are added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the prototypes for *mq_setattr*( ) and *mq_timedreceive*( ).

Issue 7

Type and structure declarations are added.

NAME

ndbm.h — definitions for ndbm database operations

SYNOPSIS

XSI

```
#include <ndbm.h>
```

DESCRIPTION

The **<ndbm.h>** header shall define the **datum** type as a structure, which shall include at least the following members:

```
void    *dptr   A pointer to the application's data.
size_t  dsize   The size of the object pointed to by dptr.
```

The **<ndbm.h>** header shall define the **size_t** type as described in **<stddef.h>**.

The **<ndbm.h>** header shall define the **DBM** type.

The **<ndbm.h>** header shall define the following symbolic constants as possible values for the *store_mode* argument to *dbm_store*( ):

DBM_INSERT — Insertion of new entries only.

DBM_REPLACE — Allow replacing existing entries.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int     dbm_clearerr(DBM *);
void    dbm_close(DBM *);
int     dbm_delete(DBM *, datum);
int     dbm_error(DBM *);
datum   dbm_fetch(DBM *, datum);
datum   dbm_firstkey(DBM *);
datum   dbm_nextkey(DBM *);
DBM    *dbm_open(const char *, int, mode_t);
int     dbm_store(DBM *, datum, datum, int);
```

The **<ndbm.h>** header shall define the **mode_t** type through **typedef**, as described in **<sys/types.h>**.

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

References to the definitions of **size_t** and **mode_t** are added to the DESCRIPTION.

Issue 7

This reference page is clarified with respect to macros and symbolic constants.

NAME

net/if.h — sockets local interfaces

SYNOPSIS

```
#include <net/if.h>
```

DESCRIPTION

The **<net/if.h>** header shall define the **if_nameindex** structure, which shall include at least the following members:

```
unsigned  if_index   Numeric index of the interface.
char      *if_name   Null-terminated name of the interface.
```

The **<net/if.h>** header shall define the following symbolic constant for the length of a buffer containing an interface name (including the terminating NULL character):

IF_NAMESIZE Interface name length.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
void                 if_freenameindex(struct if_nameindex *);
char                *if_indextoname(unsigned, char *);
struct if_nameindex *if_nameindex(void);
unsigned             if_nametoindex(const char *);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

Issue 7

This reference page is clarified with respect to macros and symbolic constants.

NAME

netdb.h — definitions for network database operations

SYNOPSIS

```
#include <netdb.h>
```

DESCRIPTION

The **<netdb.h>** header may define the **in_port_t** type and the **in_addr_t** type as described in **<netinet/in.h>**.

The **<netdb.h>** header shall define the **hostent** structure, which shall include at least the following members:

`char *h_name`	Official name of the host.
`char **h_aliases`	A pointer to an array of pointers to alternative host names, terminated by a null pointer.
`int h_addrtype`	Address type.
`int h_length`	The length, in bytes, of the address.
`char **h_addr_list`	A pointer to an array of pointers to network addresses (in network byte order) for the host, terminated by a null pointer.

The **<netdb.h>** header shall define the **netent** structure, which shall include at least the following members:

`char *n_name`	Official, fully-qualified (including the domain) name of the host.
`char **n_aliases`	A pointer to an array of pointers to alternative network names, terminated by a null pointer.
`int n_addrtype`	The address type of the network.
`uint32_t n_net`	The network number, in host byte order.

The **<netdb.h>** header shall define the **uint32_t** type as described in **<inttypes.h>**.

The **<netdb.h>** header shall define the **protoent** structure, which shall include at least the following members:

`char *p_name`	Official name of the protocol.
`char **p_aliases`	A pointer to an array of pointers to alternative protocol names, terminated by a null pointer.
`int p_proto`	The protocol number.

The **<netdb.h>** header shall define the **servent** structure, which shall include at least the following members:

`char *s_name`	Official name of the service.
`char **s_aliases`	A pointer to an array of pointers to alternative service names, terminated by a null pointer.
`int s_port`	A value which, when converted to uint16_t, yields the port number in network byte order at which the service resides.
`char *s_proto`	The name of the protocol to use when contacting the service.

The **<netdb.h>** header shall define the IPPORT_RESERVED symbolic constant with the value of the highest reserved Internet port number.

Address Information Structure

The **<netdb.h>** header shall define the **addrinfo** structure, which shall include at least the following members:

`int`	`ai_flags`	Input flags.
`int`	`ai_family`	Address family of socket.
`int`	`ai_socktype`	Socket type.
`int`	`ai_protocol`	Protocol of socket.
`socklen_t`	`ai_addrlen`	Length of socket address.
`struct sockaddr`	`*ai_addr`	Socket address of socket.
`char`	`*ai_canonname`	Canonical name of service location.
`struct addrinfo`	`*ai_next`	Pointer to next in list.

The **<netdb.h>** header shall define the following symbolic constants that evaluate to bitwise-distinct integer constants for use in the *flags* field of the **addrinfo** structure:

AI_PASSIVE	Socket address is intended for *bind*( ).
AI_CANONNAME	Request for canonical name.
AI_NUMERICHOST	Return numeric host address as name.
AI_NUMERICSERV	Inhibit service name resolution.
AI_V4MAPPED	If no IPv6 addresses are found, query for IPv4 addresses and return them to the caller as IPv4-mapped IPv6 addresses.
AI_ALL	Query for both IPv4 and IPv6 addresses.
AI_ADDRCONFIG	Query for IPv4 addresses only when an IPv4 address is configured; query for IPv6 addresses only when an IPv6 address is configured.

The **<netdb.h>** header shall define the following symbolic constants that evaluate to bitwise-distinct integer constants for use in the *flags* argument to *getnameinfo*( ):

NI_NOFQDN	Only the nodename portion of the FQDN is returned for local hosts.
NI_NUMERICHOST	The numeric form of the node's address is returned instead of its name.
NI_NAMEREQD	Return an error if the node's name cannot be located in the database.
NI_NUMERICSERV	The numeric form of the service address is returned instead of its name.
NI_NUMERICSCOPE	For IPv6 addresses, the numeric form of the scope identifier is returned instead of its name.
NI_DGRAM	Indicates that the service is a datagram service (SOCK_DGRAM).

10045 **Address Information Errors**

10046 The **<netdb.h>** header shall define the following symbolic constants for use as error values for
10047 *getaddrinfo*() and *getnameinfo*(). The values shall be suitable for use in **#if** preprocessing
10048 directives.

10049 EAI_AGAIN	10050 The name could not be resolved at this time. Future attempts may succeed.
10051 EAI_BADFLAGS	The flags had an invalid value.
10052 EAI_FAIL	A non-recoverable error occurred.
10053 EAI_FAMILY	10054 The address family was not recognized or the address length was invalid for the specified family.
10055 EAI_MEMORY	There was a memory allocation failure.
10056 EAI_NONAME	The name does not resolve for the supplied parameters.
	10057 NI_NAMEREQD is set and the host's name cannot be located, or both 10058 *nodename* and *servname* were null.
10059 EAI_SERVICE	The service passed was not recognized for the specified socket type.
10060 EAI_SOCKTYPE	The intended socket type was not recognized.
10061 EAI_SYSTEM	A system error occurred. The error code can be found in *errno*.
10062 EAI_OVERFLOW	An argument buffer overflowed.

10063 The following shall be declared as functions and may also be defined as macros. Function
10064 prototypes shall be provided.

```
10065 void             endhostent(void);
10066 void             endnetent(void);
10067 void             endprotoent(void);
10068 void             endservent(void);
10069 void             freeaddrinfo(struct addrinfo *);
10070 const char       *gai_strerror(int);
10071 int              getaddrinfo(const char *restrict, const char *restrict,
10072                      const struct addrinfo *restrict,
10073                      struct addrinfo **restrict);
10074 struct hostent   *gethostent(void);
10075 int              getnameinfo(const struct sockaddr *restrict, socklen_t,
10076                      char *restrict, socklen_t, char *restrict,
10077                      socklen_t, int);
10078 struct netent    *getnetbyaddr(uint32_t, int);
10079 struct netent    *getnetbyname(const char *);
10080 struct netent    *getnetent(void);
10081 struct protoent  *getprotobyname(const char *);
10082 struct protoent  *getprotobynumber(int);
10083 struct protoent  *getprotoent(void);
10084 struct servent   *getservbyname(const char *, const char *);
10085 struct servent   *getservbyport(int, const char *);
10086 struct servent   *getservent(void);
10087 void             sethostent(int);
10088 void             setnetent(int);
10089 void             setprotoent(int);
```

```
void                setservent(int);
```

The **<netdb.h>** header shall define the **socklen_t** type through **typedef**, as described in **<sys/socket.h>**.

Inclusion of the **<netdb.h>** header may also make visible all symbols from **<netinet/in.h>**, **<sys/socket.h>**, and **<inttypes.h>**.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<inttypes.h>, **<netinet/in.h>**, **<sys/socket.h>**

XSH *bind*( ), *endhostent*( ), *endnetent*( ), *endprotoent*( ), *endservent*( ), *freeaddrinfo*( ), *gai_strerror*( ), *getnameinfo*( )

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The Open Group Base Resolution bwg2001-009 is applied, which changes the return type for *gai_strerror*( ) from **char** * to **const char** *. This is for coordination with the IPnG Working Group.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/11 is applied, adding a description of the NI_NUMERICSCOPE macro and correcting the *getnameinfo*( ) function prototype. These changes are for alignment with IPv6.

Issue 7

SD5-XBD-ERN-14 is applied, changing the description of the *s_port* member of the **servent** structure.

The obsolescent *h_errno* external integer, and the obsolescent *gethostbyaddr*( ), and *gethostbyname*( ) functions are removed, along with the HOST_NOT_FOUND, NO_DATA, NO_RECOVERY, and TRY_AGAIN macros.

This reference page is clarified with respect to macros and symbolic constants.

NAME

netinet/in.h — Internet address family

SYNOPSIS

```
#include <netinet/in.h>
```

DESCRIPTION

The **<netinet/in.h>** header shall define the following types:

in_port_t Equivalent to the type **uint16_t** as described in **<inttypes.h>**.

in_addr_t Equivalent to the type **uint32_t** as described in **<inttypes.h>**.

The **<netinet_in.h>** header shall define the **sa_family_t** type as described in **<sys/socket.h>**.

The **<netinet_in.h>** header shall define the **uint8_t** and **uint32_t** types as described in **<inttypes.h>**. Inclusion of the **<netinet/in.h>** header may also make visible all symbols from **<inttypes.h>** and **<sys/socket.h>**.

The **<netinet/in.h>** header shall define the **in_addr** structure, which shall include at least the following member:

```
in_addr_t  s_addr
```

The **<netinet/in.h>** header shall define the **sockaddr_in** structure, which shall include at least the following members:

```
sa_family_t      sin_family    AF_INET.
in_port_t        sin_port      Port number.
struct in_addr   sin_addr      IP address.
```

The *sin_port* and *sin_addr* members shall be in network byte order.

The **sockaddr_in** structure is used to store addresses for the Internet address family. Values of this type shall be cast by applications to **struct sockaddr** for use with socket functions.

IP6 The **<netinet/in.h>** header shall define the **in6_addr** structure, which shall include at least the following member:

```
uint8_t s6_addr[16]
```

This array is used to contain a 128-bit IPv6 address, stored in network byte order.

The **<netinet/in.h>** header shall define the **sockaddr_in6** structure, which shall include at least the following members:

```
sa_family_t      sin6_family     AF_INET6.
in_port_t        sin6_port       Port number.
uint32_t         sin6_flowinfo   IPv6 traffic class and flow information.
struct in6_addr  sin6_addr       IPv6 address.
uint32_t         sin6_scope_id   Set of interfaces for a scope.
```

The *sin6_port* and *sin6_addr* members shall be in network byte order.

The **sockaddr_in6** structure shall be set to zero by an application prior to using it, since implementations are free to have additional, implementation-defined fields in **sockaddr_in6**.

The *sin6_scope_id* field is a 32-bit integer that identifies a set of interfaces as appropriate for the scope of the address carried in the *sin6_addr* field. For a link scope *sin6_addr*, the application shall ensure that *sin6_scope_id* is a link index. For a site scope *sin6_addr*, the application shall ensure that *sin6_scope_id* is a site index. The mapping of *sin6_scope_id* to an interface or set of interfaces is implementation-defined.

The **<netinet/in.h>** header shall declare the following external variable:

```
const struct in6_addr in6addr_any
```

This variable is initialized by the system to contain the wildcard IPv6 address. The **<netinet/in.h>** header also defines the IN6ADDR_ANY_INIT macro. This macro must be constant at compile time and can be used to initialize a variable of type **struct in6_addr** to the IPv6 wildcard address.

The **<netinet/in.h>** header shall declare the following external variable:

```
const struct in6_addr in6addr_loopback
```

This variable is initialized by the system to contain the loopback IPv6 address. The **<netinet/in.h>** header also defines the IN6ADDR_LOOPBACK_INIT macro. This macro must be constant at compile time and can be used to initialize a variable of type **struct in6_addr** to the IPv6 loopback address.

The **<netinet/in.h>** header shall define the **ipv6_mreq** structure, which shall include at least the following members:

```
struct in6_addr  ipv6mr_multiaddr   IPv6 multicast address.
unsigned         ipv6mr_interface   Interface index.
```

The **<netinet/in.h>** header shall define the following symbolic constants for use as values of the *level* argument of *getsockopt*( ) and *setsockopt*( ):

IPPROTO_IP	Internet protocol.
IP6 IPPROTO_IPV6	Internet Protocol Version 6.
IPPROTO_ICMP	Control message protocol.
RS IPPROTO_RAW	Raw IP Packets Protocol.
IPPROTO_TCP	Transmission control protocol.
IPPROTO_UDP	User datagram protocol.

The **<netinet/in.h>** header shall define the following symbolic constants for use as destination addresses for *connect*( ), *sendmsg*( ), and *sendto*( ):

INADDR_ANY	IPv4 local host address.
INADDR_BROADCAST	IPv4 broadcast address.

The **<netinet/in.h>** header shall define the following symbolic constant, with the value specified, to help applications declare buffers of the proper size to store IPv4 addresses in string form:

INET_ADDRSTRLEN	16. Length of the string form for IP.

The *htonl*( ), *htons*( ), *ntohl*( ), and *ntohs*( ) functions shall be available as described in **<arpa/inet.h>**. Inclusion of the **<netinet/in.h>** header may also make visible all symbols from **<arpa/inet.h>**.

IP6 The **<netinet/in.h>** header shall define the following symbolic constant, with the value specified, to help applications declare buffers of the proper size to store IPv6 addresses in string form:

INET6_ADDRSTRLEN 46. Length of the string form for IPv6.

IP6 The **<netinet/in.h>** header shall define the following symbolic constants, with distinct integer values, for use in the *option_name* argument in the *getsockopt*() or *setsockopt*() functions at protocol level IPPROTO_IPV6:

IPV6_JOIN_GROUP Join a multicast group.

IPV6_LEAVE_GROUP Quit a multicast group.

IPV6_MULTICAST_HOPS
Multicast hop limit.

IPV6_MULTICAST_IF Interface to use for outgoing multicast packets.

IPV6_MULTICAST_LOOP
Multicast packets are delivered back to the local application.

IPV6_UNICAST_HOPS Unicast hop limit.

IPV6_V6ONLY Restrict AF_INET6 socket to IPv6 communications only.

The **<netinet/in.h>** header shall define the following macros that test for special IPv6 addresses. Each macro is of type **int** and takes a single argument of type **const struct in6_addr** *:

IN6_IS_ADDR_UNSPECIFIED
Unspecified address.

IN6_IS_ADDR_LOOPBACK
Loopback address.

IN6_IS_ADDR_MULTICAST
Multicast address.

IN6_IS_ADDR_LINKLOCAL
Unicast link-local address.

IN6_IS_ADDR_SITELOCAL
Unicast site-local address.

IN6_IS_ADDR_V4MAPPED
IPv4 mapped address.

IN6_IS_ADDR_V4COMPAT
IPv4-compatible address.

IN6_IS_ADDR_MC_NODELOCAL
Multicast node-local address.

IN6_IS_ADDR_MC_LINKLOCAL
Multicast link-local address.

IN6_IS_ADDR_MC_SITELOCAL
Multicast site-local address.

IN6_IS_ADDR_MC_ORGLOCAL
Multicast organization-local address.

IN6_IS_ADDR_MC_GLOBAL
Multicast global address.

10238 **APPLICATION USAGE**
10239 None.

10240 **RATIONALE**
10241 None.

10242 **FUTURE DIRECTIONS**
10243 None.

10244 **SEE ALSO**
10245 Section 4.9 (on page 110), **<arpa/inet.h>**, **<inttypes.h>**, **<sys/socket.h>**

10247 **CHANGE HISTORY**
10248 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

10249 The *sin_zero* member was removed from the **sockaddr_in** structure as per The Open Group Base
10250 Resolution bwg2001-004.

10251 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/12 is applied, adding **const** qualifiers to
10252 the *in6addr_any* and *in6addr_loopback* external variables.

10253 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/22 is applied, making it clear which
10254 structure members are in network byte order.

10255 **Issue 7**
10256 This reference page is clarified with respect to macros and symbolic constants.

10257 **NAME**

10258 netinet/tcp.h — definitions for the Internet Transmission Control Protocol (TCP)

10259 **SYNOPSIS**

10260 `#include <netinet/tcp.h>`

10261 **DESCRIPTION**

10262 The **<netinet/tcp.h>** header shall define the following symbolic constant for use as a socket
10263 option at the IPPROTO_TCP level:

10264 TCP_NODELAY Avoid coalescing of small segments.

10265 The implementation need not allow the value of the option to be set via *setsockopt*( ) or retrieved
10266 via *getsockopt*( ).

10267 **APPLICATION USAGE**

10268 None.

10269 **RATIONALE**

10270 None.

10279 This reference page is clarified with respect to macros and symbolic constants.

NAME

nl_types.h — data types

SYNOPSIS

```
#include <nl_types.h>
```

DESCRIPTION

The **<nl_types.h>** header shall define at least the following types:

nl_catd Used by the message catalog functions *catopen*(), *catgets*(), and *catclose*() to identify a catalog descriptor.

nl_item Used by *nl_langinfo*() to identify items of *langinfo* data. Values of objects of type **nl_item** are defined in **<langinfo.h>**.

The **<nl_types.h>** header shall define at least the following symbolic constants:

NL_SETD Used by *gencat* when no $*set* directive is specified in a message text source file. This constant can be passed as the value of *set_id* on subsequent calls to *catgets*() (that is, to retrieve messages from the default message set). The value of NL_SETD is implementation-defined.

NL_CAT_LOCALE Value that must be passed as the *oflag* argument to *catopen*() to ensure that message catalog selection depends on the *LC_MESSAGES* locale category, rather than directly on the *LANG* environment variable.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int       catclose(nl_catd);
char     *catgets(nl_catd, int, int, const char *);
nl_catd   catopen(const char *, int);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<langinfo.h>

XSH *catclose*(), *catgets*(), *catopen*(), *nl_langinfo*()

XCU *gencat*

CHANGE HISTORY

First released in Issue 2.

Issue 7

The **<nl_types.h>** header is moved from the XSI option to the Base.

This reference page is clarified with respect to macros and symbolic constants.

NAME

poll.h — definitions for the poll( ) function

SYNOPSIS

```
#include <poll.h>
```

DESCRIPTION

The **<poll.h>** header shall define the **pollfd** structure, which shall include at least the following members:

`int`	`fd`	The following descriptor being polled.
`short`	`events`	The input event flags (see below).
`short`	`revents`	The output event flags (see below).

The **<poll.h>** header shall define the following type through **typedef**:

nfds_t An unsigned integer type used for the number of file descriptors.

The implementation shall support one or more programming environments in which the width of **nfds_t** is no greater than the width of type **long**. The names of these programming environments can be obtained using the *confstr*( ) function or the *getconf* utility.

The **<poll.h>** header shall define the following symbolic constants, zero or more of which may be OR'ed together to form the *events* or *revents* members in the **pollfd** structure:

POLLIN	Data other than high-priority data may be read without blocking.
POLLRDNORM	Normal data may be read without blocking.
POLLRDBAND	Priority data may be read without blocking.
POLLPRI	High priority data may be read without blocking.
POLLOUT	Normal data may be written without blocking.
POLLWRNORM	Equivalent to POLLOUT.
POLLWRBAND	Priority data may be written.
POLLERR	An error has occurred (*revents* only).
POLLHUP	Device has been disconnected (*revents* only).
POLLNVAL	Invalid *fd* member (*revents* only).

The significance and semantics of normal, priority, and high-priority data are file and device-specific.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided.

```
int   poll(struct pollfd [], nfds_t, int);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

10356 **SEE ALSO**

10357 XSH *confstr*( ), *poll*( )

10358 XCU *getconf*

10359 **CHANGE HISTORY**

10360 First released in Issue 4, Version 2.

10361 **Issue 6**

10362 The description of the symbolic constants is updated to match the *poll*( ) function.

10363 Text related to STREAMS has been moved to the *poll*( ) reference page.

10364 A note is added to the DESCRIPTION regarding the significance and semantics of normal,
10365 priority, and high-priority data.

10366 **Issue 7**

10367 The **<poll.h>** header is moved from the XSI option to the Base.

NAME

pthread.h — threads

SYNOPSIS

```
#include <pthread.h>
```

DESCRIPTION

The **<pthread.h>** header shall define the following symbolic constants:

PTHREAD_BARRIER_SERIAL_THREAD
PTHREAD_CANCEL_ASYNCHRONOUS
PTHREAD_CANCEL_ENABLE
PTHREAD_CANCEL_DEFERRED
PTHREAD_CANCEL_DISABLE
PTHREAD_CANCELED
PTHREAD_CREATE_DETACHED
PTHREAD_CREATE_JOINABLE
TPS PTHREAD_EXPLICIT_SCHED
PTHREAD_INHERIT_SCHED
PTHREAD_MUTEX_DEFAULT
PTHREAD_MUTEX_ERRORCHECK
PTHREAD_MUTEX_NORMAL
PTHREAD_MUTEX_RECURSIVE
PTHREAD_MUTEX_ROBUST
PTHREAD_MUTEX_STALLED
PTHREAD_ONCE_INIT
RPI | TPI PTHREAD_PRIO_INHERIT
MC1 PTHREAD_PRIO_NONE
RPP | TPP PTHREAD_PRIO_PROTECT
PTHREAD_PROCESS_SHARED
PTHREAD_PROCESS_PRIVATE
TPS PTHREAD_SCOPE_PROCESS
PTHREAD_SCOPE_SYSTEM

The **<pthread.h>** header shall define the following compile-time constant expressions valid as initializers for the following types:

Name	Initializer for Type
PTHREAD_COND_INITIALIZER	**pthread_cond_t**
PTHREAD_MUTEX_INITIALIZER	**pthread_mutex_t**
PTHREAD_RWLOCK_INITIALIZER	**pthread_rwlock_t**

The **<pthread.h>** header shall define the **pthread_attr_t**, **pthread_barrier_t**, **pthread_barrierattr_t**, **pthread_cond_t**, **pthread_condattr_t**, **pthread_key_t**, **pthread_mutex_t**, **pthread_mutexattr_t**, **pthread_once_t**, **pthread_rwlock_t**, **pthread_rwlockattr_t**, **pthread_spinlock_t**, and **pthread_t** types as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int   pthread_atfork(void (*)(void), void (*)(void),
          void(*)(void));
int   pthread_attr_destroy(pthread_attr_t *);
int   pthread_attr_getdetachstate(const pthread_attr_t *, int *);

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The RTT margin markers are broken out into their POSIX options.

The Open Group Corrigendum U021/9 is applied, correcting the prototype for the *pthread_cond_wait*( ) function.

The Open Group Corrigendum U026/2 is applied, correcting the prototype for the *pthread_setschedparam*( ) function so that its second argument is of type **int**.

The *pthread_getcpuclockid*( ) and *pthread_mutex_timedlock*( ) functions are added for alignment with IEEE Std 1003.1d-1999.

The following functions are added for alignment with IEEE Std 1003.1j-2000:
pthread_barrier_destroy( ), *pthread_barrier_init*( ), *pthread_barrier_wait*( ), *pthread_barrierattr_destroy*( ), *pthread_barrierattr_getpshared*( ), *pthread_barrierattr_init*( ), *pthread_barrierattr_setpshared*( ), *pthread_condattr_getclock*( ), *pthread_condattr_setclock*( ), *pthread_rwlock_timedrdlock*( ), *pthread_rwlock_timedwrlock*( ), *pthread_spin_destroy*( ), *pthread_spin_init*( ), *pthread_spin_lock*( ), *pthread_spin_trylock*( ), and *pthread_spin_unlock*( ).

PTHREAD_RWLOCK_INITIALIZER is removed for alignment with IEEE Std 1003.1j-2000.

Functions previously marked as part of the Read-Write Locks option are now moved to the Threads option.

The **restrict** keyword is added to the prototypes for *pthread_attr_getguardsize*( ), *pthread_attr_getinheritsched*( ), *pthread_attr_getschedparam*( ), *pthread_attr_getschedpolicy*( ), *pthread_attr_getscope*( ), *pthread_attr_getstackaddr*( ), *pthread_attr_getstacksize*( ), *pthread_attr_setschedparam*( ), *pthread_barrier_init*( ), *pthread_barrierattr_getpshared*( ), *pthread_cond_init*( ), *pthread_cond_signal*( ), *pthread_cond_timedwait*( ), *pthread_cond_wait*( ), *pthread_condattr_getclock*( ), *pthread_condattr_getpshared*( ), *pthread_create*( ), *pthread_getschedparam*( ), *pthread_mutex_getprioceiling*( ), *pthread_mutex_init*( ), *pthread_mutex_setprioceiling*( ), *pthread_mutexattr_getprioceiling*( ), *pthread_mutexattr_getprotocol*( ), *pthread_mutexattr_getpshared*( ), *pthread_mutexattr_gettype*( ), *pthread_rwlock_init*( ), *pthread_rwlock_timedrdlock*( ), *pthread_rwlock_timedwrlock*( ), *pthread_rwlockattr_getpshared*( ), and *pthread_sigmask*( ).

IEEE PASC Interpretation 1003.1 #86 is applied, allowing the symbols from **<sched.h>** and **<time.h>** to be made visible when **<pthread.h>** is included. Previously this was an XSI option.

IEEE PASC Interpretation 1003.1c #42 is applied, removing the requirement for prototypes for the *pthread_kill*( ) and *pthread_sigmask*( ) functions. These are required to be in the **<signal.h>** header. They are allowed here through the name space rules.

IEEE PASC Interpretation 1003.1 #96 is applied, adding the *pthread_setschedprio*( ) function.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/13 is applied, correcting shading errors that were in contradiction with the System Interfaces volume of POSIX.1-200x.

Issue 7

SD5-XBD-ERN-55 is applied, adding the **restrict** keyword to the *pthread_mutex_timedlock*() function prototype.

SD5-XBD-ERN-62 is applied.

Austin Group Interpretation 1003.1-2001 #048 is applied, reinstating the PTHREAD_RWLOCK_INITIALIZER symbol.

The **<pthread.h>** header is moved from the Threads option to the Base.

The PTHREAD_MUTEX_NORMAL, PTHREAD_MUTEX_ERRORCHECK, PTHREAD_MUTEX_RECURSIVE, and PTHREAD_MUTEX_DEFAULT extended mutex types are moved from the XSI option to the Base.

The PTHREAD_MUTEX_ROBUST and PTHREAD_MUTEX_STALLED symbols and the *pthread_mutex_consistent*(), *pthread_mutexattr_getrobust*(), and *pthread_mutexattr_setrobust*() functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Functionality relating to the Thread Priority Protection and Thread Priority Inheritance options is changed to be Non-Robust Mutex or Robust Mutex Priority Protection and Non-Robust Mutex or Robust Mutex Priority Inheritance, respectively.

This reference page is clarified with respect to macros and symbolic constants.

NAME

pwd.h — password structure

SYNOPSIS

```
#include <pwd.h>
```

DESCRIPTION

The **<pwd.h>** header shall define the **struct passwd**, structure, which shall include at least the following members:

`char`	`*pw_name`	User's login name.
`uid_t`	`pw_uid`	Numerical user ID.
`gid_t`	`pw_gid`	Numerical group ID.
`char`	`*pw_dir`	Initial working directory.
`char`	`*pw_shell`	Program to use as shell.

The **<pwd.h>** header shall define the **gid_t**, **uid_t**, and **size_t** types as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

XSI
```
void           endpwent(void);                                  +
struct passwd *getpwent(void);                                  +
struct passwd *getpwnam(const char *);
int            getpwnam_r(const char *, struct passwd *, char *,
                   size_t, struct passwd **);
struct passwd *getpwuid(uid_t);
int            getpwuid_r(uid_t, struct passwd *, char *,
                   size_t, struct passwd **);
void           setpwent(void);                                  -
```
XSI

CHANGE HISTORY

First released in Issue 1.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The **gid_t** and **uid_t** types are mandated.

- The *getpwnam_r*() and *getpwuid_r*() functions are marked as part of the Thread-Safe Functions option.

Issue 7

SD5-XBD-ERN-56 is applied, adding a reference to **<sys/types.h>** for the **size_t** type.

10672 **NAME**

10673 regex.h — regular expression matching types

10674 **SYNOPSIS**

10675 `#include <regex.h>`

10676 **DESCRIPTION**

10677 The **<regex.h>** header shall define the structures and symbolic constants used by the *regcomp*( ),
10678 *regexec*( ), *regerror*( ), and *regfree*( ) functions.

10679 The **<regex.h>** header shall define the **regex_t** structure type, which shall include at least the
10680 following member:

10681 `size_t re_nsub` Number of parenthesized subexpressions.

10682 The **<regex.h>** header shall define the **size_t** type as described in **<sys/types.h>**.

10683 The **<regex.h>** header shall define the **regoff_t** type as a signed integer type that can hold the
10684 largest value that can be stored in either a **ptrdiff_t** type or a **ssize_t** type.

10685 The **<regex.h>** header shall define the **regmatch_t** structure type, which shall include at least the
10686 following members:

10687 `regoff_t rm_so` Byte offset from start of string
10688 to start of substring.
10689 `regoff_t rm_eo` Byte offset from start of string of the
10690 first character after the end of substring.

10691 The **<regex.h>** header shall define the following symbolic constants for the *cflags* parameter to
10692 the *regcomp*( ) function:

10693 REG_EXTENDED Use Extended Regular Expressions.

10694 REG_ICASE Ignore case in match.

10695 REG_NOSUB Report only success or fail in *regexec*( ).

10696 REG_NEWLINE Change the handling of <newline>.

10697 The **<regex.h>** header shall define the following symbolic constants for the *eflags* parameter to
10698 the *regexec*( ) function:

10699 REG_NOTBOL The <circumflex> character (`'^'`), when taken as a special character, does
10700 not match the beginning of *string*.

10701 REG_NOTEOL The <dollar-sign> (`'$'`), when taken as a special character, does not
10702 match the end of *string*.

10703 The **<regex.h>** header shall define the following symbolic constants as error return values:

10704 REG_NOMATCH *regexec*( ) failed to match.

10705 REG_BADPAT Invalid regular expression.

10706 REG_ECOLLATE Invalid collating element referenced.

10707 REG_ECTYPE Invalid character class type referenced.

10708 REG_EESCAPE Trailing <backslash> character in pattern.

10709 REG_ESUBREG Number in *\digit* invalid or in error.

REG_EBRACK	"[]" imbalance.
REG_EPAREN	"\(\)" or "()" imbalance.
REG_EBRACE	"\{\}" imbalance.
REG_BADBR	Content of "\{\}" invalid: not a number, number too large, more than two numbers, first larger than second.
REG_ERANGE	Invalid endpoint in range expression.
REG_ESPACE	Out of memory.
REG_BADRPT	'?', '*', or '+' not preceded by valid regular expression.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int    regcomp(regex_t *restrict, const char *restrict, int);
size_t regerror(int, const regex_t *restrict, char *restrict, size_t);
int    regexec(const regex_t *restrict, const char *restrict, size_t,
           regmatch_t [restrict], int);
void   regfree(regex_t *);
```

The implementation may define additional macros or constants using names beginning with REG_.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>

XSH *regcomp*( )

CHANGE HISTORY

First released in Issue 4.

Originally derived from the ISO POSIX-2 standard.

Issue 6

The REG_ENOSYS constant is marked obsolescent.

The **restrict** keyword is added to the prototypes for *regcomp*( ), *regerror*( ), and *regexec*( ).

A statement is added that the **size_t** type is defined as described in **<sys/types.h>**.

Issue 7

SD5-XBD-ERN-60 is applied.

The obsolescent REG_ENOSYS constant is removed.

This reference page is clarified with respect to macros and symbolic constants.

NAME

sched.h — execution scheduling

SYNOPSIS

```
#include <sched.h>
```

DESCRIPTION

PS The **<sched.h>** header shall define the **pid_t** type as described in **<sys/types.h>**.

SS | TSP The **<sched.h>** header shall define the **time_t** type as described in **<sys/types.h>**.

The **<sched.h>** header shall define the **timespec** structure as described in **<time.h>**.

The **<sched.h>** header shall define the **sched_param** structure, which shall include the scheduling parameters required for implementation of each supported scheduling policy. This structure shall include at least the following member:

`int`	`sched_priority`	Process or thread execution scheduling priority.

SS | TSP The **sched_param** structure defined in **<sched.h>** shall include the following members in addition to those specified above:

`int`	`sched_ss_low_priority`	Low scheduling priority for sporadic server.
`struct timespec`	`sched_ss_repl_period`	Replenishment period for sporadic server.
`struct timespec`	`sched_ss_init_budget`	Initial budget for sporadic server.
`int`	`sched_ss_max_repl`	Maximum pending replenishments for sporadic server.

Each process or thread is controlled by an associated scheduling policy and priority. Associated with each policy is a priority range. Each policy definition specifies the minimum priority range for that policy. The priority ranges for each policy may overlap the priority ranges of other policies.

Four scheduling policies are defined; others may be defined by the implementation. The four standard policies are indicated by the values of the following symbolic constants:

PS | TPS	SCHED_FIFO	First in-first out (FIFO) scheduling policy.
PS | TPS	SCHED_RR	Round robin scheduling policy.
SS | TSP	SCHED_SPORADIC	Sporadic server scheduling policy.
PS | TPS	SCHED_OTHER	Another scheduling policy.

The values of these constants are distinct.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
PS | TPS  int    sched_get_priority_max(int);
             int    sched_get_priority_min(int);
PS           int    sched_getparam(pid_t, struct sched_param *);
             int    sched_getscheduler(pid_t);
PS | TPS     int    sched_rr_get_interval(pid_t, struct timespec *);
PS           int    sched_setparam(pid_t, const struct sched_param *);
             int    sched_setscheduler(pid_t, int, const struct sched_param *);
             int    sched_yield(void);
```

Inclusion of the **<sched.h>** header may make visible all symbols from the **<time.h>** header.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>, **<time.h>**

XSH *sched_get_priority_max*( ), *sched_getparam*( ), *sched_getscheduler*( ), *sched_rr_get_interval*( ), + *sched_setparam*( ), *sched_setscheduler*( ), *sched_yield*( )

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The **<sched.h>** header is marked as part of the Process Scheduling option.

Sporadic server members are added to the **sched_param** structure, and the SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #108 is applied, correcting the **sched_param** structure whose members *sched_ss_repl_period* and *sched_ss_init_budget* should be type **struct timespec** and not **timespec**.

Symbols from **<time.h>** may be made visible when **<sched.h>** is included.

IEEE Std 1003.1-2001/Cor 1-2002, items XSH/TC1/D6/52 and XSH/TC1/D6/53 are applied, aligning the function prototype shading and margin codes with the System Interfaces volume of IEEE Std 1003.1-2001.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/23 is applied, updating the DESCRIPTION to differentiate between thread and process execution.

Issue 7

SD5-XBD-ERN-13 is applied.

Austin Group Interpretation 1003.1-2001 #064 is applied, correcting the options markings.

The **<sched.h>** headers is moved from the Threads option to the Base.

Declarations for the **pid_t** and **time_t** types and the **timespec** structure are added.

NAME

search.h — search tables

SYNOPSIS

XSI

```
#include <search.h>
```

DESCRIPTION

The **<search.h>** header shall define the **ENTRY** type for structure **entry** which shall include the following members:

```
char    *key
void    *data
```

and shall define **ACTION** and **VISIT** as enumeration data types through type definitions as follows:

```
enum { FIND, ENTER } ACTION;
enum { preorder, postorder, endorder, leaf } VISIT;
```

The **<search.h>** header shall define the **size_t** type as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int    hcreate(size_t);
void   hdestroy(void);
ENTRY *hsearch(ENTRY, ACTION);
void   insque(void *, void *);
void  *lfind(const void *, const void *, size_t *,
           size_t, int (*)(const void *, const void *));
void  *lsearch(const void *, void *, size_t *,
           size_t, int (*)(const void *, const void *));
void   remque(void *);
void  *tdelete(const void *restrict, void **restrict,
           int(*)(const void *, const void *));
void  *tfind(const void *, void *const *,
           int(*)(const void *, const void *));
void  *tsearch(const void *, void **,
           int(*)(const void *, const void *));
void   twalk(const void *,
           void (*)(const void *, VISIT, int ));
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/types.h>

XSH *hcreate*( ), *insque*( ), *lsearch*( ), *tdelete*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The Open Group Corrigendum U021/6 is applied, updating the prototypes for *tdelete*() and *tsearch*().

The **restrict** keyword is added to the prototype for *tdelete*().

NAME

semaphore.h — semaphores

SYNOPSIS

```
#include <semaphore.h>
```

DESCRIPTION

The **<semaphore.h>** header shall define the **sem_t** type, used in performing semaphore operations. The semaphore may be implemented using a file descriptor, in which case applications are able to open up at least a total of {OPEN_MAX} files and semaphores.

The **<semaphore.h>** header shall define the symbolic constant SEM_FAILED which shall have type **sem_t** *.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int    sem_close(sem_t *);
int    sem_destroy(sem_t *);
int    sem_getvalue(sem_t *restrict, int *restrict);
int    sem_init(sem_t *, int, unsigned);
sem_t *sem_open(const char *, int, ...);
int    sem_post(sem_t *);
int    sem_timedwait(sem_t *restrict, const struct timespec *restrict);
int    sem_trywait(sem_t *);
int    sem_unlink(const char *);
int    sem_wait(sem_t *);
```

Inclusion of the **<semaphore.h>** header may make visible symbols defined in the **<fcntl.h>** and **<time.h>** headers.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<fcntl.h>, **<sys/types.h>**, **<time.h>**

XSH *sem_close*( ), *sem_destroy*( ), *sem_getvalue*( ), *sem_init*( ), *sem_open*( ), *sem_post*( ), *sem_timedwait*( ), *sem_trywait*( ), *sem_unlink*( )

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The **<semaphore.h>** header is marked as part of the Semaphores option.

The Open Group Corrigendum U021/3 is applied, adding a description of SEM_FAILED.

The *sem_timedwait*( ) function is added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the prototypes for *sem_getvalue*( ) and *sem_timedwait*( ).

Issue 7

SD5-XBD-ERN-57 is applied, allowing the header to make visible symbols from the **<time.h>** header.

The **<semaphore.h>** header is moved from the Semaphores option to the Base.

This reference page is clarified with respect to macros and symbolic constants.

NAME

setjmp.h — stack environment declarations

SYNOPSIS

```
#include <setjmp.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to enable the visibility of these symbols in this header.

CX The **<setjmp.h>** header shall define the array types **jmp_buf** and **sigjmp_buf**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
OB XSI  void   _longjmp(jmp_buf, int);                    +
        void   longjmp(jmp_buf, int);
CX      void   siglongjmp(sigjmp_buf, int);
                                                          -
```

The following may be declared as functions, or defined as macros, or both. If functions are declared, function prototypes shall be provided.

```
OB XSI  int    _setjmp(jmp_buf);                          +
        int    setjmp(jmp_buf);
CX      int    sigsetjmp(sigjmp_buf, int);
                                                          -
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1.

Issue 6

Extensions beyond the ISO C standard are marked.

Issue 7

SD5-XBD-ERN-6 is applied.

10949 **NAME**

10950 signal.h — signals

10951 **SYNOPSIS**

10952 `#include <signal.h>`

10953 **DESCRIPTION**

10954 CX Some of the functionality described on this reference page extends the ISO C standard.
10955 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to
10956 enable the visibility of these symbols in this header.

10957 The **<signal.h>** header shall define the following macros, which shall expand to constant
10958 expressions with distinct values that have a type compatible with the second argument to, and
10959 the return value of, the *signal*() function, and whose values shall compare unequal to the
10960 address of any declarable function.

10961 SIG_DFL Request for default signal handling.

10962 SIG_ERR Return value from *signal*() in case of error.

10963 OB CX SIG_HOLD Request that signal be held.

10964 SIG_IGN Request that signal be ignored.

10965 CX The **<signal.h>** header shall define the **pthread_t**, **size_t**, and **uid_t** types as described in
10966 **<sys/types.h>**.

10967 The **<signal.h>** header shall define the **timespec** structure as described in **<time.h>**.

10968 The **<signal.h>** header shall define the following data types:

10969 **sig_atomic_t** Possibly volatile-qualified integer type of an object that can be accessed as
10970 an atomic entity, even in the presence of asynchronous interrupts.

10971 CX **sigset_t** Integer or structure type of an object used to represent sets of signals.

10972 CX **pid_t** As described in **<sys/types.h>**.

10973 CX The **<signal.h>** header shall define the **pthread_attr_t** type as described in **<sys/types.h>**.

10974 The **<signal.h>** header shall define the **sigevent** structure, which shall include at least the
10975 following members:

```
10976 int              sigev_notify             Notification type.
10977 int              sigev_signo              Signal number.
10978 union sigval     sigev_value              Signal value.
10979 void           (*sigev_notify_function)(union sigval)
10980                                           Notification function.
10981 pthread_attr_t *sigev_notify_attributes   Notification attributes.
```

10982 The **<signal.h>** header shall define the following symbolic constants for the values of
10983 *sigev_notify*:

10984 SIGEV_NONE No asynchronous notification is delivered when the event of interest
10985 occurs.

10986 SIGEV_SIGNAL A queued signal, with an application-defined value, is generated when
10987 the event of interest occurs.

10988 SIGEV_THREAD A notification function is called to perform notification.

The **sigval** union shall be defined as:

```
int     sival_int     Integer signal value.
void  *sival_ptr      Pointer signal value.
```

The **<signal.h>** header shall declare the SIGRTMIN and SIGRTMAX macros, which shall expand to positive integer expressions with type **int**, but which need not be constant expressions. These macros specify a range of signal numbers that are reserved for application use and for which the realtime signal behavior specified in this volume of POSIX.1-200x is supported. The signal numbers in this range do not overlap any of the signals specified in the following table.

The range SIGRTMIN through SIGRTMAX inclusive shall include at least {RTSIG_MAX} signal numbers.

It is implementation-defined whether realtime signal behavior is supported for other signals.

The **<signal.h>** header shall define the following macros that are used to refer to the signals that occur in the system. Signals defined here begin with the letters SIG followed by an uppercase letter. The macros shall expand to positive integer constant expressions with type **int** and distinct values. The value 0 is reserved for use as the null signal (see *kill*( )). Additional implementation-defined signals may occur in the system.

CX The ISO C standard only requires the signal names SIGABRT, SIGFPE, SIGILL, SIGINT, SIGSEGV, and SIGTERM to be defined.

The following signals shall be supported on all implementations (default actions are explained below the table):

Signal	Default Action	Description
SIGABRT	A	Process abort signal.
SIGALRM	T	Alarm clock.
SIGBUS	A	Access to an undefined portion of a memory object.
SIGCHLD	I	Child process terminated, stopped,
XSI		or continued.
SIGCONT	C	Continue executing, if stopped.
SIGFPE	A	Erroneous arithmetic operation.
SIGHUP	T	Hangup.
SIGILL	A	Illegal instruction.
SIGINT	T	Terminal interrupt signal.
SIGKILL	T	Kill (cannot be caught or ignored).
SIGPIPE	T	Write on a pipe with no one to read it.
SIGQUIT	A	Terminal quit signal.
SIGSEGV	A	Invalid memory reference.
SIGSTOP	S	Stop executing (cannot be caught or ignored).
SIGTERM	T	Termination signal.
SIGTSTP	S	Terminal stop signal.
SIGTTIN	S	Background process attempting read.
SIGTTOU	S	Background process attempting write.
SIGUSR1	T	User-defined signal 1.
SIGUSR2	T	User-defined signal 2.
OB XSR SIGPOLL	T	Pollable event.
OB XSR SIGPROF	T	Profiling timer expired.
XSI SIGSYS	A	Bad system call.
SIGTRAP	A	Trace/breakpoint trap.
SIGURG	I	High bandwidth data is available at a socket.
XSI SIGVTALRM	T	Virtual timer expired.
SIGXCPU	A	CPU time limit exceeded.
SIGXFSZ	A	File size limit exceeded.

The default actions are as follows:

T Abnormal termination of the process.

XSI A Abnormal termination of the process with additional actions.

I Ignore the signal.

S Stop the process.

C Continue the process, if it is stopped; otherwise, ignore the signal.

The effects on the process in each case are described in XSH Section 2.4.3 (on page 486).

CX The **<signal.h>** header shall declare the **sigaction** structure, which shall include at least the following members:

```
void    (*sa_handler)(int)   Pointer to a signal-catching function
                             or one of the SIG_IGN or SIG_DFL.
sigset_t sa_mask             Set of signals to be blocked during execution
                             of the signal handling function.
int       sa_flags           Special flags.
void    (*sa_sigaction)(int, siginfo_t *, void *)
                             Pointer to a signal-catching function.
```

11055 XSI The storage occupied by *sa_handler* and *sa_sigaction* may overlap, and a conforming application
11056 shall not use both simultaneously.

11057 The **<signal.h>** header shall define the following macros which shall expand to integer constant
11058 expressions that need not be usable in **#if** preprocessing directives:

11059 CX	SIG_BLOCK	The resulting set is the union of the current set and the signal set pointed to by the argument *set*.
11061 CX	SIG_UNBLOCK	The resulting set is the intersection of the current set and the complement of the signal set pointed to by the argument *set*.
11063 CX	SIG_SETMASK	The resulting set is the signal set pointed to by the argument *set*.

11064 The **<signal.h>** header shall also define the following symbolic constants:

11065 CX	SA_NOCLDSTOP	Do not generate SIGCHLD when children stop or stopped children continue.
11067 XSI	SA_ONSTACK	Causes signal delivery to occur on an alternate stack.
11068 CX	SA_RESETHAND	Causes signal dispositions to be set to SIG_DFL on entry to signal handlers.
11070 CX	SA_RESTART	Causes certain functions to become restartable.
11071 CX	SA_SIGINFO	Causes extra information to be passed to signal handlers at the time of receipt of a signal.
11073 CX	SA_NOCLDWAIT	Causes implementations not to create zombie processes on child death.
11074 CX	SA_NODEFER	Causes signal not to be automatically blocked on entry to signal handler.
11075 XSI	SS_ONSTACK	Process is executing on an alternate signal stack.
11076 XSI	SS_DISABLE	Alternate signal stack is disabled.
11077 XSI	MINSIGSTKSZ	Minimum stack size for a signal handler.
11078 XSI	SIGSTKSZ	Default size in bytes for the alternate signal stack.

11079 CX The **<signal.h>** header shall define the **mcontext_t** type through **typedef**.

11080 CX The **<signal.h>** header shall define the **ucontext_t** type as a structure that shall include at least
11081 the following members:

11082	`ucontext_t *uc_link`	Pointer to the context that is resumed when this context returns.
11084	`sigset_t uc_sigmask`	The set of signals that are blocked when this context is active.
11086	`stack_t uc_stack`	The stack used by this context.
11087	`mcontext_t uc_mcontext`	A machine-specific representation of the saved context.

11089 The **<signal.h>** header shall define the **stack_t** type as a structure, which shall include at least
11090 the following members:

11091	`void *ss_sp`	Stack base or pointer.
11092	`size_t ss_size`	Stack size.
11093	`int ss_flags`	Flags.

11094 CX The **<signal.h>** header shall define the **siginfo_t** type as a structure, which shall include at least
11095 the following members:

11096	CX	`int`	`si_signo`	Signal number.
11097		`int`	`si_code`	Signal code.
11098	XSI	`int`	`si_errno`	If non-zero, an *errno* value associated with
11099				this signal, as described in **<errno.h>**.
11100	CX	`pid_t`	`si_pid`	Sending process ID.
11101		`uid_t`	`si_uid`	Real user ID of sending process.
11102		`void`	`*si_addr`	Address of faulting instruction.
11103		`int`	`si_status`	Exit value or signal.
11104	OB XSR	`long`	`si_band`	Band event for SIGPOLL.
11105	CX	`union sigval`	`si_value`	Signal value.

11106 CX The **<signal.h>** header shall define the symbolic constants in the **Code** column of the following
11107 table for use as values of *si_code* that are signal-specific or non-signal-specific reasons why the
11108 signal was generated.

	Signal	Code	Reason
CX	SIGILL	ILL_ILLOPC	Illegal opcode.
		ILL_ILLOPN	Illegal operand.
		ILL_ILLADR	Illegal addressing mode.
		ILL_ILLTRP	Illegal trap.
		ILL_PRVOPC	Privileged opcode.
		ILL_PRVREG	Privileged register.
		ILL_COPROC	Coprocessor error.
		ILL_BADSTK	Internal stack error.
	SIGFPE	FPE_INTDIV	Integer divide by zero.
		FPE_INTOVF	Integer overflow.
		FPE_FLTDIV	Floating-point divide by zero.
		FPE_FLTOVF	Floating-point overflow.
		FPE_FLTUND	Floating-point underflow.
		FPE_FLTRES	Floating-point inexact result.
		FPE_FLTINV	Invalid floating-point operation.
		FPE_FLTSUB	Subscript out of range.
	SIGSEGV	SEGV_MAPERR	Address not mapped to object.
		SEGV_ACCERR	Invalid permissions for mapped object.
	SIGBUS	BUS_ADRALN	Invalid address alignment.
		BUS_ADRERR	Nonexistent physical address.
		BUS_OBJERR	Object-specific hardware error.
XSI	SIGTRAP	TRAP_BRKPT	Process breakpoint.
		TRAP_TRACE	Process trace trap.
CX	SIGCHLD	CLD_EXITED	Child has exited.
		CLD_KILLED	Child has terminated abnormally and did not create a **core** file.
		CLD_DUMPED	Child has terminated abnormally and created a **core** file.
		CLD_TRAPPED	Traced child has trapped.
		CLD_STOPPED	Child has stopped.
		CLD_CONTINUED	Stopped child has continued.
OB XSR	SIGPOLL	POLL_IN	Data input available.
		POLL_OUT	Output buffers available.
		POLL_MSG	Input message available.
		POLL_ERR	I/O error.
		POLL_PRI	High priority input available.
		POLL_HUP	Device disconnected.
CX	Any	SI_USER	Signal sent by *kill*().
		SI_QUEUE	Signal sent by the *sigqueue*().
		SI_TIMER	Signal generated by expiration of a timer set by *timer_settime*().
		SI_ASYNCIO	Signal generated by completion of an asynchronous I/O request.
		SI_MESGQ	Signal generated by arrival of a message on an empty message queue

CX Implementations may support additional *si_code* values not included in this list, may generate values included in this list under circumstances other than those described in this list, and may contain extensions or limitations that prevent some values from being generated. Implementations do not generate a different value from the ones described in this list for circumstances described in this list.

CX In addition, the following signal-specific information shall be available:

Signal	Member	Value
SIGILL SIGFPE	**void** * *si_addr*	Address of faulting instruction.
SIGSEGV SIGBUS	**void** * *si_addr*	Address of faulting memory reference.
SIGCHLD	**pid_t** *si_pid* **int** *si_status* **uid_t** *si_uid*	Child process ID. Exit value or signal. Real user ID of the process that sent the signal.
OB XSR SIGPOLL	**long** *si_band*	Band event for POLL_IN, POLL_OUT, or POLL_MSG

For some implementations, the value of *si_addr* may be inaccurate.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
CX  int    kill(pid_t, int);
XSI int    killpg(pid_t, int);
CX  void   psiginfo(const siginfo_t *, const char *);
    void   psignal(int, const char *);
    int    pthread_kill(pthread_t, int);
    int    pthread_sigmask(int, const sigset_t *restrict,
               sigset_t *restrict);
    int    raise(int);
CX  int    sigaction(int, const struct sigaction *restrict,
               struct sigaction *restrict);
    int    sigaddset(sigset_t *, int);
XSI int    sigaltstack(const stack_t *restrict, stack_t *restrict);
CX  int    sigdelset(sigset_t *, int);
    int    sigemptyset(sigset_t *);
    int    sigfillset(sigset_t *);
OB XSI int sighold(int);
    int    sigignore(int);
    int    siginterrupt(int, int);
CX  int    sigismember(const sigset_t *, int);
    void (*signal(int, void (*)(int)))(int);
OB XSI int sigpause(int);
CX  int    sigpending(sigset_t *);
    int    sigprocmask(int, const sigset_t *restrict, sigset_t *restrict);
    int    sigqueue(pid_t, int, const union sigval);
OB XSI int sigrelse(int);
    void (*sigset(int, void (*)(int)))(int);
CX  int    sigsuspend(const sigset_t *);
    int    sigtimedwait(const sigset_t *restrict, siginfo_t *restrict,
               const struct timespec *restrict);
    int    sigwait(const sigset_t *restrict, int *restrict);
    int    sigwaitinfo(const sigset_t *restrict, siginfo_t *restrict);
```

CX Inclusion of the **<signal.h>** header may make visible all symbols from the **<time.h>** header.

APPLICATION USAGE

On systems not supporting the XSI option, the *si_pid* and *si_uid* members of **siginfo_t** are only required to be valid when *si_code* is SI_USER or SI_QUEUE. On XSI-conforming systems, they are also valid for all *si_code* values less than or equal to 0; however, it is unspecified whether SI_USER and SI_QUEUE have values less than or equal to zero, and therefore XSI applications should check whether *si_code* has the value SI_USER or SI_QUEUE or is less than or equal to 0 to tell whether *si_pid* and *si_uid* are valid.

RATIONALE

None.

FUTURE DIRECTIONS

The SIGPOLL and SIGPROF signals may be removed in a future version.

SEE ALSO

CHANGE HISTORY

First released in Issue 1.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

The default action for SIGURG is changed from i to iii. The function prototype for *sigmask*( ) is removed.

Issue 6

The Open Group Corrigendum U035/2 is applied. In the DESCRIPTION, the wording for abnormal termination is clarified.

The Open Group Corrigendum U028/8 is applied, correcting the prototype for the *sigset*( ) function.

The Open Group Corrigendum U026/3 is applied, correcting the type of the *sigev_notify_function* function member of the **sigevent** structure.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The SIGCHLD, SIGCONT, SIGSTOP, SIGTSTP, SIGTTIN, and SIGTTOU signals are now mandated. This is also a FIPS requirement.
- The **pid_t** definition is mandated.

The RT markings are changed to RTS to denote that the semantics are part of the Realtime Signals Extension option.

The **restrict** keyword is added to the prototypes for *sigaction*( ), *sigaltstack*( ), *sigprocmask*( ), *sigtimedwait*( ), *sigwait*( ), and *sigwaitinfo*( ).

IEEE PASC Interpretation 1003.1 #85 is applied, adding the statement that symbols from **<time.h>** may be made visible when **<signal.h>** is included.

Extensions beyond the ISO C standard are marked.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/14 is applied, changing the descriptive text for members of the **sigaction** structure.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/15 is applied, correcting the definition of the *sa_sigaction* member of the **sigaction** structure.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/24 is applied, reworking the ordering of the **siginfo_t** type structure in the DESCRIPTION. This is an editorial change and no normative change is intended.

Issue 7

SD5-XBD-ERN-5 is applied.

SD5-XBD-ERN-39 is applied, removing the **sigstack** structure which should have been removed at the same time as the LEGACY *sigstack*( ) function.

SD5-XBD-ERN-56 is applied, adding a reference to **<sys/types.h>** for the **size_t** type.

Austin Group Interpretation 1003.1-2001 #034 is applied.

The **ucontext_t** and **mcontext_t** structures are added here from the obsolescent **<ucontext.h>** header.

The *psiginfo*( ) and *psignal*( ) functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

The SIGPOLL and SIGPROF signals and text relating to the XSI STREAMS option are marked obsolescent.

The SA_RESETHAND, SA_RESTART, SA_SIGINFO, SA_NOCLDWAIT, and SA_NODEFER constants are moved from the XSI option to the Base.

Functionality relating to the Realtime Signals Extension option is moved to the Base.

This reference page is clarified with respect to macros and symbolic constants, and declarations for the **pthread_attr_t**, **pthread_t**, and **uid_t** types and the **timespec** structure are added.

SIGRTMIN and SIGRTMAX are required to be positive integer expressions.

The APPLICATION USAGE section is updated to describe the *si_pid* and *si_uid* members of **siginfo_t**.

NAME

spawn.h — spawn (**ADVANCED REALTIME**)

SYNOPSIS

SPN
```
#include <spawn.h>
```

DESCRIPTION

The **<spawn.h>** header shall define the **posix_spawnattr_t** and **posix_spawn_file_actions_t** types used in performing spawn operations.

The **<spawn.h>** header shall define the **mode_t** and **pid_t** types as described in **<sys/types.h>**.

The **<spawn.h>** header shall define the **sigset_t** type as described in **<signal.h>**.

The tag **sched_param** shall be declared as naming an incomplete structure type, the contents of which are described in the **<sched.h>** header.

The **<spawn.h>** header shall define the following symbolic constants for use as the flags that may be set in a **posix_spawnattr_t** object using the *posix_spawnattr_setflags*( ) function:

POSIX_SPAWN_RESETIDS
POSIX_SPAWN_SETPGROUP
PS POSIX_SPAWN_SETSCHEDPARAM
POSIX_SPAWN_SETSCHEDULER
POSIX_SPAWN_SETSIGDEF
POSIX_SPAWN_SETSIGMASK

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int   posix_spawn(pid_t *restrict, const char *restrict,
          const posix_spawn_file_actions_t *,
          const posix_spawnattr_t *restrict, char *const [restrict],
          char *const [restrict]);
int   posix_spawn_file_actions_addclose(posix_spawn_file_actions_t *,
          int);
int   posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t *,
          int, int);
int   posix_spawn_file_actions_addopen(posix_spawn_file_actions_t *restrict,
          int, const char *restrict, int, mode_t);
int   posix_spawn_file_actions_destroy(posix_spawn_file_actions_t *);
int   posix_spawn_file_actions_init(posix_spawn_file_actions_t *);
int   posix_spawnattr_destroy(posix_spawnattr_t *);
int   posix_spawnattr_getflags(const posix_spawnattr_t *restrict,
          short *restrict);
int   posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict,
          pid_t *restrict);
PS int   posix_spawnattr_getschedparam(const posix_spawnattr_t *restrict,
          struct sched_param *restrict);
int   posix_spawnattr_getschedpolicy(const posix_spawnattr_t *restrict,
          int *restrict);
int   posix_spawnattr_getsigdefault(const posix_spawnattr_t *restrict,
          sigset_t *restrict);
int   posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict,
          sigset_t *restrict);
int   posix_spawnattr_init(posix_spawnattr_t *);
```

```
11319        int   posix_spawnattr_setflags(posix_spawnattr_t *, short);
11320        int   posix_spawnattr_setpgroup(posix_spawnattr_t *, pid_t);
11321 PS     int   posix_spawnattr_setschedparam(posix_spawnattr_t *restrict,
11322                  const struct sched_param *restrict);
11323        int   posix_spawnattr_setschedpolicy(posix_spawnattr_t *, int);
11324        int   posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict,
11325                  const sigset_t *restrict);
11326        int   posix_spawnattr_setsigmask(posix_spawnattr_t *restrict,
11327                  const sigset_t *restrict);
11328        int   posix_spawnp(pid_t *restrict, const char *restrict,
11329                  const posix_spawn_file_actions_t *,
11330                  const posix_spawnattr_t *restrict,
11331                  char *const [restrict], char *const [restrict]);
```

11332 Inclusion of the **<spawn.h>** header may make visible symbols defined in the **<sched.h>** and
11333 **<signal.h>** headers.

11345 *posix_spawnattr_getsigdefault*( ), *posix_spawnattr_getsigmask*( )

11346 **CHANGE HISTORY**

11347 First released in Issue 6. Included for alignment with IEEE Std 1003.1d-1999.

11348 The **restrict** keyword is added to the prototypes for *posix_spawn*( ),
11349 *posix_spawn_file_actions_addopen*( ), *posix_spawnattr_getsigdefault*( ), *posix_spawnattr_getflags*( ),
11350 *posix_spawnattr_getpgroup*( ), *posix_spawnattr_getschedparam*( ), *posix_spawnattr_getschedpolicy*( ),
11351 *posix_spawnattr_getsigmask*( ), *posix_spawnattr_setsigdefault*( ), *posix_spawnattr_setschedparam*( ),
11352 *posix_spawnattr_setsigmask*( ), and *posix_spawnp*( ).

11353 **Issue 7**

11354 This reference page is clarified with respect to macros and symbolic constants, and declarations
11355 for the **mode_t**, **pid_t**, and **sigset_t** types are added.

11356 **NAME**

11357 stdarg.h — handle variable argument list

11358 **SYNOPSIS**

11359 ```
#include <stdarg.h>
```

11360 ```
void va_start(va_list ap, argN);
```
11361 ```
void va_copy(va_list dest, va_list src);
```
11362 ```
type va_arg(va_list ap, type);
```
11363 ```
void va_end(va_list ap);
```

11364 **DESCRIPTION**

11365 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11366 conflict between the requirements described here and the ISO C standard is unintentional. This
11367 volume of POSIX.1-200x defers to the ISO C standard.

11368 The **<stdarg.h>** header shall contain a set of macros which allows portable functions that accept
11369 variable argument lists to be written. Functions that have variable argument lists (such as
11370 *printf*()) but do not use these macros are inherently non-portable, as different systems use
11371 different argument-passing conventions.

11372 The **<stdarg.h>** header shall define the **va_list** type for variables used to traverse the list.

11373 The *va_start*() macro is invoked to initialize *ap* to the beginning of the list before any calls to
11374 *va_arg*().

11375 The *va_copy*() macro initializes *dest* as a copy of *src*, as if the *va_start*() macro had been applied
11376 to *dest* followed by the same sequence of uses of the *va_arg*() macro as had previously been used
11377 to reach the present state of *src*. Neither the *va_copy*() nor *va_start*() macro shall be invoked to
11378 reinitialize *dest* without an intervening invocation of the *va_end*() macro for the same *dest*.

11379 The object *ap* may be passed as an argument to another function; if that function invokes the
11380 *va_arg*() macro with parameter *ap*, the value of *ap* in the calling function is unspecified and shall
11381 be passed to the *va_end*() macro prior to any further reference to *ap*. The parameter *argN* is the
11382 identifier of the rightmost parameter in the variable parameter list in the function definition (the
11383 one just before the ...). If the parameter *argN* is declared with the **register** storage class, with a
11384 function type or array type, or with a type that is not compatible with the type that results after
11385 application of the default argument promotions, the behavior is undefined.

11386 The *va_arg*() macro shall return the next argument in the list pointed to by *ap*. Each invocation
11387 of *va_arg*() modifies *ap* so that the values of successive arguments are returned in turn. The *type*
11388 parameter shall be a type name specified such that the type of a pointer to an object that has the
11389 specified type can be obtained simply by postfixing a '*' to type. If there is no actual next
11390 argument, or if *type* is not compatible with the type of the actual next argument (as promoted
11391 according to the default argument promotions), the behavior is undefined, except for the
11392 following cases:

11393 • One type is a signed integer type, the other type is the corresponding unsigned integer
11394 type, and the value is representable in both types.

11395 • One type is a pointer to **void** and the other is a pointer to a character type.

11396 XSI • Both types are pointers.

11397 Different types can be mixed, but it is up to the routine to know what type of argument is
11398 expected.

11399 The *va_end*() macro is used to clean up; it invalidates *ap* for use (unless *va_start*() or *va_copy*() is
11400 invoked again).
```

Each invocation of the *va_start*() and *va_copy*() macros shall be matched by a corresponding invocation of the *va_end*() macro in the same function.

Multiple traversals, each bracketed by *va_start*() ... *va_end*(), are possible.

EXAMPLES

This example is a possible implementation of *execl*():

```
#include <stdarg.h>

#define  MAXARGS     31

/*
 * execl is called by
 * execl(file, arg1, arg2, ..., (char *)(0));
 */
int execl(const char *file, const char *args, ...)
{
    va_list ap;
    char *array[MAXARGS +1];
    int argno = 0;

    va_start(ap, args);
    while (args != 0 && argno < MAXARGS)
    {
        array[argno++] = args;
        args = va_arg(ap, const char *);
    }
    array[argno] = (char *) 0;
    va_end(ap);
    return execv(file, array);
}
```

APPLICATION USAGE

It is up to the calling routine to communicate to the called routine how many arguments there are, since it is not always possible for the called routine to determine this in any other way. For example, *execl*() is passed a null pointer to signal the end of the list. The *printf*() function can tell how many arguments are there by the *format* argument.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4. Derived from the ANSI C standard.

Issue 6

This reference page is updated to align with the ISO/IEC 9899: 1999 standard.

11442 **NAME**

11443 stdbool.h — boolean type and values

11444 **SYNOPSIS**

11445 `#include <stdbool.h>`

11446 **DESCRIPTION**

11447 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11448 conflict between the requirements described here and the ISO C standard is unintentional. This
11449 volume of POSIX.1-200x defers to the ISO C standard.

11450 The **<stdbool.h>** header shall define the following macros:

11451 bool Expands to **_Bool**.

11452 true Expands to the integer constant 1.

11453 false Expands to the integer constant 0.

11454 __bool_true_false_are_defined
11455 Expands to the integer constant 1.

11456 An application may undefine and then possibly redefine the macros bool, true, and false.

11457 **APPLICATION USAGE**

11458 None.

11459 **RATIONALE**

11460 None.

11461 **FUTURE DIRECTIONS**

11462 The ability to undefine and redefine the macros bool, true, and false is an obsolescent feature
11463 and may be removed in a future version.

11464 **SEE ALSO**

11465 None.

11466 **CHANGE HISTORY**

11467 First released in Issue 6. Included for alignment with the ISO/IEC 9899: 1999 standard.

NAME

stddef.h — standard type definitions

SYNOPSIS

```
#include <stddef.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The **<stddef.h>** header shall define the following macros:

CX NULL Null pointer constant. The macro shall expand to an integer constant expression with the value 0 cast to type **void** *.

offsetof(*type*, *member-designator*)
Integer constant expression of type **size_t**, the value of which is the offset in bytes to the structure member (*member-designator*), from the beginning of its structure (*type*).

The **<stddef.h>** header shall define the following types:

ptrdiff_t Signed integer type of the result of subtracting two pointers.

wchar_t Integer type whose range of values can represent distinct codes for all members of the largest extended character set specified among the supported locales; the null character shall have the code value zero. Each member of the basic character set shall have a code value equal to its value when used as the lone character in an integer character constant if an implementation does not define __STDC_MB_MIGHT_NEQ_WC__.

size_t Unsigned integer type of the result of the *sizeof* operator.

The implementation shall support one or more programming environments in which the widths of **ptrdiff_t**, **size_t**, and **wchar_t** are no greater than the width of type **long**. The names of these programming environments can be obtained using the *confstr*( ) function or the *getconf* utility.

APPLICATION USAGE

None.

RATIONALE

The ISO C standard does not require the NULL macro to include the cast to type **void** * and specifies that the NULL macro be implementation-defined. POSIX.1-200x requires the cast and therefore need not be implementation-defined.

FUTURE DIRECTIONS

None.

XCU *getconf*

CHANGE HISTORY

First released in Issue 4. Derived from the ANSI C standard.

Issue 7

This reference page is clarified with respect to macros and symbolic constants.

SD5-XBD-ERN-53 is applied, updating the definition of **wchar_t** to align with ISO/IEC 9899: 1999 standard, Technical Corrigendum 3.

11513 **NAME**

11514 stdint.h — integer types

11515 **SYNOPSIS**

11516
```
#include <stdint.h>
```

11517 **DESCRIPTION**

11518 CX Some of the functionality described on this reference page extends the ISO C standard.
11519 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to
11520 enable the visibility of these symbols in this header.

11521 The **<stdint.h>** header shall declare sets of integer types having specified widths, and shall
11522 define corresponding sets of macros. It shall also define macros that specify limits of integer
11523 types corresponding to types defined in other standard headers.

11524 **Note:** The "width" of an integer type is the number of bits used to store its value in a pure binary
11525 system; the actual type may use more bits than that (for example, a 28-bit type could be stored
11526 in 32 bits of actual storage). An N-bit signed type has values in the range -2^{N-1} or $1-2^{N-1}$ to
11527 $2^{N-1}-1$, while an N-bit unsigned type has values in the range 0 to 2^N-1.

11528 Types are defined in the following categories:

11529 • Integer types having certain exact widths

11530 • Integer types having at least certain specified widths

11531 • Fastest integer types having at least certain specified widths

11532 • Integer types wide enough to hold pointers to objects

11533 • Integer types having greatest width

11534 (Some of these types may denote the same type.)

11535 Corresponding macros specify limits of the declared types and construct suitable constants.

11536 For each type described herein that the implementation provides, the **<stdint.h>** header shall
11537 declare that **typedef** name and define the associated macros. Conversely, for each type described
11538 herein that the implementation does not provide, the **<stdint.h>** header shall not declare that
11539 **typedef** name, nor shall it define the associated macros. An implementation shall provide those
11540 types described as required, but need not provide any of the others (described as optional).

11541 **Integer Types**

11542 When **typedef** names differing only in the absence or presence of the initial *u* are defined, they
11543 shall denote corresponding signed and unsigned types as described in the ISO/IEC 9899:1999
11544 standard, Section 6.2.5; an implementation providing one of these corresponding types shall also
11545 provide the other.

11546 In the following descriptions, the symbol N represents an unsigned decimal integer with no
11547 leading zeros (for example, 8 or 24, but not 04 or 048).

11548 • Exact-width integer types

11549 The **typedef** name **int**N**_t** designates a signed integer type with width N, no padding bits,
11550 and a two's-complement representation. Thus, **int8_t** denotes a signed integer type with a
11551 width of exactly 8 bits.

11552 The **typedef** name **uint**N**_t** designates an unsigned integer type with width N. Thus,
11553 **uint24_t** denotes an unsigned integer type with a width of exactly 24 bits.

11554 CX The following types are required:

11555 **int8_t**
11556 **int16_t**
11557 **int32_t**
11558 **uint8_t**
11559 **uint16_t**
11560 **uint32_t**

11561 If an implementation provides integer types with width 64 that meet these requirements,
11562 then the following types are required:

11563 **int64_t**
11564 **uint64_t**

11565 CX In particular, this will be the case if any of the following are true:

11566 — The implementation supports the _POSIX_V7_ILP32_OFFBIG programming
11567 environment and the application is being built in the _POSIX_V7_ILP32_OFFBIG
11568 programming environment (see the Shell and Utilities volume of POSIX.1-200x, *c99*,
11569 Programming Environments).

11570 — The implementation supports the _POSIX_V7_LP64_OFF64 programming
11571 environment and the application is being built in the _POSIX_V7_LP64_OFF64
11572 programming environment.

11573 — The implementation supports the _POSIX_V7_LPBIG_OFFBIG programming
11574 environment and the application is being built in the _POSIX_V7_LPBIG_OFFBIG
11575 programming environment.

11576 All other types of this form are optional.

11577 • Minimum-width integer types

11578 The **typedef** name **int_least***N*_**t** designates a signed integer type with a width of at least *N*,
11579 such that no signed integer type with lesser size has at least the specified width. Thus,
11580 **int_least32_t** denotes a signed integer type with a width of at least 32 bits.

11581 The **typedef** name **uint_least***N*_**t** designates an unsigned integer type with a width of at
11582 least *N*, such that no unsigned integer type with lesser size has at least the specified width.
11583 Thus, **uint_least16_t** denotes an unsigned integer type with a width of at least 16 bits.

11584 The following types are required:

11585 **int_least8_t**
11586 **int_least16_t**
11587 **int_least32_t**
11588 **int_least64_t**
11589 **uint_least8_t**
11590 **uint_least16_t**
11591 **uint_least32_t**
11592 **uint_least64_t**

11593 All other types of this form are optional.

- Fastest minimum-width integer types

  Each of the following types designates an integer type that is usually fastest to operate with among all integer types that have at least the specified width.

  The designated type is not guaranteed to be fastest for all purposes; if the implementation has no clear grounds for choosing one type over another, it will simply pick some integer type satisfying the signedness and width requirements.

  The **typedef** name **int_fast***N***_t** designates the fastest signed integer type with a width of at least *N*. The **typedef** name **uint_fast***N***_t** designates the fastest unsigned integer type with a width of at least *N*.

  The following types are required:

  int_fast8_t
  int_fast16_t
  int_fast32_t
  int_fast64_t
  uint_fast8_t
  uint_fast16_t
  uint_fast32_t
  uint_fast64_t

  All other types of this form are optional.

- Integer types capable of holding object pointers

  The following type designates a signed integer type with the property that any valid pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and the result will compare equal to the original pointer:

  intptr_t

  The following type designates an unsigned integer type with the property that any valid pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and the result will compare equal to the original pointer:

  uintptr_t

  XSI On XSI-conformant systems, the **intptr_t** and **uintptr_t** types are required; otherwise, they are optional.

- Greatest-width integer types

  The following type designates a signed integer type capable of representing any value of any signed integer type:

  intmax_t

  The following type designates an unsigned integer type capable of representing any value of any unsigned integer type:

  uintmax_t

  These types are required.

Note: Applications can test for optional types by using the corresponding limit macro from Limits of Specified-Width Integer Types.

Limits of Specified-Width Integer Types

The following macros specify the minimum and maximum limits of the types declared in the **<stdint.h>** header. Each macro name corresponds to a similar type name in Integer Types (on page 344).

Each instance of any defined macro shall be replaced by a constant expression suitable for use in **#if** preprocessing directives, and this expression shall have the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. Its implementation-defined value shall be equal to or greater in magnitude (absolute value) than the corresponding value given below, with the same sign, except where stated to be exactly the given value.

- Limits of exact-width integer types
  - — Minimum values of exact-width signed integer types:

    {INT*N*_MIN} Exactly $-(2^{N-1})$
  - — Maximum values of exact-width signed integer types:

    {INT*N*_MAX} Exactly $2^{N-1}-1$
  - — Maximum values of exact-width unsigned integer types:

    {UINT*N*_MAX} Exactly $2^{N}-1$
- Limits of minimum-width integer types
  - — Minimum values of minimum-width signed integer types:

    {INT_LEAST*N*_MIN} $-(2^{N-1}-1)$
  - — Maximum values of minimum-width signed integer types:

    {INT_LEAST*N*_MAX} $2^{N-1}-1$
  - — Maximum values of minimum-width unsigned integer types:

    {UINT_LEAST*N*_MAX} $2^{N}-1$
- Limits of fastest minimum-width integer types
  - — Minimum values of fastest minimum-width signed integer types:

    {INT_FAST*N*_MIN} $-(2^{N-1}-1)$
  - — Maximum values of fastest minimum-width signed integer types:

    {INT_FAST*N*_MAX} $2^{N-1}-1$
  - — Maximum values of fastest minimum-width unsigned integer types:

    {UINT_FAST*N*_MAX} $2^{N}-1$
- Limits of integer types capable of holding object pointers
  - — Minimum value of pointer-holding signed integer type:

    {INTPTR_MIN} $-(2^{15}-1)$

11668 — Maximum value of pointer-holding signed integer type:

11669 {INTPTR_MAX} $2^{15} - 1$

11670 — Maximum value of pointer-holding unsigned integer type:

11671 {UINTPTR_MAX} $2^{16} - 1$

11672 • Limits of greatest-width integer types

11673 — Minimum value of greatest-width signed integer type:

11674 {INTMAX_MIN} $-(2^{63} - 1)$

11675 — Maximum value of greatest-width signed integer type:

11676 {INTMAX_MAX} $2^{63} - 1$

11677 — Maximum value of greatest-width unsigned integer type:

11678 {UINTMAX_MAX} $2^{64} - 1$

11679 **Limits of Other Integer Types**

11680 The following macros specify the minimum and maximum limits of integer types corresponding
11681 to types defined in other standard headers.

11682 Each instance of these macros shall be replaced by a constant expression suitable for use in **#if**
11683 preprocessing directives, and this expression shall have the same type as would an expression
11684 that is an object of the corresponding type converted according to the integer promotions. Its
11685 implementation-defined value shall be equal to or greater in magnitude (absolute value) than
11686 the corresponding value given below, with the same sign.

11687 • Limits of **ptrdiff_t**:

11688 {PTRDIFF_MIN} –65 535

11689 {PTRDIFF_MAX} +65 535

11690 • Limits of **sig_atomic_t**:

11691 {SIG_ATOMIC_MIN} See below.

11692 {SIG_ATOMIC_MAX} See below.

11693 • Limit of **size_t**:

11694 {SIZE_MAX} 65 535

11695 • Limits of **wchar_t**:

11696 {WCHAR_MIN} See below.

11697 {WCHAR_MAX} See below.

11698 • Limits of **wint_t**:

11699 {WINT_MIN} See below.

11700 {WINT_MAX} See below.

11701 If **sig_atomic_t** (see the **<signal.h>** header) is defined as a signed integer type, the value of
11702 {SIG_ATOMIC_MIN} shall be no greater than –127 and the value of {SIG_ATOMIC_MAX} shall
11703 be no less than 127; otherwise, **sig_atomic_t** shall be defined as an unsigned integer type, and
11704 the value of {SIG_ATOMIC_MIN} shall be 0 and the value of {SIG_ATOMIC_MAX} shall be no

less than 255.

If **wchar_t** (see the **<stddef.h>** header) is defined as a signed integer type, the value of {WCHAR_MIN} shall be no greater than −127 and the value of {WCHAR_MAX} shall be no less than 127; otherwise, **wchar_t** shall be defined as an unsigned integer type, and the value of {WCHAR_MIN} shall be 0 and the value of {WCHAR_MAX} shall be no less than 255.

If **wint_t** (see the **<wchar.h>** header) is defined as a signed integer type, the value of {WINT_MIN} shall be no greater than −32 767 and the value of {WINT_MAX} shall be no less than 32 767; otherwise, **wint_t** shall be defined as an unsigned integer type, and the value of {WINT_MIN} shall be 0 and the value of {WINT_MAX} shall be no less than 65 535.

Macros for Integer Constant Expressions

The following macros expand to integer constant expressions suitable for initializing objects that have integer types corresponding to types defined in the **<stdint.h>** header. Each macro name corresponds to a similar type name listed under *Minimum-width integer types* and *Greatest-width integer types*.

Each invocation of one of these macros shall expand to an integer constant expression suitable for use in **#if** preprocessing directives. The type of the expression shall have the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. The value of the expression shall be that of the argument.

The argument in any instance of these macros shall be an unsuffixed integer constant with a value that does not exceed the limits for the corresponding type.

- Macros for minimum-width integer constant expressions

  The macro *INTN_C*(*value*) shall expand to an integer constant expression corresponding to the type **int_least***N***_t**. The macro *UINTN_C*(*value*) shall expand to an integer constant expression corresponding to the type **uint_least***N***_t**. For example, if **uint_least64_t** is a name for the type **unsigned long long**, then *UINT64_C*(0x123) might expand to the integer constant 0x123ULL.

- Macros for greatest-width integer constant expressions

  The following macro expands to an integer constant expression having the value specified by its argument and the type **intmax_t**:

  INTMAX_C(*value*)

  The following macro expands to an integer constant expression having the value specified by its argument and the type **uintmax_t**:

  UINTMAX_C(*value*)

APPLICATION USAGE

None.

RATIONALE

The **<stdint.h>** header is a subset of the **<inttypes.h>** header more suitable for use in freestanding environments, which might not support the formatted I/O functions. In some environments, if the formatted conversion support is not wanted, using this header instead of the **<inttypes.h>** header avoids defining such a large number of macros.

As a consequence of adding **int8_t**, the following are true:

- A byte is exactly 8 bits.
- {CHAR_BIT} has the value 8, {SCHAR_MAX} has the value 127, {SCHAR_MIN} has the value –128, and {UCHAR_MAX} has the value 255.

(The POSIX standard explicitly requires 8-bit char and two's-complement arithmetic.)

FUTURE DIRECTIONS

typedef names beginning with **int** or **uint** and ending with _t may be added to the types defined in the **<stdint.h>** header. Macro names beginning with INT or UINT and ending with _MAX, _MIN, or _C may be added to the macros defined in the **<stdint.h>** header.

SD5-XBD-ERN-67 is applied.

NAME

stdio.h — standard buffered input/output

SYNOPSIS

```
#include <stdio.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to enable the visibility of these symbols in this header.

The **<stdio.h>** header shall define the following data types through **typedef**:

FILE A structure containing information about a file.

fpos_t A non-array type containing all information needed to specify uniquely every position within a file.

off_t As described in **<sys/types.h>**.

size_t As described in **<stddef.h>**.

CX **ssize_t** As described in **<sys/types.h>**.

CX **va_list** As described in **<stdarg.h>**.

The **<stdio.h>** header shall define the following macros which shall expand to integer constant expressions:

CX BUFSIZ Size of **<stdio.h>** buffers. This shall expand to a positive value.

CX L_ctermid Maximum size of character array to hold *ctermid*() output.

OB L_tmpnam Maximum size of character array to hold *tmpnam*() output.

The **<stdio.h>** header shall define the following macros which shall expand to integer constant expressions with distinct values:

_IOFBF Input/output fully buffered.

_IOLBF Input/output line buffered.

_IONBF Input/output unbuffered.

The **<stdio.h>** header shall define the following macros which shall expand to integer constant expressions with distinct values:

SEEK_CUR Seek relative to current position.

SEEK_END Seek relative to end-of-file.

SEEK_SET Seek relative to start-of-file.

The **<stdio.h>** header shall define the following macros which shall expand to integer constant expressions denoting implementation limits:

{FILENAME_MAX} Maximum size in bytes of the longest filename string that the implementation guarantees can be opened.

{FOPEN_MAX} Number of streams which the implementation guarantees can be open simultaneously. The value is at least eight.

OB {TMP_MAX} Minimum number of unique filenames generated by *tmpnam*(). Maximum number of times an application can call *tmpnam*() reliably. The value of {TMP_MAX} is at least 25.

11803 OB XSI On XSI-conformant systems, the value of {TMP_MAX} is at least 10 000.

11804 The **<stdio.h>** header shall define the following macro which shall expand to an integer constant
11805 expression with type **int** and a negative value:

11806 EOF End-of-file return value.

11807 The **<stdio.h>** header shall define NULL as described in **<stddef.h>**.

11808 The **<stdio.h>** header shall define the following macro which shall expand to a string constant:

11809 OB XSI P_tmpdir Default directory prefix for *tempnam*().

11810 The **<stdio.h>** header shall define the following macros which shall expand to expressions of
11811 type "pointer to **FILE**" that point to the **FILE** objects associated, respectively, with the standard
11812 error, input, and output streams:

11813 *stderr* Standard error output stream.

11814 *stdin* Standard input stream.

11815 *stdout* Standard output stream.

11816 The following shall be declared as functions and may also be defined as macros. Function
11817 prototypes shall be provided.

```
11818       void     clearerr(FILE *);
11819 CX    char    *ctermid(char *);
11820       int      dprintf(int, const char *restrict, ...)
11821       int      fclose(FILE *);
11822 CX    FILE    *fdopen(int, const char *);
11823       int      feof(FILE *);
11824       int      ferror(FILE *);
11825       int      fflush(FILE *);
11826       int      fgetc(FILE *);
11827       int      fgetpos(FILE *restrict, fpos_t *restrict);
11828       char    *fgets(char *restrict, int, FILE *restrict);
11829 CX    int      fileno(FILE *);
11830       void     flockfile(FILE *);
11831       FILE    *fmemopen(void *restrict, size_t, const char *restrict);
11832       FILE    *fopen(const char *restrict, const char *restrict);
11833       int      fprintf(FILE *restrict, const char *restrict, ...);
11834       int      fputc(int, FILE *);
11835       int      fputs(const char *restrict, FILE *restrict);
11836       size_t   fread(void *restrict, size_t, size_t, FILE *restrict);
11837       FILE    *freopen(const char *restrict, const char *restrict,
11838                    FILE *restrict);
11839       int      fscanf(FILE *restrict, const char *restrict, ...);
11840       int      fseek(FILE *, long, int);
11841 CX    int      fseeko(FILE *, off_t, int);
11842       int      fsetpos(FILE *, const fpos_t *);
11843       long     ftell(FILE *);
11844 CX    off_t    ftello(FILE *);
11845       int      ftrylockfile(FILE *);
11846       void     funlockfile(FILE *);
11847       size_t   fwrite(const void *restrict, size_t, size_t, FILE *restrict);
11848       int      getc(FILE *);
```

```
11849          int      getchar(void);
11850   CX     int      getc_unlocked(FILE *);
11851          int      getchar_unlocked(void);
11852          ssize_t  getdelim(char **restrict, size_t *restrict, int,
11853                       FILE *restrict);
11854          ssize_t  getline(char **restrict, size_t *restrict, FILE *restrict);
11855   OB     char    *gets(char *);
11856   CX     FILE    *open_memstream(char **, size_t *);
11857          int      pclose(FILE *);
11858          void     perror(const char *);
11859   CX     FILE    *popen(const char *, const char *);
11860          int      printf(const char *restrict, ...);
11861          int      putc(int, FILE *);
11862          int      putchar(int);
11863   CX     int      putc_unlocked(int, FILE *);
11864          int      putchar_unlocked(int);
11865          int      puts(const char *);
11866          int      remove(const char *);
11867          int      rename(const char *, const char *);
11868   CX     int      renameat(int, const char *, int, const char *);
11869          void     rewind(FILE *);
11870          int      scanf(const char *restrict, ...);
11871          void     setbuf(FILE *restrict, char *restrict);
11872          int      setvbuf(FILE *restrict, char *restrict, int, size_t);
11873          int      snprintf(char *restrict, size_t, const char *restrict, ...);
11874          int      sprintf(char *restrict, const char *restrict, ...);
11875          int      sscanf(const char *restrict, const char *restrict, ...);
11876   OB XSI char    *tempnam(const char *, const char *);
11877          FILE    *tmpfile(void);
11878   OB     char    *tmpnam(char *);
11879          int      ungetc(int, FILE *);
11880   CX     int      vdprintf(int, const char *restrict, va_list);
11881          int      vfprintf(FILE *restrict, const char *restrict, va_list);
11882          int      vfscanf(FILE *restrict, const char *restrict, va_list);
11883          int      vprintf(const char *restrict, va_list);
11884          int      vscanf(const char *restrict, va_list);
11885          int      vsnprintf(char *restrict, size_t, const char *restrict,
11886                       va_list);
11887          int      vsprintf(char *restrict, const char *restrict, va_list);
11888          int      vsscanf(const char *restrict, const char *restrict, va_list);
```

11889 CX Inclusion of the **<stdio.h>** header may also make visible all symbols from **<stddef.h>**.

11890 **APPLICATION USAGE**

11891 Since standard I/O streams may use an underlying file descriptor to access the file associated
11892 with a stream, application developers need to be aware that {FOPEN_MAX} streams may not be
11893 available if file descriptors are being used to access files that are not associated with streams.

11894 **RATIONALE**

11895 There is a conflict between the ISO C standard and the POSIX definition of the {TMP_MAX}
11896 macro that is addressed by ISO/IEC 9899: 1999 standard, Defect Report 336. The POSIX standard
11897 is in alignment with the public record of the response to the Defect Report. This change has not
11898 yet been published as part of the ISO C standard.

FUTURE DIRECTIONS

None.

SEE ALSO

<stdarg.h>, **<stddef.h>**, **<sys/types.h>**

XSH Section 2.2 (on page 468), *clearerr*( ), *ctermid*( ), *fclose*( ), *fdopen*( ), *feof*( ), *ferror*( ), *fflush*( ), *fgetc*( ), *fgetpos*( ), *fgets*( ), *fileno*( ), *flockfile*( ), *fmemopen*( ), *fopen*( ), *fprintf*( ), *fputc*( ), *fputs*( ), *fread*( ), *freopen*( ), *fscanf*( ), *fseek*( ), *fsetpos*( ), *ftell*( ), *fwrite*( ), *getc*( ), *getchar*( ), *getc_unlocked*( ), *getdelim*( ), *getopt*( ), *gets*( ), *open_memstream*( ), *pclose*( ), *perror*( ), *popen*( ), *putc*( ), *putchar*( ), *puts*( ), *remove*( ), *rename*( ), *rewind*( ), *setbuf*( ), *setvbuf*( ), *stdin*, *system*( ), *tempnam*( ), *tmpfile*( ), *tmpnam*( ), *ungetc*( ), *vfprintf*( ), *vfscanf*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Large File System extensions are added.

The constant L_cuserid and the external variables *optarg*, *opterr*, *optind*, and *optopt* are marked as extensions and LEGACY.

The *cuserid*( ) and *getopt*( ) functions are marked LEGACY.

Issue 6

The constant L_cuserid and the external variables *optarg*, *opterr*, *optind*, and *optopt* are removed as they were previously marked LEGACY.

The *cuserid*( ), *getopt*( ), and *getw*( ) functions are removed as they were previously marked LEGACY.

Several functions are marked as part of the Thread-Safe Functions option.

This reference page is updated to align with the ISO/IEC 9899:1999 standard. Note that the description of the **fpos_t** type is now explicitly updated to exclude array types.

Extensions beyond the ISO C standard are marked.

Issue 7

Austin Group Interpretation 1003.1-2001 #172 is applied, adding rationale about a conflict for the definition of {TMP_MAX} with the ISO C standard.

SD5-XBD-ERN-99 is applied, adding APPLICATION USAGE.

The *dprintf*( ), *fmemopen*( ), *getdelim*( ), *getline*( ), *open_memstream*( ), and *vdprintf*( ) functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

The *renameat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

The *gets*( ), *tmpnam*( ), and *tempnam*( ) functions and the L_tmpnam macro are marked obsolescent.

This reference page is clarified with respect to macros and symbolic constants, and a declaration for the **off_t** type is added.

NAME

stdlib.h — standard library definitions

SYNOPSIS

```
#include <stdlib.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to enable the visibility of these symbols in this header.

The **<stdlib.h>** header shall define the following macros which shall expand to integer constant expressions:

EXIT_FAILURE Unsuccessful termination for *exit*( ); evaluates to a non-zero value.

EXIT_SUCCESS Successful termination for *exit*( ); evaluates to 0.

{RAND_MAX} Maximum value returned by *rand*( ); at least 32 767.

The **<stdlib.h>** header shall define the following macro which shall expand to a positive integer expression with type **size_t**:

{MB_CUR_MAX} Maximum number of bytes in a character specified by the current locale (category *LC_CTYPE*).

The **<stdlib.h>** header shall define NULL as described in **<stddef.h>**.

The **<stdlib.h>** header shall define the following data types through **typedef**:

div_t Structure type returned by the *div*( ) function.

ldiv_t Structure type returned by the *ldiv*( ) function.

lldiv_t Structure type returned by the *lldiv*( ) function.

size_t As described in **<stddef.h>**.

wchar_t As described in **<stddef.h>**.

CX In addition, the **<stdlib.h>** header shall define the following symbolic constants and macros as described in **<sys/wait.h>**:

WEXITSTATUS
WIFEXITED
WIFSIGNALED
WIFSTOPPED
WNOHANG
WSTOPSIG
WTERMSIG
WUNTRACED

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
void          _Exit(int);
XSI long      a64l(const char *);
void          abort(void);
int           abs(int);
int           atexit(void (*)(void));
double        atof(const char *);
```

```
11980           int             atoi(const char *);
11981           long            atol(const char *);
11982           long long       atoll(const char *);
11983           void           *bsearch(const void *, const void *, size_t, size_t,
11984                               int (*)(const void *, const void *));
11985           void           *calloc(size_t, size_t);
11986           div_t           div(int, int);
11987   XSI     double          drand48(void);
11988           double          erand48(unsigned short [3]);
11989           void            exit(int);
11990           void            free(void *);
11991           char           *getenv(const char *);
11992           int             getsubopt(char **, char *const *, char **);
11993   XSI     int             grantpt(int);
11994           char           *initstate(unsigned, char *, size_t);
11995           long            jrand48(unsigned short [3]);
11996           char           *l64a(long);
11997           long            labs(long);
11998   XSI     void            lcong48(unsigned short [7]);
11999           ldiv_t          ldiv(long, long);
12000           long long       llabs(long long);
12001           lldiv_t         lldiv(long long, long long);
12002   XSI     long            lrand48(void);
12003           void           *malloc(size_t);
12004           int             mblen(const char *, size_t);
12005           size_t          mbstowcs(wchar_t *restrict, const char *restrict, size_t);
12006           int             mbtowc(wchar_t *restrict, const char *restrict, size_t);
12007   CX      char           *mkdtemp(char *);
12008           int             mkstemp(char *);
12009   XSI     long            mrand48(void);
12010           long            nrand48(unsigned short [3]);
12011   ADV     int             posix_memalign(void **, size_t, size_t);
12012   XSI     int             posix_openpt(int);
12013           char           *ptsname(int);
12014           int             putenv(char *);
12015           void            qsort(void *, size_t, size_t, int (*)(const void *,
12016                               const void *));
12017           int             rand(void);
12018   OB CX   int             rand_r(unsigned *);
12019   XSI     long            random(void);
12020           void           *realloc(void *, size_t);
12021   XSI     char           *realpath(const char *restrict, char *restrict);
12022           unsigned short *seed48(unsigned short [3]);
12023   CX      int             setenv(const char *, const char *, int);
12024   XSI     void            setkey(const char *);
12025           char           *setstate(char *);                                  |
12026           void            srand(unsigned);
12027   XSI     void            srand48(long);
12028           void            srandom(unsigned);
12029           double          strtod(const char *restrict, char **restrict);
12030           float           strtof(const char *restrict, char **restrict);
12031           long            strtol(const char *restrict, char **restrict, int);
```

```
12032          long double   strtold(const char *restrict, char **restrict);
12033          long long     strtoll(const char *restrict, char **restrict, int);
12034          unsigned long strtoul(const char *restrict, char **restrict, int);
12035          unsigned long long
12036                        strtoull(const char *restrict, char **restrict, int);
12037          int           system(const char *);
12038   XSI    int           unlockpt(int);
12039   CX     int           unsetenv(const char *);
12040          size_t        wcstombs(char *restrict, const wchar_t *restrict, size_t);
12041          int           wctomb(char *, wchar_t);
```

12042 CX Inclusion of the **<stdlib.h>** header may also make visible all symbols from **<stddef.h>**,
12043 **<limits.h>**, **<math.h>**, and **<sys/wait.h>**.

12044 **APPLICATION USAGE**

12045 None.

12046 **RATIONALE**

12047 None.

12048 **FUTURE DIRECTIONS**

12049 None.

12050 **SEE ALSO**

12051 **<limits.h>**, **<math.h>**, **<stddef.h>**, **<sys/types.h>**, **<sys/wait.h>**

12056 *strtoul*( ), *system*( ), *unlockpt*( ), *unsetenv*( ), *wcstombs*( ), *wctomb*( )

12057 **CHANGE HISTORY**

12058 First released in Issue 3.

12059 **Issue 5**

12060 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

12061 The *ttyslot*( ) and *valloc*( ) functions are marked LEGACY.

12062 The type of the third argument to *initstate*( ) is changed from **int** to **size_t**. The type of the return
12063 value from *setstate*( ) is changed from **char** to **char** *, and the type of the first argument is
12064 changed from **char** * to **const char** *.

12065 **Issue 6**

12066 The Open Group Corrigendum U021/1 is applied, correcting the prototype for *realpath*( ) to be
12067 consistent with the reference page.

12068 The Open Group Corrigendum U028/13 is applied, correcting the prototype for *putenv*( ) to be
12069 consistent with the reference page.

12070 The *rand_r*( ) function is marked as part of the Thread-Safe Functions option.

12071 Function prototypes for *setenv*( ) and *unsetenv*( ) are added.

12072 The *posix_memalign*( ) function is added for alignment with IEEE Std 1003.1d-1999.

12073 This reference page is updated to align with the ISO/IEC 9899: 1999 standard.

12074 The *ecvt*( ), *fcvt*( ), *gcvt*( ), and *mktemp*( ) functions are marked LEGACY.

The *ttyslot*( ) and *valloc*( ) functions are removed as they were previously marked LEGACY.

Extensions beyond the ISO C standard are marked.

Issue 7

SD5-XBD-ERN-79 and SD5-XBD-ERN-105 are applied.

The LEGACY functions are removed.

The *mkdtemp*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

The *rand_r*( ) function is marked obsolescent.

This reference page is clarified with respect to macros and symbolic constants.

The type of the first argument to *setstate*( ) is changed from **const char** * to **char** *. +

NAME

string.h — string operations

SYNOPSIS

```
#include <string.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to enable the visibility of these symbols in this header.

The **<string.h>** header shall define NULL and **size_t** as described in **<stddef.h>**.

CX The **<string.h>** header shall define the **locale_t** type as described in **<locale.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with ISO C standard compilers.

```
XSI void    *memccpy(void *restrict, const void *restrict, int, size_t);
    void    *memchr(const void *, int, size_t);
    int      memcmp(const void *, const void *, size_t);
    void    *memcpy(void *restrict, const void *restrict, size_t);
    void    *memmove(void *, const void *, size_t);
    void    *memset(void *, int, size_t);
CX  char    *stpcpy(char *restrict, const char *restrict);
    char    *stpncpy(char *restrict, const char *restrict, size_t);
    char    *strcat(char *restrict, const char *restrict);
    char    *strchr(const char *, int);
    int      strcmp(const char *, const char *);
    int      strcoll(const char *, const char *);
CX  int      strcoll_l(const char *, const char *, locale_t);
    char    *strcpy(char *restrict, const char *restrict);
    size_t   strcspn(const char *, const char *);
CX  char    *strdup(const char *);
    char    *strerror(int);
CX  char    *strerror_l(int, locale_t);
    int      strerror_r(int, char *, size_t);
    size_t   strlen(const char *);
    char    *strncat(char *restrict, const char *restrict, size_t);
    int      strncmp(const char *, const char *, size_t);
    char    *strncpy(char *restrict, const char *restrict, size_t);
CX  char    *strndup(const char *, size_t);
    size_t   strnlen(const char *, size_t);
    char    *strpbrk(const char *, const char *);
    char    *strrchr(const char *, int);
CX  char    *strsignal(int);
    size_t   strspn(const char *, const char *);
    char    *strstr(const char *, const char *);
    char    *strtok(char *restrict, const char *restrict);
CX  char    *strtok_r(char *restrict, const char *restrict, char **restrict);
    size_t   strxfrm(char *restrict, const char *restrict, size_t);
CX  size_t   strxfrm_l(char *restrict, const char *restrict,
                size_t, locale_t);
```

12132 CX Inclusion of the **<string.h>** header may also make visible all symbols from **<stddef.h>**.

12133 **APPLICATION USAGE**

12134 None.

12135 **RATIONALE**

12136 None.

12137 **FUTURE DIRECTIONS**

12138 None.

12139 **SEE ALSO**

12140 **<locale.h>**, **<stddef.h>**, **<sys/types.h>**

12141 XSH Section 2.2 (on page 468), *memccpy*( ), *memchr*( ), *memcmp*( ), *memcpy*( ), *memmove*( ),

12143 *strncat*( ), *strncmp*( ), *strncpy*( ), *strpbrk*( ), *strrchr*( ), *strsignal*( ), *strspn*( ), *strstr*( ), *strtok*( ), *strxfrm*( )

12144 **CHANGE HISTORY**

12145 First released in Issue 1. Derived from Issue 1 of the SVID.

12146 **Issue 5**

12147 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

12148 **Issue 6**

12149 The *strtok_r*( ) function is marked as part of the Thread-Safe Functions option.

12150 This reference page is updated to align with the ISO/IEC 9899: 1999 standard.

12151 The *strerror_r*( ) function is added in response to IEEE PASC Interpretation 1003.1c #39.

12152 **Issue 7**

12153 SD5-XBD-ERN-15 is applied, correcting the prototype for the *strerror_r*( ) function.

12154 The *stpcpy*( ), *stpncpy*( ), *strndup*( ), *strnlen*( ), and *strsignal*( ) functions are added from The Open
12155 Group Technical Standard, 2006, Extended API Set Part 1.

12156 The *strcoll_l*( ), *strerror_l*( ), and *strxfrm_l*( ) functions are added from The Open Group Technical
12157 Standard, 2006, Extended API Set Part 4.

12158 This reference page is clarified with respect to macros and symbolic constants, and a declaration
12159 for the **locale_t** type is added.

12160 **NAME**

12161 strings.h — string operations

12162 **SYNOPSIS**

12163
```
#include <strings.h>
```

12164 **DESCRIPTION**

12165 The following shall be declared as functions and may also be defined as macros. Function
12166 prototypes shall be provided for use with ISO C standard compilers.

12167 XSI
```
int    ffs(int);
int    strcasecmp(const char *, const char *);
int    strcasecmp_l(const char *, const char *, locale_t);
int    strncasecmp(const char *, const char *, size_t);
int    strncasecmp_l(const char *, const char *, size_t, locale_t);
```

12172 The **<strings.h>** header shall define the **locale_t** type as described in **<locale.h>**.

12173 The **<strings.h>** header shall define the **size_t** type as described in **<sys/types.h>**.

12174 **APPLICATION USAGE**

12175 None.

12176 **RATIONALE**

12177 None.

12178 **FUTURE DIRECTIONS**

12179 None.

12180 **SEE ALSO**

12181 **<locale.h>**, **<sys/types.h>**

12182 XSH *ffs*( ), *strcasecmp*( )

12183 **CHANGE HISTORY**

12184 First released in Issue 4, Version 2.

12185 **Issue 6**

12186 The Open Group Corrigendum U021/2 is applied, correcting the prototype for *index*( ) to be
12187 consistent with the reference page.

12188 The *bcmp*( ), *bcopy*( ), *bzero*( ), *index*( ), and *rindex*( ) functions are marked LEGACY.

12189 **Issue 7**

12190 SD5-XBD-ERN-56 is applied, adding a reference to **<sys/types.h>** for the **size_t** type.

12191 The LEGACY functions are removed.

12192 The **<strings.h>** header is moved from the XSI option to the Base.

12193 The *strcasecmp_l*( ) and *strncasecmp_l*( ) functions are added from The Open Group Technical
12194 Standard, 2006, Extended API Set Part 4.

12195 A declaration for the **locale_t** type is added.

NAME

stropts.h — STREAMS interface (**STREAMS**)

SYNOPSIS

OB XSR

```
#include <stropts.h>
```

DESCRIPTION

The **<stropts.h>** header shall define the **bandinfo** structure, which shall include at least the following members:

`int`	`bi_flag`	Flushing type.
`unsigned char`	`bi_pri`	Priority band.

The **<stropts.h>** header shall define the **strpeek** structure, which shall include at least the following members:

`struct strbuf`	`ctlbuf`	The control portion of the message.
`struct strbuf`	`databuf`	The data portion of the message.
`t_uscalar_t`	`flags`	RS_HIPRI or 0.

The **<stropts.h>** header shall define the **strbuf** structure, which shall include at least the following members:

`char`	`*buf`	Pointer to buffer.
`int`	`len`	Length of data.
`int`	`maxlen`	Maximum buffer length.

The **<stropts.h>** header shall define the **strfdinsert** structure, which shall include at least the following members:

`struct strbuf`	`ctlbuf`	The control portion of the message.
`struct strbuf`	`databuf`	The data portion of the message.
`int`	`fildes`	File descriptor of the other STREAM.
`t_uscalar_t`	`flags`	RS_HIPRI or 0.
`int`	`offset`	Relative location of the stored value.

The **<stropts.h>** header shall define the **strioctl** structure, which shall include at least the following members:

`int`	`ic_cmd`	*ioctl*( ) command.
`char`	`*ic_dp`	Pointer to buffer.
`int`	`ic_len`	Length of data.
`int`	`ic_timout`	Timeout for response.

The **<stropts.h>** header shall define the **strrecvfd** structure, which shall include at least the following members:

`int`	`fd`	Received file descriptor.
`gid_t`	`gid`	GID of sender.
`uid_t`	`uid`	UID of sender.

The **<stropts.h>** header shall define the **uid_t** and **gid_t** types through **typedef**, as described in **<sys/types.h>**.

The **<stropts.h>** header shall define the **t_scalar_t** and **t_uscalar_t** types, respectively, as signed and unsigned opaque types of equal length of at least 32 bits.

The **<stropts.h>** header shall define the **str_list** structure, which shall include at least the following members:

12239 `struct str_mlist *sl_modlist` STREAMS module names.
12240 `int sl_nmods` Number of STREAMS module names.

12241 The **<stropts.h>** header shall define the **str_mlist** structure, which shall include at least the
12242 following member:

12243 `char l_name[FMNAMESZ+1]` A STREAMS module name.

12244 The **<stropts.h>** header shall define at least the following symbolic constants for use as the
12245 *request* argument to *ioctl*( ):

12246 I_ATMARK Is the top message "marked"?
12247 I_CANPUT Is a band writable?
12248 I_CKBAND See if any messages exist in a band.
12249 I_FDINSERT Send implementation-defined information about another STREAM.
12250 I_FIND Look for a STREAMS module.
12251 I_FLUSH Flush a STREAM.
12252 I_FLUSHBAND Flush one band of a STREAM.
12253 I_GETBAND Get the band of the top message on a STREAM.
12254 I_GETCLTIME Get close time delay.
12255 I_GETSIG Retrieve current notification signals.
12256 I_GRDOPT Get the read mode.
12257 I_GWROPT Get the write mode.
12258 I_LINK Connect two STREAMs.
12259 I_LIST Get all the module names on a STREAM.
12260 I_LOOK Get the top module name.
12261 I_NREAD Size the top message.
12262 I_PEEK Peek at the top message on a STREAM.
12263 I_PLINK Persistently connect two STREAMs.
12264 I_POP Pop a STREAMS module.
12265 I_PUNLINK Dismantle a persistent STREAMS link.
12266 I_PUSH Push a STREAMS module.
12267 I_RECVFD Get a file descriptor sent via I_SENDFD.
12268 I_SENDFD Pass a file descriptor through a STREAMS pipe.
12269 I_SETCLTIME Set close time delay.
12270 I_SETSIG Ask for notification signals.
12271 I_SRDOPT Set the read mode.
12272 I_STR Send a STREAMS *ioctl*( ).

12273 I_SWROPT Set the write mode.

12274 I_UNLINK Disconnect two STREAMs.

12275 The **<stropts.h>** header shall define at least the following symbolic constant for use with
12276 I_LOOK:

12277 FMNAMESZ The minimum size in bytes of the buffer referred to by the *arg* argument.

12278 The **<stropts.h>** header shall define at least the following symbolic constants for use with
12279 I_FLUSH:

12280 FLUSHR Flush read queues.

12281 FLUSHRW Flush read and write queues.

12282 FLUSHW Flush write queues.

12283 The **<stropts.h>** header shall define at least the following symbolic constants for use with
12284 I_SETSIG:

12285 S_BANDURG When used in conjunction with S_RDBAND, SIGURG is generated instead of
12286 SIGPOLL when a priority message reaches the front of the STREAM head read
12287 queue.

12288 S_ERROR Notification of an error condition reaches the STREAM head.

12289 S_HANGUP Notification of a hangup reaches the STREAM head.

12290 S_HIPRI A high-priority message is present on a STREAM head read queue.

12291 S_INPUT A message, other than a high-priority message, has arrived at the head of a
12292 STREAM head read queue.

12293 S_MSG A STREAMS signal message that contains the SIGPOLL signal reaches the
12294 front of the STREAM head read queue.

12295 S_OUTPUT The write queue for normal data (priority band 0) just below the STREAM
12296 head is no longer full. This notifies the process that there is room on the queue
12297 for sending (or writing) normal data downstream.

12298 S_RDBAND A message with a non-zero priority band has arrived at the head of a
12299 STREAM head read queue.

12300 S_RDNORM A normal (priority band set to 0) message has arrived at the head of a
12301 STREAM head read queue.

12302 S_WRBAND The write queue for a non-zero priority band just below the STREAM head is
12303 no longer full.

12304 S_WRNORM Equivalent to S_OUTPUT.

12305 The **<stropts.h>** header shall define at least the following symbolic constant for use with
12306 I_PEEK:

12307 RS_HIPRI Only look for high-priority messages.

12308 The **<stropts.h>** header shall define at least the following symbolic constants for use with
12309 I_SRDOPT:

12310 RMSGD Message-discard mode.

12311	RMSGN	Message-non-discard mode.
12312	RNORM	Byte-STREAM mode, the default.
12313	RPROTDAT	Deliver the control part of a message as data when a process issues a *read*( ).
12314 12315	RPROTDIS	Discard the control part of a message, delivering any data part, when a process issues a *read*( ).
12316 12317	RPROTNORM	Fail *read*( ) with [EBADMSG] if a message containing a control part is at the front of the STREAM head read queue.

12318 12319 The **<stropts.h>** header shall define at least the following symbolic constant for use with I_SWOPT:

12320	SNDZERO	Send a zero-length message downstream when a *write*( ) of 0 bytes occurs.

12321 12322 The **<stropts.h>** header shall define at least the following symbolic constants for use with I_ATMARK:

12323	ANYMARK	Check if the message is marked.
12324	LASTMARK	Check if the message is the last one marked on the queue.

12325 12326 The **<stropts.h>** header shall define at least the following symbolic constant for use with I_UNLINK:

12327	MUXID_ALL	Unlink all STREAMs linked to the STREAM associated with *fildes*.

12328 12329 The **<stropts.h>** header shall define the following symbolic constants for *getmsg*( ), *getpmsg*( ), *putmsg*( ), and *putpmsg*( ):

12330	MORECTL	More control information is left in message.
12331	MOREDATA	More data is left in message.
12332	MSG_ANY	Receive any message.
12333	MSG_BAND	Receive message from specified band.
12334	MSG_HIPRI	Send/receive high-priority message.

12335 The **<stropts.h>** header may make visible all of the symbols from **<unistd.h>**.

12336 12337 The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
12338 int     fattach(int, const char *);
12339 int     fdetach(const char *);
12340 int     getmsg(int, struct strbuf *restrict, struct strbuf *restrict,
12341             int *restrict);
12342 int     getpmsg(int, struct strbuf *restrict, struct strbuf *restrict,
12343             int *restrict, int *restrict);
12344 int     ioctl(int, int, ...);                                          -
12345 int     isastream(int);                                                +
12346 int     putmsg(int, const struct strbuf *, const struct strbuf *, int);
12347 int     putpmsg(int, const struct strbuf *, const struct strbuf *, int,
12348             int);
```

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

The *flags* members of the **strpeek** and **strfdinsert** structures are changed from **type long** to **t_uscalar_t**.

Issue 6

This header is marked as part of the XSI STREAMS Option Group.

The **restrict** keyword is added to the prototypes for *getmsg*( ) and *getpmsg*( ).

Issue 7

SD5-XBD-ERN-87 is applied, correcting an error in the **strrecvfd** structure.

The **<stropts.h>** header is marked obsolescent.

This reference page is clarified with respect to macros and symbolic constants. -

NAME

sys/ipc.h — XSI interprocess communication access structure

SYNOPSIS

XSI

```
#include <sys/ipc.h>
```

DESCRIPTION

The **<sys/ipc.h>** header is used by three mechanisms for XSI interprocess communication (IPC): messages, semaphores, and shared memory. All use a common structure type, **ipc_perm**, to pass information used in determining permission to perform an IPC operation.

The **<sys/ipc.h>** header shall define the **ipc_perm** structure, which shall include the following members:

`uid_t`	`uid`	Owner's user ID.
`gid_t`	`gid`	Owner's group ID.
`uid_t`	`cuid`	Creator's user ID.
`gid_t`	`cgid`	Creator's group ID.
`mode_t`	`mode`	Read/write permission.

The **<sys/ipc.h>** header shall define the **uid_t**, **gid_t**, **mode_t**, and **key_t** types as described in **<sys/types.h>**.

The **<sys/ipc.h>** header shall define the following symbolic constants.

Mode bits:

IPC_CREAT	Create entry if key does not exist.
IPC_EXCL	Fail if key exists.
IPC_NOWAIT	Error if request must wait.

Keys:

IPC_PRIVATE	Private key.

Control commands:

IPC_RMID	Remove identifier.
IPC_SET	Set options.
IPC_STAT	Get options.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided.

```
key_t  ftok(const char *, int);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

12411 **CHANGE HISTORY**

12412 First released in Issue 2. Derived from System V Release 2.0.

12413 **Issue 7**

12414 This reference page is clarified with respect to macros and symbolic constants.

12415 **NAME**

12416 sys/mman.h — memory management declarations

12417 **SYNOPSIS**

12418 `#include <sys/mman.h>`

12419 **DESCRIPTION**

12420 The **<sys/mman.h>** header shall define the following symbolic constants for use as protection
12421 options:

12422 PROT_EXEC Page can be executed.

12423 PROT_NONE Page cannot be accessed.

12424 PROT_READ Page can be read.

12425 PROT_WRITE Page can be written.

12426 The **<sys/mman.h>** header shall define the following symbolic constants for use as flag options:

12427 MAP_FIXED Interpret *addr* exactly.

12428 MAP_PRIVATE Changes are private.

12429 MAP_SHARED Share changes.

12430 XSI | SIO The **<sys/mman.h>** header shall define the following symbolic constants for the *msync*( )
12431 function:

12432 MS_ASYNC Perform asynchronous writes.

12433 MS_INVALIDATE Invalidate mappings.

12434 MS_SYNC Perform synchronous writes.

12435 ML The **<sys/mman.h>** header shall define the following symbolic constants for the *mlockall*( )
12436 function:

12437 MCL_CURRENT Lock currently mapped pages.

12438 MCL_FUTURE Lock pages that become mapped.

12439 The **<sys/mman.h>** header shall define the symbolic constant MAP_FAILED which shall have
12440 type **void** * and shall be used to indicate a failure from the *mmap*( ) function .

12441 ADV If the Advisory Information option is supported, the **<sys/mman.h>** header shall define
12442 symbolic constants for the *advice* argument to the *posix_madvise*( ) function as follows:

12443 POSIX_MADV_DONTNEED
12444 The application expects that it will not access the specified range in the near future.

12445 POSIX_MADV_NORMAL
12446 The application has no advice to give on its behavior with respect to the specified range. It
12447 is the default characteristic if no advice is given for a range of memory.

12448 POSIX_MADV_RANDOM
12449 The application expects to access the specified range in a random order.

12450 POSIX_MADV_SEQUENTIAL
12451 The application expects to access the specified range sequentially from lower addresses to
12452 higher addresses.

POSIX_MADV_WILLNEED
The application expects to access the specified range in the near future.

TYM The **<sys/mman.h>** header shall define the following symbolic constants for use as flags for the *posix_typed_mem_open*( ) function:

POSIX_TYPED_MEM_ALLOCATE
Allocate on *mmap*( ).

POSIX_TYPED_MEM_ALLOCATE_CONTIG
Allocate contiguously on *mmap*( ).

POSIX_TYPED_MEM_MAP_ALLOCATABLE
Map on *mmap*( ), without affecting allocatability.

The **<sys/mman.h>** header shall define the **mode_t**, **off_t**, and **size_t** types as described in **<sys/types.h>**.

TYM The **<sys/mman.h>** header shall define the **posix_typed_mem_info** structure, which shall include at least the following member:

`size_t posix_tmi_length` Maximum length which may be allocated from a typed memory object.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
MLR  int    mlock(const void *, size_t);
ML   int    mlockall(int);
     void  *mmap(void *, size_t, int, int, int, off_t);
     int    mprotect(void *, size_t, int);
XSI|SIO int msync(void *, size_t, int);
MLR  int    munlock(const void *, size_t);
ML   int    munlockall(void);
     int    munmap(void *, size_t);
ADV  int    posix_madvise(void *, size_t, int);
TYM  int    posix_mem_offset(const void *restrict, size_t, off_t *restrict,
                size_t *restrict, int *restrict);
     int    posix_typed_mem_get_info(int, struct posix_typed_mem_info *);
     int    posix_typed_mem_open(const char *, int, int);
SHM  int    shm_open(const char *, int, mode_t);
     int    shm_unlink(const char *);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Updated for alignment with the POSIX Realtime Extension.

Issue 6

The **<sys/mman.h>** header is marked as dependent on support for either the Memory Mapped Files, Process Memory Locking, or Shared Memory Objects options.

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The TYM margin code is added to the list of margin codes for the **<sys/mman.h>** header line, as well as for other lines.
- The POSIX_TYPED_MEM_ALLOCATE, POSIX_TYPED_MEM_ALLOCATE_CONTIG, and POSIX_TYPED_MEM_MAP_ALLOCATABLE flags are added.
- The **posix_tmi_length** structure is added.
- The *posix_mem_offset*( ), *posix_typed_mem_get_info*( ), and *posix_typed_mem_open*( ) functions are added.

The **restrict** keyword is added to the prototype for *posix_mem_offset*( ).

IEEE PASC Interpretation 1003.1 #102 is applied, adding the prototype for *posix_madvise*( ).

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/16 is applied, correcting margin code and shading errors for the *mlock*( ) and *munlock*( ) functions.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code for the *mmap*( ) function from MF | SHM to MC3 (notation for MF | SHM | TYM).

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code for the *munmap*( ) function from MF | SHM to MC3 (notation for MF | SHM | TYM).

Issue 7

SD5-XBD-ERN-5 is applied, rewriting the DESCRIPTION.

Functionality relating to the Memory Protection and Memory Mapped Files options is moved to the Base.

This reference page is clarified with respect to macros and symbolic constants.

12525 **NAME**

12526 sys/msg.h — XSI message queue structures

12527 **SYNOPSIS**

12528 XSI
```
#include <sys/msg.h>
```

12529 **DESCRIPTION**

12530 The **<sys/msg.h>** header shall define the following data types through **typedef**:

12531 **msgqnum_t** Used for the number of messages in the message queue.

12532 **msglen_t** Used for the number of bytes allowed in a message queue.

12533 These types shall be unsigned integer types that are able to store values at least as large as a type
12534 **unsigned short**.

12535 The **<sys/msg.h>** header shall define the following symbolic constant as a message operation
12536 flag:

12537 MSG_NOERROR No error if big message.

12538 The **<sys/msg.h>** header shall define the **msqid_ds** structure, which shall include the following
12539 members:

12540 `struct ipc_perm` `msg_perm` Operation permission structure.
12541 `msgqnum_t` `msg_qnum` Number of messages currently on queue.
12542 `msglen_t` `msg_qbytes` Maximum number of bytes allowed on queue.
12543 `pid_t` `msg_lspid` Process ID of last *msgsnd*( ).
12544 `pid_t` `msg_lrpid` Process ID of last *msgrcv*( ).
12545 `time_t` `msg_stime` Time of last *msgsnd*( ).
12546 `time_t` `msg_rtime` Time of last *msgrcv*( ).
12547 `time_t` `msg_ctime` Time of last change.

12548 The **<sys/msg.h>** header shall define the **pid_t**, **size_t**, **ssize_t**, and **time_t** types as described in
12549 **<sys/types.h>**.

12550 The following shall be declared as functions and may also be defined as macros. Function
12551 prototypes shall be provided.

12552
```
int     msgctl(int, int, struct msqid_ds *);
12553
int     msgget(key_t, int);
12554
ssize_t msgrcv(int, void *, size_t, long, int);
12555
int     msgsnd(int, const void *, size_t, int);
```

12556 In addition, the **<sys/msg.h>** header shall include the **<sys/ipc.h>** header.

12557 **APPLICATION USAGE**

12558 None.

12559 **RATIONALE**

12560 None.

12561 **FUTURE DIRECTIONS**

12562 None.

12563 **SEE ALSO**

12564 **<sys/ipc.h>**, **<sys/types.h>**

12565 XSH *msgctl*( ), *msgget*( ), *msgrcv*( ), *msgsnd*( )

12566 **CHANGE HISTORY**

12567 First released in Issue 2. Derived from System V Release 2.0.

12568 **Issue 7**

12569 Austin Group Interpretation 1003.1-2001 #179 is applied.

12570 This reference page is clarified with respect to macros and symbolic constants.

12571 **NAME**

12572 sys/resource.h — definitions for XSI resource operations

12573 **SYNOPSIS**

12574 XSI
```
#include <sys/resource.h>
```

12575 **DESCRIPTION**

12576 The **<sys/resource.h>** header shall define the following symbolic constants as possible values of
12577 the *which* argument of *getpriority*( ) and *setpriority*( ):

12578 PRIO_PROCESS Identifies the *who* argument as a process ID.

12579 PRIO_PGRP Identifies the *who* argument as a process group ID.

12580 PRIO_USER Identifies the *who* argument as a user ID.

12581 The **<sys/resource.h>** header shall define the following type through **typedef**:

12582 **rlim_t** Unsigned integer type used for limit values.

12583 The **<sys/resource.h>** header shall define the following symbolic constants, which shall have
12584 values suitable for use in **#if** preprocessing directives:

12585 RLIM_INFINITY A value of **rlim_t** indicating no limit.

12586 RLIM_SAVED_MAX A value of type **rlim_t** indicating an unrepresentable saved hard
12587 limit.

12588 RLIM_SAVED_CUR A value of type **rlim_t** indicating an unrepresentable saved soft limit.

12589 On implementations where all resource limits are representable in an object of type **rlim_t**,
12590 RLIM_SAVED_MAX and RLIM_SAVED_CUR need not be distinct from RLIM_INFINITY.

12591 The **<sys/resource.h>** header shall define the following symbolic constants as possible values of
12592 the *who* parameter of *getrusage*( ):

12593 RUSAGE_SELF Returns information about the current process.

12594 RUSAGE_CHILDREN Returns information about children of the current process.

12595 The **<sys/resource.h>** header shall define the **rlimit** structure, which shall include at least the
12596 following members:

12597 `rlim_t rlim_cur` The current (soft) limit.
12598 `rlim_t rlim_max` The hard limit.

12599 The **<sys/resource.h>** header shall define the **rusage** structure, which shall include at least the
12600 following members:

12601 `struct timeval ru_utime` User time used.
12602 `struct timeval ru_stime` System time used.

12603 The **<sys/resource.h>** header shall define the **timeval** structure as described in **<sys/time.h>**.

12604 The **<sys/resource.h>** header shall define the following symbolic constants as possible values for
12605 the *resource* argument of *getrlimit*( ) and *setrlimit*( ):

12606 RLIMIT_CORE Limit on size of **core** file.

12607 RLIMIT_CPU Limit on CPU time per process.

12608	RLIMIT_DATA	Limit on data segment size.
12609	RLIMIT_FSIZE	Limit on file size.
12610	RLIMIT_NOFILE	Limit on number of open files.
12611	RLIMIT_STACK	Limit on stack size.
12612	RLIMIT_AS	Limit on address space size.

12613 The following shall be declared as functions and may also be defined as macros. Function
12614 prototypes shall be provided.

```
12615 int  getpriority(int, id_t);
12616 int  getrlimit(int, struct rlimit *);
12617 int  getrusage(int, struct rusage *);
12618 int  setpriority(int, id_t, int);
12619 int  setrlimit(int, const struct rlimit *);
```

12620 The **<sys/resource.h>** header shall define the **id_t** type through **typedef**, as described in
12621 **<sys/types.h>**.

12622 Inclusion of the **<sys/resource.h>** header may also make visible all symbols from **<sys/time.h>**.

12623 **APPLICATION USAGE**

12624 None.

12625 **RATIONALE**

12626 None.

12627 **FUTURE DIRECTIONS**

12628 None.

12629 **SEE ALSO**

12630 **<sys/time.h>**, **<sys/types.h>**

12631 XSH *getpriority*( ), *getrlimit*( ), *getrusage*( )

12632 **CHANGE HISTORY**

12633 First released in Issue 4, Version 2.

12634 **Issue 5**

12635 Large File System extensions are added.

12636 **Issue 7**

12637 This reference page is clarified with respect to macros and symbolic constants.

12638 **NAME**

12639 sys/select.h — select types

12640 **SYNOPSIS**

12641 `#include <sys/select.h>`

12642 **DESCRIPTION**

12643 The **<sys/select.h>** header shall define the **timeval** structure, which shall include at least the
12644 following members:

12645 `time_t` `tv_sec` Seconds.
12646 `suseconds_t` `tv_usec` Microseconds.

12647 The **<sys/select.h>** header shall define the **time_t** and **suseconds_t** types as described in
12648 **<sys/types.h>**.

12649 The **<sys/select.h>** header shall define the **sigset_t** type as described in **<signal.h>**.

12650 The **<sys/select.h>** header shall define the **timespec** structure as described in **<time.h>**.

12651 The **<sys/select.h>** header shall define the **fd_set** type as a structure.

12652 The **<sys/select.h>** header shall define the following symbolic constant, which shall have a value
12653 suitable for use in **#if** preprocessing directives:

12654 FD_SETSIZE Maximum number of file descriptors in an **fd_set** structure.

12655 The following shall be declared as functions, defined as macros, or both. If functions are
12656 declared, function prototypes shall be provided.

```
12657 void FD_CLR(int, fd_set *);
12658 int  FD_ISSET(int, fd_set *);
12659 void FD_SET(int, fd_set *);
12660 void FD_ZERO(fd_set *);
```

12661 If implemented as macros, these may evaluate their arguments more than once, so applications
12662 should ensure that the arguments they supply are never expressions with side-effects.

12663 The following shall be declared as functions and may also be defined as macros. Function
12664 prototypes shall be provided.

```
12665 int  pselect(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
12666          const struct timespec *restrict, const sigset_t *restrict);
12667 int  select(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
12668          struct timeval *restrict);
```

12669 Inclusion of the **<sys/select.h>** header may make visible all symbols from the headers
12670 **<signal.h>** and **<time.h>**.

12671 **APPLICATION USAGE**

12672 None.

12673 **RATIONALE**

12674 None.

12675 **FUTURE DIRECTIONS**

12676 None.

12677 **SEE ALSO**

12678 **<signal.h>**, **<sys/time.h>**, **<sys/types.h>**, **<time.h>**

12679 XSH *pselect*( )

12680 **CHANGE HISTORY**

12681 First released in Issue 6. Derived from IEEE Std 1003.1g-2000.

12682 The requirement for the **fd_set** structure to have a member *fds_bits* has been removed as per The
12683 Open Group Base Resolution bwg2001-005.

12684 **Issue 7**

12685 SD5-XBD-ERN-6 is applied, reordering the DESCRIPTION.

12686 This reference page is clarified with respect to macros and symbolic constants.

12687 **NAME**

12688 sys/sem.h — XSI semaphore facility

12689 **SYNOPSIS**

12690 XSI
```
#include <sys/sem.h>
```

12691 **DESCRIPTION**

12692 The **<sys/sem.h>** header shall define the following symbolic constant for use as a semaphore
12693 operation flag:

12694 SEM_UNDO Set up adjust on exit entry.

12695 The **<sys/sem.h>** header shall define the following symbolic constants for use as commands for
12696 the *semctl*() function:

12697 GETNCNT Get *semncnt*.

12698 GETPID Get *sempid*.

12699 GETVAL Get *semval*.

12700 GETALL Get all cases of *semval*.

12701 GETZCNT Get *semzcnt*.

12702 SETVAL Set *semval*.

12703 SETALL Set all cases of *semval*.

12704 The **<sys/sem.h>** header shall define the **semid_ds** structure, which shall include the following
12705 members:

12706 `struct ipc_perm` `sem_perm` Operation permission structure.
12707 `unsigned short` `sem_nsems` Number of semaphores in set.
12708 `time_t` `sem_otime` Last *semop*() time.
12709 `time_t` `sem_ctime` Last time changed by *semctl*().

12710 The **<sys/sem.h>** header shall define the **pid_t**, **size_t**, and **time_t** types as described in
12711 **<sys/types.h>**.

12712 A semaphore shall be represented by an anonymous structure, which shall include the following
12713 members:

12714 `unsigned short` `semval` Semaphore value.
12715 `pid_t` `sempid` Process ID of last operation.
12716 `unsigned short` `semncnt` Number of processes waiting for *semval*
12717 to become greater than current value.
12718 `unsigned short` `semzcnt` Number of processes waiting for *semval*
12719 to become 0.

12720 The **<sys/sem.h>** header shall define the **sembuf** structure, which shall include the following
12721 members:

12722 `unsigned short` `sem_num` Semaphore number.
12723 `short` `sem_op` Semaphore operation.
12724 `short` `sem_flg` Operation flags.

12725 The following shall be declared as functions and may also be defined as macros. Function
12726 prototypes shall be provided.

12727
```
int   semctl(int, int, int, ...);
```

```
int   semget(key_t, int, int);
int   semop(int, struct sembuf *, size_t);
```

In addition, the **<sys/sem.h>** header shall include the **<sys/ipc.h>** header.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 2. Derived from System V Release 2.0.

Issue 7

Austin Group Interpretation 1003.1-2001 #179 is applied.

This reference page is clarified with respect to macros and symbolic constants.

12745 **NAME**

12746 sys/shm.h — XSI shared memory facility

12747 **SYNOPSIS**

12748 XSI
```
#include <sys/shm.h>
```

12749 **DESCRIPTION**

12750 The **<sys/shm.h>** header shall define the following symbolic constants:

12751 SHM_RDONLY Attach read-only (else read-write).

12752 SHM_RND Round attach address to SHMLBA.

12753 SHMLBA Segment low boundary address multiple.

12754 The **<sys/shm.h>** header shall define the following data types through **typedef**:

12755 **shmatt_t** Unsigned integer used for the number of current attaches that must be able to
12756 store values at least as large as a type **unsigned short**.

12757 The **<sys/shm.h>** header shall define the **shmid_ds** structure, which shall include the following
12758 members:

12759 `struct ipc_perm` `shm_perm` Operation permission structure.
12760 `size_t` `shm_segsz` Size of segment in bytes.
12761 `pid_t` `shm_lpid` Process ID of last shared memory operation.
12762 `pid_t` `shm_cpid` Process ID of creator.
12763 `shmatt_t` `shm_nattch` Number of current attaches.
12764 `time_t` `shm_atime` Time of last *shmat*( ).
12765 `time_t` `shm_dtime` Time of last *shmdt*( ).
12766 `time_t` `shm_ctime` Time of last change by *shmctl*( ).

12767 The **<sys/shm.h>** header shall define the **pid_t**, **size_t**, and **time_t** types as described in
12768 **<sys/types.h>**.

12769 The following shall be declared as functions and may also be defined as macros. Function
12770 prototypes shall be provided.

```
12771 void *shmat(int, const void *, int);
12772 int   shmctl(int, int, struct shmid_ds *);
12773 int   shmdt(const void *);
12774 int   shmget(key_t, size_t, int);
```

12775 In addition, the **<sys/shm.h>** header shall include the **<sys/ipc.h>** header.

12776 **APPLICATION USAGE**

12777 None.

12791 This reference page is clarified with respect to macros and symbolic constants.

12792 **NAME**

12793 sys/socket.h — main sockets header

12794 **SYNOPSIS**

12795 `#include <sys/socket.h>`

12796 **DESCRIPTION**

12797 The **<sys/socket.h>** header shall define the **socklen_t** type, which is an integer type of width of
12798 at least 32 bits; see APPLICATION USAGE.

12799 The **<sys/socket.h>** header shall define the **sa_family_t** unsigned integer type.

12800 The **<sys/socket.h>** header shall define the **sockaddr** structure, which shall include at least the
12801 following members:

12802 `sa_family_t  sa_family` Address family.
12803 `char  sa_data[]` Socket address (variable-length data).

12804 The **sockaddr** structure is used to define a socket address which is used in the *bind*( ), *connect*( ),
12805 *getpeername*( ), *getsockname*( ), *recvfrom*( ), and *sendto*( ) functions.

12806 The **<sys/socket.h>** header shall define the **sockaddr_storage** structure, which shall be:

12807 • Large enough to accommodate all supported protocol-specific address structures

12808 • Aligned at an appropriate boundary so that pointers to it can be cast as pointers to
12809 protocol-specific address structures and used to access the fields of those structures
12810 without alignment problems

12811 The **sockaddr_storage** structure shall include at least the following members:

12812 `sa_family_t  ss_family`

12813 When a **sockaddr_storage** structure is cast as a **sockaddr** structure, the *ss_family* field of the
12814 **sockaddr_storage** structure shall map onto the *sa_family* field of the **sockaddr** structure. When a
12815 **sockaddr_storage** structure is cast as a protocol-specific address structure, the *ss_family* field
12816 shall map onto a field of that structure that is of type **sa_family_t** and that identifies the
12817 protocol's address family.

12818 The **<sys/socket.h>** header shall define the **msghdr** structure, which shall include at least the
12819 following members:

12820 `void  *msg_name` Optional address.
12821 `socklen_t  msg_namelen` Size of address.
12822 `struct iovec  *msg_iov` Scatter/gather array.
12823 `int  msg_iovlen` Members in *msg_iov*.
12824 `void  *msg_control` Ancillary data; see below.
12825 `socklen_t  msg_controllen` Ancillary data buffer *len*.
12826 `int  msg_flags` Flags on received message.

12827 The **msghdr** structure is used to minimize the number of directly supplied parameters to the
12828 *recvmsg*( ) and *sendmsg*( ) functions. This structure is used as a *value-result* parameter in the
12829 *recvmsg*( ) function and *value* only for the *sendmsg*( ) function.

12830 The **<sys/socket.h>** header shall define the **iovec** structure as described in **<sys/uio.h>**.

12831 The **<sys/socket.h>** header shall define the **cmsghdr** structure, which shall include at least the
12832 following members:

12833 `socklen_t  cmsg_len` Data byte count, including the **cmsghdr**.
12834 `int  cmsg_level` Originating protocol.

12835 `int` `cmsg_type` Protocol-specific type.

12836 The **cmsghdr** structure is used for storage of ancillary data object information.

12837 Ancillary data consists of a sequence of pairs, each consisting of a **cmsghdr** structure followed
12838 by a data array. The data array contains the ancillary data message, and the **cmsghdr** structure
12839 contains descriptive information that allows an application to correctly parse the data.

12840 The values for *cmsg_level* shall be legal values for the *level* argument to the *getsockopt*( ) and
12841 *setsockopt*( ) functions. The system documentation shall specify the *cmsg_type* definitions for the
12842 supported protocols.

12843 Ancillary data is also possible at the socket level. The **<sys/socket.h>** header shall define the
12844 following symbolic constant for use as the *cmsg_type* value when *cmsg_level* is SOL_SOCKET:

12845 SCM_RIGHTS Indicates that the data array contains the access rights to be sent or
12846 received.

12847 The **<sys/socket.h>** header shall define the following macros to gain access to the data arrays in
12848 the ancillary data associated with a message header:

12849 CMSG_DATA(*cmsg*)
12850 If the argument is a pointer to a **cmsghdr** structure, this macro shall return an unsigned
12851 character pointer to the data array associated with the **cmsghdr** structure.

12852 CMSG_NXTHDR(*mhdr,cmsg*)
12853 If the first argument is a pointer to a **msghdr** structure and the second argument is a pointer
12854 to a **cmsghdr** structure in the ancillary data pointed to by the *msg_control* field of that
12855 **msghdr** structure, this macro shall return a pointer to the next **cmsghdr** structure, or a null
12856 pointer if this structure is the last **cmsghdr** in the ancillary data.

12857 CMSG_FIRSTHDR(*mhdr*)
12858 If the argument is a pointer to a **msghdr** structure, this macro shall return a pointer to the
12859 first **cmsghdr** structure in the ancillary data associated with this **msghdr** structure, or a null
12860 pointer if there is no ancillary data associated with the **msghdr** structure.

12861 The **<sys/socket.h>** header shall define the **linger** structure, which shall include at least the
12862 following members:

12863 `int l_onoff` Indicates whether linger option is enabled.
12864 `int l_linger` Linger time, in seconds.

12865 The **<sys/socket.h>** header shall define the following symbolic constants with distinct values:

12866 SOCK_DGRAM Datagram socket.

12867 RS SOCK_RAW Raw Protocol Interface.

12868 SOCK_SEQPACKET Sequenced-packet socket.

12869 SOCK_STREAM Byte-stream socket.

12870 The **<sys/socket.h>** header shall define the following symbolic constant for use as the *level*
12871 argument of *setsockopt*( ) and *getsockopt*( ).

12872 SOL_SOCKET Options to be accessed at socket level, not protocol level.

12873 The **<sys/socket.h>** header shall define the following symbolic constants with distinct values for
12874 use as the *option_name* argument in *getsockopt*( ) or *setsockopt*( ) calls (see XSH Section 2.10.16, on
12875 page 522):

12876	SO_ACCEPTCONN	Socket is accepting connections.
12877	SO_BROADCAST	Transmission of broadcast messages is supported.
12878	SO_DEBUG	Debugging information is being recorded.
12879	SO_DONTROUTE	Bypass normal routing.
12880	SO_ERROR	Socket error status.
12881	SO_KEEPALIVE	Connections are kept alive with periodic messages.
12882	SO_LINGER	Socket lingers on close.
12883	SO_OOBINLINE	Out-of-band data is transmitted in line.
12884	SO_RCVBUF	Receive buffer size.
12885	SO_RCVLOWAT	Receive "low water mark".
12886	SO_RCVTIMEO	Receive timeout.
12887	SO_REUSEADDR	Reuse of local addresses is supported.
12888	SO_SNDBUF	Send buffer size.
12889	SO_SNDLOWAT	Send "low water mark".
12890	SO_SNDTIMEO	Send timeout.
12891	SO_TYPE	Socket type.

12892 The **<sys/socket.h>** header shall define the following symbolic constant for use as the maximum
12893 *backlog* queue length which may be specified by the *backlog* field of the *listen*( ) function:

12894	SOMAXCONN	The maximum *backlog* queue length.

12895 The **<sys/socket.h>** header shall define the following symbolic constants with distinct values for
12896 use as the valid values for the *msg_flags* field in the **msghdr** structure, or the *flags* parameter in
12897 *recv*( ), *recvfrom*( ), *recvmsg*( ), *send*( ), *sendmsg*( ), or *sendto*( ) calls:

12898	MSG_CTRUNC	Control data truncated.
12899	MSG_DONTROUTE	Send without using routing tables.
12900	MSG_EOR	Terminates a record (if supported by the protocol).
12901	MSG_OOB	Out-of-band data.
12902 12903	MSG_NOSIGNAL	No SIGPIPE generated when an attempt to send is made on a stream-oriented socket that is no longer connected.
12904	MSG_PEEK	Leave received data in queue.
12905	MSG_TRUNC	Normal data truncated.
12906	MSG_WAITALL	Attempt to fill the read buffer.

12907 The **<sys/socket.h>** header shall define the following symbolic constants with distinct values:

12908		AF_INET	Internet domain sockets for use with IPv4 addresses.
12909	IP6	AF_INET6	Internet domain sockets for use with IPv6 addresses.
12910		AF_UNIX	UNIX domain sockets.

AF_UNSPEC Unspecified.

The **<sys/socket.h>** header shall define the following symbolic constants with distinct values:

SHUT_RD Disables further receive operations.

SHUT_RDWR Disables further send and receive operations.

SHUT_WR Disables further send operations.

The **<sys/socket.h>** header shall define the **size_t** and **ssize_t** types as described in **<sys/types.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int     accept(int, struct sockaddr *restrict, socklen_t *restrict);
int     bind(int, const struct sockaddr *, socklen_t);
int     connect(int, const struct sockaddr *, socklen_t);
int     getpeername(int, struct sockaddr *restrict, socklen_t *restrict);
int     getsockname(int, struct sockaddr *restrict, socklen_t *restrict);
int     getsockopt(int, int, int, void *restrict, socklen_t *restrict);
int     listen(int, int);
ssize_t recv(int, void *, size_t, int);
ssize_t recvfrom(int, void *restrict, size_t, int,
        struct sockaddr *restrict, socklen_t *restrict);
ssize_t recvmsg(int, struct msghdr *, int);
ssize_t send(int, const void *, size_t, int);
ssize_t sendmsg(int, const struct msghdr *, int);
ssize_t sendto(int, const void *, size_t, int, const struct sockaddr *,
        socklen_t);
int     setsockopt(int, int, int, const void *, socklen_t);
int     shutdown(int, int);
int     sockatmark(int);
int     socket(int, int, int);
int     socketpair(int, int, int, int [2]);
```

Inclusion of **<sys/socket.h>** may also make visible all symbols from **<sys/uio.h>**.

APPLICATION USAGE

To forestall portability problems, it is recommended that applications not use values larger than $2^{31} - 1$ for the **socklen_t** type.

The **sockaddr_storage** structure solves the problem of declaring storage for automatic variables which is both large enough and aligned enough for storing the socket address data structure of any family. For example, code with a file descriptor and without the context of the address family can pass a pointer to a variable of this type, where a pointer to a socket address structure is expected in calls such as *getpeername*(), and determine the address family by accessing the received content after the call.

The example below illustrates a data structure which aligns on a 64-bit boundary. An implementation-defined field *_ss_align* following *_ss_pad1* is used to force a 64-bit alignment which covers proper alignment good enough for needs of at least **sockaddr_in6** (IPv6) and **sockaddr_in** (IPv4) address data structures. The size of padding field *_ss_pad1* depends on the chosen alignment boundary. The size of padding field *_ss_pad2* depends on the value of overall size chosen for the total size of the structure. This size and alignment are represented in the above example by implementation-defined (not required) constants _SS_MAXSIZE (chosen

value 128) and _SS_ALIGNMENT (with chosen value 8). Constants _SS_PAD1SIZE (derived value 6) and _SS_PAD2SIZE (derived value 112) are also for illustration and not required. The implementation-defined definitions and structure field names above start with an <underscore> to denote implementation private name space. Portable code is not expected to access or reference those fields or constants.

```
/*
 *  Desired design of maximum size and alignment.
 */
#define _SS_MAXSIZE 128
    /* Implementation-defined maximum size. */
#define _SS_ALIGNSIZE (sizeof(int64_t))
    /* Implementation-defined desired alignment. */

/*
 *  Definitions used for sockaddr_storage structure paddings design.
 */
#define _SS_PAD1SIZE (_SS_ALIGNSIZE – sizeof(sa_family_t))
#define _SS_PAD2SIZE (_SS_MAXSIZE – (sizeof(sa_family_t)+ \
                      _SS_PAD1SIZE + _SS_ALIGNSIZE))
struct sockaddr_storage {
    sa_family_t  ss_family;  /* Address family. */
/*
 *  Following fields are implementation-defined.
 */
    char _ss_pad1[_SS_PAD1SIZE];
        /* 6-byte pad; this is to make implementation-defined
           pad up to alignment field that follows explicit in
           the data structure. */
    int64_t _ss_align;  /* Field to force desired structure
                           storage alignment. */
    char _ss_pad2[_SS_PAD2SIZE];
        /* 112-byte pad to achieve desired size,
           _SS_MAXSIZE value minus size of ss_family
           __ss_pad1, __ss_align fields is 112. */
};
```

RATIONALE

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the prototypes for *accept*( ), *getpeername*( ), *getsockname*( ), *getsockopt*( ), and *recvfrom*( ).

13004 **Issue 7**

13005 SD5-XBD-ERN-56 is applied, adding a reference to **<sys/types.h>** for the **ssize_t** type.

13006 SD5-XBD-ERN-62 is applied.

13007 The MSG_NOSIGNAL symbolic constant is added from The Open Group Technical Standard,
13008 2006, Extended API Set Part 2.

13009 This reference page is clarified with respect to macros and symbolic constants, and a declaration
13010 for the **size_t** type is added.

13011 **NAME**

13012 sys/stat.h — data returned by the stat( ) function

13013 **SYNOPSIS**

13014 `#include <sys/stat.h>`

13015 **DESCRIPTION**

13016 The **<sys/stat.h>** header shall define the structure of the data returned by the *fstat*( ), *lstat*( ), and
13017 *stat*( ) functions.

13018 The **<sys/stat.h>** header shall define the **stat** structure, which shall include at least the following
13019 members:

13020		`dev_t st_dev`	Device ID of device containing file.
13021		`ino_t st_ino`	File serial number.
13022		`mode_t st_mode`	Mode of file (see below).
13023		`nlink_t st_nlink`	Number of hard links to the file.
13024		`uid_t st_uid`	User ID of file.
13025		`gid_t st_gid`	Group ID of file.
13026	XSI	`dev_t st_rdev`	Device ID (if file is character or block special).
13027		`off_t st_size`	For regular files, the file size in bytes.
13028			For symbolic links, the length in bytes of the
13029			pathname contained in the symbolic link.
13030	SHM		For a shared memory object, the length in bytes.
13031	TYM		For a typed memory object, the length in bytes.
13032			For other file types, the use of this field is
13033			unspecified.
13034		`struct timespec st_atim`	Last data access timestamp.
13035		`struct timespec at_mtim`	Last data modification timestamp.
13036		`struct timespec st_ctim`	Last file status change timestamp.
13037	XSI	`blksize_t st_blksize`	A file system-specific preferred I/O block size
13038			for this object. In some file system types, this
13039			may vary from file to file.
13040		`blkcnt_t st_blocks`	Number of blocks allocated for this object.

13041 The *st_ino* and *st_dev* fields taken together uniquely identify the file within the system.

13042 The **<sys/stat.h>** header shall define the **blkcnt_t**, **blksize_t**, **dev_t**, **ino_t**, **mode_t**, **nlink_t**,
13043 **uid_t**, **gid_t**, **off_t**, and **time_t** types as described in **<sys/types.h>**.

13044 The **<sys/stat.h>** header shall define the **timespec** structure as described in **<time.h>**. Times
13045 shall be given in seconds since the Epoch.

13046 Which structure members have meaningful values depends on the type of file. For further
13047 information, see the descriptions of *fstat*( ), *lstat*( ), and *stat*( ) in the System Interfaces volume of
13048 POSIX.1-200x.

13049 For compatibility with earlier versions of this standard, the *st_atime* macro shall be defined with
13050 the value *st_atim.tv_sec*. Similarly, *st_ctime* and *st_mtime* shall be defined as macros with the
13051 values *st_ctim.tv_sec* and *st_mtim.tv_sec*, respectively.

The **<sys/stat.h>** header shall define the following symbolic constants for the file types encoded in type **mode_t**. The values shall be suitable for use in **#if** preprocessing directives:

XSI

S_IFMT	Type of file.
S_IFBLK	Block special.
S_IFCHR	Character special.
S_IFIFO	FIFO special.
S_IFREG	Regular.
S_IFDIR	Directory.
S_IFLNK	Symbolic link.
S_IFSOCK	Socket.

The **<sys/stat.h>** header shall define the following symbolic constants for the file mode bits encoded in type **mode_t**, with the indicated numeric values. These macros shall expand to an expression which has a type that allows them to be used, either singly or OR'ed together, as the third argument to *open*( ) without the need for a **mode_t** cast. The values shall be suitable for use in **#if** preprocessing directives.

Name	Numeric Value	Description
S_IRWXU	0700	Read, write, execute/search by owner.
S_IRUSR	0400	Read permission, owner.
S_IWUSR	0200	Write permission, owner.
S_IXUSR	0100	Execute/search permission, owner.
S_IRWXG	070	Read, write, execute/search by group.
S_IRGRP	040	Read permission, group.
S_IWGRP	020	Write permission, group.
S_IXGRP	010	Execute/search permission, group.
S_IRWXO	07	Read, write, execute/search by others.
S_IROTH	04	Read permission, others.
S_IWOTH	02	Write permission, others.
S_IXOTH	01	Execute/search permission, others.
S_ISUID	04000	Set-user-ID on execution.
S_ISGID	02000	Set-group-ID on execution.
S_ISVTX	01000	On directories, restricted deletion flag.

XSI

The following macros shall be provided to test whether a file is of the specified type. The value *m* supplied to the macros is the value of *st_mode* from a **stat** structure. The macro shall evaluate to a non-zero value if the test is true; 0 if the test is false.

S_ISBLK(*m*) Test for a block special file.

S_ISCHR(*m*) Test for a character special file.

S_ISDIR(*m*) Test for a directory.

S_ISFIFO(*m*) Test for a pipe or FIFO special file.

S_ISREG(*m*) Test for a regular file.

S_ISLNK(*m*) Test for a symbolic link.

S_ISSOCK(*m*) Test for a socket.

The implementation may implement message queues, semaphores, or shared memory objects as distinct file types. The following macros shall be provided to test whether a file is of the specified type. The value of the *buf* argument supplied to the macros is a pointer to a **stat** structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the **stat** structure referenced by *buf*. Otherwise, the macro shall evaluate to zero.

S_TYPEISMQ(*buf*) Test for a message queue.

S_TYPEISSEM(*buf*) Test for a semaphore.

S_TYPEISSHM(*buf*) Test for a shared memory object.

TYM The implementation may implement typed memory objects as distinct file types, and the following macro shall test whether a file is of the specified type. The value of the *buf* argument supplied to the macros is a pointer to a **stat** structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the **stat** structure referenced by *buf*. Otherwise, the macro shall evaluate to zero.

S_TYPEISTMO(*buf*) Test macro for a typed memory object.

The **<sys/stat.h>** header shall define the following symbolic constants as distinct integer values outside of the range [0,999 999 999], for use with the *futimens*() and *utimensat*() functions:

UTIME_NOW
UTIME_OMIT

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int    chmod(const char *, mode_t);
int    fchmod(int, mode_t);
int    fchmodat(int, const char *, mode_t, int);
int    fstat(int, struct stat *);
int    fstatat(int, const char *restrict, struct stat *restrict, int);
int    futimens(int, const struct timespec [2]);
int    lstat(const char *restrict, struct stat *restrict);
int    mkdir(const char *, mode_t);
int    mkdirat(int, const char *, mode_t);
int    mkfifo(const char *, mode_t);
int    mkfifoat(int, const char *, mode_t);
```

XSI
```
int    mknod(const char *, mode_t, dev_t);
int    mknodat(int, const char *, mode_t, dev_t);
```

```
int    stat(const char *restrict, struct stat *restrict);
mode_t umask(mode_t);
int    utimensat(int, const char *, const struct timespec [2], int);
```

APPLICATION USAGE

Use of the macros is recommended for determining the type of a file.

RATIONALE

A conforming C-language application must include **<sys/stat.h>** for functions that have arguments or return values of type **mode_t**, so that symbolic values for that type can be used. An alternative would be to require that these constants are also defined by including **<sys/types.h>**.

The S_ISUID and S_ISGID bits may be cleared on any write, not just on *open*(), as some historical implementations do.

System calls that update the time entry fields in the **stat** structure must be documented by the implementors. POSIX-conforming systems should not update the time entry fields for functions listed in the System Interfaces volume of POSIX.1-200x unless the standard requires that they do, except in the case of documented extensions to the standard.

Upon assignment, file timestamps are immediately converted to the resolution of the file system by truncation (i.e., the recorded time can be older than the actual time). For example, if the file system resolution is 1 microsecond, then a conforming *stat*() must always return an *st_mtim.tv_nsec* that is a multiple of 1000. Some older implementations returned higher-resolution timestamps while the *inode* information was cached, and then spontaneously truncated the *tv_nsec* fields when they were stored to and retrieved from disk, but this behavior does not conform.

Note that *st_dev* must be unique within a Local Area Network (LAN) in a "system" made up of multiple computers' file systems connected by a LAN.

Networked implementations of a POSIX-conforming system must guarantee that all files visible within the file tree (including parts of the tree that may be remotely mounted from other machines on the network) on each individual processor are uniquely identified by the combination of the *st_ino* and *st_dev* fields.

The unit for the *st_blocks* member of the **stat** structure is not defined within POSIX.1-200x. In some implementations it is 512 bytes. It may differ on a file system basis. There is no correlation between values of the *st_blocks* and *st_blksize*, and the *f_bsize* (from **<sys/statvfs.h>**) structure members.

Traditionally, some implementations defined the multiplier for *st_blocks* in **<sys/param.h>** as the symbol DEV_BSIZE.

Some earlier versions of this standard did not specify values for the file mode bit macros. The expectation was that some implementors might choose to use a different encoding for these bits than the traditional one, and that new applications would use symbolic file modes instead of numeric. This version of the standard specifies the traditional encoding, in recognition that nearly 20 years after the first publication of this standard numeric file modes are still in widespread use by application developers, and that all conforming implementations still use the traditional encoding.

FUTURE DIRECTIONS

No new S_IFMT symbolic names for the file type values of **mode_t** will be defined by POSIX.1-200x; if new file types are required, they will only be testable through *S_ISxx*() or *S_TYPEISxxx*() macros instead.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

The type of *st_blksize* is changed from **long** to **blksize_t**; the type of *st_blocks* is changed from **long** to **blkcnt_t**.

Issue 6

The S_TYPEISMQ( ), S_TYPEISSEM( ), and S_TYPEISSHM( ) macros are unconditionally mandated.

The Open Group Corrigendum U035/4 is applied. In the DESCRIPTION, the types **blksize_t** and **blkcnt_t** have been described.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The **dev_t**, **ino_t**, **mode_t**, **nlink_t**, **uid_t**, **gid_t**, **off_t**, and **time_t** types are mandated.

S_IFSOCK and S_ISSOCK are added for sockets.

The description of **stat** structure members is changed to reflect contents when file type is a symbolic link.

The test macro S_TYPEISTMO is added for alignment with IEEE Std 1003.1j-2000.

The **restrict** keyword is added to the prototypes for *lstat*( ) and *stat*( ).

The *lstat*( ) function is made mandatory.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/17 is applied, adding text regarding the *st_blocks* member of the **stat** structure to the RATIONALE.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/25 is applied, adding to the DESCRIPTION that the **timespec** structure may be defined as described in the **<time.h>** header.

Issue 7

SD5-XSH-ERN-161 is applied, updating the DESCRIPTION to clarify that the descriptions of the interfaces should be consulted in order to determine which structure members have meaningful values.

The *fchmodat*( ), *fstatat*( ), *mkdirat*( ), *mkfifoat*( ), *mknodat*( ), and *utimensat*( ) functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

The *futimens*( ) function is added.

This reference page is clarified with respect to macros and symbolic constants.

Changes are made related to support for finegrained timestamps and the UTIME_NOW and UTIME_OMIT symbolic constants are added.

NAME

sys/statvfs.h — VFS File System information structure

SYNOPSIS

```
#include <sys/statvfs.h>
```

DESCRIPTION

The **<sys/statvfs.h>** header shall define the **statvfs** structure, which shall include at least the following members:

`unsigned long`	`f_bsize`	File system block size.
`unsigned long`	`f_frsize`	Fundamental file system block size.
`fsblkcnt_t`	`f_blocks`	Total number of blocks on file system in units of *f_frsize.*
`fsblkcnt_t`	`f_bfree`	Total number of free blocks.
`fsblkcnt_t`	`f_bavail`	Number of free blocks available to non-privileged process.
`fsfilcnt_t`	`f_files`	Total number of file serial numbers.
`fsfilcnt_t`	`f_ffree`	Total number of free file serial numbers.
`fsfilcnt_t`	`f_favail`	Number of file serial numbers available to non-privileged process.
`unsigned long`	`f_fsid`	File system ID.
`unsigned long`	`f_flag`	Bit mask of *f_flag* values.
`unsigned long`	`f_namemax`	Maximum filename length.

The **<sys/statvfs.h>** header shall define the **fsblkcnt_t** and **fsfilcnt_t** types as described in **<sys/types.h>**.

The **<sys/statvfs.h>** header shall define the following symbolic constants for the *f_flag* member:

ST_RDONLY Read-only file system.

ST_NOSUID Does not support the semantics of the ST_ISUID and ST_ISGID file mode bits.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int fstatvfs(int, struct statvfs *);
int statvfs(const char *restrict, struct statvfs *restrict);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XSH *fstatvfs*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

The type of *f_blocks*, *f_bfree*, and *f_bavail* is changed from **unsigned long** to **fsblkcnt_t**; the type of *f_files*, *f_ffree*, and *f_favail* is changed from **unsigned long** to **fsfilcnt_t**.

Issue 6

The Open Group Corrigendum U035/5 is applied. In the DESCRIPTION, the types **fsblkcnt_t** and **fsfilcnt_t** have been described.

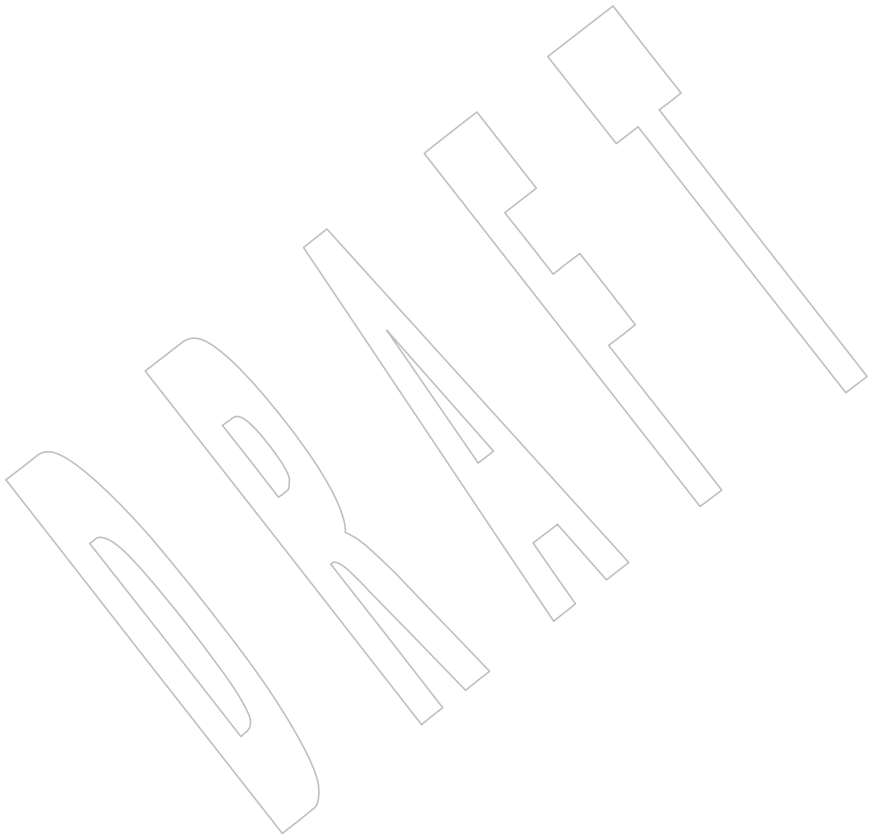
The **restrict** keyword is added to the prototype for *statvfs*().

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/18 is applied, changing the description of ST_NOSUID from "Does not support *setuid*()/*setgid*() semantics" to "Does not support the semantics of the ST_ISUID and ST_ISGID file mode bits".

Issue 7

The **<sys/statvfs.h>** header is moved from the XSI option to the Base.

This reference page is clarified with respect to macros and symbolic constants.



13263 **NAME**

13264 sys/time.h — time types

13265 **SYNOPSIS**

13266 XSI
```
#include <sys/time.h>
```

13267 **DESCRIPTION**

13268 The **<sys/time.h>** header shall define the **timeval** structure, which shall include at least the
13269 following members:

13270 `time_t` `tv_sec` Seconds.
13271 `suseconds_t` `tv_usec` Microseconds.

13272 OB The **<sys/time.h>** header shall define the **itimerval** structure, which shall include at least the
13273 following members:

13274 `struct timeval it_interval` Timer interval.
13275 `struct timeval it_value` Current value.

13276 The **<sys/time.h>** header shall define the **time_t** and **suseconds_t** types as described in
13277 **<sys/types.h>**.

13278 The **<sys/time.h>** header shall define the **fd_set** type as described in **<sys/select.h>**.

13279 OB The **<sys/time.h>** header shall define the following symbolic constants for the *which* argument of
13280 *getitimer*( ) and *setitimer*( ):

13281 ITIMER_REAL Decrements in real time.

13282 ITIMER_VIRTUAL Decrements in process virtual time.

13283 ITIMER_PROF Decrements both in process virtual time and when the system is running
13284 on behalf of the process.

13285 The **<sys/time.h>** header shall define the following as described in **<sys/select.h>**:

13286 *FD_CLR*( )
13287 *FD_ISSET*( )
13288 *FD_SET*( )
13289 *FD_ZERO*( )
13290 FD_SETSIZE

13291 The following shall be declared as functions and may also be defined as macros. Function
13292 prototypes shall be provided.

13293 OB
```
int   getitimer(int, struct itimerval *);
int   gettimeofday(struct timeval *restrict, void *restrict);
int   setitimer(int, const struct itimerval *restrict,
          struct itimerval *restrict);
int   select(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
          struct timeval *restrict);
int   utimes(const char *, const struct timeval [2]);
```

13300 Inclusion of the **<sys/time.h>** header may make visible all symbols from the **<sys/select.h>**
13301 header.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

<sys/select.h>, **<sys/types.h>**

XSH *futimens*( ), *getitimer*( ), *gettimeofday*( ), *pselect*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

The type of *tv_usec* is changed from **long** to **suseconds_t**.

Issue 6

The **restrict** keyword is added to the prototypes for *gettimeofday*( ), *select*( ), and *setitimer*( ).

The note is added that inclusion of this header may also make symbols visible from **<sys/select.h>**.

The *utimes*( ) function is marked LEGACY.

Issue 7

This reference page is clarified with respect to macros and symbolic constants.

NAME

sys/times.h — file access and modification times structure

SYNOPSIS

```
#include <sys/times.h>
```

DESCRIPTION

The **<sys/times.h>** header shall define the **tms** structure, which is returned by *times*() and shall include at least the following members:

```
clock_t  tms_utime   User CPU time.
clock_t  tms_stime   System CPU time.
clock_t  tms_cutime  User CPU time of terminated child processes.
clock_t  tms_cstime  System CPU time of terminated child processes.
```

The **<sys/times.h>** header shall define the **clock_t** type as described in **<sys/types.h>**.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided.

```
clock_t times(struct tms *);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

NAME

sys/types.h — data types

SYNOPSIS

```
#include <sys/types.h>
```

DESCRIPTION

The **<sys/types.h>** header shall define at least the following types:

	blkcnt_t	Used for file block counts.
	blksize_t	Used for block sizes.
	clock_t	Used for system times in clock ticks or CLOCKS_PER_SEC; see **<time.h>**.
	clockid_t	Used for clock ID type in the clock and timer functions.
	dev_t	Used for device IDs.
XSI	**fsblkcnt_t**	Used for file system block counts.
XSI	**fsfilcnt_t**	Used for file system file counts.
	gid_t	Used for group IDs.
	id_t	Used as a general identifier; can be used to contain at least a **pid_t**, **uid_t**, or **gid_t**.
	ino_t	Used for file serial numbers.
XSI	**key_t**	Used for XSI interprocess communication.
	mode_t	Used for some file attributes.
	nlink_t	Used for link counts.
	off_t	Used for file sizes.
	pid_t	Used for process IDs and process group IDs.
	pthread_attr_t	Used to identify a thread attribute object.
	pthread_barrier_t	Used to identify a barrier.
	pthread_barrierattr_t	Used to define a barrier attributes object.
	pthread_cond_t	Used for condition variables.
	pthread_condattr_t	Used to identify a condition attribute object.
	pthread_key_t	Used for thread-specific data keys.
	pthread_mutex_t	Used for mutexes.
	pthread_mutexattr_t	Used to identify a mutex attribute object.
	pthread_once_t	Used for dynamic package initialization.
	pthread_rwlock_t	Used for read-write locks.
	pthread_rwlockattr_t	Used for read-write lock attributes.
	pthread_spinlock_t	Used to identify a spin lock.

13383		**pthread_t**	Used to identify a thread.
13384		**size_t**	Used for sizes of objects.
13385		**ssize_t**	Used for a count of bytes or an error indication.
13386	XSI	**suseconds_t**	Used for time in microseconds.
13387		**time_t**	Used for time in seconds.
13388		**timer_t**	Used for timer ID returned by *timer_create*( ).
13389	OB TRC		Also used to identify a trace stream attributes object.
13390	OB TRC	**trace_event_id_t**	Used to identify a trace event type.
13391	OB TEF	**trace_event_set_t**	Used to identify a trace event type set.
13392	OB TRC	**trace_id_t**	Used to identify a trace stream.
13393		**uid_t**	Used for user IDs.

13394 All of the types shall be defined as arithmetic types of an appropriate length, with the following
13395 exceptions:

13396 **pthread_attr_t**
13397 **pthread_barrier_t**
13398 **pthread_barrierattr_t**
13399 **pthread_cond_t**
13400 **pthread_condattr_t**
13401 **pthread_key_t**
13402 **pthread_mutex_t**
13403 **pthread_mutexattr_t**
13404 **pthread_once_t**
13405 **pthread_rwlock_t**
13406 **pthread_rwlockattr_t**
13407 **pthread_spinlock_t**
13408 **pthread_t**
13409 OB TRC **trace_attr_t**
13410 **trace_event_id_t**
13411 OB TEF **trace_event_set_t**
13412 OB TRC **trace_id_t**

13413 Additionally:

13414 • **mode_t** shall be an integer type.

13415 • **nlink_t**, **uid_t**, **gid_t**, and **id_t** shall be integer types.

13416 • **blkcnt_t** and **off_t** shall be signed integer types.

13417 XSI • **fsblkcnt_t**, **fsfilcnt_t**, and **ino_t** shall be defined as unsigned integer types.

13418 • **size_t** shall be an unsigned integer type.

13419 • **blksize_t**, **pid_t**, and **ssize_t** shall be signed integer types.

13420 • **time_t** and **clock_t** shall be integer or real-floating types.

13421 XSI The type **ssize_t** shall be capable of storing values at least in the range [–1, {SSIZE_MAX}]. The
13422 type **suseconds_t** shall be a signed integer type capable of storing values at least in the range

[–1, 1 000 000].

The implementation shall support one or more programming environments in which the widths of **blksize_t**, **pid_t**, **size_t**, **ssize_t**, and **suseconds_t** are no greater than the width of type **long**. The names of these programming environments can be obtained using the *confstr*( ) function or the *getconf* utility.

There are no defined comparison or assignment operators for the following types:

pthread_attr_t
pthread_barrier_t
pthread_barrierattr_t
pthread_cond_t
pthread_condattr_t
pthread_mutex_t
pthread_mutexattr_t
pthread_rwlock_t
pthread_rwlockattr_t
pthread_spinlock_t
OB TRC **trace_attr_t**

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XSH *confstr*( )

XCU *getconf*

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The **clockid_t** and **timer_t** types are defined for alignment with the POSIX Realtime Extension.

The types **blkcnt_t**, **blksize_t**, **fsblkcnt_t**, **fsfilcnt_t**, and **suseconds_t** are added.

Large File System extensions are added.

Updated for alignment with the POSIX Threads Extension.

Issue 6

The **pthread_barrier_t**, **pthread_barrierattr_t**, and **pthread_spinlock_t** types are added for alignment with IEEE Std 1003.1j-2000.

The margin code is changed from XSI to THR for the **pthread_rwlock_t** and **pthread_rwlockattr_t** types as Read-Write Locks have been absorbed into the POSIX Threads option. The threads types are marked THR.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/26 is applied, adding **pthread_t** to the list of types that are not required to be arithmetic types, thus allowing **pthread_t** to be defined as a

structure.

Issue 7

Austin Group Interpretation 1003.1-2001 #033 is applied, requiring **key_t** to be an arithmetic type.

The Trace option types are marked obsolescent.

The **clock_t** and **id_t** types are moved from the XSI option to the Base.

The **pthread_barrier_t** and **pthread_barrierattr_t** types are moved from the Barriers option to the Base.

The **pthread_spinlock_t** type is moved from the Spin Locks option to the Base.

Functionality relating to the Timers and Threads options is moved to the Base.

13475 **NAME**

13476 sys/uio.h — definitions for vector I/O operations

13477 **SYNOPSIS**

13478 XSI
```
#include <sys/uio.h>
```

13479 **DESCRIPTION**

13480 The **<sys/uio.h>** header shall define the **iovec** structure, which shall include at least the
13481 following members:

13482 `void *iov_base` Base address of a memory region for input or output.
13483 `size_t iov_len` The size of the memory pointed to by *iov_base.*

13484 The **<sys/uio.h>** header uses the **iovec** structure for scatter/gather I/O.

13485 The **<sys/uio.h>** header shall define the **ssize_t** and **size_t** types as described in **<sys/types.h>**.

13486 The following shall be declared as functions and may also be defined as macros. Function
13487 prototypes shall be provided.

13488
```
ssize_t readv(int, const struct iovec *, int);
```
13489
```
ssize_t writev(int, const struct iovec *, int);
```

13490 **APPLICATION USAGE**

13491 The implementation can put a limit on the number of scatter/gather elements which can be
13492 processed in one call. The symbol {IOV_MAX} defined in **<limits.h>** should always be used to
13493 learn about the limits instead of assuming a fixed value.

13494 **RATIONALE**

13495 Traditionally, the maximum number of scatter/gather elements the system can process in one
13496 call were described by the symbolic value {UIO_MAXIOV}. In IEEE Std 1003.1-2001 this value is
13497 replaced by the constant {IOV_MAX} which can be found in **<limits.h>**.

13498 **FUTURE DIRECTIONS**

13499 None.

13500 **SEE ALSO**

13501 **<limits.h>**, **<sys/types.h>**

13502 XSH *read*( ), *readv*( ), *write*( ), *writev*( )

13503 **CHANGE HISTORY**

13504 First released in Issue 4, Version 2.

13505 **Issue 6**

13506 Text referring to scatter/gather I/O is added to the DESCRIPTION.

13507 **NAME**

13508 sys/un.h — definitions for UNIX domain sockets

13509 **SYNOPSIS**

13510 `#include <sys/un.h>`

13511 **DESCRIPTION**

13512 The **<sys/un.h>** header shall define the **sockaddr_un** structure, which shall include at least the
13513 following members:

13514 `sa_family_t sun_family` Address family.
13515 `char sun_path[]` Socket pathname.

13516 The **sockaddr_un** structure is used to store addresses for UNIX domain sockets. Values of this
13517 type shall be cast by applications to **struct sockaddr** for use with socket functions.

13518 The **<sys/un.h>** header shall define the **sa_family_t** type as described in **<sys/socket.h>**.

13519 **APPLICATION USAGE**

13520 The size of *sun_path* has intentionally been left undefined. This is because different
13521 implementations use different sizes. For example, 4.3 BSD uses a size of 108, and 4.4 BSD uses a
13522 size of 104. Since most implementations originate from BSD versions, the size is typically in the
13523 range 92 to 108.

13524 Applications should not assume a particular length for *sun_path* or assume that it can hold
13525 {_POSIX_PATH_MAX} bytes (256).

13526 **RATIONALE**

13527 None.

13528 **FUTURE DIRECTIONS**

13529 None.

13530 **SEE ALSO**

13531 **<sys/socket.h>**

13532 XSH *bind*( ), *socket*( ), *socketpair*( )

13533 **CHANGE HISTORY**

13534 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

13535 **Issue 7**

13536 The value for {_POSIX_PATH_MAX} is updated to 256.

13537 **NAME**

13538 sys/utsname.h — system name structure

13539 **SYNOPSIS**

13540 `#include <sys/utsname.h>`

13541 **DESCRIPTION**

13542 The **<sys/utsname.h>** header shall define the structure **utsname** which shall include at least the
13543 following members:

13544 `char sysname[]` Name of this implementation of the operating system.
13545 `char nodename[]` Name of this node within the communications
13546 network to which this node is attached, if any.
13547 `char release[]` Current release level of this implementation.
13548 `char version[]` Current version level of this release.
13549 `char machine[]` Name of the hardware type on which the system is running.

13550 The character arrays are of unspecified size, but the data stored in them shall be terminated by a
13551 null byte.

13552 The following shall be declared as a function and may also be defined as a macro:

13553 `int uname(struct utsname *);`

13554 **APPLICATION USAGE**

13555 None.

13556 **RATIONALE**

13557 None.

13558 **FUTURE DIRECTIONS**

13559 None.

13560 **SEE ALSO**

13561 XSH *uname*( )

13562 **CHANGE HISTORY**

13563 First released in Issue 1. Derived from Issue 1 of the SVID.

13564 **Issue 6**

13565 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/27 is applied, changing the description of
13566 *nodename* within the **utsname** structure from "an implementation-defined communications
13567 network" to "the communications network to which this node is attached, if any".

13568 **NAME**

13569 sys/wait.h — declarations for waiting

13570 **SYNOPSIS**

13571
```
#include <sys/wait.h>
```

13572 **DESCRIPTION**

13573 The **<sys/wait.h>** header shall define the following symbolic constants for use with *waitpid*( ):

13574 XSI WCONTINUED Report status of continued child process. +

13575 WNOHANG Do not hang if no status is available; return immediately.

13576 WUNTRACED Report status of stopped child process.

13577 The **<sys/wait.h>** header shall define the following macros for analysis of process status values:

13578 WEXITSTATUS Return exit status.

13579 XSI WIFCONTINUED True if child has been continued.

13580 WIFEXITED True if child exited normally.

13581 WIFSIGNALED True if child exited due to uncaught signal.

13582 WIFSTOPPED True if child is currently stopped.

13583 WSTOPSIG Return signal number that caused process to stop.

13584 WTERMSIG Return signal number that caused process to terminate.

13585 The **<sys/wait.h>** header shall define the following symbolic constants as possible values for the
13586 *options* argument to *waitid*( ):

13587 WEXITED Wait for processes that have exited. -

13588 WNOWAIT Keep the process whose status is returned in *infop* in a waitable state.

13589 WSTOPPED Status is returned for any child that has stopped upon receipt of a signal. +

13590 XSI The WCONTINUED and WNOHANG constants, described above for *waitpid*( ), can also be +
13591 used with *waitid*( ). +

13592 The type **idtype_t** shall be defined as an enumeration type whose possible values shall include
13593 at least the following:

13594 P_ALL -
13595 P_PGID +
13596 P_PID

13597 The **<sys/wait.h>** header shall define the **id_t** and **pid_t** types as described in **<sys/types.h>**.

13598 The **<sys/wait.h>** header shall define the **siginfo_t** type as described in **<signal.h>**.

13599 Inclusion of the **<sys/wait.h>** header may also make visible all symbols from **<signal.h>**.

13600 The following shall be declared as functions and may also be defined as macros. Function
13601 prototypes shall be provided.

13602
```
pid_t  wait(int *);
```
13603
```
int    waitid(idtype_t, id_t, siginfo_t *, int);
```
13604
```
pid_t  waitpid(pid_t, int *, int);
```

13605 **APPLICATION USAGE**

13606 None.

13607 **RATIONALE**

13608 None.

13609 **FUTURE DIRECTIONS**

13610 None.

13611 **SEE ALSO**

13612 **<signal.h>**, **<sys/types.h>**

13613 XSH *wait*( ), *waitid*( )

13614 **CHANGE HISTORY**

13615 First released in Issue 3.

13616 Included for alignment with the POSIX.1-1988 standard.

13617 **Issue 6**

13618 The *wait3*( ) function is removed.

13619 **Issue 7**

13620 The *waitid*( ) function and symbolic constants for its *options* argument are moved to the Base.

13621 The description of the WNOHANG constant is clarified.

13622 **NAME**

13623 syslog.h — definitions for system error logging

13624 **SYNOPSIS**

13625 XSI
```
#include <syslog.h>
```

13626 **DESCRIPTION**

13627 The **<syslog.h>** header shall define the following symbolic constants, zero or more of which
13628 may be OR'ed together to form the *logopt* option of *openlog*( ):

13629 LOG_PID Log the process ID with each message.

13630 LOG_CONS Log to the system console on error.

13631 LOG_NDELAY Connect to syslog daemon immediately.

13632 LOG_ODELAY Delay open until *syslog*( ) is called.

13633 LOG_NOWAIT Do not wait for child processes.

13634 The **<syslog.h>** header shall define the following symbolic constants for use as the *facility*
13635 argument to *openlog*( ):

13636 LOG_KERN Reserved for message generated by the system.

13637 LOG_USER Message generated by a process.

13638 LOG_MAIL Reserved for message generated by mail system.

13639 LOG_NEWS Reserved for message generated by news system.

13640 LOG_UUCP Reserved for message generated by UUCP system.

13641 LOG_DAEMON Reserved for message generated by system daemon.

13642 LOG_AUTH Reserved for message generated by authorization daemon.

13643 LOG_CRON Reserved for message generated by clock daemon.

13644 LOG_LPR Reserved for message generated by printer system.

13645 LOG_LOCAL0 Reserved for local use.

13646 LOG_LOCAL1 Reserved for local use.

13647 LOG_LOCAL2 Reserved for local use.

13648 LOG_LOCAL3 Reserved for local use.

13649 LOG_LOCAL4 Reserved for local use.

13650 LOG_LOCAL5 Reserved for local use.

13651 LOG_LOCAL6 Reserved for local use.

13652 LOG_LOCAL7 Reserved for local use.

13653 The **<syslog.h>** header shall define the following macros for constructing the *maskpri* argument
13654 to *setlogmask*( ). The following macros expand to an expression of type **int** when the argument
13655 *pri* is an expression of type **int**:

13656 LOG_MASK(*pri*) A mask for priority *pri*.

13657 The **<syslog.h>** header shall define the following symbolic constants for use as the *priority*
13658 argument of *syslog*( ):

LOG_EMERG	A panic condition was reported to all processes.
LOG_ALERT	A condition that should be corrected immediately.
LOG_CRIT	A critical condition.
LOG_ERR	An error message.
LOG_WARNING	A warning message.
LOG_NOTICE	A condition requiring special handling.
LOG_INFO	A general information message.
LOG_DEBUG	A message useful for debugging programs.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
void  closelog(void);
void  openlog(const char *, int, int);
int   setlogmask(int);
void  syslog(int, const char *, ...);
```

APPLICATION USAGE

None.

First released in Issue 4, Version 2.

Issue 5

Moved from X/Open UNIX to BASE.

Issue 7

This reference page is clarified with respect to macros and symbolic constants.

13687 **NAME**

13688 tar.h — extended tar definitions

13689 **SYNOPSIS**

13690 `#include <tar.h>`

13691 **DESCRIPTION**

13692 The **<tar.h>** header shall define the following symbolic constants with the indicated values.

13693 General definitions:

13694
13695
13696
13697
13698

Name	Value	Description
TMAGIC	`"ustar"`	ustar plus null byte.
TMAGLEN	`6`	Length of the above.
TVERSION	`"00"`	00 without a null byte.
TVERSLEN	`2`	Length of the above.

13699 *Typeflag* field definitions:

13700
13701
13702
13703
13704
13705
13706
13707
13708
13709

Name	Value	Description
REGTYPE	`'0'`	Regular file.
AREGTYPE	`'\0'`	Regular file.
LNKTYPE	`'1'`	Link.
SYMTYPE	`'2'`	Symbolic link.
CHRTYPE	`'3'`	Character special.
BLKTYPE	`'4'`	Block special.
DIRTYPE	`'5'`	Directory.
FIFOTYPE	`'6'`	FIFO special.
CONTTYPE	`'7'`	Reserved.

13710 *Mode* field bit definitions (octal):

13711
13712
13713
13714 XSI
13715
13716
13717
13718
13719
13720
13721
13722
13723

Name	Value	Description
TSUID	04000	Set UID on execution.
TSGID	02000	Set GID on execution.
TSVTX	01000	On directories, restricted deletion flag.
TUREAD	00400	Read by owner.
TUWRITE	00200	Write by owner special.
TUEXEC	00100	Execute/search by owner.
TGREAD	00040	Read by group.
TGWRITE	00020	Write by group.
TGEXEC	00010	Execute/search by group.
TOREAD	00004	Read by other.
TOWRITE	00002	Write by other.
TOEXEC	00001	Execute/search by other.

NAME

termios.h — define values for termios

SYNOPSIS

```
#include <termios.h>
```

DESCRIPTION

The **<termios.h>** header shall contain the definitions used by the terminal I/O interfaces (see Chapter 11 (on page 199) for the structures and names defined).

The termios Structure

The **<termios.h>** header shall define the following data types through **typedef**:

cc_t Used for terminal special characters.

speed_t Used for terminal baud rates.

tcflag_t Used for terminal modes.

The above types shall be all unsigned integer types.

The implementation shall support one or more programming environments in which the widths of **cc_t**, **speed_t**, and **tcflag_t** are no greater than the width of type **long**. The names of these programming environments can be obtained using the *confstr*( ) function or the *getconf* utility.

The **<termios.h>** header shall define the **termios** structure, which shall include at least the following members:

`tcflag_t`	`c_iflag`	Input modes.
`tcflag_t`	`c_oflag`	Output modes.
`tcflag_t`	`c_cflag`	Control modes.
`tcflag_t`	`c_lflag`	Local modes.
`cc_t`	`c_cc[NCCS]`	Control characters.

The **<termios.h>** header shall define the following symbolic constant:

NCCS Size of the array *c_cc* for control characters.

The **<termios.h>** header shall define the following symbolic constants for use as subscripts for the array *c_cc*:

Subscript Usage		
Canonical Mode	**Non-Canonical Mode**	**Description**
VEOF		EOF character.
VEOL		EOL character.
VERASE		ERASE character.
VINTR	VINTR	INTR character.
VKILL		KILL character.
	VMIN	MIN value.
VQUIT	VQUIT	QUIT character.
VSTART	VSTART	START character.
VSTOP	VSTOP	STOP character.
VSUSP	VSUSP	SUSP character.
	VTIME	TIME value.

The subscript values shall be suitable for use in **#if** preprocessing directives and shall be distinct, except that the VMIN and VTIME subscripts may have the same values as the VEOF and VEOL subscripts, respectively.

Input Modes

The **<termios.h>** header shall define the following symbolic constants for use as flags in the *c_iflag* field. The *c_iflag* field describes the basic terminal input control.

BRKINT	Signal interrupt on break.
ICRNL	Map CR to NL on input.
IGNBRK	Ignore break condition.
IGNCR	Ignore CR.
IGNPAR	Ignore characters with parity errors.
INLCR	Map NL to CR on input.
INPCK	Enable input parity check.
ISTRIP	Strip character.
IXANY	Enable any character to restart output.
IXOFF	Enable start/stop input control.
IXON	Enable start/stop output control.
PARMRK	Mark parity errors.

Output Modes

The **<termios.h>** header shall define the following symbolic constants for use as flags in the *c_oflag* field. The *c_oflag* field specifies the system treatment of output.

OPOST	Post-process output.
XSI ONLCR	Map NL to CR-NL on output.
XSI OCRNL	Map CR to NL on output.
XSI ONOCR	No CR output at column 0.
XSI ONLRET	NL performs CR function.
XSI OFDEL	Fill is DEL.
XSI OFILL	Use fill characters for delay.
XSI NLDLY	Select newline delays:
	NL0 Newline type 0.
	NL1 Newline type 1.
XSI CRDLY	Select carriage-return delays:
	CR0 Carriage-return delay type 0.
	CR1 Carriage-return delay type 1.
	CR2 Carriage-return delay type 2.
	CR3 Carriage-return delay type 3.

13814 XSI TABDLY Select horizontal-tab delays:

13815 TAB0 Horizontal-tab delay type 0.

13816 TAB1 Horizontal-tab delay type 1.

13817 TAB2 Horizontal-tab delay type 2.

13818 TAB3 Expand tabs to spaces.

13819 XSI BSDLY Select backspace delays:

13820 BS0 Backspace-delay type 0.

13821 BS1 Backspace-delay type 1.

13822 XSI VTDLY Select vertical-tab delays:

13823 VT0 Vertical-tab delay type 0.

13824 VT1 Vertical-tab delay type 1.

13825 XSI FFDLY Select form-feed delays:

13826 FF0 Form-feed delay type 0.

13827 FF1 Form-feed delay type 1.

13828 **Baud Rate Selection**

13829 The **<termios.h>** header shall define the following symbolic constants for use as values of
13830 objects of type **speed_t**.

13831 The input and output baud rates are stored in the **termios** structure. These are the valid values
13832 for objects of type **speed_t**. Not all baud rates need be supported by the underlying hardware.

13833 B0 Hang up

13834 B50 50 baud

13835 B75 75 baud

13836 B110 110 baud

13837 B134 134.5 baud

13838 B150 150 baud

13839 B200 200 baud

13840 B300 300 baud

13841 B600 600 baud

13842 B1200 1 200 baud

13843 B1800 1 800 baud

13844 B2400 2 400 baud

B4800	4 800 baud
B9600	9 600 baud
B19200	19 200 baud
B38400	38 400 baud

Control Modes

The **<termios.h>** header shall define the following symbolic constants for use as flags in the *c_cflag* field. The *c_cflag* field describes the hardware control of the terminal; not all values specified are required to be supported by the underlying hardware.

CSIZE	Character size:	
	CS5	5 bits
	CS6	6 bits
	CS7	7 bits
	CS8	8 bits
CSTOPB	Send two stop bits, else one.	
CREAD	Enable receiver.	
PARENB	Parity enable.	
PARODD	Odd parity, else even.	
HUPCL	Hang up on last close.	
CLOCAL	Ignore modem status lines.	

The implementation shall support the functionality associated with the symbols CS7, CS8, CSTOPB, PARODD, and PARENB.

Local Modes

The **<termios.h>** header shall define the following symbolic constants for use as flags in the *c_lflag* field. The *c_lflag* field of the argument structure is used to control various terminal functions.

ECHO	Enable echo.
ECHOE	Echo erase character as error-correcting backspace.
ECHOK	Echo KILL.
ECHONL	Echo NL.
ICANON	Canonical input (erase and kill processing).
IEXTEN	Enable extended input character processing.
ISIG	Enable signals.
NOFLSH	Disable flush after interrupt or quit.
TOSTOP	Send SIGTTOU for background output.

13879 **Attribute Selection**

13880 The **<termios.h>** header shall define the following symbolic constants for use with *tcsetattr*( ):

13881 TCSANOW Change attributes immediately.

13882 TCSADRAIN Change attributes when output has drained.

13883 TCSAFLUSH Change attributes when output has drained; also flush pending input.

13884 **Line Control**

13885 The **<termios.h>** header shall define the following symbolic constants for use with *tcflush*( ):

13886 TCIFLUSH Flush pending input.

13887 TCIOFLUSH Flush both pending input and untransmitted output.

13888 TCOFLUSH Flush untransmitted output.

13889 The **<termios.h>** header shall define the following symbolic constants for use with *tcflow*( ):

13890 TCIOFF Transmit a STOP character, intended to suspend input data.

13891 TCION Transmit a START character, intended to restart input data.

13892 TCOOFF Suspend output.

13893 TCOON Restart output.

13894 The **<termios.h>** header shall define the **pid_t** type as described in **<sys/types.h>**.

13895 The following shall be declared as functions and may also be defined as macros. Function
13896 prototypes shall be provided.

```
13897 speed_t cfgetispeed(const struct termios *);
13898 speed_t cfgetospeed(const struct termios *);
13899 int     cfsetispeed(struct termios *, speed_t);
13900 int     cfsetospeed(struct termios *, speed_t);
13901 int     tcdrain(int);
13902 int     tcflow(int, int);
13903 int     tcflush(int, int);
13904 int     tcgetattr(int, struct termios *);
13905 pid_t   tcgetsid(int);
13906 int     tcsendbreak(int, int);
13907 int     tcsetattr(int, int, const struct termios *);
```

13908 **APPLICATION USAGE**

13909 The following names are reserved for XSI-conformant systems to use as an extension to the
13910 above; therefore strictly conforming applications shall not use them:

13911 CBAUD	EXTB	VDSUSP
13912 DEFECHO	FLUSHO	VLNEXT
13913 ECHOCTL	LOBLK	VREPRINT
13914 ECHOKE	PENDIN	VSTATUS
13915 ECHOPRT	SWTCH	VWERASE
13916 EXTA	VDISCARD	

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3.

Included for alignment with the ISO POSIX-1 standard.

Issue 6

The LEGACY symbols IUCLC, OLCUC, and XCASE are removed.

FIPS 151-2 requirements for the symbols CS7, CS8, CSTOPB, PARODD, and PARENB are reaffirmed.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/19 is applied, changing ECHOK to ECHOKE in the APPLICATION USAGE section.

Issue 7

Austin Group Interpretation 1003.1-2001 #144 is applied, moving functionality relating to the IXANY symbol from the XSI option to the Base.

SD5-XBD-ERN-35 is applied, adding the OFDEL output mode.

This reference page is clarified with respect to macros and symbolic constants, and a declaration for the **pid_t** type is added.

NAME

tgmath.h — type-generic macros

SYNOPSIS

```
#include <tgmath.h>
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The **<tgmath.h>** header shall include the headers **<math.h>** and **<complex.h>** and shall define several type-generic macros.

Of the functions contained within the **<math.h>** and **<complex.h>** headers without an *f* (**float**) or *l* (**long double**) suffix, several have one or more parameters whose corresponding real type is **double**. For each such function, except *modf*( ), *j0*( ), *j1*( ), *jn*( ), *y0*( ), *y1*( ), and *yn*( ), there shall be a corresponding type-generic macro. The parameters whose corresponding real type is **double** in the function synopsis are generic parameters. Use of the macro invokes a function whose corresponding real type and type domain are determined by the arguments for the generic parameters.

XSI

Use of the macro invokes a function whose generic parameters have the corresponding real type determined as follows:

- First, if any argument for generic parameters has type **long double**, the type determined is **long double**.
- Otherwise, if any argument for generic parameters has type **double** or is of integer type, the type determined is **double**.
- Otherwise, the type determined is **float**.

For each unsuffixed function in the **<math.h>** header for which there is a function in the **<complex.h>** header with the same name except for a *c* prefix, the corresponding type-generic macro (for both functions) has the same name as the function in the **<math.h>** header. The corresponding type-generic macro for *fabs*( ) and *cabs*( ) is *fabs*( ).

<math.h> Function	**<complex.h> Function**	**Type-Generic Macro**
acos( )	*cacos*( )	*acos*( )
asin( )	*casin*( )	*asin*( )
atan( )	*catan*( )	*atan*( )
acosh( )	*cacosh*( )	*acosh*( )
asinh( )	*casinh*( )	*asinh*( )
atanh( )	*catanh*( )	*atanh*( )
cos( )	*ccos*( )	*cos*( )
sin( )	*csin*( )	*sin*( )
tan( )	*ctan*( )	*tan*( )
cosh( )	*ccosh*( )	*cosh*( )
sinh( )	*csinh*( )	*sinh*( )
tanh( )	*ctanh*( )	*tanh*( )
exp( )	*cexp*( )	*exp*( )
log( )	*clog*( )	*log*( )
pow( )	*cpow*( )	*pow*( )
sqrt( )	*csqrt*( )	*sqrt*( )
fabs( )	*cabs*( )	*fabs*( )

If at least one argument for a generic parameter is complex, then use of the macro invokes a complex function; otherwise, use of the macro invokes a real function.

For each unsuffixed function in the **<math.h>** header without a *c*-prefixed counterpart in the **<complex.h>** header, except for *modf*(), *j0*(), *j1*(), *jn*(), *y0*(), *y1*(), and *yn*(), the corresponding type-generic macro has the same name as the function. These type-generic macros are:

atan2()	*fma*()	*llround*()	*remainder*()
cbrt()	*fmax*()	*log10*()	*remquo*()
ceil()	*fmin*()	*log1p*()	*rint*()
copysign()	*fmod*()	*log2*()	*round*()
erf()	*frexp*()	*logb*()	*scalbn*()
erfc()	*hypot*()	*lrint*()	*scalbln*()
exp2()	*ilogb*()	*lround*()	*tgamma*()
expm1()	*ldexp*()	*nearbyint*()	*trunc*()
fdim()	*lgamma*()	*nextafter*()	
floor()	*llrint*()	*nexttoward*()	

If all arguments for generic parameters are real, then use of the macro invokes a real function; otherwise, use of the macro results in undefined behavior.

For each unsuffixed function in the **<complex.h>** header that is not a *c*-prefixed counterpart to a function in the **<math.h>** header, the corresponding type-generic macro has the same name as the function. These type-generic macros are:

carg()
cimag()
conj()
cproj()
creal()

Use of the macro with any real or complex argument invokes a complex function.

APPLICATION USAGE

With the declarations:

```
#include <tgmath.h>
int n;
float f;
double d;
long double ld;
float complex fc;
double complex dc;
long double complex ldc;
```

functions invoked by use of type-generic macros are shown in the following table:

Macro	Use Invokes
exp(*n*)	*exp*(*n*), the function
acosh(*f*)	*acoshf*(*f*)
sin(*d*)	*sin*(*d*), the function
atan(*ld*)	*atanl*(*ld*)
log(*fc*)	*clogf*(*fc*)
sqrt(*dc*)	*csqrt*(*dc*)

Macro	Use Invokes
pow(*ldc,f*)	*cpowl*(*ldc, f*)
remainder(*n,n*)	*remainder*(*n, n*), the function
nextafter(*d,f*)	*nextafter*(*d, f*), the function
nexttoward(*f,ld*)	*nexttowardf*(*f, ld*)
copysign(*n,ld*)	*copysignl*(*n, ld*)
ceil(*fc*)	Undefined behavior
rint(*dc*)	Undefined behavior
fmax(*ldc,ld*)	Undefined behavior
carg(*n*)	*carg*(*n*), the function
cproj(*f*)	*cprojf*(*f*)
creal(*d*)	*creal*(*d*), the function
cimag(*ld*)	*cimagl*(*ld*)
cabs(*fc*)	*cabsf*(*fc*)
carg(*dc*)	*carg*(*dc*), the function
cproj(*ldc*)	*cprojl*(*ldc*)

RATIONALE

Type-generic macros allow calling a function whose type is determined by the argument type, as is the case for C operators such as `'+'` and `'*'`. For example, with a type-generic *cos*( ) macro, the expression *cos*((**float**)*x*) will have type **float**. This feature enables writing more portably efficient code and alleviates need for awkward casting and suffixing in the process of porting or adjusting precision. Generic math functions are a widely appreciated feature of Fortran.

The only arguments that affect the type resolution are the arguments corresponding to the parameters that have type **double** in the synopsis. Hence the type of a type-generic call to *nexttoward*( ), whose second parameter is **long double** in the synopsis, is determined solely by the type of the first argument.

The term "type-generic" was chosen over the proposed alternatives of intrinsic and overloading. The term is more specific than intrinsic, which already is widely used with a more general meaning, and reflects a closer match to Fortran's generic functions than to C++ overloading.

The macros are placed in their own header in order not to silently break old programs that include the **<math.h>** header; for example, with:

```
printf ("%e", sin(x))
```

modf(**double**, **double** *) is excluded because no way was seen to make it safe without complicating the type resolution.

The implementation might, as an extension, endow appropriate ones of the macros that POSIX.1-200x specifies only for real arguments with the ability to invoke the complex functions.

POSIX.1-200x does not prescribe any particular implementation mechanism for generic macros. It could be implemented simply with built-in macros. The generic macro for *sqrt*( ), for example, could be implemented with:

```
#undef sqrt
#define sqrt(x) __BUILTIN_GENERIC_sqrt(x)
```

Generic macros are designed for a useful level of consistency with C++ overloaded math functions.

The great majority of existing C programs are expected to be unaffected when the **<tgmath.h>** header is included instead of the **<math.h>** or **<complex.h>** headers. Generic macros are similar to the ISO/IEC 9899: 1999 standard library masking macros, though the semantic types of return

values differ.

The ability to overload on integer as well as floating types would have been useful for some functions; for example, *copysign*( ). Overloading with different numbers of arguments would have allowed reusing names; for example, *remainder*( ) for *remquo*( ). However, these facilities would have complicated the specification; and their natural consistent use, such as for a floating *abs*( ) or a two-argument *atan*( ), would have introduced further inconsistencies with the ISO/IEC 9899: 1999 standard for insufficient benefit.

The ISO C standard in no way limits the implementation's options for efficiency, including inlining library functions.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Included for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #184 is applied, clarifying the functions for which a corresponding type-generic macro exists with the same name as the function.

NAME

time.h — time types

SYNOPSIS

```
#include <time.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to enable the visibility of these symbols in this header.

The **<time.h>** header shall define the **clock_t**, **size_t**, **time_t**, types as described in **<sys/types.h>**.

CX The **<time.h>** header shall define the **clockid_t** and **timer_t** types as described in **<sys/types.h>**.

CX The **<time.h>** header shall define the **locale_t** type as described in **<locale.h>**.

CPT The **<time.h>** header shall define the **pid_t** type as described in **<sys/types.h>**.

CX The tag **sigevent** shall be declared as naming an incomplete structure type, the contents of which are described in the **<signal.h>** header.

The **<time.h>** header shall declare the **tm** structure, which shall include at least the following members:

```
int     tm_sec    Seconds [0,60].
int     tm_min    Minutes [0,59].
int     tm_hour   Hour [0,23].
int     tm_mday   Day of month [1,31].
int     tm_mon    Month of year [0,11].
int     tm_year   Years since 1900.
int     tm_wday   Day of week [0,6] (Sunday =0).
int     tm_yday   Day of year [0,365].
int     tm_isdst  Daylight Savings flag.
```

The value of *tm_isdst* shall be positive if Daylight Savings Time is in effect, 0 if Daylight Savings Time is not in effect, and negative if the information is not available.

CX The **<time.h>** header shall declare the **timespec** structure, which shall include at least the following members:

```
time_t  tv_sec     Seconds.
long    tv_nsec    Nanoseconds.
```

The **<time.h>** header shall also declare the **itimerspec** structure, which shall include at least the following members:

```
struct timespec  it_interval  Timer period.
struct timespec  it_value     Timer expiration.
```

The **<time.h>** header shall define the following macros:

NULL — As described in **<stddef.h>**.

CLOCKS_PER_SEC — XSI A number used to convert the value returned by the *clock*( ) function into seconds. The value shall be an expression with type **clock_t**. The value of CLOCKS_PER_SEC shall be 1 million on XSI-conformant systems.

14137 14138 However, it may be variable on other systems, and it should not be assumed that CLOCKS_PER_SEC is a compile-time constant.

14139 CX 14140 The **<time.h>** header shall define the following symbolic constants. The values shall have a type that is assignment-compatible with **clockid_t**.

14141 MON CLOCK_MONOTONIC
14142 14143 14144 14145 The identifier for the system-wide monotonic clock, which is defined as a clock measuring real time, whose value cannot be set via *clock_settime*( ) and which cannot have negative clock jumps. The maximum possible clock jump shall be implementation-defined.

14146 CPT CLOCK_PROCESS_CPUTIME_ID
14147 14148 The identifier of the CPU-time clock associated with the process making a *clock*( ) or *timer**( ) function call.

14149 CX CLOCK_REALTIME The identifier of the system-wide clock measuring real time.

14150 TCT CLOCK_THREAD_CPUTIME_ID
14151 14152 The identifier of the CPU-time clock associated with the thread making a *clock*( ) or *timer**( ) function call.

14153 The **<time.h>** header shall define the following symbolic constant:

14154 14155 TIMER_ABSTIME Flag indicating time is absolute. For functions taking timer objects, this refers to the clock associated with the timer.

14156 XSI 14157 14158 14159 14160 The **<time.h>** header shall provide a declaration or definition for *getdate_err*. The *getdate_err* symbol shall expand to an expression of type **int**. It is unspecified whether *getdate_err* is a macro or an identifier declared with external linkage, and whether or not it is a modifiable lvalue. If a macro definition is suppressed in order to access an actual object, or a progrm defines an identifier with the name *getdate_err*, the behavior is undefined.

14161 14162 The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
14163 OB    char      *asctime(const struct tm *);
14164 OB CX char      *asctime_r(const struct tm *restrict, char *restrict);
14165       clock_t    clock(void);
14166 CPT   int        clock_getcpuclockid(pid_t, clockid_t *);
14167 CX    int        clock_getres(clockid_t, struct timespec *);
14168       int        clock_gettime(clockid_t, struct timespec *);
14169       int        clock_nanosleep(clockid_t, int, const struct timespec *,
14170                      struct timespec *);
14171       int        clock_settime(clockid_t, const struct timespec *);
14172 OB    char      *ctime(const time_t *);
14173 OB CX char      *ctime_r(const time_t *, char *);
14174       double     difftime(time_t, time_t);
14175 XSI   struct tm *getdate(const char *);
14176       struct tm *gmtime(const time_t *);
14177 CX    struct tm *gmtime_r(const time_t *restrict, struct tm *restrict);
14178       struct tm *localtime(const time_t *);
14179 CX    struct tm *localtime_r(const time_t *restrict, struct tm *restrict);
14180       time_t     mktime(struct tm *);
14181 CX    int        nanosleep(const struct timespec *, struct timespec *);
14182       size_t     strftime(char *restrict, size_t, const char *restrict,
14183                  const struct tm *restrict);
```

```
14184 CX      size_t     strftime_l(char *restrict, size_t, const char *restrict,
14185                        const struct tm *restrict, locale_t);
14186 XSI     char      *strptime(const char *restrict, const char *restrict,
14187                        struct tm *restrict);
14188         time_t     time(time_t *);
14189 CX      int        timer_create(clockid_t, struct sigevent *restrict,
14190                        timer_t *restrict);
14191         int        timer_delete(timer_t);
14192         int        timer_getoverrun(timer_t);
14193         int        timer_gettime(timer_t, struct itimerspec *);
14194         int        timer_settime(timer_t, int, const struct itimerspec *restrict,
14195                        struct itimerspec *restrict);
14196         void       tzset(void);
```

14197 The **<time.h>** header shall declare the following as variables:

```
14198 XSI     extern int    daylight;
14199         extern long   timezone;
14200 CX      extern char  *tzname[];
```

14201 CX Inclusion of the **<time.h>** header may make visible all symbols from the **<signal.h>** header.

14202 **APPLICATION USAGE**

14203 The range [0,60] for *tm_sec* allows for the occasional leap second.

14204 *tm_year* is a signed value; therefore, years before 1900 may be represented.

14205 To obtain the number of clock ticks per second returned by the *times*() function, applications
14206 should call *sysconf*(_SC_CLK_TCK).

14207 **RATIONALE**

14208 The range [0,60] seconds allows for positive or negative leap seconds. The formal definition of
14209 UTC does not permit double leap seconds, so all mention of double leap seconds has been
14210 removed, and the range shortened from the former [0,61] seconds seen in earlier versions of this
14211 standard.

14212 **FUTURE DIRECTIONS**

14213 None.

14214 **SEE ALSO**

14215 **<locale.h>**, **<signal.h>**, **<stddef.h>**, **<sys/types.h>**

14221 **CHANGE HISTORY**

14222 First released in Issue 1. Derived from Issue 1 of the SVID.

14223 **Issue 5**

14224 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
14225 Threads Extension.

Issue 6

The Open Group Corrigendum U035/6 is applied. In the DESCRIPTION, the types **clockid_t** and **timer_t** have been described.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The POSIX timer-related functions are marked as part of the Timers option.

The symbolic name CLK_TCK is removed. Application usage is added describing how its equivalent functionality can be obtained using *sysconf*( ).

The *clock_getcpuclockid*( ) function and manifest constants CLOCK_PROCESS_CPUTIME_ID and CLOCK_THREAD_CPUTIME_ID are added for alignment with IEEE Std 1003.1d-1999.

The manifest constant CLOCK_MONOTONIC and the *clock_nanosleep*( ) function are added for alignment with IEEE Std 1003.1j-2000.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The range for seconds is changed from [0,61] to [0,60].
- The **restrict** keyword is added to the prototypes for *asctime_r*( ), *gmtime_r*( ), *localtime_r*( ), *strftime*( ), *strptime*( ), *timer_create*( ), and *timer_settime*( ).

IEEE PASC Interpretation 1003.1 #84 is applied adding the statement that symbols from the **<signal.h>** header may be made visible when the **<time.h>** header is included.

Extensions beyond the ISO C standard are marked.

Issue 7

Austin Group Interpretation 1003.1-2001 #111 is applied.

SD5-XBD-ERN-74 is applied.

The *strftime_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

Functionality relating to the Timers option is moved to the Base.

This reference page is clarified with respect to macros and symbolic constants, and declarations for the **locale_t** and **pid_t** types and the **sigevent** structure are added.

The description of the *getdate_err* value is expanded.

NAME

trace.h — tracing

SYNOPSIS

OB TRC

```
#include <trace.h>
```

DESCRIPTION

The **<trace.h>** header shall define the **posix_trace_event_info** structure, which shall include at least the following members:

```
trace_event_id_t  posix_event_id
pid_t             posix_pid
void             *posix_prog_address
pthread_t         posix_thread_id
struct timespec   posix_timestamp
int               posix_truncation_status
```

The **<trace.h>** header shall define the **posix_trace_status_info** structure, which shall include at least the following members:

```
int     posix_stream_full_status
int     posix_stream_overrun_status
int     posix_stream_status
```

OB TRL

```
int     posix_log_full_status
int     posix_log_overrun_status
int     posix_stream_flush_error
int     posix_stream_flush_status
```

The **<trace.h>** header shall define the following symbolic constants:

POSIX_TRACE_ALL_EVENTS

OB TRL POSIX_TRACE_APPEND

OB TRI POSIX_TRACE_CLOSE_FOR_CHILD

OB TEF POSIX_TRACE_FILTER

OB TRL POSIX_TRACE_FLUSH

POSIX_TRACE_FLUSH_START

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/40 is applied, adding the TRL margin code to the *posix_trace_flush*() function, for alignment with the System Interfaces volume of POSIX.1-200x.

Issue 7

SD5-XBD-ERN-56 is applied, adding a reference to **<sys/types.h>** for the **size_t** type.

The **<trace.h>** header is marked obsolescent.

This reference page is clarified with respect to macros and symbolic constants.

NAME

ulimit.h — ulimit commands

SYNOPSIS

OB XSI

```
#include <ulimit.h>
```

DESCRIPTION

The **<ulimit.h>** header shall define the symbolic constants used by the *ulimit*( ) function.

Symbolic constants:

UL_GETFSIZE Get maximum file size.

UL_SETFSIZE Set maximum file size.

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided.

```
long ulimit(int, ...);
```

APPLICATION USAGE

See *ulimit*( ).

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XSH *ulimit*( )

CHANGE HISTORY

First released in Issue 3.

Issue 7

The **<ulimit.h>** header is marked obsolescent.

NAME

unistd.h — standard symbolic constants and types

SYNOPSIS

```
#include <unistd.h>
```

DESCRIPTION

The **<unistd.h>** header defines miscellaneous symbolic constants and types, and declares miscellaneous functions. The actual values of the constants are unspecified except as shown. The contents of this header are shown below.

Version Test Macros

The **<unistd.h>** header shall define the following symbolic constants. The values shall be suitable for use in **#if** preprocessing directives.

_POSIX_VERSION
: Integer value indicating version of this standard (C-language binding) to which the implementation conforms. For implementations conforming to POSIX.1-200x, the value shall be 200xxxL.

_POSIX2_VERSION
: Integer value indicating version of the Shell and Utilities volume of POSIX.1 to which the implementation conforms. For implementations conforming to POSIX.1-200x, the value shall be 200xxxL.

The **<unistd.h>** header shall define the following symbolic constant only if the implementation supports the XSI option; see Section 2.1.4 (on page 19). If defined, its value shall be suitable for use in **#if** preprocessing directives.

XSI _XOPEN_VERSION
: Integer value indicating version of the X/Open Portability Guide to which the implementation conforms. The value shall be 700.

Constants for Options and Option Groups

The following symbolic constants, if defined in **<unistd.h>**, shall have a value of −1, 0, or greater, unless otherwise specified below. The values shall be suitable for use in **#if** preprocessing directives.

If a symbolic constant is not defined or is defined with the value −1, the option is not supported for compilation. If it is defined with a value greater than zero, the option shall always be supported when the application is executed. If it is defined with the value zero, the option shall be supported for compilation and might or might not be supported at runtime. See Section 2.1.6 (on page 26) for further information about the conformance requirements of these three categories of support.

ADV _POSIX_ADVISORY_INFO
: The implementation supports the Advisory Information option. If this symbol is defined in **<unistd.h>**, it shall be defined to be −1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( ) shall either be −1 or 200xxxL.

_POSIX_ASYNCHRONOUS_IO
: The implementation supports asynchronous input and output. This symbol shall always be set to the value 200xxxL.

14471 _POSIX_BARRIERS
14472 The implementation supports barriers. This symbol shall always be set to the value
14473 200xxxL.

14474 _POSIX_CHOWN_RESTRICTED
14475 The use of *chown*( ) and *fchown*( ) is restricted to a process with appropriate privileges, and
14476 to changing the group ID of a file only to the effective group ID of the process or to one of
14477 its supplementary group IDs. This symbol shall be defined with a value other than –1.

14478 _POSIX_CLOCK_SELECTION
14479 The implementation supports clock selection. This symbol shall always be set to the value
14480 200xxxL.

14481 CPT _POSIX_CPUTIME
14482 The implementation supports the Process CPU-Time Clocks option. If this symbol is
14483 defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol
14484 reported by *sysconf*( ) shall either be –1 or 200xxxL.

14485 FSC _POSIX_FSYNC
14486 The implementation supports the File Synchronization option. If this symbol is defined in
14487 **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported by
14488 *sysconf*( ) shall either be –1 or 200xxxL.

14489 _POSIX_IPV6
14490 The implementation supports the IPv6 option. If this symbol is defined in **<unistd.h>**, it
14491 shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( ) shall
14492 either be –1 or 200xxxL.

14493 _POSIX_JOB_CONTROL
14494 The implementation supports job control. This symbol shall always be set to a value greater
14495 than zero.

14496 _POSIX_MAPPED_FILES
14497 The implementation supports memory mapped Files. This symbol shall always be set to the
14498 value 200xxxL.

14499 ML _POSIX_MEMLOCK
14500 The implementation supports the Process Memory Locking option. If this symbol is defined
14501 in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported
14502 by *sysconf*( ) shall either be –1 or 200xxxL.

14503 MLR _POSIX_MEMLOCK_RANGE
14504 The implementation supports the Range Memory Locking option. If this symbol is defined
14505 in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported
14506 by *sysconf*( ) shall either be –1 or 200xxxL.

14507 _POSIX_MEMORY_PROTECTION
14508 The implementation supports memory protection. This symbol shall always be set to the
14509 value 200xxxL.

14510 MSG _POSIX_MESSAGE_PASSING
14511 The implementation supports the Message Passing option. If this symbol is defined in
14512 **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported by
14513 *sysconf*( ) shall either be –1 or 200xxxL.

14514 MON _POSIX_MONOTONIC_CLOCK
14515 The implementation supports the Monotonic Clock option. If this symbol is defined in
14516 **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported by

sysconf( ) shall either be –1 or 200xxxL.

_POSIX_NO_TRUNC
Pathname components longer than {NAME_MAX} generate an error. This symbol shall be defined with a value other than –1.

PIO _POSIX_PRIORITIZED_IO
The implementation supports the Prioritized Input and Output option. If this symbol is defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( ) shall either be –1 or 200xxxL.

PS _POSIX_PRIORITY_SCHEDULING
The implementation supports the Process Scheduling option. If this symbol is defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( ) shall either be –1 or 200xxxL.

RS _POSIX_RAW_SOCKETS
The implementation supports the Raw Sockets option. If this symbol is defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( ) shall either be –1 or 200xxxL.

_POSIX_READER_WRITER_LOCKS
The implementation supports read-write locks. This symbol shall always be set to the value 200xxxL.

_POSIX_REALTIME_SIGNALS
The implementation supports realtime signals. This symbol shall always be set to the value 200xxxL.

_POSIX_REGEXP
The implementation supports the Regular Expression Handling option. This symbol shall always be set to a value greater than zero.

_POSIX_SAVED_IDS
Each process has a saved set-user-ID and a saved set-group-ID. This symbol shall always be set to a value greater than zero.

_POSIX_SEMAPHORES
The implementation supports semaphores. This symbol shall always be set to the value 200xxxL.

SHM _POSIX_SHARED_MEMORY_OBJECTS
The implementation supports the Shared Memory Objects option. If this symbol is defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( ) shall either be –1 or 200xxxL.

_POSIX_SHELL
The implementation supports the POSIX shell. This symbol shall always be set to a value greater than zero.

SPN _POSIX_SPAWN
The implementation supports the Spawn option. If this symbol is defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( ) shall either be –1 or 200xxxL.

_POSIX_SPIN_LOCKS
The implementation supports spin locks. This symbol shall always be set to the value 200xxxL.

14562 SS _POSIX_SPORADIC_SERVER
14563 The implementation supports the Process Sporadic Server option. If this symbol is defined
14564 in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported
14565 by *sysconf*( ) shall either be –1 or 200xxxL.

14566 SIO _POSIX_SYNCHRONIZED_IO
14567 The implementation supports the Synchronized Input and Output option. If this symbol is
14568 defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol
14569 reported by *sysconf*( ) shall either be –1 or 200xxxL.

14570 TSA _POSIX_THREAD_ATTR_STACKADDR
14571 The implementation supports the Thread Stack Address Attribute option. If this symbol is
14572 defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol
14573 reported by *sysconf*( ) shall either be –1 or 200xxxL.

14574 TSS _POSIX_THREAD_ATTR_STACKSIZE
14575 The implementation supports the Thread Stack Size Attribute option. If this symbol is
14576 defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol
14577 reported by *sysconf*( ) shall either be –1 or 200xxxL.

14578 TCT _POSIX_THREAD_CPUTIME
14579 The implementation supports the Thread CPU-Time Clocks option. If this symbol is
14580 defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol
14581 reported by *sysconf*( ) shall either be –1 or 200xxxL.

14582 TPI _POSIX_THREAD_PRIO_INHERIT
14583 The implementation supports the Non-Robust Mutex Priority Inheritance option. If this
14584 symbol is defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this
14585 symbol reported by *sysconf*( ) shall either be –1 or 200xxxL.

14586 TPP _POSIX_THREAD_PRIO_PROTECT
14587 The implementation supports the Non-Robust Mutex Priority Protection option. If this
14588 symbol is defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this
14589 symbol reported by *sysconf*( ) shall either be –1 or 200xxxL.

14590 TPS _POSIX_THREAD_PRIORITY_SCHEDULING
14591 The implementation supports the Thread Execution Scheduling option. If this symbol is
14592 defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol
14593 reported by *sysconf*( ) shall either be –1 or 200xxxL.

14594 TSH _POSIX_THREAD_PROCESS_SHARED
14595 The implementation supports the Thread Process-Shared Synchronization option. If this
14596 symbol is defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this
14597 symbol reported by *sysconf*( ) shall either be –1 or 200xxxL.

14598 RPI _POSIX_THREAD_ROBUST_PRIO_INHERIT
14599 The implementation supports the Robust Mutex Priority Inheritance option. If this symbol
14600 is defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol
14601 reported by *sysconf*( ) shall either be –1 or 200xxxL.

14602 RPP _POSIX_THREAD_ROBUST_PRIO_PROTECT
14603 The implementation supports the Robust Mutex Priority Protection option. If this symbol is
14604 defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol
14605 reported by *sysconf*( ) shall either be –1 or 200xxxL.

14606 _POSIX_THREAD_SAFE_FUNCTIONS
14607 The implementation supports thread-safe functions. This symbol shall always be set to the
14608 value 200xxxL.

14609 TSP _POSIX_THREAD_SPORADIC_SERVER
14610 The implementation supports the Thread Sporadic Server option. If this symbol is defined
14611 in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported
14612 by *sysconf*( ) shall either be –1 or 200xxxL.

14613 _POSIX_THREADS
14614 The implementation supports threads. This symbol shall always be set to the value
14615 200xxxL.

14616 _POSIX_TIMEOUTS
14617 The implementation supports timeouts. This symbol shall always be set to the value
14618 200xxxL.

14619 _POSIX_TIMERS
14620 The implementation supports timers. This symbol shall always be set to the value 200xxxL.

14621 OB TRC _POSIX_TRACE
14622 The implementation supports the Trace option. If this symbol is defined in **<unistd.h>**, it
14623 shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( ) shall
14624 either be –1 or 200xxxL.

14625 OB TEF _POSIX_TRACE_EVENT_FILTER
14626 The implementation supports the Trace Event Filter option. If this symbol is defined in
14627 **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported by
14628 *sysconf*( ) shall either be –1 or 200xxxL.

14629 OB TRI _POSIX_TRACE_INHERIT
14630 The implementation supports the Trace Inherit option. If this symbol is defined in
14631 **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported by
14632 *sysconf*( ) shall either be –1 or 200xxxL.

14633 OB TRL _POSIX_TRACE_LOG
14634 The implementation supports the Trace Log option. If this symbol is defined in **<unistd.h>**,
14635 it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( )
14636 shall either be –1 or 200xxxL.

14637 TYM _POSIX_TYPED_MEMORY_OBJECTS
14638 The implementation supports the Typed Memory Objects option. If this symbol is defined
14639 in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported
14640 by *sysconf*( ) shall either be –1 or 200xxxL.

14641 OB _POSIX_V6_ILP32_OFF32
14642 The implementation provides a C-language compilation environment with 32-bit **int**, **long**,
14643 **pointer**, and **off_t** types.

14644 OB _POSIX_V6_ILP32_OFFBIG
14645 The implementation provides a C-language compilation environment with 32-bit **int**, **long**,
14646 and **pointer** types and an **off_t** type using at least 64 bits.

14647 OB _POSIX_V6_LP64_OFF64
14648 The implementation provides a C-language compilation environment with 32-bit **int** and
14649 64-bit **long**, **pointer**, and **off_t** types.

14650 OB _POSIX_V6_LPBIG_OFFBIG
14651 The implementation provides a C-language compilation environment with an **int** type
14652 using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

14653 _POSIX_V7_ILP32_OFF32
14654 The implementation provides a C-language compilation environment with 32-bit **int**, **long**,
14655 **pointer**, and **off_t** types.

14656 _POSIX_V7_ILP32_OFFBIG
14657 The implementation provides a C-language compilation environment with 32-bit **int**, **long**,
14658 and **pointer** types and an **off_t** type using at least 64 bits.

14659 _POSIX_V7_LP64_OFF64
14660 The implementation provides a C-language compilation environment with 32-bit **int** and
14661 64-bit **long**, **pointer**, and **off_t** types.

14662 _POSIX_V7_LPBIG_OFFBIG
14663 The implementation provides a C-language compilation environment with an **int** type
14664 using at least 32 bits and **long**, **pointer**, and **off_t** types using at least 64 bits.

14665 _POSIX2_C_BIND
14666 The implementation supports the C-Language Binding option. This symbol shall always
14667 have the value 200xxxL.

14668 CD _POSIX2_C_DEV
14669 The implementation supports the C-Language Development Utilities option. If this symbol
14670 is defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol
14671 reported by *sysconf*( ) shall either be –1 or 200xxxL.

14672 _POSIX2_CHAR_TERM
14673 The implementation supports the Terminal Characteristics option. The value of this symbol
14674 reported by *sysconf*( ) shall either be –1 or a value greater than zero.

14675 FD _POSIX2_FORT_DEV
14676 The implementation supports the FORTRAN Development Utilities option. If this symbol
14677 is defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol
14678 reported by *sysconf*( ) shall either be –1 or 200xxxL.

14679 FR _POSIX2_FORT_RUN
14680 The implementation supports the FORTRAN Runtime Utilities option. If this symbol is
14681 defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol
14682 reported by *sysconf*( ) shall either be –1 or 200xxxL.

14683 _POSIX2_LOCALEDEF
14684 The implementation supports the creation of locales by the *localedef* utility. If this symbol is
14685 defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol
14686 reported by *sysconf*( ) shall either be –1 or 200xxxL.

14687 OB BE _POSIX2_PBS
14688 The implementation supports the Batch Environment Services and Utilities option. If this
14689 symbol is defined in **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this
14690 symbol reported by *sysconf*( ) shall either be –1 or 200xxxL.

14691 OB BE _POSIX2_PBS_ACCOUNTING
14692 The implementation supports the Batch Accounting option. If this symbol is defined in
14693 **<unistd.h>**, it shall be defined to be –1, 0, or 200xxxL. The value of this symbol reported by
14694 *sysconf*( ) shall either be –1 or 200xxxL.

OB BE _POSIX2_PBS_CHECKPOINT
The implementation supports the Batch Checkpoint/Restart option. If this symbol is defined in **<unistd.h>**, it shall be defined to be −1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( ) shall either be −1 or 200xxxL.

OB BE _POSIX2_PBS_LOCATE
The implementation supports the Locate Batch Job Request option. If this symbol is defined in **<unistd.h>**, it shall be defined to be −1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( ) shall either be −1 or 200xxxL.

OB BE _POSIX2_PBS_MESSAGE
The implementation supports the Batch Job Message Request option. If this symbol is defined in **<unistd.h>**, it shall be defined to be −1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( ) shall either be −1 or 200xxxL.

OB BE _POSIX2_PBS_TRACK
The implementation supports the Track Batch Job Request option. If this symbol is defined in **<unistd.h>**, it shall be defined to be −1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( ) shall either be −1 or 200xxxL.

SD _POSIX2_SW_DEV
The implementation supports the Software Development Utilities option. If this symbol is defined in **<unistd.h>**, it shall be defined to be −1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( ) shall either be −1 or 200xxxL.

UP _POSIX2_UPE
The implementation supports the User Portability Utilities option. If this symbol is defined in **<unistd.h>**, it shall be defined to be −1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( ) shall either be −1 or 200xxxL.

XSI _XOPEN_CRYPT
The implementation supports the X/Open Encryption Option Group.

_XOPEN_ENH_I18N
The implementation supports the Issue 4, Version 2 Enhanced Internationalization Option Group. This symbol shall always be set to a value other than −1.

_XOPEN_REALTIME
The implementation supports the X/Open Realtime Option Group.

_XOPEN_REALTIME_THREADS
The implementation supports the X/Open Realtime Threads Option Group.

_XOPEN_SHM
The implementation supports the Issue 4, Version 2 Shared Memory Option Group. This symbol shall always be set to a value other than −1.

OB XSR _XOPEN_STREAMS
The implementation supports the XSI STREAMS Option Group.

XSI _XOPEN_UNIX
The implementation supports the XSI option.

UU _XOPEN_UUCP
The implementation supports the UUCP Utilities option. If this symbol is defined in **<unistd.h>**, it shall be defined to be −1, 0, or 200xxxL. The value of this symbol reported by *sysconf*( ) shall be either −1 or 200xxxL.

14739 **Execution-Time Symbolic Constants**

14740 If any of the following symbolic constants are not defined in the **<unistd.h>** header, the value
14741 shall vary depending on the file to which it is applied. If defined, they shall have values suitable
14742 for use in **#if** preprocessing directives.

14743 If any of the following symbolic constants are defined to have value –1 in the **<unistd.h>** header,
14744 the implementation shall not provide the option on any file; if any are defined to have a value
14745 other than –1 in the **<unistd.h>** header, the implementation shall provide the option on all
14746 applicable files.

14747 All of the following values, whether defined as symbolic constants in **<unistd.h>** or not, may be
14748 queried with respect to a specific file using the *pathconf*( ) or *fpathconf*( ) functions:

14749 _POSIX_ASYNC_IO
14750 Asynchronous input or output operations may be performed for the associated file.

14751 _POSIX_PRIO_IO
14752 Prioritized input or output operations may be performed for the associated file.

14753 _POSIX_SYNC_IO
14754 Synchronized input or output operations may be performed for the associated file.

14755 If the following symbolic constants are defined in the **<unistd.h>** header, they apply to files and
14756 all paths in all file systems on the implementation:

14757 _POSIX_TIMESTAMP_RESOLUTION
14758 The resolution in nanoseconds for all file timestamps.

14759 _POSIX2_SYMLINKS
14760 Symbolic links can be created.

14761 **Constants for Functions**

14762 The **<unistd.h>** header shall define NULL as described in **<stddef.h>**.

14763 The **<unistd.h>** header shall define the following symbolic constants for use with the *access*( )
14764 function. The values shall be suitable for use in **#if** preprocessing directives.

14765 F_OK Test for existence of file.

14766 R_OK Test for read permission.

14767 W_OK Test for write permission.

14768 X_OK Test for execute (search) permission.

14769 The constants F_OK, R_OK, W_OK, and X_OK and the expressions *R_OK* | *W_OK*, *R_OK* | *X_OK*,
14770 and *R_OK* | *W_OK* | *X_OK* shall all have distinct values.

14771 The **<unistd.h>** header shall define the following symbolic constants for the *confstr*( ) function:

14772 _CS_PATH
14773 This is the value for the *PATH* environment variable that finds all standard utilities.

14774 _CS_POSIX_V7_ILP32_OFF32_CFLAGS
14775 If *sysconf*(_SC_V7_ILP32_OFF32) returns –1, the meaning of this value is unspecified.
14776 Otherwise, this value is the set of initial options to be given to the *c99* utility to build an
14777 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

14778 _CS_POSIX_V7_ILP32_OFF32_LDFLAGS
14779 If *sysconf*(_SC_V7_ILP32_OFF32) returns –1, the meaning of this value is unspecified.
14780 Otherwise, this value is the set of final options to be given to the *c99* utility to build an
14781 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

14782 _CS_POSIX_V7_ILP32_OFF32_LIBS
14783 If *sysconf*(_SC_V7_ILP32_OFF32) returns –1, the meaning of this value is unspecified.
14784 Otherwise, this value is the set of libraries to be given to the *c99* utility to build an
14785 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

14786 _CS_POSIX_V7_ILP32_OFFBIG_CFLAGS
14787 If *sysconf*(_SC_V7_ILP32_OFFBIG) returns –1, the meaning of this value is unspecified.
14788 Otherwise, this value is the set of initial options to be given to the *c99* utility to build an
14789 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an
14790 **off_t** type using at least 64 bits.

14791 _CS_POSIX_V7_ILP32_OFFBIG_LDFLAGS
14792 If *sysconf*(_SC_V7_ILP32_OFFBIG) returns –1, the meaning of this value is unspecified.
14793 Otherwise, this value is the set of final options to be given to the *c99* utility to build an
14794 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an
14795 **off_t** type using at least 64 bits.

14796 _CS_POSIX_V7_ILP32_OFFBIG_LIBS
14797 If *sysconf*(_SC_V7_ILP32_OFFBIG) returns –1, the meaning of this value is unspecified.
14798 Otherwise, this value is the set of libraries to be given to the *c99* utility to build an
14799 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an
14800 **off_t** type using at least 64 bits.

14801 _CS_POSIX_V7_LP64_OFF64_CFLAGS
14802 If *sysconf*(_SC_V7_LP64_OFF64) returns –1, the meaning of this value is unspecified.
14803 Otherwise, this value is the set of initial options to be given to the *c99* utility to build an
14804 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t**
14805 types.

14806 _CS_POSIX_V7_LP64_OFF64_LDFLAGS
14807 If *sysconf*(_SC_V7_LP64_OFF64) returns –1, the meaning of this value is unspecified.
14808 Otherwise, this value is the set of final options to be given to the *c99* utility to build an
14809 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t**
14810 types.

14811 _CS_POSIX_V7_LP64_OFF64_LIBS
14812 If *sysconf*(_SC_V7_LP64_OFF64) returns –1, the meaning of this value is unspecified.
14813 Otherwise, this value is the set of libraries to be given to the *c99* utility to build an
14814 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t**
14815 types.

14816 _CS_POSIX_V7_LPBIG_OFFBIG_CFLAGS
14817 If *sysconf*(_SC_V7_LPBIG_OFFBIG) returns –1, the meaning of this value is unspecified.
14818 Otherwise, this value is the set of initial options to be given to the *c99* utility to build an
14819 application using a programming model with an **int** type using at least 32 bits and **long**,
14820 **pointer**, and **off_t** types using at least 64 bits.

14821 _CS_POSIX_V7_LPBIG_OFFBIG_LDFLAGS
14822 If *sysconf*(_SC_V7_LPBIG_OFFBIG) returns –1, the meaning of this value is unspecified.
14823 Otherwise, this value is the set of final options to be given to the *c99* utility to build an
14824 application using a programming model with an **int** type using at least 32 bits and **long**,

14825 **pointer**, and **off_t** types using at least 64 bits.

14826 _CS_POSIX_V7_LPBIG_OFFBIG_LIBS
14827 If *sysconf*(_SC_V7_LPBIG_OFFBIG) returns –1, the meaning of this value is unspecified.
14828 Otherwise, this value is the set of libraries to be given to the *c99* utility to build an
14829 application using a programming model with an **int** type using at least 32 bits and **long**,
14830 **pointer**, and **off_t** types using at least 64 bits.

14831 _CS_POSIX_V7_THREADS_CFLAGS
14832 If *sysconf* (_SC_POSIX_THREADS) returns –1, the meaning of this value is unspecified.
14833 Otherwise, this value is the set of initial options to be given to the *c99* utility to build a
14834 multi-threaded application. These flags are in addition to those associated with any of the
14835 other _CS_POSIX_V7_*_CFLAGS values used to specify particular type size programing
14836 environments.

14837 _CS_POSIX_V7_THREADS_LDFLAGS
14838 If *sysconf* (_SC_POSIX_THREADS) returns –1, the meaning of this value is unspecified.
14839 Otherwise, this value is the set of final options to be given to the *c99* utility to build a multi-
14840 threaded application. These flags are in addition to those associated with any of the other
14841 _CS_POSIX_V7_*_LDFLAGS values used to specify particular type size programing
14842 environments.

14843 _CS_POSIX_V7_WIDTH_RESTRICTED_ENVS
14844 This value is a <newline>-separated list of names of programming environments supported
14845 by the implementation in which the widths of the **blksize_t**, **cc_t**, **mode_t**, **nfds_t**, **pid_t**,
14846 **ptrdiff_t**, **size_t**, **speed_t**, **ssize_t**, **suseconds_t**, **tcflag_t**, **wchar_t**, and **wint_t** types are no
14847 greater than the width of type **long**. The format of each name shall be suitable for use with
14848 the *getconf* **–v** option.

14849 _CS_V7_ENV
14850 This is the value that provides the environment variable information (other than that
14851 provided by _CS_PATH) that is required by the implementation to create a conforming
14852 environment, as described in the implementation's conformance documentation.

14853 OB The following symbolic constants are reserved for compatibility with Issue 6:

14854 _CS_POSIX_V6_ILP32_OFF32_CFLAGS
14855 _CS_POSIX_V6_ILP32_OFF32_LDFLAGS
14856 _CS_POSIX_V6_ILP32_OFF32_LIBS
14857 _CS_POSIX_V6_ILP32_OFFBIG_CFLAGS
14858 _CS_POSIX_V6_ILP32_OFFBIG_LDFLAGS
14859 _CS_POSIX_V6_ILP32_OFFBIG_LIBS
14860 _CS_POSIX_V6_LP64_OFF64_CFLAGS
14861 _CS_POSIX_V6_LP64_OFF64_LDFLAGS
14862 _CS_POSIX_V6_LP64_OFF64_LIBS
14863 _CS_POSIX_V6_LPBIG_OFFBIG_CFLAGS
14864 _CS_POSIX_V6_LPBIG_OFFBIG_LDFLAGS
14865 _CS_POSIX_V6_LPBIG_OFFBIG_LIBS
14866 _CS_POSIX_V6_WIDTH_RESTRICTED_ENVS
14867 _CS_V6_ENV

14868 The **<unistd.h>** header shall define SEEK_CUR, SEEK_END, and SEEK_SET as described in
14869 **<stdio.h>**.

14870 The **<unistd.h>** header shall define the following symbolic constants as possible values for the

function argument to the *lockf*( ) function:

F_LOCK	Lock a section for exclusive use.
F_TEST	Test section for locks by other processes.
F_TLOCK	Test and lock a section for exclusive use.
F_ULOCK	Unlock locked sections.

The **<unistd.h>** header shall define the following symbolic constants for *pathconf*( ):

_PC_2_SYMLINKS
_PC_ALLOC_SIZE_MIN
_PC_ASYNC_IO
_PC_CHOWN_RESTRICTED
_PC_FILESIZEBITS
_PC_LINK_MAX
_PC_MAX_CANON
_PC_MAX_INPUT
_PC_NAME_MAX
_PC_NO_TRUNC
_PC_PATH_MAX
_PC_PIPE_BUF
_PC_PRIO_IO
_PC_REC_INCR_XFER_SIZE
_PC_REC_MAX_XFER_SIZE
_PC_REC_MIN_XFER_SIZE
_PC_REC_XFER_ALIGN
_PC_SYMLINK_MAX
_PC_SYNC_IO
_PC_TIMESTAMP_RESOLUTION
_PC_VDISABLE

The **<unistd.h>** header shall define the following symbolic constants for *sysconf*( ):

_SC_2_C_BIND

15023 _SC_XOPEN_VERSION

15024 The two constants _SC_PAGESIZE and _SC_PAGE_SIZE may be defined to have the same value.

15025 The **<unistd.h>** header shall define the following symbolic constants for file streams:

15026 STDERR_FILENO File number of *stderr*; 2.

15027 STDIN_FILENO File number of *stdin*; 0.

15028 STDOUT_FILENO File number of *stdout*; 1.

15029 The **<unistd.h>** header shall define the following symbolic constant for terminal special
15030 character handling:

15031 _POSIX_VDISABLE This symbol shall be defined to be the value of a character that shall
15032 disable terminal special character handling as described in Section 11.2.6
15033 (on page 212). This symbol shall always be set to a value other than –1.

15034 **Type Definitions**

15035 The **<unistd.h>** header shall define the **size_t**, **ssize_t**, **uid_t**, **gid_t**, **off_t**, and **pid_t** types as
15036 described in **<sys/types.h>**.

15037 The **<unistd.h>** header shall define the **intptr_t** type as described in **<inttypes.h>**.

15038 **Declarations**

15039 The following shall be declared as functions and may also be defined as macros. Function
15040 prototypes shall be provided.

```
15041          int          access(const char *, int);
15042          unsigned     alarm(unsigned);
15043          int          chdir(const char *);
15044          int          chown(const char *, uid_t, gid_t);
15045          int          close(int);
15046          size_t       confstr(int, char *, size_t);
15047 XSI      char        *crypt(const char *, const char *);
15048 CX       char        *ctermid(char *);
15049          int          dup(int);
15050          int          dup2(int, int);
15051          void         _exit(int);                                    +
15052 XSI      void         encrypt(char [64], int);
15053          int          execl(const char *, const char *, ...);
15054          int          execle(const char *, const char *, ...);
15055          int          execlp(const char *, const char *, ...);
15056          int          execv(const char *, char *const []);
15057          int          execve(const char *, char *const [], char *const []);
15058          int          execvp(const char *, char *const []);

15085         int           isatty(int);
15086         int           lchown(const char *, uid_t, gid_t);
15087         int           link(const char *, const char *);
15088         int           linkat(int, const char *, int, const char *, int);
15089 XSI     int           lockf(int, int, off_t);
15090         off_t         lseek(int, off_t, int);
15091 XSI     int           nice(int);
15092         long          pathconf(const char *, int);
15093         int           pause(void);
15094         int           pipe(int [2]);
15095         ssize_t       pread(int, void *, size_t, off_t);
15096         ssize_t       pwrite(int, const void *, size_t, off_t);
15097         ssize_t       read(int, void *, size_t);
15098         ssize_t       readlink(const char *restrict, char *restrict, size_t);
15099         ssize_t       readlinkat(int, const char *restrict, char *restrict, size_t);
15100         int           rmdir(const char *);
15101         int           setegid(gid_t);
15102         int           seteuid(uid_t);
15103         int           setgid(gid_t);
15104         int           setpgid(pid_t, pid_t);
15105 OB XSI  pid_t         setpgrp(void);
15106 XSI     int           setregid(gid_t, gid_t);
15107         int           setreuid(uid_t, uid_t);
15108         pid_t         setsid(void);
15109         int           setuid(uid_t);
15110         unsigned      sleep(unsigned);
15111 XSI     void          swab(const void *restrict, void *restrict, ssize_t);
15112         int           symlink(const char *, const char *);
15113         int           symlinkat(const char *, int, const char *);
15114 XSI     void          sync(void);
15115         long          sysconf(int);
15116         pid_t         tcgetpgrp(int);
15117         int           tcsetpgrp(int, pid_t);
15118         int           truncate(const char *, off_t);
```

```
char        *ttyname(int);
int          ttyname_r(int, char *, size_t);
int          unlink(const char *);
int          unlinkat(int, const char *, int);
ssize_t      write(int, const void *, size_t);
```

Implementations may also include the *pthread_atfork*( ) prototype as defined in **<pthread.h>**.

The **<unistd.h>** header shall declare the following external variables:

```
extern char  *optarg;
extern int    opterr, optind, optopt;
```

APPLICATION USAGE

POSIX.1-200x only describes the behavior of systems that claim conformance to it. However, application developers who want to write applications that adapt to other versions of this standard (or to systems that do not conform to any POSIX standard) may find it useful to code them so as to conditionally compile different code depending on the value of _POSIX_VERSION, for example:

```
#if _POSIX_VERSION >= 200112L
/* Use the newer function that copes with large files. */
off_t pos=ftello(fp);
#else
/* Either this is an old version of POSIX, or _POSIX_VERSION is
   not even defined, so use the traditional function. */
long pos=ftell(fp);
#endif
```

Earlier versions of POSIX.1-200x and of the Single UNIX Specification can be identified by the following macros:

POSIX.1-1988 standard
: _POSIX_VERSION == 198808L

POSIX.1-1990 standard
: _POSIX_VERSION == 199009L

ISO POSIX-1: 1996 standard
: _POSIX_VERSION == 199506L

Single UNIX Specification, Version 1
: _XOPEN_UNIX and _XOPEN_VERSION == 4

Single UNIX Specification, Version 2
: _XOPEN_UNIX and _XOPEN_VERSION == 500

ISO POSIX-1: 2001 and Single UNIX Specification, Version 3
: _POSIX_VERSION == 200112L, plus (if the XSI option is supported) _XOPEN_UNIX and _XOPEN_VERSION == 600

POSIX.1-200x does not make any attempt to define application binary interaction with the underlying operating system. However, application developers may find it useful to query _SC_VERSION at runtime via *sysconf*( ) to determine whether the current version of the operating system supports the necessary functionality as in the following program fragment:

```
if (sysconf(_SC_VERSION) < 200xxxL) {
    fprintf(stderr, "POSIX.1-200x system required, terminating \n");
    exit(1);
```

```
}
```

New applications should not use _XOPEN_SHM or _XOPEN_ENH_I18N.

RATIONALE

As POSIX.1-200x evolved, certain options became sufficiently standardized that it was concluded that simply requiring one of the option choices was simpler than retaining the option. However, for backwards-compatibility, the option flags (with required constant values) are retained.

Version Test Macros

The standard developers considered altering the definition of _POSIX_VERSION and removing _SC_VERSION from the specification of *sysconf*( ) since the utility to an application was deemed by some to be minimal, and since the implementation of the functionality is potentially problematic. However, they recognized that support for existing application binaries is a concern to manufacturers, application developers, and the users of implementations conforming to POSIX.1-200x.

While the example using _SC_VERSION in the APPLICATION USAGE section does not provide the greatest degree of imaginable utility to the application developer or user, it is arguably better than a **core** file or some other equally obscure result. (It is also possible for implementations to encode and recognize application binaries compiled in various POSIX.1-conforming environments, and modify the semantics of the underlying system to conform to the expectations of the application.) For the reasons outlined in the preceding paragraphs and in the APPLICATION USAGE section, the standard developers elected to retain the _POSIX_VERSION and _SC_VERSION functionality.

Compile-Time Symbolic Constants for System-Wide Options

POSIX.1-200x includes support in certain areas for the newly adopted policy governing options and stubs.

This policy provides flexibility for implementations in how they support options. It also specifies how conforming applications can adapt to different implementations that support different sets of options. It allows the following:

1. If an implementation has no interest in supporting an option, it does not have to provide anything associated with that option beyond the announcement that it does not support it.
2. An implementation can support a partial or incompatible version of an option (as a non-standard extension) as long as it does not claim to support the option.
3. An application can determine whether the option is supported. A strictly conforming application must check this announcement mechanism before first using anything associated with the option.

There is an important implication of this policy. POSIX.1-200x cannot dictate the behavior of interfaces associated with an option when the implementation does not claim to support the option. In particular, it cannot require that a function associated with an unsupported option will fail if it does not perform as specified. However, this policy does not prevent a standard from requiring certain functions to always be present, but that they shall always fail on some implementations. The *setpgid*( ) function in the POSIX.1-1990 standard, for example, is considered appropriate.

The POSIX standards include various options, and the C-language binding support for an

option implies that the implementation must supply data types and function interfaces. An application must be able to discover whether the implementation supports each option.

Any application must consider the following three cases for each option:

1. Option never supported.

   The implementation advertises at compile time that the option will never be supported. In this case, it is not necessary for the implementation to supply any of the data types or function interfaces that are provided only as part of the option. The implementation might provide data types and functions that are similar to those defined by POSIX.1-200x, but there is no guarantee for any particular behavior.

2. Option always supported.

   The implementation advertises at compile time that the option will always be supported. In this case, all data types and function interfaces shall be available and shall operate as specified.

3. Option might or might not be supported.

   Some implementations might not provide a mechanism to specify support of options at compile time. In addition, the implementation might be unable or unwilling to specify support or non-support at compile time. In either case, any application that might use the option at runtime must be able to compile and execute. The implementation must provide, at compile time, all data types and function interfaces that are necessary to allow this. In this situation, there must be a mechanism that allows the application to query, at runtime, whether the option is supported. If the application attempts to use the option when it is not supported, the result is unspecified unless explicitly specified otherwise in POSIX.1-200x.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

The symbolic constants _XOPEN_REALTIME and _XOPEN_REALTIME_THREADS are added. _POSIX2_C_BIND, _XOPEN_ENH_I18N, and _XOPEN_SHM must now be set to a value other than –1 by a conforming implementation.

Large File System extensions are added.

The type of the argument to *sbrk*( ) is changed from **int** to **intptr_t**.

XBS constants are added to the list of constants for Options and Option Groups, to the list of constants for the *confstr*( ) function, and to the list of constants to the *sysconf*( ) function. These are all marked EX.

Issue 6

_POSIX2_C_VERSION is removed.

The Open Group Corrigendum U026/4 is applied, adding the prototype for *fdatasync*( ).

The Open Group Corrigendum U026/1 is applied, adding the symbols _SC_XOPEN_LEGACY, _SC_XOPEN_REALTIME, and _SC_XOPEN_REALTIME_THREADS.

The symbols _XOPEN_STREAMS and _SC_XOPEN_STREAMS are added to support the XSI STREAMS Option Group.

Text in the DESCRIPTION relating to conformance requirements is moved elsewhere in IEEE Std 1003.1-2001.

The LEGACY symbol _SC_PASS_MAX is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The _CS_POSIX_* and _CS_XBS5_* constants are added for the *confstr*( ) function.
- The _SC_XBS5_* constants are added for the *sysconf*( ) function.
- The symbolic constants F_ULOCK, F_LOCK, F_TLOCK, and F_TEST are added.
- The **uid_t**, **gid_t**, **off_t**, **pid_t**, and **useconds_t** types are mandated.

The *gethostname*( ) prototype is added for sockets.

A new section is added for System-Wide Options.

Function prototypes for *setegid*( ) and *seteuid*( ) are added.

Option symbolic constants are added for _POSIX_ADVISORY_INFO, _POSIX_CPUTIME, _POSIX_SPAWN, _POSIX_SPORADIC_SERVER, _POSIX_THREAD_CPUTIME, _POSIX_THREAD_SPORADIC_SERVER, and _POSIX_TIMEOUTS, and *pathconf*( ) variables are added for _PC_ALLOC_SIZE_MIN, _PC_REC_INCR_XFER_SIZE, _PC_REC_MAX_XFER_SIZE, _PC_REC_MIN_XFER_SIZE, and _PC_REC_XFER_ALIGN for alignment with IEEE Std 1003.1d-1999.

The following are added for alignment with IEEE Std 1003.1j-2000:

- Option symbolic constants _POSIX_BARRIERS, _POSIX_CLOCK_SELECTION, _POSIX_MONOTONIC_CLOCK, _POSIX_READER_WRITER_LOCKS, _POSIX_SPIN_LOCKS, and _POSIX_TYPED_MEMORY_OBJECTS
- *sysconf*( ) variables _SC_BARRIERS, _SC_CLOCK_SELECTION, _SC_MONOTONIC_CLOCK, _SC_READER_WRITER_LOCKS, _SC_SPIN_LOCKS, and _SC_TYPED_MEMORY_OBJECTS

The _SC_XBS5 macros associated with the ISO/IEC 9899:1990 standard are marked LEGACY, and new equivalent _SC_V6 macros associated with the ISO/IEC 9899:1999 standard are introduced.

The *getwd*( ) function is marked LEGACY.

The **restrict** keyword is added to the prototypes for *readlink*( ) and *swab*( ).

Constants for options are now harmonized, so when supported they take the year of approval of IEEE Std 1003.1-2001 as the value.

The following are added for alignment with IEEE Std 1003.1q-2000:

- Optional symbolic constants _POSIX_TRACE, _POSIX_TRACE_EVENT_FILTER, _POSIX_TRACE_LOG, and _POSIX_TRACE_INHERIT
- The *sysconf*( ) symbolic constants _SC_TRACE, _SC_TRACE_EVENT_FILTER, _SC_TRACE_LOG, and _SC_TRACE_INHERIT

The *brk*( ) and *sbrk*( ) LEGACY functions are removed.

The Open Group Base Resolution bwg2001-006 is applied, which reworks the XSI versioning information.

The Open Group Base Resolution bwg2001-008 is applied, changing the *namelen* parameter for *gethostname*( ) from **socklen_t** to **size_t**.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/2 is applied, changing "Thread Stack Address Size" to "Thread Stack Size Attribute".

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/20 is applied, adding the _POSIX_IPV6, _SC_V6, and _SC_RAW_SOCKETS symbols.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/21 is applied, correcting the description in "Constants for Functions" for the _CS_POSIX_V6_LP64_OFF64_CFLAGS, _CS_POSIX_V6_LP64_OFF64_LDFLAGS, and _CS_POSIX_V6_LP64_OFF64_LIBS symbols.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/22 is applied, removing the shading for the _PC* and _SC* constants, since these are mandatory on all implementations.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/23 is applied, adding the _PC_SYMLINK_MAX and _SC_SYMLOOP_MAX constants.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/24 is applied, correcting the shading and margin code for the *fsync*( ) function.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/25 is applied, adding the following text to the APPLICATION USAGE section: "New applications should not use _XOPEN_SHM or _XOPEN_ENH_I18N.".

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/29 is applied, clarifying the requirements for when constants for Options and Option Groups can be defined or undefined.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/30 is applied, changing the _V6_ILP32_OFF32, _V6_ILP32_OFFBIG, _V6_LP64_OFF64, and _V6_LPBIG_OFFBIG symbols to _POSIX_V6_ILP32_OFF32, _POSIX_V6_ILP32_OFFBIG, _POSIX_V6_LP64_OFF64, and _POSIX_V6_LPBIG_OFFBIG, respectively. This is for consistency with the *sysconf*( ) and *c99* reference pages.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/31 is applied, adding that the format of names of programming environments can be obtained using the *getconf* **–v** option.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/32 is applied, deleting the _SC_FILE_LOCKING, _SC_2_C_VERSION, and _SC_XOPEN_XCU_VERSION constants.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/33 is applied, adding _SC_SS_REPL_MAX, _SC_TRACE_EVENT_NAME_MAX, _SC_TRACE_NAME_MAX, _SC_TRACE_SYS_MAX, and _SC_TRACE_USER_EVENT_MAX to the list of symbolic constants for *sysconf*( ).

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/34 is applied, updating the prototype for the *symlink*( ) function to match that in the System Interfaces volume of IEEE Std 1003.1-2001.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/35 is applied, adding _PC_2_SYMLINKS to the symbolic constants list for *pathconf*( ). This corresponds to the definition of POSIX2_SYMLINKS in the Shell and Utilities volume of IEEE Std 1003.1-2001.

Issue 7

Austin Group Interpretations 1003.1-2001 #026 and #047 are applied.

Austin Group Interpretation 1003.1-2001 #166 is applied to permit an additional compiler flag to enable threads.

Austin Group Interpretation 1003.1-2001 #178 is applied, clarifying the values allowed for _POSIX2_CHAR_TERM.

SD5-XBD-ERN-41 is applied, adding the _POSIX2_SYMLINKS constant.

SD5-XBD-ERN-76 and SD5-XBD-ERN-77 are applied.

Symbols to support the UUCP Utilities option are added.

The variables for the supported programming environments are updated to be V7.

The LEGACY and obsolescent symbols are removed.

The *faccessat*( ), *fchownat*( ), *fexecve*( ), *linkat*( ), *readlinkat*( ), *symlinkat*( ), and *unlinkat*( ) functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

The _POSIX_TRACE* constants from the Trace option are marked obsolescent.

The _POSIX2_PBS* constants from the Batch Environment Services and Utilities option are marked obsolescent.

Functionality relating to the Asynchronous Input and Output, Barriers, Clock Selection, Memory Mapped Files, Memory Protection, Realtime Signals Extension, Semaphores, Spin Locks, Threads, Timeouts, and Timers options is moved to the Base.

Functionality relating to the Thread Priority Protection and Thread Priority Inheritance options is changed to be Non-Robust Mutex or Robust Mutex Priority Protection and Non-Robust Mutex or Robust Mutex Priority Inheritance, respectively.

This reference page is clarified with respect to macros and symbolic constants.

Changes are made related to support for finegrained timestamps and the _POSIX_TIMESTAMP_RESOLUTION constant is added.

The _SC_THREAD_ROBUST_PRIO_INHERIT and _SC_THREAD_ROBUST_PRIO_PROTECT + symbolic constants are added.

15368 **NAME**

15369 utime.h — access and modification times structure

15370 **SYNOPSIS**

15371 OB
```
#include <utime.h>
```

15372 **DESCRIPTION**

15373 The **<utime.h>** header shall declare the **utimbuf** structure, which shall include the following
15374 members:

15375 `time_t` `actime` Access time.
15376 `time_t` `modtime` Modification time.

15377 The times shall be measured in seconds since the Epoch.

15378 The **<utime.h>** header shall define the **time_t** type as described in **<sys/types.h>**.

15379 The following shall be declared as a function and may also be defined as a macro. A function
15380 prototype shall be provided.

15381
```
int utime(const char *, const struct utimbuf *);
```

15382 **APPLICATION USAGE**

15383 The *utime*( ) function only allows setting file timestamps to the nearest second. Applications
15384 should use the *utimensat*( ) function instead. See **<sys/stat.h>**.

15385 **RATIONALE**

15386 None.

15387 **FUTURE DIRECTIONS**

15388 The **<utime.h>** header may be removed in a future version.

15389 **SEE ALSO**

15390 **<sys/stat.h>**, **<sys/types.h>**

15391 XSH *futimens*( ), *utime*( )

15392 **CHANGE HISTORY**

15393 First released in Issue 3.

15394 **Issue 6**

15395 The following new requirements on POSIX implementations derive from alignment with the
15396 Single UNIX Specification:

15397 - The **time_t** type is defined.

15398 **Issue 7**

15399 The **<utime.h>** header is marked obsolescent.

NAME

utmpx.h — user accounting database definitions

SYNOPSIS

XSI
```
#include <utmpx.h>
```

DESCRIPTION

The **<utmpx.h>** header shall define the **utmpx** structure that shall include at least the following members:

`char`	`ut_user[]`	User login name.
`char`	`ut_id[]`	Unspecified initialization process identifier.
`char`	`ut_line[]`	Device name.
`pid_t`	`ut_pid`	Process ID.
`short`	`ut_type`	Type of entry.
`struct timeval`	`ut_tv`	Time entry was made.

The **<utmpx.h>** header shall define the **pid_t** type through **typedef**, as described in **<sys/types.h>**.

The **<utmpx.h>** header shall define the **timeval** structure as described in **<sys/time.h>**.

Inclusion of the **<utmpx.h>** header may also make visible all symbols from **<sys/time.h>**.

The **<utmpx.h>** header shall define the following symbolic constants as possible values for the *ut_type* member of the **utmpx** structure:

EMPTY	No valid user accounting information.
BOOT_TIME	Identifies time of system boot.
OLD_TIME	Identifies time when system clock changed.
NEW_TIME	Identifies time after system clock changed.
USER_PROCESS	Identifies a process.
INIT_PROCESS	Identifies a process spawned by the init process.
LOGIN_PROCESS	Identifies the session leader of a logged-in user.
DEAD_PROCESS	Identifies a session leader who has exited.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
void          endutxent(void);
struct utmpx *getutxent(void);
struct utmpx *getutxid(const struct utmpx *);
struct utmpx *getutxline(const struct utmpx *);
struct utmpx *pututxline(const struct utmpx *);
void          setutxent(void);
```

15435 **APPLICATION USAGE**

15436 None.

15437 **RATIONALE**

15438 None.

15439 **FUTURE DIRECTIONS**

15440 None.

15441 **SEE ALSO**

15442 **<sys/time.h>**, **<sys/types.h>**

15443 XSH *endutxent*( )

15444 **CHANGE HISTORY**

15445 First released in Issue 4, Version 2.

NAME

wchar.h — wide-character handling

SYNOPSIS

```
#include <wchar.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to enable the visibility of these symbols in this header.

The **<wchar.h>** header shall define the following types:

CX **FILE** As described in **<stdio.h>**.

CX **locale_t** As described in **<locale.h>**.

mbstate_t An object type other than an array type that can hold the conversion state information necessary to convert between sequences of (possibly multi-byte) CX characters and wide characters. If a codeset is being used such that an **mbstate_t** needs to preserve more than two levels of reserved state, the results are unspecified.

size_t As described in **<stddef.h>**.

CX **va_list** As described in **<stdarg.h>**.

wchar_t As described in **<stddef.h>**.

OB XSI **wctype_t** A scalar type of a data object that can hold values which represent locale-specific character classification.

wint_t An integer type capable of storing any valid value of **wchar_t** or WEOF.

The tag **tm** shall be declared as naming an incomplete structure type, the contents of which are described in the **<time.h>** header.

The implementation shall support one or more programming environments in which the width of **wint_t** is no greater than the width of type **long**. The names of these programming environments can be obtained using the *confstr*( ) function or the *getconf* utility.

The **<wchar.h>** header shall define the following macros:

WCHAR_MAX As described in **<stdint.h>**.

WCHAR_MIN As described in **<stdint.h>**.

WEOF Constant expression of type **wint_t** that is returned by several WP functions to indicate end-of-file.

NULL As described in **<stddef.h>**.

CX Inclusion of the **<wchar.h>** header may make visible all symbols from the headers **<ctype.h>**, **<string.h>**, **<stdarg.h>**, **<stddef.h>**, **<stdio.h>**, **<stdlib.h>**, and **<time.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with ISO C standard compilers.

```
wint_t        btowc(int);
wint_t        fgetwc(FILE *);
wchar_t      *fgetws(wchar_t *restrict, int, FILE *restrict);
wint_t        fputwc(wchar_t, FILE *);
int           fputws(const wchar_t *restrict, FILE *restrict);
```

```
15488           int             fwide(FILE *, int);
15489           int             fwprintf(FILE *restrict, const wchar_t *restrict, ...);
15490           int             fwscanf(FILE *restrict, const wchar_t *restrict, ...);
15491           wint_t          getwc(FILE *);
15492           wint_t          getwchar(void);
15493   OB XSI  int             iswalnum(wint_t);
15494           int             iswalpha(wint_t);
15495           int             iswcntrl(wint_t);
15496           int             iswctype(wint_t, wctype_t);
15497           int             iswdigit(wint_t);
15498           int             iswgraph(wint_t);
15499           int             iswlower(wint_t);
15500           int             iswprint(wint_t);
15501           int             iswpunct(wint_t);
15502           int             iswspace(wint_t);
15503           int             iswupper(wint_t);
15504           int             iswxdigit(wint_t);
15505           size_t          mbrlen(const char *restrict, size_t, mbstate_t *restrict);
15506           size_t          mbrtowc(wchar_t *restrict, const char *restrict, size_t,
15507                               mbstate_t *restrict);
15508           int             mbsinit(const mbstate_t *);
15509   CX      size_t          mbsnrtowcs(wchar_t *restrict, const char **restrict,
15510                               size_t, size_t, mbstate_t *restrict);
15511           size_t          mbsrtowcs(wchar_t *restrict, const char **restrict, size_t,
15512                               mbstate_t *restrict);
15513   CX      FILE           *open_wmemstream(wchar_t **, size_t *);
15514           wint_t          putwc(wchar_t, FILE *);
15515           wint_t          putwchar(wchar_t);
15516           int             swprintf(wchar_t *restrict, size_t,
15517                               const wchar_t *restrict, ...);
15518           int             swscanf(const wchar_t *restrict,
15519                               const wchar_t *restrict, ...);
15520   OB XSI  wint_t          towlower(wint_t);
15521           wint_t          towupper(wint_t);
15522           wint_t          ungetwc(wint_t, FILE *);
15523           int             vfwprintf(FILE *restrict, const wchar_t *restrict, va_list);
15524           int             vfwscanf(FILE *restrict, const wchar_t *restrict, va_list);
15525           int             vswprintf(wchar_t *restrict, size_t,                    -
15526                               const wchar_t *restrict, va_list);
15527           int             vswscanf(const wchar_t *restrict, const wchar_t *restrict,
15528                               va_list);
15529           int             vwprintf(const wchar_t *restrict, va_list);             +
15530           int             vwscanf(const wchar_t *restrict, va_list);
15531   CX      wchar_t        *wcpcpy(wchar_t restrict*, const wchar_t *restrict);
15532           wchar_t        *wcpncpy(wchar_t restrict *, const wchar_t *restrict, size_t);
15533           size_t          wcrtomb(char *restrict, wchar_t, mbstate_t *restrict);
15534   CX      int             wcscasecmp(const wchar_t *, const wchar_t *);
15535           int             wcscasecmp_l(const wchar_t *, const wchar_t *, locale_t);
15536           wchar_t        *wcscat(wchar_t *restrict, const wchar_t *restrict);
15537           wchar_t        *wcschr(const wchar_t *, wchar_t);
15538           int             wcscmp(const wchar_t *, const wchar_t *);
15539           int             wcscoll(const wchar_t *, const wchar_t *);
```

```
15540 CX      int            wcscoll_l(const wchar_t *, const wchar_t *, locale_t);
15541         wchar_t       *wcscpy(wchar_t *restrict, const wchar_t *restrict);
15542         size_t         wcscspn(const wchar_t *, const wchar_t *);
15543 CX      wchar_t       *wcsdup(const wchar_t *);
15544         size_t         wcsftime(wchar_t *restrict, size_t,
15545                            const wchar_t *restrict, const struct tm *restrict);
15546         size_t         wcslen(const wchar_t *);

15569         unsigned long  wcstoul(const wchar_t *restrict, wchar_t **restrict, int);
15570         unsigned long long
15571                        wcstoull(const wchar_t *restrict, wchar_t **restrict, int);
15572 XSI     int            wcswidth(const wchar_t *, size_t);
15573         size_t         wcsxfrm(wchar_t *restrict, const wchar_t *restrict, size_t);
15574 CX      size_t         wcsxfrm_l(wchar_t *restrict, const wchar_t *restrict,
15575                            size_t, locale_t);
15576         int            wctob(wint_t);
15577 OB XSI  wctype_t       wctype(const char *);
15578 XSI     int            wcwidth(wchar_t);
15579         wchar_t       *wmemchr(const wchar_t *, wchar_t, size_t);
15580         int            wmemcmp(const wchar_t *, const wchar_t *, size_t);
15581         wchar_t       *wmemcpy(wchar_t *restrict, const wchar_t *restrict, size_t);
15582         wchar_t       *wmemmove(wchar_t *, const wchar_t *, size_t);
15583         wchar_t       *wmemset(wchar_t *, wchar_t, size_t);
15584         int            wprintf(const wchar_t *restrict, ...);
15585         int            wscanf(const wchar_t *restrict, ...);
```

APPLICATION USAGE

The *iswblank*( ) function was a late addition to the ISO C standard and was introduced at the same time as the ISO C standard introduced **<wctype.h>**, which contains all of the *isw**( ) functions. The Open Group Base Specifications had previously aligned with the MSE working draft and had introduced the rest of the *isw**( ) functions into **<wchar.h>**. For backwards-compatibility, the original set of *isw**( ) functions, without *iswblank*( ), are permitted (as part of the XSI option) in **<wchar.h>**. For maximum portability, applications should include **<wctype.h>** in order to obtain declarations for the *isw**( ) functions. This compatibility has been made obsolescent.

RATIONALE

In the ISO C standard, the symbols referenced as XSI extensions are in **<wctype.h>**. Their presence here is thus an extension.

FUTURE DIRECTIONS

None.

XCU *getconf*

CHANGE HISTORY

First released in Issue 4.

Issue 5

Aligned with the ISO/IEC 9899: 1990/Amendment 1: 1995 (E).

Issue 6

The Open Group Corrigendum U021/10 is applied. The prototypes for *wcswidth*( ) and *wcwidth*( ) are marked as extensions.

The Open Group Corrigendum U028/5 is applied, correcting the prototype for the *mbsinit*( ) function.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- Various function prototypes are updated to add the **restrict** keyword.
- The functions *vfwscanf*( ), *vswscanf*( ), *wcstof*( ), *wcstold*( ), *wcstoll*( ), and *wcstoull*( ) are added.

The type **wctype_t**, the *isw**( ), *to**( ), and *wctype*( ) functions are marked as XSI extensions.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/26 is applied, adding the APPLICATION USAGE section.

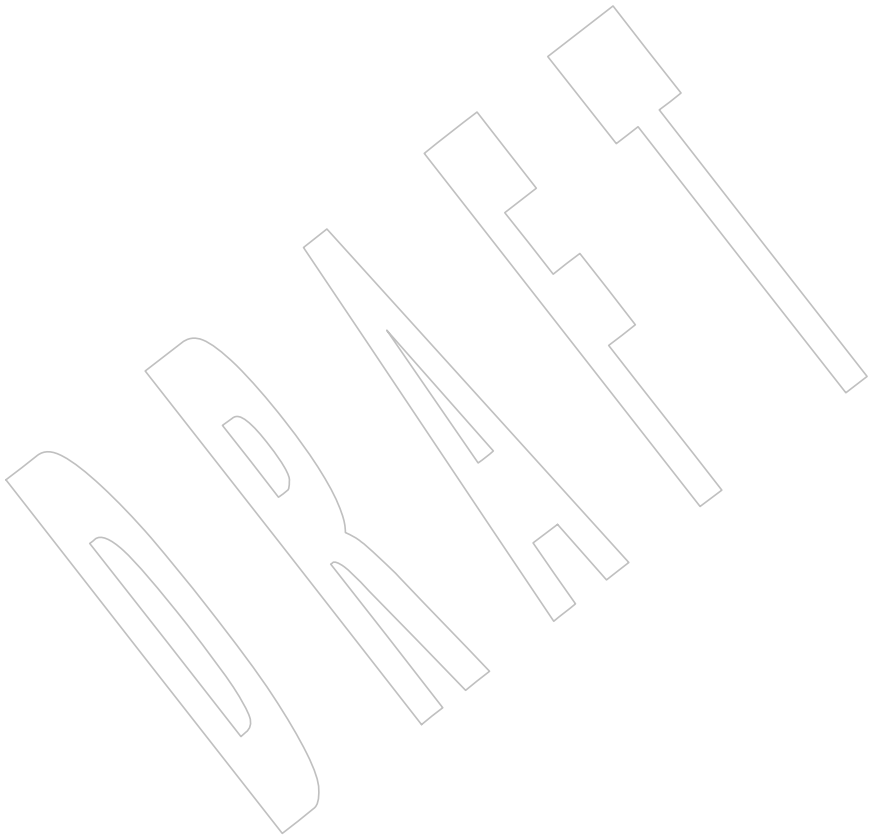
Issue 7

The *mbsnrtowcs*(), *open_wmemstream*(), *wcpcpy*(), *wcpncpy*(), *wcscasecmp*(), *wcsdup*(), *wcsncasecmp*(), *wcsnlen*(), and *wscnrtombs*() functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

The *wcscasecmp_l*(), *wcsncasecmp_l*(), *wcscoll_l*(), and *wcsxfrm_l*() functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

The **wctype_t** type, and the *isw**, *towlower*(), and *towupper*() functions are marked obsolescent in **<wchar.h>** since the ISO C standard requires the declarations to be in **<wctype.h>**.

This reference page is clarified with respect to macros and symbolic constants, and a declaration for the **locale_t** type is added.



NAME

wctype.h — wide-character classification and mapping utilities

SYNOPSIS

```
#include <wctype.h>
```

DESCRIPTION

CX Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 468) to enable the visibility of these symbols in this header.

The **<wctype.h>** header shall define the following types:

wint_t As described in **<wchar.h>**.

wctrans_t A scalar type that can hold values which represent locale-specific character mappings.

wctype_t As described in **<wchar.h>**.

CX The **<wctype.h>** header shall define the **locale_t** type as described in **<locale.h>**.

The **<wctype.h>** header shall define the following macro:

WEOF As described in **<wchar.h>**.

For all functions described in this header that accept an argument of type **wint_t**, the value is representable as a **wchar_t** or equals the value of WEOF. If this argument has any other value, the behavior is undefined.

The behavior of these functions shall be affected by the *LC_CTYPE* category of the current locale.

CX Inclusion of the **<wctype.h>** header may make visible all symbols from the headers **<ctype.h>**, **<stdarg.h>**, **<stddef.h>**, **<stdio.h>**, **<stdlib.h>**, **<string.h>**, **<time.h>**, and **<wchar.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided for use with ISO C standard compilers.

```
int       iswalnum(wint_t);
CX int    iswalnum_l(wint_t, locale_t);
int       iswalpha(wint_t);
CX int    iswalpha_l(wint_t, locale_t);
int       iswblank(wint_t);
CX int    iswblank_l(wint_t, locale_t);
int       iswcntrl(wint_t);
CX int    iswcntrl_l(wint_t, locale_t);
int       iswctype(wint_t, wctype_t);
CX int    iswctype_l(wint_t, wctype_t, locale_t);
int       iswdigit(wint_t);
CX int    iswdigit_l(wint_t, locale_t);
int       iswgraph(wint_t);
CX int    iswgraph_l(wint_t, locale_t);
int       iswlower(wint_t);
CX int    iswlower_l(wint_t, locale_t);
int       iswprint(wint_t);
CX int    iswprint_l(wint_t, locale_t);
int       iswpunct(wint_t);
CX int    iswpunct_l(wint_t, locale_t);
int       iswspace(wint_t);
```

```
15684 CX    int       iswspace_l(wint_t, locale_t);
15685       int       iswupper(wint_t);
15686 CX    int       iswupper_l(wint_t, locale_t);
15687       int       iswxdigit(wint_t);
15688 CX    int       iswxdigit_l(wint_t, locale_t);
15689       wint_t    towctrans(wint_t, wctrans_t);
15690 CX    wint_t    towctrans_l(wint_t, wctrans_t, locale_t);
15691       wint_t    towlower(wint_t);
15692 CX    wint_t    towlower_l(wint_t, locale_t);
15693       wint_t    towupper(wint_t);
15694 CX    wint_t    towupper_l(wint_t, locale_t);
15695       wctrans_t wctrans(const char *);
15696 CX    wctrans_t wctrans_l(const char *, locale_t);
15697       wctype_t  wctype(const char *);
15698 CX    wctype_t  wctype_l(const char *, locale_t);

15719 This reference page is clarified with respect to macros and symbolic constants.

NAME

wordexp.h — word-expansion types

SYNOPSIS

```
#include <wordexp.h>
```

DESCRIPTION

The **<wordexp.h>** header shall define the structures and symbolic constants used by the *wordexp*( ) and *wordfree*( ) functions.

The **<wordexp.h>** header shall define the **wordexp_t** structure type, which shall include at least the following members:

`size_t`	`we_wordc`	Count of words matched by *words.*
`char`	`**we_wordv`	Pointer to list of expanded words.
`size_t`	`we_offs`	Slots to reserve at the beginning of *we_wordv.*

The **<wordexp.h>** header shall define the following symbolic constants for use as flags for the *wordexp*( ) function:

WRDE_APPEND	Append words to those previously generated.
WRDE_DOOFFS	Number of null pointers to prepend to *we_wordv*.
WRDE_NOCMD	Fail if command substitution is requested.
WRDE_REUSE	The *pwordexp* argument was passed to a previous successful call to *wordexp*( ), and has not been passed to *wordfree*( ). The result is the same as if the application had called *wordfree*( ) and then called *wordexp*( ) without WRDE_REUSE.
WRDE_SHOWERR	Do not redirect *stderr* to **/dev/null**.
WRDE_UNDEF	Report error on an attempt to expand an undefined shell variable.

The **<wordexp.h>** header shall define the following symbolic constants as error return values:

WRDE_BADCHAR	One of the unquoted characters—<newline>, `'|'`, `'&'`, `';'`, `'<'`, `'>'`, `'('`, `')'`, `'{'`, `'}'`—appears in *words* in an inappropriate context.
WRDE_BADVAL	Reference to undefined shell variable when WRDE_UNDEF is set in *flags*.
WRDE_CMDSUB	Command substitution requested when WRDE_NOCMD was set in *flags*.
WRDE_NOSPACE	Attempt to allocate memory failed.
WRDE_SYNTAX	Shell syntax error, such as unbalanced parentheses or unterminated string.

The **<wordexp.h>** header shall define the **size_t** type as described in **<stddef.h>**.

The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

```
int  wordexp(const char *restrict, wordexp_t *restrict, int);
void wordfree(wordexp_t *);
```

15756 **APPLICATION USAGE**

15765 **CHANGE HISTORY**

15766 First released in Issue 4. Derived from the ISO POSIX-2 standard.

15767 **Issue 6**

15768 The **restrict** keyword is added to the prototype for *wordexp*( ).

15769 The WRDE_NOSYS constant is marked obsolescent.

15770 **Issue 7**

15771 The obsolescent WRDE_NOSYS constant is removed.

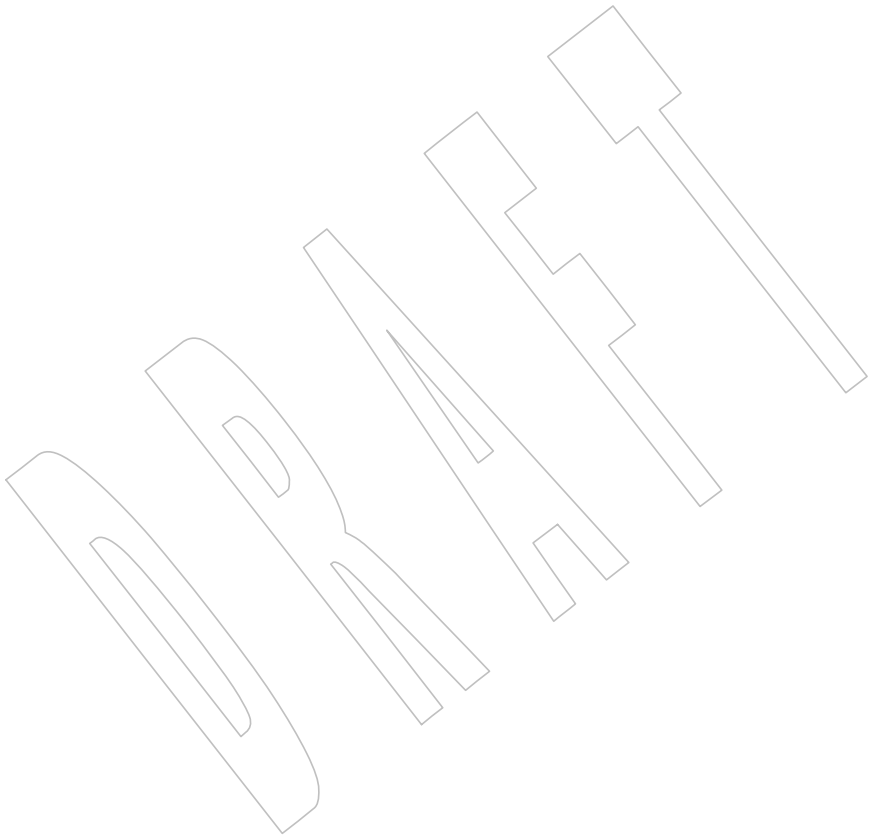
15772 This reference page is clarified with respect to macros and symbolic constants.

15773 *Technical Standard*

15774 **Volume 2:**

15775 **System Interfaces, Issue 7**

15776 *The Open Group*
15777 *The Institute of Electrical and Electronics Engineers, Inc.*



15778 *Chapter 1*

15779 # *Introduction*

15780 The System Interfaces volume of POSIX.1-200x describes the interfaces offered to application
15781 programs by POSIX-conformant systems.

15782 ## 1.1 Relationship to Other Formal Standards

15783 Great care has been taken to ensure that this volume of POSIX.1-200x is fully aligned with the
15784 following standards:

15785 ISO C (1999)
15786 ISO/IEC 9899: 1999, Programming Languages — C, including ISO/IEC
15787 9899: 1999/Cor.1: 2001(E), ISO/IEC 9899: 1999/Cor.2: 2004(E), and ISO/IEC
15788 9899: 1999/Cor.3: 200x(E).

15789 Parts of the ISO/IEC 9899: 1999 standard (hereinafter referred to as the ISO C standard) are
15790 referenced to describe requirements also mandated by this volume of POSIX.1-200x. Some
15791 functions and headers included within this volume of POSIX.1-200x have a version in the ISO C
15792 standard; in this case CX markings are added as appropriate to show where the ISO C standard
15793 has been extended (see Section 1.7.1, on page 7). Any conflict between this volume of
15794 POSIX.1-200x and the ISO C standard is unintentional.

15795 This volume of POSIX.1-200x also allows, but does not require, mathematics functions to
15796 support IEEE Std 754-1985 and IEEE Std 854-1987.

15797 ## 1.2 Format of Entries

15798 The entries in Chapter 3 are based on a common format as follows. The only sections relating to
15799 conformance are the SYNOPSIS, DESCRIPTION, RETURN VALUE, and ERRORS sections.

15800 **NAME**
15801 This section gives the name or names of the entry and briefly states its purpose.

15802 **SYNOPSIS**
15803 This section summarizes the use of the entry being described. If it is necessary to
15804 include a header to use this function, the names of such headers are shown, for
15805 example:

15806 ```
#include <stdio.h>
```

15807 **DESCRIPTION**
15808 This section describes the functionality of the function or header.

15809 **RETURN VALUE**
15810 This section indicates the possible return values, if any.

15811 If the implementation can detect errors, "successful completion" means that no error
```

has been detected during execution of the function. If the implementation does detect an error, the error is indicated.

For functions where no errors are defined, "successful completion" means that if the implementation checks for errors, no error has been detected. If the implementation can detect errors, and an error is detected, the indicated return value is returned and *errno* may be set.

ERRORS

This section gives the symbolic names of the error values returned by a function or stored into a variable accessed through the symbol *errno* if an error occurs.

"No errors are defined" means that error values returned by a function or stored into a variable accessed through the symbol *errno*, if any, depend on the implementation.

EXAMPLES

This section is informative.

This section gives examples of usage, where appropriate. In the event of conflict between an example and a normative part of this volume of POSIX.1-200x, the normative material is to be taken as correct.

APPLICATION USAGE

This section is informative.

This section gives warnings and advice to application developers about the entry. In the event of conflict between warnings and advice and a normative part of this volume of POSIX.1-200x, the normative material is to be taken as correct.

RATIONALE

This section is informative.

This section contains historical information concerning the contents of this volume of POSIX.1-200x and why features were included or discarded by the standard developers.

FUTURE DIRECTIONS

This section is informative.

This section provides comments which should be used as a guide to current thinking; there is not necessarily a commitment to adopt these future directions.

SEE ALSO

This section is informative.

This section gives references to related information.

CHANGE HISTORY

This section is informative.

This section shows the derivation of the entry and any significant changes that have been made to it.

15849 *Chapter 2*

15850 # *General Information*

15851 This chapter covers information that is relevant to all the functions specified in Chapter 3 and
15852 XBD Chapter 13 (on page 219).

15853 ## 2.1 Use and Implementation of Interfaces

15854 ### 2.1.1 Use and Implementation of Functions

15855 Each of the following statements shall apply to all functions unless explicitly stated otherwise in
15856 the detailed descriptions that follow:

15857 1. If an argument to a function has an invalid value (such as a value outside the domain of
15858 the function, or a pointer outside the address space of the program, or a null pointer), the
15859 behavior is undefined.

15860 2. Any function declared in a header may also be implemented as a macro defined in the
15861 header, so a function should not be declared explicitly if its header is included. Any
15862 macro definition of a function can be suppressed locally by enclosing the name of the
15863 function in parentheses, because the name is then not followed by the <left-parenthesis>
15864 that indicates expansion of a macro function name. For the same syntactic reason, it is
15865 permitted to take the address of a function even if it is also defined as a macro. The use of
15866 the C-language **#undef** construct to remove any such macro definition shall also ensure
15867 that an actual function is referred to.

15868 3. Any invocation of a function that is implemented as a macro shall expand to code that
15869 evaluates each of its arguments exactly once, fully protected by parentheses where
15870 necessary, so it is generally safe to use arbitrary expressions as arguments.

15871 4. Provided that a function can be declared without reference to any type defined in a
15872 header, it is also permissible to declare the function explicitly and use it without including
15873 its associated header.

15874 5. If a function that accepts a variable number of arguments is not declared (explicitly or by
15875 including its associated header), the behavior is undefined.

2.1.2 Use and Implementation of Macros

Each of the following statements shall apply to all macros unless explicitly stated otherwise:

1. Any definition of an object-like macro in a header shall expand to code that is fully protected by parentheses where necessary, so that it groups in an arbitrary expression as if it were a single identifier.
2. All object-like macros listed as expanding to integer constant expressions shall additionally be suitable for use in **#if** preprocessing directives.
3. Any definition of a function-like macro in a header shall expand to code that evaluates each of its arguments exactly once, fully protected by parentheses where necessary, so that it is generally safe to use arbitrary expressions as arguments.
4. Any definition of a function-like macro in a header can be invoked in an expression anywhere a function with a compatible return type could be called.

2.2 The Compilation Environment

2.2.1 POSIX.1 Symbols

Certain symbols in this volume of POSIX.1-200x are defined in headers (see XBD Chapter 13, on page 219). Some of those headers could also define symbols other than those defined by POSIX.1-200x, potentially conflicting with symbols used by the application. Also, POSIX.1-200x defines symbols that are not permitted by other standards to appear in those headers without some control on the visibility of those symbols.

Symbols called "feature test macros" are used to control the visibility of symbols that might be included in a header. Implementations, future versions of this standard, and other standards may define additional feature test macros.

In the compilation of an application that **#define**s a feature test macro specified by POSIX.1-200x, no header defined by POSIX.1-200x shall be included prior to the definition of the feature test macro. This restriction also applies to any implementation-provided header in which these feature test macros are used. If the definition of the macro does not precede the **#include**, the result is undefined.

Feature test macros shall begin with the <underscore> character (`'_'`).

2.2.1.1 *The _POSIX_C_SOURCE Feature Test Macro*

A POSIX-conforming application shall ensure that the feature test macro _POSIX_C_SOURCE is defined before inclusion of any header.

When an application includes a header described by POSIX.1-200x, and when this feature test macro is defined to have the value 200xxxL:

1. All symbols required by POSIX.1-200x to appear when the header is included shall be made visible.

2. Symbols that are explicitly permitted, but not required, by POSIX.1-200x to appear in that header (including those in reserved name spaces) may be made visible.

3. Additional symbols not required or explicitly permitted by POSIX.1-200x to be in that header shall not be made visible, except when enabled by another feature test macro.

Identifiers in POSIX.1-200x may only be undefined using the **#undef** directive as described in Section 2.1 (on page 467) or Section 2.2.2. These **#undef** directives shall follow all **#include** directives of any header in POSIX.1-200x.

Note: The POSIX.1-1990 standard specified a macro called _POSIX_SOURCE. This has been superseded by _POSIX_C_SOURCE.

2.2.1.2 *The _XOPEN_SOURCE Feature Test Macro*

XSI An XSI-conforming application shall ensure that the feature test macro _XOPEN_SOURCE is defined with the value 700 before inclusion of any header. This is needed to enable the functionality described in Section 2.2.1.1 (on page 468) and to ensure that the XSI option is enabled.

Since this volume of POSIX.1-200x is aligned with the ISO C standard, and since all functionality enabled by _POSIX_C_SOURCE set equal to 200xxxL is enabled by _XOPEN_SOURCE set equal to 700, there should be no need to define _POSIX_C_SOURCE if _XOPEN_SOURCE is so defined. Therefore, if _XOPEN_SOURCE is set equal to 700 and _POSIX_C_SOURCE is set equal to 200xxxL, the behavior is the same as if only _XOPEN_SOURCE is defined and set equal to 700. However, should _POSIX_C_SOURCE be set to a value greater than 200xxxL, the behavior is unspecified.

If _XOPEN_SOURCE is defined with the value 700 and _POSIX_C_SOURCE is undefined before inclusion of any header, then the header may define the _POSIX_C_SOURCE macro with the value 200xxxL.

2.2.2 The Name Space

All identifiers in this volume of POSIX.1-200x, except *environ*, are defined in at least one of the XSI headers, as shown in XBD Chapter 13 (on page 219). When _XOPEN_SOURCE or _POSIX_C_SOURCE is defined, each header defines or declares some identifiers, potentially conflicting with identifiers used by the application. The set of identifiers visible to the application consists of precisely those identifiers from the header pages of the included headers, as well as additional identifiers reserved for the implementation. In addition, some headers may make visible identifiers from other headers as indicated on the relevant header pages.

Implementations may also add members to a structure or union without controlling the visibility of those members with a feature test macro, as long as a user-defined macro with the same name cannot interfere with the correct interpretation of the program. The identifiers reserved for use by the implementation are described below:

1. Each identifier with external linkage described in the header section is reserved for use as an identifier with external linkage if the header is included.

2. Each macro described in the header section is reserved for any use if the header is included.

3. Each identifier with file scope described in the header section is reserved for use as an identifier with file scope in the same name space if the header is included.

The prefixes posix_, POSIX_, and _POSIX_ are reserved for use by POSIX.1-200x and other

15955 POSIX standards. Implementations may add symbols to the headers shown in the following
15956 table, provided the identifiers for those symbols either:

15957 1. Begin with the corresponding reserved prefixes in the table, or

15958 2. Have one of the corresponding complete names in the table, or

15959 3. End in the string indicated as a reserved suffix in the table and do not use the reserved
15960 prefixes posix_, POSIX_, or _POSIX_, as long as the reserved suffix is in that part of the
15961 name considered significant by the implementation.

15962 Symbols that use the reserved prefix _POSIX_ may be made visible by implementations in any
15963 header defined by POSIX.1-200x.

	Header	Prefix	Suffix	Complete Name
	<aio.h>	aio_, lio_, AIO_, LIO_		
	<arpa/inet.h>	inet_		
	<ctype.h>	to[a-z], is[a-z]		
	<dlfcn.h>	RTLD_		
	<dirent.h>	d_		
	<fcntl.h>	l_

	<wctype.h>	is[a-z], to[a-z]		
	<wordexp.h>	we_, WRDE_		
	ANY header		_t	

Note: The notation [A–Z] indicates any uppercase letter in the portable character set. The notation [a–z] indicates any lowercase letter in the portable character set. Commas and spaces in the lists of prefixes and complete names in the above table are not part of any prefix or complete name.

16040 If any header in the following table is included, macros with the prefixes shown may be defined.
16041 After the last inclusion of a given header, an application may use identifiers with the
16042 corresponding prefixes for its own purpose, provided their use is preceded by a **#undef** of the
16043 corresponding macro.

		Header	Prefix
16044			
16045		**<errno.h>**	E[0-9], E[A-Z]
16046		**<fcntl.h>**	F_, O_
16047		**<fenv.h>**	FE_[A-Z]
16048		**<inttypes.h>**	PRI[Xa-z], SCN[Xa-z]
16049		**<locale.h>**	LC_[A-Z]
16050		**<math.h>**	FP_[A-Z]
16051		**<netinet/in.h>**	IMPLINK_, IN_, IP_, IPPORT_, SOCK_,
16052	IP6		IN6_
16053		**<signal.h>**	SIG_, SIG[A-Z],
16054	XSI		SV_
16055	CX	**<stdio.h>**	SEEK_
16056	OB XSR	**<stropts.h>**	M_, MUXID_R[A-Z], STR
16057	XSI	**<sys/resource.h>**	RLIM_
16058	XSI	**<sys/socket.h>**	CMSG_
16059		**<sys/stat.h>**	S_
16060	XSI	**<sys/uio.h>**	IOV_
16061		**<termios.h>**	I, O, V (See below.)
16062		**<unistd.h>**	SEEK_

16063 The following are used to reserve complete names for the **<stdint.h>** header:

16064 INT[0-9A-Za-z_]*_MIN
16065 INT[0-9A-Za-z_]*_MAX
16066 INT[0-9A-Za-z_]*_C
16067 UINT[0-9A-Za-z_]*_MIN
16068 UINT[0-9A-Za-z_]*_MAX
16069 UINT[0-9A-Za-z_]*_C

16070 **Note:** The notation [0–9] indicates any digit. The notation [A–Z] indicates any uppercase letter in the
16071 portable character set. The notation [0–9a–z_] indicates any digit, any lowercase letter in the
16072 portable character set, or <underscore>.

16073 XSI The following reserved names are used as exact matches for **<termios.h>**:

16074	CBAUD	EXTB	VDSUSP
16075	DEFECHO	FLUSHO	VLNEXT
16076	ECHOCTL	LOBLK	VREPRINT
16077	ECHOKE	PENDIN	VSTATUS
16078	ECHOPRT	SWTCH	VWERASE
16079	EXTA	VDISCARD	

16080 The following identifiers are reserved regardless of the inclusion of headers:

16081 1. With the exception of identifiers beginning with the prefix _POSIX_, all identifiers that
16082 begin with an <underscore> and either an uppercase letter or another <underscore> are
16083 always reserved for any use by the implementation.

16084 2. All identifiers that begin with an <underscore> are always reserved for use as identifiers
16085 with file scope in both the ordinary identifier and tag name spaces.

16086 3. All identifiers in the table below are reserved for use as identifiers with external linkage.
16087 Some of these identifiers do not appear in this volume of POSIX.1-200x, but are reserved for
16088 future use by the ISO C standard.

16089 4. All functions and external identifiers defined in XBD Chapter 13 (on page 219) are reserved
16090 for use as identifiers with external linkage.

16091 5. All the identifiers defined in this volume of POSIX.1-200x that have external linkage are
16092 always reserved for use as identifiers with external linkage.

16093 **Note:** The notation [a–z] indicates any lowercase letter in the portable character set. The notation '*'
16094 indicates any combination of digits, letters in the portable character set, or <underscore>.

16095 No other identifiers are reserved.

16180 Applications shall not declare or define identifiers with the same name as an identifier reserved
16181 in the same context. Since macro names are replaced whenever found, independent of scope and
16182 name space, macro names matching any of the reserved identifier names shall not be defined by
16183 an application if any associated header is included.

16184 Except that the effect of each inclusion of **<assert.h>** depends on the definition of NDEBUG,
16185 headers may be included in any order, and each may be included more than once in a given
16186 scope, with no difference in effect from that of being included only once.

16187 If used, the application shall ensure that a header is included outside of any external declaration
16188 or definition, and it shall be first included before the first reference to any type or macro it
16189 defines, or to any function or object it declares. However, if an identifier is declared or defined in
16190 more than one header, the second and subsequent associated headers may be included after the
16191 initial reference to the identifier. Prior to the inclusion of a header, the application shall not
16192 define any macros with names lexically identical to symbols defined by that header.

2.3 Error Numbers

Most functions can provide an error number. The means by which each function provides its error numbers is specified in its description.

Some functions provide the error number in a variable accessed through the symbol *errno*, defined by including the **<errno.h>** header. The value of *errno* should only be examined when it is indicated to be valid by a function's return value. No function in this volume of POSIX.1-200x shall set *errno* to zero. For each thread of a process, the value of *errno* shall not be affected by function calls or assignments to *errno* by other threads.

Some functions return an error number directly as the function value. These functions return a value of zero to indicate success.

If more than one error occurs in processing a function call, any one of the possible errors may be returned, as the order of detection is undefined.

Implementations may support additional errors not included in this list, may generate errors included in this list under circumstances other than those described here, or may contain extensions or limitations that prevent some errors from occurring.

The ERRORS section on each reference page specifies which error conditions shall be detected by all implementations ("shall fail") and which may be optionally detected by an implementation ("may fail"). If no error condition is detected, the action requested shall be successful.

Implementations may generate error numbers listed here under circumstances other than those described, if and only if all those error conditions can always be treated identically to the error conditions as described in this volume of POSIX.1-200x. Implementations shall not generate a different error number from one required by this volume of POSIX.1-200x for an error condition described in this volume of POSIX.1-200x, but may generate additional errors unless explicitly disallowed for a particular function.

Each implementation shall document, in the conformance document, situations in which each of the optional conditions defined in POSIX.1-200x is detected. The conformance document may also contain statements that one or more of the optional error conditions are not detected.

Certain threads-related functions are not allowed to return an error code of [EINTR]. Where this applies it is stated in the ERRORS section on the individual function pages.

The following macro names identify the possible error numbers, in the context of the functions specifically defined in this volume of POSIX.1-200x; these general descriptions are more precisely defined in the ERRORS sections of the functions that return them. Only these macro names should be used in programs, since the actual value of the error number is unspecified. All values listed in this section shall be unique, except as noted below. The values for all these macros shall be found in the **<errno.h>** header defined in the Base Definitions volume of POSIX.1-200x. The actual values are unspecified by this volume of POSIX.1-200x.

[E2BIG]

Argument list too long. The sum of the number of bytes used by the new process image's argument list and environment list is greater than the system-imposed limit of {ARG_MAX} bytes.

or:

Lack of space in an output buffer.

or:

Argument is greater than the system-imposed maximum.

16238 [EACCES]
16239 Permission denied. An attempt was made to access a file in a way forbidden by its file
16240 access permissions.

16241 [EADDRINUSE]
16242 Address in use. The specified address is in use.

16243 [EADDRNOTAVAIL]
16244 Address not available. The specified address is not available from the local system.

16245 [EAFNOSUPPORT]
16246 Address family not supported. The implementation does not support the specified address
16247 family, or the specified address is not a valid address for the address family of the specified
16248 socket.

16249 [EAGAIN]
16250 Resource temporarily unavailable. This is a temporary condition and later calls to the same
16251 routine may complete normally.

16252 [EALREADY]
16253 Connection already in progress. A connection request is already in progress for the specified
16254 socket.

16255 [EBADF]
16256 Bad file descriptor. A file descriptor argument is out of range, refers to no open file, or a
16257 read (write) request is made to a file that is only open for writing (reading).

16258 [EBADMSG]
16259 OB XSR Bad message. During a *read*(), *getmsg*(), *getpmsg*(), or *ioctl*() I_RECVFD request to a
16260 STREAMS device, a message arrived at the head of the STREAM that is inappropriate for
16261 the function receiving the message.

16262 *read*() Message waiting to be read on a STREAM is not a data message.

16263 *getmsg*() or *getpmsg*()
16264 A file descriptor was received instead of a control message.

16265 *ioctl*() Control or data information was received instead of a file descriptor when
16266 I_RECVFD was specified.

16267 or:

16268 Bad Message. The implementation has detected a corrupted message.

16269 [EBUSY]
16270 Resource busy. An attempt was made to make use of a system resource that is not currently
16271 available, as it is being used by another process in a manner that would have conflicted
16272 with the request being made by this process.

16273 [ECANCELED]
16274 Operation canceled. The associated asynchronous operation was canceled before
16275 completion.

16276 [ECHILD]
16277 No child process. A *wait*(), *waitid*(), or *waitpid*() function was executed by a process that
16278 had no existing or unwaited-for child process.

16279 [ECONNABORTED]
16280 Connection aborted. The connection has been aborted.

16281 [ECONNREFUSED]
16282 Connection refused. An attempt to connect to a socket was refused because there was no
16283 process listening or because the queue of connection requests was full and the underlying
16284 protocol does not support retransmissions.

16285 [ECONNRESET]
16286 Connection reset. The connection was forcibly closed by the peer.

16287 [EDEADLK]
16288 Resource deadlock would occur. An attempt was made to lock a system resource that would
16289 have resulted in a deadlock situation.

16290 [EDESTADDRREQ]
16291 Destination address required. No bind address was established.

16292 [EDOM]
16293 Domain error. An input argument is outside the defined domain of the mathematical
16294 function (defined in the ISO C standard).

16295 [EDQUOT]
16296 Reserved.

16297 [EEXIST]
16298 File exists. An existing file was mentioned in an inappropriate context; for example, as a
16299 new link name in the *link*( ) function.

16300 [EFAULT]
16301 Bad address. The system detected an invalid address in attempting to use an argument of a
16302 call. The reliable detection of this error cannot be guaranteed, and when not detected may
16303 result in the generation of a signal, indicating an address violation, which is sent to the
16304 process.

16305 [EFBIG]
16306 File too large. The size of a file would exceed the maximum file size of an implementation
16307 or offset maximum established in the corresponding file description.

16308 [EHOSTUNREACH]
16309 Host is unreachable. The destination host cannot be reached (probably because the host is
16310 down or a remote router cannot reach it).

16311 [EIDRM]
16312 Identifier removed. Returned during XSI interprocess communication if an identifier has
16313 been removed from the system.

16314 [EILSEQ]
16315 Illegal byte sequence. A wide-character code has been detected that does not correspond to
16316 a valid character, or a byte sequence does not form a valid wide-character code (defined in
16317 the ISO C standard).

16318 [EINPROGRESS]
16319 Operation in progress. This code is used to indicate that an asynchronous operation has not
16320 yet completed.

16321 or:

16322 O_NONBLOCK is set for the socket file descriptor and the connection cannot be
16323 immediately established.

16324 [EINTR]
16325 Interrupted function call. An asynchronous signal was caught by the process during the
16326 execution of an interruptible function. If the signal handler performs a normal return, the
16327 interrupted function call may return this condition (see the Base Definitions volume of
16328 POSIX.1-200x, **<signal.h>**).

16329 [EINVAL]
16330 Invalid argument. Some invalid argument was supplied; for example, specifying an
16331 undefined signal in a *signal*( ) function or a *kill*( ) function.

16332 [EIO]
16333 Input/output error. Some physical input or output error has occurred. This error may be
16334 reported on a subsequent operation on the same file descriptor. Any other error-causing
16335 operation on the same file descriptor may cause the [EIO] error indication to be lost.

16336 [EISCONN]
16337 Socket is connected. The specified socket is already connected.

16338 [EISDIR]
16339 Is a directory. An attempt was made to open a directory with write mode specified.

16340 [ELOOP]
16341 Symbolic link loop. A loop exists in symbolic links encountered during pathname
16342 resolution. This error may also be returned if more than {SYMLOOP_MAX} symbolic links
16343 are encountered during pathname resolution.

16344 [EMFILE]
16345 File descriptor value too large or too many open streams. An attempt was made to open a
16346 XSI file descriptor with a value greater than or equal to {OPEN_MAX}, or greater than or equal
16347 to the soft limit RLIMIT_NOFILE for the process (if smaller than {OPEN_MAX}); or an
16348 attempt was made to open more than the maximum number of streams allowed in the
16349 process.

16350 [EMLINK]
16351 Too many links. An attempt was made to have the link count of a single file exceed
16352 {LINK_MAX}.

16353 [EMSGSIZE]
16354 Message too large. A message sent on a transport provider was larger than an internal
16355 message buffer or some other network limit.

16356 or:

16357 Inappropriate message buffer length.

16358 [EMULTIHOP]
16359 Reserved.

16360 [ENAMETOOLONG]
16361 Filename too long. The length of a pathname exceeds {PATH_MAX} and the
16362 implementation considers this to be an error, or a pathname component is longer than
16363 {NAME_MAX}. This error may also occur when pathname substitution, as a result of
16364 encountering a symbolic link during pathname resolution, results in a pathname string the
16365 size of which exceeds {PATH_MAX}.

16366 [ENETDOWN]
16367 Network is down. The local network interface used to reach the destination is down.

16368 [ENETRESET]
16369 The connection was aborted by the network.

16370 [ENETUNREACH]
16371 Network unreachable. No route to the network is present.

16372 [ENFILE]
16373 Too many files open in system. Too many files are currently open in the system. The system
16374 has reached its predefined limit for simultaneously open files and temporarily cannot
16375 accept requests to open another one.

16376 [ENOBUFS]
16377 No buffer space available. Insufficient buffer resources were available in the system to
16378 perform the socket operation.

16379 OB XSR [ENODATA]
16380 No message available. No message is available on the STREAM head read queue.

16381 [ENODEV]
16382 No such device. An attempt was made to apply an inappropriate function to a device; for
16383 example, trying to read a write-only device such as a printer.

16384 [ENOENT]
16385 No such file or directory. A component of a specified pathname does not exist, or the
16386 pathname is an empty string.

16387 [ENOEXEC]
16388 Executable file format error. A request is made to execute a file that, although it has
16389 appropriate privileges, is not in the format required by the implementation for executable
16390 files.

16391 [ENOLCK]
16392 No locks available. A system-imposed limit on the number of simultaneous file and record
16393 locks has been reached and no more are currently available.

16394 [ENOLINK]
16395 Reserved.

16396 [ENOMEM]
16397 Not enough space. The new process image requires more memory than is allowed by the
16398 hardware or system-imposed memory management constraints.

16399 [ENOMSG]
16400 No message of the desired type. The message queue does not contain a message of the
16401 required type during XSI interprocess communication.

16402 [ENOPROTOOPT]
16403 Protocol not available. The protocol option specified to *setsockopt*( ) is not supported by the
16404 implementation.

16405 [ENOSPC]
16406 No space left on a device. During the *write*( ) function on a regular file or when extending a
16407 directory, there is no free space left on the device.

16408 OB XSR [ENOSR]
16409 No STREAM resources. Insufficient STREAMS memory resources are available to perform a
16410 STREAMS-related function. This is a temporary condition; it may be recovered from if other
16411 processes release resources.

16412 OB XSR [ENOSTR]
16413 Not a STREAM. A STREAM function was attempted on a file descriptor that was not
16414 associated with a STREAMS device.

16415 [ENOSYS]
16416 Function not implemented. An attempt was made to use a function that is not available in
16417 this implementation.

16418 [ENOTCONN]
16419 Socket not connected. The socket is not connected.

16420 [ENOTDIR]
16421 Not a directory. A component of the specified pathname exists, but it is not a directory,
16422 when a directory was expected.

16423 [ENOTEMPTY]
16424 Directory not empty. A directory other than an empty directory was supplied when an
16425 empty directory was expected.

16426 [ENOTRECOVERABLE]
16427 State not recoverable. The state protected by a robust mutex is not recoverable.

16428 [ENOTSOCK]
16429 Not a socket. The file descriptor does not refer to a socket.

16430 [ENOTSUP]
16431 Not supported. The implementation does not support this feature of the Realtime Option
16432 Group.

16433 [ENOTTY]
16434 Inappropriate I/O control operation. A control function has been attempted for a file or
16435 special file for which the operation is inappropriate.

16436 [ENXIO]
16437 No such device or address. Input or output on a special file refers to a device that does not
16438 exist, or makes a request beyond the capabilities of the device. It may also occur when, for
16439 example, a tape drive is not on-line.

16440 [EOPNOTSUPP]
16441 Operation not supported on socket. The type of socket (address family or protocol) does not
16442 support the requested operation. A conforming implementation may assign the same values
16443 for [EOPNOTSUP] and [ENOTSUP].

16444 [EOVERFLOW]
16445 Value too large to be stored in data type. An operation was attempted which would
16446 generate a value that is outside the range of values that can be represented in the relevant
16447 data type or that are allowed for a given data item.

16448 [EOWNERDEAD]
16449 Previous owner died. The owner of a robust mutex terminated while holding the mutex
16450 lock.

16451 [EPERM]
16452 Operation not permitted. An attempt was made to perform an operation limited to
16453 processes with appropriate privileges or to the owner of a file or other resource.

16454 [EPIPE]
16455 Broken pipe. A write was attempted on a socket, pipe, or FIFO for which there is no process
16456 to read the data.

16457 [EPROTO]
16458 Protocol error. Some protocol error occurred. This error is device-specific, but is generally
16459 not related to a hardware failure.

16460 [EPROTONOSUPPORT]
16461 Protocol not supported. The protocol is not supported by the address family, or the protocol
16462 is not supported by the implementation.

16463 [EPROTOTYPE]
16464 Protocol wrong type for socket. The socket type is not supported by the protocol.

16465 [ERANGE]
16466 Result too large or too small. The result of the function is too large (overflow) or too small
16467 (underflow) to be represented in the available space (defined in the ISO C standard).

16468 [EROFS]
16469 Read-only file system. An attempt was made to modify a file or directory on a file system
16470 that is read-only.

16471 [ESPIPE]
16472 Invalid seek. An attempt was made to access the file offset associated with a pipe or FIFO.

16473 [ESRCH]
16474 No such process. No process can be found corresponding to that specified by the given
16475 process ID.

16476 [ESTALE]
16477 Reserved.

16478 OB XSR [ETIME]
16479 STREAM *ioctl*( ) timeout. The timer set for a STREAMS *ioctl*( ) call has expired. The cause of
16480 this error is device-specific and could indicate either a hardware or software failure, or a
16481 timeout value that is too short for the specific operation. The status of the *ioctl*( ) operation is
16482 unspecified.

16483 [ETIMEDOUT]
16484 Connection timed out. The connection to a remote machine has timed out. If the connection
16485 timed out during execution of the function that reported this error (as opposed to timing
16486 out prior to the function being called), it is unspecified whether the function has completed
16487 some or all of the documented behavior associated with a successful completion of the
16488 function.

16489 or:

16490 Operation timed out. The time limit associated with the operation was exceeded before the
16491 operation completed.

16492 [ETXTBSY]
16493 Text file busy. An attempt was made to execute a pure-procedure program that is currently
16494 open for writing, or an attempt has been made to open for writing a pure-procedure
16495 program that is being executed.

16496 [EWOULDBLOCK]
16497 Operation would block. An operation on a socket marked as non-blocking has encountered
16498 a situation such as no data available that otherwise would have caused the function to
16499 suspend execution.

16500 A conforming implementation may assign the same values for [EWOULDBLOCK] and
16501 [EAGAIN].

16502 [EXDEV]
16503 Improper link. A link to a file on another file system was attempted.

16504 ### 2.3.1 Additional Error Numbers

16505 Additional implementation-defined error numbers may be defined in **<errno.h>**.

16506 ## 2.4 Signal Concepts

16507 -

16508 ### 2.4.1 Signal Generation and Delivery

16509 A signal is said to be "generated" for (or sent to) a process or thread when the event that causes
16510 the signal first occurs. Examples of such events include detection of hardware faults, timer
16511 expiration, signals generated via the **sigevent** structure and terminal activity, as well as
16512 invocations of the *kill*( ) and *sigqueue*( ) functions. In some circumstances, the same event
16513 generates signals for multiple processes.

16514 At the time of generation, a determination shall be made whether the signal has been generated
16515 for the process or for a specific thread within the process. Signals which are generated by some
16516 action attributable to a particular thread, such as a hardware fault, shall be generated for the
16517 thread that caused the signal to be generated. Signals that are generated in association with a
16518 process ID or process group ID or an asynchronous event, such as terminal activity, shall be
16519 generated for the process.

16520 Each process has an action to be taken in response to each signal defined by the system (see
16521 Section 2.4.3, on page 486). A signal is said to be "delivered" to a process when the appropriate
16522 action for the process and signal is taken. A signal is said to be "accepted" by a process when the
16523 signal is selected and returned by one of the *sigwait*( ) functions.

16524 During the time between the generation of a signal and its delivery or acceptance, the signal is
16525 said to be "pending". Ordinarily, this interval cannot be detected by an application. However, a
16526 signal can be "blocked" from delivery to a thread. If the action associated with a blocked signal
16527 is anything other than to ignore the signal, and if that signal is generated for the thread, the
16528 signal shall remain pending until it is unblocked, it is accepted when it is selected and returned
16529 by a call to the *sigwait*( ) function, or the action associated with it is set to ignore the signal.
16530 Signals generated for the process shall be delivered to exactly one of those threads within the
16531 process which is in a call to a *sigwait*( ) function selecting that signal or has not blocked delivery
16532 of the signal. If there are no threads in a call to a *sigwait*( ) function selecting that signal, and if all
16533 threads within the process block delivery of the signal, the signal shall remain pending on the
16534 process until a thread calls a *sigwait*( ) function selecting that signal, a thread unblocks delivery
16535 of the signal, or the action associated with the signal is set to ignore the signal. If the action
16536 associated with a blocked signal is to ignore the signal and if that signal is generated for the
16537 process, it is unspecified whether the signal is discarded immediately upon generation or
16538 remains pending.

16539 Each thread has a "signal mask" that defines the set of signals currently blocked from delivery
16540 to it. The signal mask for a thread shall be initialized from that of its parent or creating thread,
16541 or from the corresponding thread in the parent process if the thread was created as the result of a
16542 call to *fork*( ). The *pthread_sigmask*( ), *sigaction*( ), *sigprocmask*( ), and *sigsuspend*( ) functions control
16543 the manipulation of the signal mask.

The determination of which action is taken in response to a signal is made at the time the signal is delivered, allowing for any changes since the time of generation. This determination is independent of the means by which the signal was originally generated. If a subsequent occurrence of a pending signal is generated, it is implementation-defined as to whether the signal is delivered or accepted more than once in circumstances other than those in which queuing is required. The order in which multiple, simultaneously pending signals outside the range SIGRTMIN to SIGRTMAX are delivered to or accepted by a process is unspecified.

When any stop signal (SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU) is generated for a process, any pending SIGCONT signals for that process shall be discarded. Conversely, when SIGCONT is generated for a process, all pending stop signals for that process shall be discarded. When SIGCONT is generated for a process that is stopped, the process shall be continued, even if the SIGCONT signal is blocked or ignored. If SIGCONT is blocked and not ignored, it shall remain pending until it is either unblocked or a stop signal is generated for the process.

An implementation shall document any condition not specified by this volume of POSIX.1-200x under which the implementation generates signals.

2.4.2 Realtime Signal Generation and Delivery

This section describes functionality to support realtime signal generation and delivery.

Some signal-generating functions, such as high-resolution timer expiration, asynchronous I/O completion, interprocess message arrival, and the *sigqueue*( ) function, support the specification of an application-defined value, either explicitly as a parameter to the function or in a **sigevent** structure parameter. The **sigevent** structure is defined in **<signal.h>** and contains at least the following members:

Member Type	Member Name	Description
int	*sigev_notify*	Notification type.
int	*sigev_signo*	Signal number.
union sigval	*sigev_value*	Signal value.
void(*)(union sigval)	*sigev_notify_function*	Notification function.
(pthread_attr_t*)	*sigev_notify_attributes*	Notification attributes.

The *sigev_notify* member specifies the notification mechanism to use when an asynchronous event occurs. This volume of POSIX.1-200x defines the following values for the *sigev_notify* member:

SIGEV_NONE — No asynchronous notification shall be delivered when the event of interest occurs.

SIGEV_SIGNAL — The signal specified in *sigev_signo* shall be generated for the process when the event of interest occurs. If the implementation supports the Realtime Signals Extension option and if the SA_SIGINFO flag is set for that signal number, then the signal shall be queued to the process and the value specified in *sigev_value* shall be the *si_value* component of the generated signal. If SA_SIGINFO is not set for that signal number, it is unspecified whether the signal is queued and what value, if any, is sent.

SIGEV_THREAD — A notification function shall be called to perform notification.

An implementation may define additional notification mechanisms.

The *sigev_signo* member specifies the signal to be generated. The *sigev_value* member is the application-defined value to be passed to the signal-catching function at the time of the signal

delivery or to be returned at signal acceptance as the *si_value* member of the **siginfo_t** structure.

The **sigval** union is defined in **<signal.h>** and contains at least the following members:

Member Type	Member Name	Description
int	*sival_int*	Integer signal value.
void*	*sival_ptr*	Pointer signal value.

The *sival_int* member shall be used when the application-defined value is of type **int**; the *sival_ptr* member shall be used when the application-defined value is a pointer.

When a signal is generated by the *sigqueue*( ) function or any signal-generating function that supports the specification of an application-defined value, the signal shall be marked pending and, if the SA_SIGINFO flag is set for that signal, the signal shall be queued to the process along with the application-specified signal value. Multiple occurrences of signals so generated are queued in FIFO order. It is unspecified whether signals so generated are queued when the SA_SIGINFO flag is not set for that signal.

Signals generated by the *kill*( ) function or other events that cause signals to occur, such as detection of hardware faults, *alarm*( ) timer expiration, or terminal activity, and for which the implementation does not support queuing, shall have no effect on signals already queued for the same signal number.

When multiple unblocked signals, all in the range SIGRTMIN to SIGRTMAX, are pending, the behavior shall be as if the implementation delivers the pending unblocked signal with the lowest signal number within that range. No other ordering of signal delivery is specified.

If, when a pending signal is delivered, there are additional signals queued to that signal number, the signal shall remain pending. Otherwise, the pending indication shall be reset.

Multi-threaded programs can use an alternate event notification mechanism. When a notification is processed, and the *sigev_notify* member of the **sigevent** structure has the value SIGEV_THREAD, the function *sigev_notify_function* is called with parameter *sigev_value*.

The function shall be executed in an environment as if it were the *start_routine* for a newly created thread with thread attributes specified by *sigev_notify_attributes*. If *sigev_notify_attributes* is NULL, the behavior shall be as if the thread were created with the *detachstate* attribute set to PTHREAD_CREATE_DETACHED. Supplying an attributes structure with a *detachstate* attribute of PTHREAD_CREATE_JOINABLE results in undefined behavior. The signal mask of this thread is implementation-defined.

2.4.3 Signal Actions

There are three types of action that can be associated with a signal: SIG_DFL, SIG_IGN, or a pointer to a function. Initially, all signals shall be set to SIG_DFL or SIG_IGN prior to entry of the *main*( ) routine (see the *exec* functions). The actions prescribed by these values are as follows.

SIG_DFL

Signal-specific default action.

The default actions for the signals defined in this volume of POSIX.1-200x are specified under **<signal.h>**. The default actions for the realtime signals in the range SIGRTMIN to SIGRTMAX shall be to terminate the process abnormally.

If the default action is to terminate the process abnormally, the process is terminated as if by a call to *_exit*( ), except that the status made available to *wait*( ), *waitid*( ), and *waitpid*( ) indicates

16630 XSI abnormal termination by the signal. If the default action is to terminate the process abnormally
16631 with additional actions, implementation-defined abnormal termination actions, such as creation
16632 of a core file, may also occur.

16633 If the default action is to stop the process, the execution of that process is temporarily
16634 suspended. When a process stops, a SIGCHLD signal shall be generated for its parent process,
16635 unless the parent process has set the SA_NOCLDSTOP flag. While a process is stopped, any
16636 additional signals that are sent to the process shall not be delivered until the process is
16637 continued, except SIGKILL which always terminates the receiving process. A process that is a
16638 member of an orphaned process group shall not be allowed to stop in response to the SIGTSTP,
16639 SIGTTIN, or SIGTTOU signals. In cases where delivery of one of these signals would stop such a
16640 process, the signal shall be discarded.

16641 If the default action is to ignore the signal, delivery of the signal shall have no effect on the
16642 process.

16643 Setting a signal action to SIG_DFL for a signal that is pending, and whose default action is to
16644 ignore the signal (for example, SIGCHLD), shall cause the pending signal to be discarded,
16645 whether or not it is blocked. Any queued values pending shall be discarded and the resources
16646 used to queue them shall be released and returned to the system for other use.

16647 The default action for SIGCONT is to resume execution at the point where the process was
16648 stopped, after first handling any pending unblocked signals.

16649 XSI When a stopped process is continued, a SIGCHLD signal may be generated for its parent
16650 process, unless the parent process has set the SA_NOCLDSTOP flag.

16651 **SIG_IGN**

16652 Ignore signal.

16653 Delivery of the signal shall have no effect on the process. The behavior of a process is undefined
16654 after it ignores a SIGFPE, SIGILL, SIGSEGV, or SIGBUS signal that was not generated by *kill*( ),
16655 *sigqueue*( ), or *raise*( ).

16656 The system shall not allow the action for the signals SIGKILL or SIGSTOP to be set to SIG_IGN.

16657 Setting a signal action to SIG_IGN for a signal that is pending shall cause the pending signal to
16658 be discarded, whether or not it is blocked.

16659 If a process sets the action for the SIGCHLD signal to SIG_IGN, the behavior is unspecified,
16660 XSI except as specified below.

16661 If the action for the SIGCHLD signal is set to SIG_IGN, child processes of the calling processes
16662 shall not be transformed into zombie processes when they terminate. If the calling process
16663 subsequently waits for its children, and the process has no unwaited-for children that were
16664 transformed into zombie processes, it shall block until all of its children terminate, and *wait*( ),
16665 *waitid*( ), and *waitpid*( ) shall fail and set *errno* to [ECHILD].

16666 Any queued values pending shall be discarded and the resources used to queue them shall be
16667 released and made available to queue other signals.

16668 **Pointer to a Function**

16669 Catch signal.

16670 On delivery of the signal, the receiving process is to execute the signal-catching function at the
16671 specified address. After returning from the signal-catching function, the receiving process shall
16672 resume execution at the point at which it was interrupted.

16673 If the SA_SIGINFO flag for the signal is cleared, the signal-catching function shall be entered as
16674 a C-language function call as follows:

16675 `void func(int signo);`

16676 If the SA_SIGINFO flag for the signal is set, the signal-catching function shall be entered as a C-
16677 language function call as follows:

16678 `void func(int signo, siginfo_t *info, void *context);`

16679 where *func* is the specified signal-catching function, *signo* is the signal number of the signal
16680 being delivered, and *info* is a pointer to a **siginfo_t** structure defined in **<signal.h>** containing at
16681 least the following members:

16682

Member Type	Member Name	Description
int	*si_signo*	Signal number.
int	*si_code*	Cause of the signal.
pid_t	*si_pid*	Sending process ID.
uid_t	*si_uid*	Real user ID of sending process.
void *	*si_addr*	Address of faulting instruction.
int	*si_status*	Exit value or signal.
union sigval	*si_value*	Signal value.

16690 The *si_signo* member shall contain the signal number. This shall be the same as the *signo*
16691 parameter. The *si_code* member shall contain a code identifying the cause of the signal. The
16692 following non-signal-specific values are defined for *si_code*:

16693 SI_USER The signal was sent by the *kill*() function. The implementation may set *si_code*
16694 to SI_USER if the signal was sent by the *raise*() or *abort*() functions or any
16695 similar functions provided as implementation extensions.

16696 SI_QUEUE The signal was sent by the *sigqueue*() function.

16697 SI_TIMER The signal was generated by the expiration of a timer set by *timer_settime*().

16698 SI_ASYNCIO The signal was generated by the completion of an asynchronous I/O request.

16699 MSG SI_MESGQ The signal was generated by the arrival of a message on an empty message
16700 queue.

16701 Signal-specific values for *si_code* are also defined, as described in XBD **<signal.h>**.

16702 If the signal was not generated by one of the functions or events listed above, *si_code* shall be set
16703 either to one of the signal-specific values described in XBD **<signal.h>**, or to an implementation-
16704 defined value that is not equal to any of the values defined above.

16705 XSI If *si_code* is SI_USER or SI_QUEUE, or any value less than or equal to 0, then the signal was
16706 generated by a process and *si_pid* and *si_uid* shall be set to the process ID and the real user ID of
16707 the sender, respectively.

16708 In addition, *si_addr*, *si_pid*, *si_status*, and *si_uid* shall be set for certain signal-specific values of
16709 *si_code*, as described in XBD **<signal.h>**.

16710 If *si_code* is one of SI_QUEUE, SI_TIMER, SI_ASYNCIO, or SI_MESGQ, then *si_value* shall

16711 contain the application-specified signal value. Otherwise, the contents of *si_value* are undefined.

16712 The behavior of a process is undefined after it returns normally from a signal-catching function
16713 for a SIGBUS, SIGFPE, SIGILL, or SIGSEGV signal that was not generated by *kill*(), *sigqueue*(),
16714 or *raise*().

16715 The system shall not allow a process to catch the signals SIGKILL and SIGSTOP.

16716 If a process establishes a signal-catching function for the SIGCHLD signal while it has a
16717 terminated child process for which it has not waited, it is unspecified whether a SIGCHLD
16718 signal is generated to indicate that child process.

16719 When signal-catching functions are invoked asynchronously with process execution, the
16720 behavior of some of the functions defined by this volume of POSIX.1-200x is unspecified if they
16721 are called from a signal-catching function.

16722 The following table defines a set of functions that shall be async-signal-safe. Therefore,
16723 applications can invoke them, without restriction, from signal-catching functions:

16724 *_Exit*()
16725 *_exit*()
16726 *abort*()
16727 *accept*()
16728 *access*()
16729 *aio_error*()
16730 *aio_return*()
16731 *aio_suspend*()
16732 *alarm*()
16733 *bind*()
16734 *cfgetispeed*()
16735 *cfgetospeed*()
16736 *cfsetispeed*()
16737 *cfsetospeed*()
16738 *chdir*()
16739 *chmod*()
16740 *chown*()
16741 *clock_gettime*()
16742 *close*()
16743 *connect*()
16744 *creat*()
16745 *dup*()
16746 *dup2*()
16747 *execl*()
16748 *execle*()
16749 *execv*()
16750 *execve*()
16751 *faccessat*()
16752 *fchmod*()
16753 *fchmodat*()
16754 *fchown*()
16755 *fchownat*()
16756 *fcntl*()
16757 *fdatasync*()

16758 All functions not in the above table are considered to be unsafe with respect to signals. In the
16759 presence of signals, all functions defined by this volume of POSIX.1-200x shall behave as defined

when called from or interrupted by a signal-catching function, with a single exception: when a signal interrupts an unsafe function and the signal-catching function calls an unsafe function, the behavior is undefined.

Operations which obtain the value of *errno* and operations which assign a value to *errno* shall be async-signal-safe.

When a signal is delivered to a thread, if the action of that signal specifies termination, stop, or continue, the entire process shall be terminated, stopped, or continued, respectively.

2.4.4 Signal Effects on Other Functions

Signals affect the behavior of certain functions defined by this volume of POSIX.1-200x if delivered to a process while it is executing such a function. If the action of the signal is to terminate the process, the process shall be terminated and the function shall not return. If the action of the signal is to stop the process, the process shall stop until continued or terminated. Generation of a SIGCONT signal for the process shall cause the process to be continued, and the original function shall continue at the point the process was stopped. If the action of the signal is to invoke a signal-catching function, the signal-catching function shall be invoked; in this case the original function is said to be "interrupted" by the signal. If the signal-catching function executes a **return** statement, the behavior of the interrupted function shall be as described individually for that function, except as noted for unsafe functions. Signals that are ignored shall not affect the behavior of any function; signals that are blocked shall not affect the behavior of any function until they are unblocked and then delivered, except as specified for the *sigpending*( ) and *sigwait*( ) functions.

2.5 Standard I/O Streams

CX A stream is associated with an external file (which may be a physical device) or memory buffer
CX by "opening" a file or buffer. This may involve "creating" a new file. Creating an existing file causes its former contents to be discarded if necessary. If a file can support positioning requests (such as a disk file, as opposed to a terminal), then a "file position indicator" associated with the stream is positioned at the start (byte number 0) of the file, unless the file is opened with append mode, in which case it is implementation-defined whether the file position indicator is initially positioned at the beginning or end of the file. The file position indicator is maintained by subsequent reads, writes, and positioning requests, to facilitate an orderly progression through the file. All input takes place as if bytes were read by successive calls to *fgetc*( ); all output takes place as if bytes were written by successive calls to *fputc*( ).

When a stream is "unbuffered", bytes are intended to appear from the source or at the destination as soon as possible; otherwise, bytes may be accumulated and transmitted as a block. When a stream is "fully buffered", bytes are intended to be transmitted as a block when a buffer is filled. When a stream is "line buffered", bytes are intended to be transmitted as a block when a <newline> byte is encountered. Furthermore, bytes are intended to be transmitted as a block when a buffer is filled, when input is requested on an unbuffered stream, or when input is requested on a line-buffered stream that requires the transmission of bytes. Support for these characteristics is implementation-defined, and may be affected via *setbuf*( ) and *setvbuf*( ).

A file may be disassociated from a controlling stream by "closing" the file. Output streams are flushed (any unwritten buffer contents are transmitted) before the stream is disassociated from the file. The value of a pointer to a **FILE** object is unspecified after the associated file is closed (including the standard streams).

A file may be subsequently reopened, by the same or another program execution, and its contents reclaimed or modified (if it can be repositioned at its start). If the *main*() function returns to its original caller, or if the *exit*() function is called, all open files are closed (hence all output streams are flushed) before program termination. Other paths to program termination, such as calling *abort*(), need not close all files properly.

The address of the **FILE** object used to control a stream may be significant; a copy of a **FILE** object need not necessarily serve in place of the original.

At program start-up, three streams are predefined and need not be opened explicitly: *standard input* (for reading conventional input), *standard output* (for writing conventional output), and *standard error* (for writing diagnostic output). When opened, the standard error stream is not fully buffered; the standard input and standard output streams are fully buffered if and only if the stream can be determined not to refer to an interactive device.

CX A stream associated with a memory buffer shall have the same operations for text files that a stream associated with an external file would have. In addition, the stream orientation shall be determined in exactly the same fashion.

Input and output operations on a stream associated with a memory buffer by a call to *fmemopen*() shall be constrained by the implementation to take place within the bounds of the memory buffer. In the case of a stream opened by *open_memstream*() or *open_wmemstream*(), the memory area shall grow dynamically to accommodate write operations as necessary. For output, data is moved from the buffer provided by *setvbuf*() to the memory stream during a flush or close operation.

2.5.1 Interaction of File Descriptors and Standard I/O Streams

CX This section describes the interaction of file descriptors and standard I/O streams. The functionality described in this section is an extension to the ISO C standard (and the rest of this section is not further CX shaded).

An open file description may be accessed through a file descriptor, which is created using functions such as *open*() or *pipe*(), or through a stream, which is created using functions such as *fopen*() or *popen*(). Either a file descriptor or a stream is called a "handle" on the open file description to which it refers; an open file description may have several handles.

Handles can be created or destroyed by explicit user action, without affecting the underlying open file description. Some of the ways to create them include *fcntl*(), *dup*(), *fdopen*(), *fileno*(), and *fork*(). They can be destroyed by at least *fclose*(), *close*(), and the *exec* functions.

A file descriptor that is never used in an operation that could affect the file offset (for example, *read*(), *write*(), or *lseek*()) is not considered a handle for this discussion, but could give rise to one (for example, as a consequence of *fdopen*(), *dup*(), or *fork*()). This exception does not include the file descriptor underlying a stream, whether created with *fopen*() or *fdopen*(), so long as it is not used directly by the application to affect the file offset. The *read*() and *write*() functions implicitly affect the file offset; *lseek*() explicitly affects it.

The result of function calls involving any one handle (the "active handle") is defined elsewhere in this volume of POSIX.1-200x, but if two or more handles are used, and any one of them is a stream, the application shall ensure that their actions are coordinated as described below. If this is not done, the result is undefined.

A handle which is a stream is considered to be closed when either an *fclose*() or *freopen*() is executed on it (the result of *freopen*() is a new stream, which cannot be a handle on the same open file description as its previous value), or when the process owning that stream terminates with *exit*(), *abort*(), or due to a signal. A file descriptor is closed by *close*(), *_exit*(), or the *exec*

functions when FD_CLOEXEC is set on that file descriptor.

For a handle to become the active handle, the application shall ensure that the actions below are performed between the last use of the handle (the current active handle) and the first use of the second handle (the future active handle). The second handle then becomes the active handle. All activity by the application affecting the file offset on the first handle shall be suspended until it again becomes the active file handle. (If a stream function has as an underlying function one that affects the file offset, the stream function shall be considered to affect the file offset.)

The handles need not be in the same process for these rules to apply.

Note that after a *fork*( ), two handles exist where one existed before. The application shall ensure that, if both handles can ever be accessed, they are both in a state where the other could become the active handle first. The application shall prepare for a *fork*( ) exactly as if it were a change of active handle. (If the only action performed by one of the processes is one of the *exec* functions or *_exit*( ) (not *exit*( )), the handle is never accessed in that process.)

For the first handle, the first applicable condition below applies. After the actions required below are taken, if the handle is still open, the application can close it.

- If it is a file descriptor, no action is required.
- If the only further action to be performed on any handle to this open file descriptor is to close it, no action need be taken.
- If it is a stream which is unbuffered, no action need be taken.
- If it is a stream which is line buffered, and the last byte written to the stream was a <newline> (that is, as if a:

  ```
  putc('\n')
  ```

  was the most recent operation on that stream), no action need be taken.
- If it is a stream which is open for writing or appending (but not also open for reading), the application shall either perform an *fflush*( ), or the stream shall be closed.
- If the stream is open for reading and it is at the end of the file (*feof*( ) is true), no action need be taken.
- If the stream is open with a mode that allows reading and the underlying open file description refers to a device that is capable of seeking, the application shall either perform an *fflush*( ), or the stream shall be closed.

Otherwise, the result is undefined.

For the second handle:

- If any previous active handle has been used by a function that explicitly changed the file offset, except as required above for the first handle, the application shall perform an *lseek*( ) or *fseek*( ) (as appropriate to the type of handle) to an appropriate location.

If the active handle ceases to be accessible before the requirements on the first handle, above, have been met, the state of the open file description becomes undefined. This might occur during functions such as a *fork*( ) or *_exit*( ).

The *exec* functions make inaccessible all streams that are open at the time they are called, independent of which streams or file descriptors may be available to the new process image.

When these rules are followed, regardless of the sequence of handles used, implementations shall ensure that an application, even one consisting of several processes, shall yield correct

results: no data shall be lost or duplicated when writing, and all data shall be written in order, except as requested by seeks. It is implementation-defined whether, and under what conditions, all input is seen exactly once.

If the rules above are not followed, the result is unspecified.

Each function that operates on a stream is said to have zero or more "underlying functions". This means that the stream function shares certain traits with the underlying functions, but does not require that there be any relation between the implementations of the stream function and its underlying functions.

2.5.2 Stream Orientation and Encoding Rules

For conformance to the ISO/IEC 9899:1999 standard, the definition of a stream includes an "orientation". After a stream is associated with an external file, but before any operations are performed on it, the stream is without orientation. Once a wide-character input/output function has been applied to a stream without orientation, the stream shall become "wide-oriented". Similarly, once a byte input/output function has been applied to a stream without orientation, the stream shall become "byte-oriented". Only a call to the *freopen*( ) function or the *fwide*( ) function can otherwise alter the orientation of a stream.

A successful call to *freopen*( ) shall remove any orientation. The three predefined streams *standard input*, *standard output*, and *standard error* shall be unoriented at program start-up.

Byte input/output functions cannot be applied to a wide-oriented stream, and wide-character input/output functions cannot be applied to a byte-oriented stream. The remaining stream operations shall not affect and shall not be affected by a stream's orientation, except for the following additional restriction:

- For wide-oriented streams, after a successful call to a file-positioning function that leaves the file position indicator prior to the end-of-file, a wide-character output function can overwrite a partial character; any file contents beyond the byte(s) written are henceforth undefined.

Each wide-oriented stream has an associated **mbstate_t** object that stores the current parse state of the stream. A successful call to *fgetpos*( ) shall store a representation of the value of this **mbstate_t** object as part of the value of the **fpos_t** object. A later successful call to *fsetpos*( ) using the same stored **fpos_t** value shall restore the value of the associated **mbstate_t** object as well as the position within the controlled stream.

Implementations that support multiple encoding rules associate an encoding rule with the stream. The encoding rule shall be determined by the setting of the *LC_CTYPE* category in the current locale at the time when the stream becomes wide-oriented. As with the stream's orientation, the encoding rule associated with a stream cannot be changed once it has been set, except by a successful call to *freopen*( ) which clears the encoding rule and resets the orientation to unoriented.

Although wide-oriented streams are conceptually sequences of wide characters, the external file associated with a wide-oriented stream is a sequence of (possibly multi-byte) characters generalized as follows:

- Multi-byte encodings within files may contain embedded null bytes (unlike multi-byte encodings valid for use internal to the program).
- A file need not begin nor end in the initial shift state.

Moreover, the encodings used for characters may differ among files. Both the nature and choice of such encodings are implementation-defined.

The wide-character input functions read characters from the stream and convert them to wide characters as if they were read by successive calls to the *fgetwc*( ) function. Each conversion shall occur as if by a call to the *mbrtowc*( ) function, with the conversion state described by the CX stream's own **mbstate_t** object, except the encoding rule associated with the stream is used instead of the encoding rule implied by the *LC_CTYPE* category of the current locale.

The wide-character output functions convert wide characters to (possibly multi-byte) characters and write them to the stream as if they were written by successive calls to the *fputwc*( ) function. Each conversion shall occur as if by a call to the *wcrtomb*( ) function, with the conversion state CX described by the stream's own **mbstate_t** object, except the encoding rule associated with the stream is used instead of the encoding rule implied by the *LC_CTYPE* category of the current locale.

An "encoding error" shall occur if the character sequence presented to the underlying *mbrtowc*( ) function does not form a valid (generalized) character, or if the code value passed to the underlying *wcrtomb*( ) function does not correspond to a valid (generalized) character. The wide-character input/output functions and the byte input/output functions store the value of the macro [EILSEQ] in *errno* if and only if an encoding error occurs.

2.6 STREAMS

OB XSR STREAMS functionality is provided on implementations supporting the XSI STREAMS Option Group. The functionality described in this section is dependent on support of the XSI STREAMS option (and the rest of this section is not further shaded for this option).

STREAMS provides a uniform mechanism for implementing networking services and other character-based I/O. The STREAMS function provides direct access to protocol modules. STREAMS modules are unspecified objects. Access to STREAMS modules is provided by interfaces in POSIX.1-200x. Creation of STREAMS modules is outside the scope of POSIX.1-200x.

A STREAM is typically a full-duplex connection between a process and an open device or pseudo-device. However, since pipes may be STREAMS-based, a STREAM can be a full-duplex connection between two processes. The STREAM itself exists entirely within the implementation and provides a general character I/O function for processes. It optionally includes one or more intermediate processing modules that are interposed between the process end of the STREAM (STREAM head) and a device driver at the end of the STREAM (STREAM end).

STREAMS I/O is based on messages. There are three types of message:

- *Data messages* containing actual data for input or output
- *Control data* containing instructions for the STREAMS modules and underlying implementation
- Other messages, which include file descriptors

The interface between the STREAM and the rest of the implementation is provided by a set of functions at the STREAM head. When a process calls *write*( ), *writev*( ), *putmsg*( ), *putpmsg*( ), or *ioctl*( ), messages are sent down the STREAM, and *read*( ), *readv*( ), *getmsg*( ), or *getpmsg*( ) accepts data from the STREAM and passes it to a process. Data intended for the device at the downstream end of the STREAM is packaged into messages and sent downstream, while data and signals from the device are composed into messages by the device driver and sent upstream to the STREAM head.

When a STREAMS-based device is opened, a STREAM shall be created that contains the

STREAM head and the STREAM end (driver). If pipes are STREAMS-based in an implementation, when a pipe is created, two STREAMS shall be created, each containing a STREAM head. Other modules are added to the STREAM using *ioctl*(). New modules are "pushed" onto the STREAM one at a time in last-in, first-out (LIFO) style, as though the STREAM was a push-down stack.

Priority

Message types are classified according to their queuing priority and may be *normal* (non-priority), *priority*, or *high-priority* messages. A message belongs to a particular priority band that determines its ordering when placed on a queue. Normal messages have a priority band of 0 and shall always be placed at the end of the queue following all other messages in the queue. High-priority messages are always placed at the head of a queue, but shall be discarded if there is already a high-priority message in the queue. Their priority band shall be ignored; they are high-priority by virtue of their type. Priority messages have a priority band greater than 0. Priority messages are always placed after any messages of the same or higher priority. High-priority and priority messages are used to send control and data information outside the normal flow of control. By convention, high-priority messages shall not be affected by flow control. Normal and priority messages have separate flow controls.

Message Parts

A process may access STREAMS messages that contain a data part, control part, or both. The data part is that information which is transmitted over the communication medium and the control information is used by the local STREAMS modules. The other types of messages are used between modules and are not accessible to processes. Messages containing only a data part are accessible via *putmsg*(), *putpmsg*(), *getmsg*(), *getpmsg*(), *read*(), *readv*(), *write*(), or *writev*(). Messages containing a control part with or without a data part are accessible via calls to *putmsg*(), *putpmsg*(), *getmsg*(), or *getpmsg*().

2.6.1 Accessing STREAMS

A process accesses STREAMS-based files using the standard functions *close*(), *ioctl*(), *getmsg*(), *getpmsg*(), *open*(), *pipe*(), *poll*(), *putmsg*(), *putpmsg*(), *read*(), or *write*(). Refer to the applicable function definitions for general properties and errors.

Calls to *ioctl*() shall perform control functions on the STREAM associated with the file descriptor *fildes*. The control functions may be performed by the STREAM head, a STREAMS module, or the STREAMS driver for the STREAM.

STREAMS modules and drivers can detect errors, sending an error message to the STREAM head, thus causing subsequent functions to fail and set *errno* to the value specified in the message. In addition, STREAMS modules and drivers can elect to fail a particular *ioctl*() request alone by sending a negative acknowledgement message to the STREAM head. This shall cause just the pending *ioctl*() request to fail and set *errno* to the value specified in the message.

2.7 XSI Interprocess Communication

XSI This section describes extensions to support interprocess communication. The functionality described in this section shall be provided on implementations that support the XSI option (and the rest of this section is not further shaded).

The following message passing, semaphore, and shared memory services form an XSI interprocess communication facility. Certain aspects of their operation are common, and are defined as follows.

IPC Functions		
msgctl( )	*semctl*( )	*shmat*( )
msgget( )	*semget*( )	*shmctl*( )
msgrcv( )	*semop*( )	*shmdt*( )
msgsnd( )		*shmget*( )

Another interprocess communication facility is provided by functions in the Realtime Option Group; see Section 2.8 (on page 497).

2.7.1 IPC General Description

Each individual shared memory segment, message queue, and semaphore set shall be identified by a unique positive integer, called, respectively, a shared memory identifier, *shmid*, a semaphore identifier, *semid*, and a message queue identifier, *msqid*. The identifiers shall be returned by calls to *shmget*( ), *semget*( ), and *msgget*( ), respectively.

Associated with each identifier is a data structure which contains data related to the operations which may be or may have been performed; see the Base Definitions volume of POSIX.1-200x, **<sys/shm.h>**, **<sys/sem.h>**, and **<sys/msg.h>** for their descriptions.

Each of the data structures contains both ownership information and an **ipc_perm** structure (see the Base Definitions volume of POSIX.1-200x, **<sys/ipc.h>**) which are used in conjunction to determine whether or not read/write (read/alter for semaphores) permissions should be granted to processes using the IPC facilities. The *mode* member of the **ipc_perm** structure acts as a bit field which determines the permissions.

The values of the bits are given below in octal notation.

Bit	Meaning
0400	Read by user.
0200	Write by user.
0040	Read by group.
0020	Write by group.
0004	Read by others.
0002	Write by others.

The name of the **ipc_perm** structure is *shm_perm*, *sem_perm*, or *msg_perm*, depending on which service is being used. In each case, read and write/alter permissions shall be granted to a process if one or more of the following are true ("xxx" is replaced by *shm*, *sem*, or *msg*, as appropriate):

- The process has appropriate privileges.
- The effective user ID of the process matches *xxx_perm.cuid* or *xxx_perm.uid* in the data structure associated with the IPC identifier, and the appropriate bit of the *user* field in *xxx_perm.mode* is set.

- The effective user ID of the process does not match *xxx_perm.cuid* or *xxx_perm.uid* but the effective group ID of the process matches *xxx_perm.cgid* or *xxx_perm.gid* in the data structure associated with the IPC identifier, and the appropriate bit of the *group* field in *xxx_perm.mode* is set.
- The effective user ID of the process does not match *xxx_perm.cuid* or *xxx_perm.uid* and the effective group ID of the process does not match *xxx_perm.cgid* or *xxx_perm.gid* in the data structure associated with the IPC identifier, but the appropriate bit of the *other* field in *xxx_perm.mode* is set.

Otherwise, the permission shall be denied.

2.8 Realtime

This section defines functions to support the source portability of applications with realtime requirements. The presence of some of these functions is dependent on support for implementation options described in the text.

The specific functional areas included in this section and their scope include the following. Full definitions of these terms can be found in XBD Chapter 3 (on page 33).

- Semaphores
- Process Memory Locking
- Memory Mapped Files and Shared Memory Objects
- Priority Scheduling
- Realtime Signal Extension
- Timers
- Interprocess Communication
- Synchronized Input and Output
- Asynchronous Input and Output

All the realtime functions defined in this volume of POSIX.1-200x are portable, although some of the numeric parameters used by an implementation may have hardware dependencies.

2.8.1 Realtime Signals

See Section 2.4.2 (on page 485).

2.8.2 Asynchronous I/O

An asynchronous I/O control block structure **aiocb** is used in many asynchronous I/O functions. It is defined in the Base Definitions volume of POSIX.1-200x, **<aio.h>** and has at least the following members:

Member Type	Member Name	Description
int	*aio_fildes*	File descriptor.
off_t	*aio_offset*	File offset.
volatile void*	*aio_buf*	Location of buffer.
size_t	*aio_nbytes*	Length of transfer.
int	*aio_reqprio*	Request priority offset.
struct sigevent	*aio_sigevent*	Signal number and value.
int	*aio_lio_opcode*	Operation to be performed.

The *aio_fildes* element is the file descriptor on which the asynchronous operation is performed.

If O_APPEND is not set for the file descriptor *aio_fildes* and if *aio_fildes* is associated with a device that is capable of seeking, then the requested operation takes place at the absolute position in the file as given by *aio_offset*, as if *lseek*( ) were called immediately prior to the operation with an *offset* argument equal to *aio_offset* and a *whence* argument equal to SEEK_SET. If O_APPEND is set for the file descriptor, or if *aio_fildes* is associated with a device that is incapable of seeking, write operations append to the file in the same order as the calls were made, with the following exception: under implementation-defined circumstances, such as operation on a multi-processor or when requests of differing priorities are submitted at the same time, the ordering restriction may be relaxed. Since there is no way for a strictly conforming application to determine whether this relaxation applies, all strictly conforming applications which rely on ordering of output shall be written in such a way that they will operate correctly if the relaxation applies. After a successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file is unspecified. The *aio_nbytes* and *aio_buf* elements are the same as the *nbyte* and *buf* arguments defined by *read*( ) and *write*( ), respectively.

If _POSIX_PRIORITIZED_IO and _POSIX_PRIORITY_SCHEDULING are defined, then asynchronous I/O is queued in priority order, with the priority of each asynchronous operation based on the current scheduling priority of the calling process. The *aio_reqprio* member can be used to lower (but not raise) the asynchronous I/O operation priority and is within the range zero through {AIO_PRIO_DELTA_MAX}, inclusive. Unless both _POSIX_PRIORITIZED_IO and _POSIX_PRIORITY_SCHEDULING are defined, the order of processing asynchronous I/O requests is unspecified. When both _POSIX_PRIORITIZED_IO and _POSIX_PRIORITY_SCHEDULING are defined, the order of processing of requests submitted by processes whose schedulers are not SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC is unspecified. The priority of an asynchronous request is computed as (process scheduling priority) minus *aio_reqprio*. The priority assigned to each asynchronous I/O request is an indication of the desired order of execution of the request relative to other asynchronous I/O requests for this file. If _POSIX_PRIORITIZED_IO is defined, requests issued with the same priority to a character special file are processed by the underlying device in FIFO order; the order of processing of requests of the same priority issued to files that are not character special files is unspecified. Numerically higher priority values indicate requests of higher priority. The value of *aio_reqprio* has no effect on process scheduling priority. When prioritized asynchronous I/O requests to the same file are blocked waiting for a resource required for that I/O operation, the higher-priority I/O requests shall be granted the resource before lower-priority I/O requests are granted the resource. The relative priority of asynchronous I/O and synchronous I/O is implementation-defined. If _POSIX_PRIORITIZED_IO is defined, the implementation shall define for which files I/O prioritization is supported.

The *aio_sigevent* determines how the calling process shall be notified upon I/O completion, as specified in Section 2.4.1 (on page 484). If *aio_sigevent.sigev_notify* is SIGEV_NONE, then no signal shall be posted upon I/O completion, but the error status for the operation and the return status for the operation shall be set appropriately.

The *aio_lio_opcode* field is used only by the *lio_listio*( ) call. The *lio_listio*( ) call allows multiple

asynchronous I/O operations to be submitted at a single time. The function takes as an argument an array of pointers to **aiocb** structures. Each **aiocb** structure indicates the operation to be performed (read or write) via the *aio_lio_opcode* field.

The address of the **aiocb** structure is used as a handle for retrieving the error status and return status of the asynchronous operation while it is in progress.

The **aiocb** structure and the data buffers associated with the asynchronous I/O operation are being used by the system for asynchronous I/O while, and only while, the error status of the asynchronous operation is equal to [EINPROGRESS]. Applications shall not modify the **aiocb** structure while the structure is being used by the system for asynchronous I/O.

The return status of the asynchronous operation is the number of bytes transferred by the I/O operation. If the error status is set to indicate an error completion, then the return status is set to the return value that the corresponding *read*(), *write*(), or *fsync*() call would have returned. When the error status is not equal to [EINPROGRESS], the return status shall reflect the return status of the corresponding synchronous operation.

2.8.3 Memory Management

2.8.3.1 *Memory Locking*

MLR Range memory locking operations are defined in terms of pages. Implementations may restrict the size and alignment of range lockings to be on page-size boundaries. The page size, in bytes, is the value of the configurable system variable {PAGESIZE}. If an implementation has no restrictions on size or alignment, it may specify a 1-byte page size.

ML | MLR Memory locking guarantees the residence of portions of the address space. It is implementation-defined whether locking memory guarantees fixed translation between virtual addresses (as seen by the process) and physical addresses. Per-process memory locks are not inherited across a *fork*(), and all memory locks owned by a process are unlocked upon *exec* or process termination. Unmapping of an address range removes any memory locks established on that address range by this process.

2.8.3.2 *Memory Mapped Files*

Range memory mapping operations are defined in terms of pages. Implementations may restrict the size and alignment of range mappings to be on page-size boundaries. The page size, in bytes, is the value of the configurable system variable {PAGESIZE}. If an implementation has no restrictions on size or alignment, it may specify a 1-byte page size.

Memory mapped files provide a mechanism that allows a process to access files by directly incorporating file data into its address space. Once a file is mapped into a process address space, the data can be manipulated as memory. If more than one process maps a file, its contents are shared among them. If the mappings allow shared write access, then data written into the memory object through the address space of one process appears in the address spaces of all processes that similarly map the same portion of the memory object.

SHM Shared memory objects are named regions of storage that may be independent of the file system and can be mapped into the address space of one or more processes to allow them to share the associated memory.

17184 SHM An *unlink*( ) of a file or *shm_unlink*( ) of a shared memory object, while causing the removal of
17185 the name, does not unmap any mappings established for the object. Once the name has been
17186 removed, the contents of the memory object are preserved as long as it is referenced. The
17187 memory object remains referenced as long as a process has the memory object open or has some
17188 area of the memory object mapped.

17189 *2.8.3.3 Memory Protection*

17190 When an object is mapped, various application accesses to the mapped region may result in
17191 signals. In this context, SIGBUS is used to indicate an error using the mapped object, and
17192 SIGSEGV is used to indicate a protection violation or misuse of an address:

17193 • A mapping may be restricted to disallow some types of access.

17194 • Write attempts to memory that was mapped without write access, or any access to
17195 memory mapped PROT_NONE, shall result in a SIGSEGV signal.

17196 • References to unmapped addresses shall result in a SIGSEGV signal.

17197 • Reference to whole pages within the mapping, but beyond the current length of the object,
17198 shall result in a SIGBUS signal.

17199 • The size of the object is unaffected by access beyond the end of the object (even if a
17200 SIGBUS is not generated).

17201 *2.8.3.4 Typed Memory Objects*

17202 TYM The functionality described in this section shall be provided on implementations that support
17203 the Typed Memory Objects option (and the rest of this section is not further shaded for this
17204 option).

17205 Implementations may support the Typed Memory Objects option independently of support for
17206 memory mapped files or shared memory objects. Typed memory objects are implementation-
17207 configurable named storage pools accessible from one or more processors in a system, each via
17208 one or more ports, such as backplane buses, LANs, I/O channels, and so on. Each valid
17209 combination of a storage pool and a port is identified through a name that is defined at system
17210 configuration time, in an implementation-defined manner; the name may be independent of the
17211 file system. Using this name, a typed memory object can be opened and mapped into process
17212 address space. For a given storage pool and port, it is necessary to support both dynamic
17213 allocation from the pool as well as mapping at an application-supplied offset within the pool;
17214 when dynamic allocation has been performed, subsequent deallocation must be supported.
17215 Lastly, accessing typed memory objects from different ports requires a method for obtaining the
17216 offset and length of contiguous storage of a region of typed memory (dynamically allocated or
17217 not); this allows typed memory to be shared among processes and/or processors while being
17218 accessed from the desired port.

2.8.4 Process Scheduling

PS The functionality described in this section shall be provided on implementations that support the Process Scheduling option (and the rest of this section is not further shaded for this option).

Scheduling Policies

The scheduling semantics described in this volume of POSIX.1-200x are defined in terms of a conceptual model that contains a set of thread lists. No implementation structures are necessarily implied by the use of this conceptual model. It is assumed that no time elapses during operations described using this model, and therefore no simultaneous operations are possible. This model discusses only processor scheduling for runnable threads, but it should be noted that greatly enhanced predictability of realtime applications results if the sequencing of other resources takes processor scheduling policy into account.

There is, conceptually, one thread list for each priority. A runnable thread will be on the thread list for that thread's priority. Multiple scheduling policies shall be provided. Each non-empty thread list is ordered, contains a head as one end of its order, and a tail as the other. The purpose of a scheduling policy is to define the allowable operations on this set of lists (for example, moving threads between and within lists).

The POSIX model treats a "process" as an aggregation of system resources, including one or more threads that may be scheduled by the operating system on the processor(s) it controls. Although a process has its own set of scheduling attributes, these have an indirect effect (if any) on the scheduling behavior of individual threads as described below.

Each thread shall be controlled by an associated scheduling policy and priority. These parameters may be specified by explicit application execution of the *pthread_setschedparam*( ) function. Additionally, the scheduling parameters of a thread (but not its scheduling policy) may be changed by application execution of the *pthread_setschedprio*( ) function.

Each process shall be controlled by an associated scheduling policy and priority. These parameters may be specified by explicit application execution of the *sched_setscheduler*( ) or *sched_setparam*( ) functions.

The effect of the process scheduling attributes on individual threads in the process is dependent on the scheduling contention scope of the threads (see Section 2.9.4, on page 509):

- For threads with system scheduling contention scope, the process scheduling attributes shall have no effect on the scheduling attributes or behavior either of the thread or an underlying kernel scheduling entity dedicated to that thread.
- For threads with process scheduling contention scope, the process scheduling attributes shall have no effect on the scheduling attributes of the thread. However, any underlying kernel scheduling entity used by these threads shall at all times behave as specified by the scheduling attributes of the containing process, and this behavior may affect the scheduling behavior of the process contention scope threads. For example, a process contention scope thread with scheduling policy SCHED_FIFO and the system maximum priority *H* (the value returned by *sched_get_priority_max*(SCHED_FIFO)) in a process with scheduling policy SCHED_RR and system minimum priority *L* (the value returned by *sched_get_priority_min*(SCHED_RR)) shall be subject to timeslicing and to preemption by any thread with an effective priority higher than *L*.

Associated with each policy is a priority range. Each policy definition shall specify the minimum priority range for that policy. The priority ranges for each policy may but need not overlap the priority ranges of other policies.

A conforming implementation shall select the thread that is defined as being at the head of the

17265 highest priority non-empty thread list to become a running thread, regardless of its associated
17266 policy. This thread is then removed from its thread list.

17267 Four scheduling policies are specifically required. Other implementation-defined scheduling
17268 policies may be defined. The following symbols are defined in the Base Definitions volume of
17269 POSIX.1-200x, **<sched.h>**:

17270 SCHED_FIFO First in, first out (FIFO) scheduling policy.

17271 SCHED_RR Round robin scheduling policy.

17272 SS SCHED_SPORADIC Sporadic server scheduling policy.

17273 SCHED_OTHER Another scheduling policy.

17274 The values of these symbols shall be distinct.

17275 **SCHED_FIFO**

17276 Conforming implementations shall include a scheduling policy called the FIFO scheduling
17277 policy.

17278 Threads scheduled under this policy are chosen from a thread list that is ordered by the time its
17279 threads have been on the list without being executed; generally, the head of the list is the thread
17280 that has been on the list the longest time, and the tail is the thread that has been on the list the
17281 shortest time.

17282 Under the SCHED_FIFO policy, the modification of the definitional thread lists is as follows:

17283 1. When a running thread becomes a preempted thread, it becomes the head of the thread
17284 list for its priority.

17285 2. When a blocked thread becomes a runnable thread, it becomes the tail of the thread list
17286 for its priority.

17287 3. When a running thread calls the *sched_setscheduler*( ) function, the process specified in the
17288 function call is modified to the specified policy and the priority specified by the *param*
17289 argument.

17290 4. When a running thread calls the *sched_setparam*( ) function, the priority of the process
17291 specified in the function call is modified to the priority specified by the *param* argument.

17292 5. When a running thread calls the *pthread_setschedparam*( ) function, the thread specified in
17293 the function call is modified to the specified policy and the priority specified by the *param*
17294 argument.

17295 6. When a running thread calls the *pthread_setschedprio*( ) function, the thread specified in the
17296 function call is modified to the priority specified by the *prio* argument.

17297 7. If a thread whose policy or priority has been modified other than by *pthread_setschedprio*( )
17298 is a running thread or is runnable, it then becomes the tail of the thread list for its new
17299 priority.

17300 8. If a thread whose priority has been modified by *pthread_setschedprio*( ) is a running thread
17301 or is runnable, the effect on its position in the thread list depends on the direction of the
17302 modification, as follows:

17303 a. If the priority is raised, the thread becomes the tail of the thread list.

17304 b. If the priority is unchanged, the thread does not change position in the thread list.

c. If the priority is lowered, the thread becomes the head of the thread list.

9. When a running thread issues the *sched_yield*() function, the thread becomes the tail of the thread list for its priority.

10. At no other time is the position of a thread with this scheduling policy within the thread lists affected.

For this policy, valid priorities shall be within the range returned by the *sched_get_priority_max*() and *sched_get_priority_min*() functions when SCHED_FIFO is provided as the parameter. Conforming implementations shall provide a priority range of at least 32 priorities for this policy.

SCHED_RR

Conforming implementations shall include a scheduling policy called the "round robin" scheduling policy. This policy shall be identical to the SCHED_FIFO policy with the additional condition that when the implementation detects that a running thread has been executing as a running thread for a time period of the length returned by the *sched_rr_get_interval*() function or longer, the thread shall become the tail of its thread list and the head of that thread list shall be removed and made a running thread.

The effect of this policy is to ensure that if there are multiple SCHED_RR threads at the same priority, one of them does not monopolize the processor. An application should not rely only on the use of SCHED_RR to ensure application progress among multiple threads if the application includes threads using the SCHED_FIFO policy at the same or higher priority levels or SCHED_RR threads at a higher priority level.

A thread under this policy that is preempted and subsequently resumes execution as a running thread completes the unexpired portion of its round robin interval time period.

For this policy, valid priorities shall be within the range returned by the *sched_get_priority_max*() and *sched_get_priority_min*() functions when SCHED_RR is provided as the parameter. Conforming implementations shall provide a priority range of at least 32 priorities for this policy.

SCHED_SPORADIC

SS | TSP The functionality described in this section shall be provided on implementations that support the Process Sporadic Server or Thread Sporadic Server options (and the rest of this section is not further shaded for these options).

If _POSIX_SPORADIC_SERVER or _POSIX_THREAD_SPORADIC_SERVER is defined, the implementation shall include a scheduling policy identified by the value SCHED_SPORADIC.

The sporadic server policy is based primarily on two time parameters: the replenishment period and the available execution capacity. The replenishment period is given by the *sched_ss_repl_period* member of the **sched_param** structure. The available execution capacity is initialized to the value given by the *sched_ss_init_budget* member of the same parameter. The sporadic server policy is identical to the SCHED_FIFO policy with some additional conditions that cause the thread's assigned priority to be switched between the values specified by the *sched_priority* and *sched_ss_low_priority* members of the **sched_param** structure.

The priority assigned to a thread using the sporadic server scheduling policy is determined in the following manner: if the available execution capacity is greater than zero and the number of pending replenishment operations is strictly less than *sched_ss_max_repl*, the thread is assigned the priority specified by *sched_priority*; otherwise, the assigned priority shall be *sched_ss_low_priority*. If the value of *sched_priority* is less than or equal to the value of

sched_ss_low_priority, the results are undefined. When active, the thread shall belong to the thread list corresponding to its assigned priority level, according to the mentioned priority assignment. The modification of the available execution capacity and, consequently of the assigned priority, is done as follows:

1. When the thread at the head of the *sched_priority* list becomes a running thread, its execution time shall be limited to at most its available execution capacity, plus the resolution of the execution time clock used for this scheduling policy. This resolution shall be implementation-defined.

2. Each time the thread is inserted at the tail of the list associated with *sched_priority*—because as a blocked thread it became runnable with priority *sched_priority* or because a replenishment operation was performed—the time at which this operation is done is posted as the *activation_time*.

3. When the running thread with assigned priority equal to *sched_priority* becomes a preempted thread, it becomes the head of the thread list for its priority, and the execution time consumed is subtracted from the available execution capacity. If the available execution capacity would become negative by this operation, it shall be set to zero.

4. When the running thread with assigned priority equal to *sched_priority* becomes a blocked thread, the execution time consumed is subtracted from the available execution capacity, and a replenishment operation is scheduled, as described in 6 and 7. If the available execution capacity would become negative by this operation, it shall be set to zero.

5. When the running thread with assigned priority equal to *sched_priority* reaches the limit imposed on its execution time, it becomes the tail of the thread list for *sched_ss_low_priority*, the execution time consumed is subtracted from the available execution capacity (which becomes zero), and a replenishment operation is scheduled, as described in 6 and 7.

6. Each time a replenishment operation is scheduled, the amount of execution capacity to be replenished, *replenish_amount*, is set equal to the execution time consumed by the thread since the *activation_time*. The replenishment is scheduled to occur at *activation_time* plus *sched_ss_repl_period*. If the scheduled time obtained is before the current time, the replenishment operation is carried out immediately. Several replenishment operations may be pending at the same time, each of which will be serviced at its respective scheduled time. With the above rules, the number of replenishment operations simultaneously pending for a given thread that is scheduled under the sporadic server policy shall not be greater than *sched_ss_max_repl*.

7. A replenishment operation consists of adding the corresponding *replenish_amount* to the available execution capacity at the scheduled time. If, as a consequence of this operation, the execution capacity would become larger than *sched_ss_initial_budget*, it shall be rounded down to a value equal to *sched_ss_initial_budget*. Additionally, if the thread was runnable or running, and had assigned priority equal to *sched_ss_low_priority*, then it becomes the tail of the thread list for *sched_priority*.

Execution time is defined in XBD Section 3.118 (on page 52).

For this policy, changing the value of a CPU-time clock via *clock_settime*() shall have no effect on its behavior.

For this policy, valid priorities shall be within the range returned by the *sched_get_priority_min*() and *sched_get_priority_max*() functions when SCHED_SPORADIC is provided as the parameter. Conforming implementations shall provide a priority range of at least 32 distinct priorities for this policy.

If the scheduling policy of the target process is either SCHED_FIFO or SCHED_RR, the *sched_ss_low_priority*, *sched_ss_repl_period*, and *sched_ss_init* budget members of the *param* argument shall have no effect on the scheduling behavior. If the scheduling policy of this process is not SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC, the effects of these members are implementation-defined; this case includes the SCHED_OTHER policy.

SCHED_OTHER

Conforming implementations shall include one scheduling policy identified as SCHED_OTHER (which may execute identically with either the FIFO or round robin scheduling policy). The effect of scheduling threads with the SCHED_OTHER policy in a system in which other threads SS are executing under SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC is implementation-defined.

This policy is defined to allow strictly conforming applications to be able to indicate in a portable manner that they no longer need a realtime scheduling policy.

For threads executing under this policy, the implementation shall use only priorities within the range returned by the *sched_get_priority_max*() and *sched_get_priority_min*() functions when SCHED_OTHER is provided as the parameter.

2.8.5 Clocks and Timers

The **<time.h>** header defines the types and manifest constants used by the timing facility.

Time Value Specification Structures

Many of the timing facility functions accept or return time value specifications. A time value structure **timespec** specifies a single time value and includes at least the following members:

Member Type	Member Name	Description
time_t	*tv_sec*	Seconds.
long	*tv_nsec*	Nanoseconds.

The *tv_nsec* member is only valid if greater than or equal to zero, and less than the number of nanoseconds in a second (1 000 million). The time interval described by this structure is (*tv_sec* * 10^9 + *tv_nsec*) nanoseconds.

A time value structure **itimerspec** specifies an initial timer value and a repetition interval for use by the per-process timer functions. This structure includes at least the following members:

Member Type	Member Name	Description
struct timespec	*it_interval*	Timer period.
struct timespec	*it_value*	Timer expiration.

If the value described by *it_value* is non-zero, it indicates the time to or time of the next timer expiration (for relative and absolute timer values, respectively). If the value described by *it_value* is zero, the timer shall be disarmed.

If the value described by *it_interval* is non-zero, it specifies an interval which shall be used in reloading the timer when it expires; that is, a periodic timer is specified. If the value described by *it_interval* is zero, the timer is disarmed after its next expiration; that is, a one-shot timer is specified.

17436 **Timer Event Notification Control Block**

17437 Per-process timers may be created that notify the process of timer expirations by queuing a
17438 realtime extended signal. The **sigevent** structure, defined in the Base Definitions volume of
17439 POSIX.1-200x, **<signal.h>**, is used in creating such a timer. The **sigevent** structure contains the
17440 signal number and an application-specific data value which shall be used when notifying the
17441 calling process of timer expiration events.

17442 **Manifest Constants**

17443 The following constants are defined in the Base Definitions volume of POSIX.1-200x, **<time.h>**:

17444 CLOCK_REALTIME — The identifier for the system-wide realtime clock.

17445 TIMER_ABSTIME — Flag indicating time is absolute with respect to the clock associated
17446 with a timer.

17447 MON CLOCK_MONOTONIC — The identifier for the system-wide monotonic clock, which is defined
17448 as a clock whose value cannot be set via *clock_settime*( ) and which
17449 cannot have backward clock jumps. The maximum possible clock
17450 jump is implementation-defined.

17451 MON The maximum allowable resolution for CLOCK_REALTIME and CLOCK_MONOTONIC clocks
17452 and all time services based on these clocks is represented by {_POSIX_CLOCKRES_MIN} and
17453 shall be defined as 20 ms (1/50 of a second). Implementations may support smaller values of
17454 resolution for these clocks to provide finer granularity time bases. The actual resolution
17455 supported by an implementation for a specific clock is obtained using the *clock_getres*( ) function.
17456 If the actual resolution supported for a time service based on one of these clocks differs from the
17457 resolution supported for that clock, the implementation shall document this difference.

17458 MON The minimum allowable maximum value for CLOCK_REALTIME and CLOCK_MONOTONIC
17459 clocks and all absolute time services based on them is the same as that defined by the ISO C
17460 standard for the **time_t** type. If the maximum value supported by a time service based on one of
17461 these clocks differs from the maximum value supported by that clock, the implementation shall
17462 document this difference.

17463 **Execution Time Monitoring**

17464 CPT If _POSIX_CPUTIME is defined, process CPU-time clocks shall be supported in addition to the
17465 clocks described in Manifest Constants.

17466 TCT If _POSIX_THREAD_CPUTIME is defined, thread CPU-time clocks shall be supported.

17467 CPT | TCT CPU-time clocks measure execution or CPU time, which is defined in XBD Section 3.118 (on
17468 page 52). The mechanism used to measure execution time is described in XBD Section 4.10 (on
17469 page 110).

17470 CPT If _POSIX_CPUTIME is defined, the following constant of the type **clockid_t** is defined in
17471 **<time.h>**:

17472 CLOCK_PROCESS_CPUTIME_ID
17473 When this value of the type **clockid_t** is used in a *clock*( ) or *timer**( ) function call, it is
17474 interpreted as the identifier of the CPU-time clock associated with the process making the
17475 function call.

17476 TCT If _POSIX_THREAD_CPUTIME is defined, the following constant of the type **clockid_t** is
17477 defined in **<time.h>**:

CLOCK_THREAD_CPUTIME_ID
When this value of the type **clockid_t** is used in a *clock*( ) or *timer**( ) function call, it is interpreted as the identifier of the CPU-time clock associated with the thread making the function call.

2.9 Threads

This section defines functionality to support multiple flows of control, called "threads", within a process. For the definition of threads, see XBD Section 3.396 (on page 97).

The specific functional areas covered by threads and their scope include:

- Thread management: the creation, control, and termination of multiple flows of control in the same process under the assumption of a common shared address space
- Synchronization primitives optimized for tightly coupled operation of multiple control flows in a common, shared address space

2.9.1 Thread-Safety

All functions defined by this volume of POSIX.1-200x shall be thread-safe, except that the following functions[7] need not be thread-safe.

asctime( )	*ftw*( )	*getservbyport*( )	*putc_unlocked*( )
basename( )	*getc_unlocked*( )	*getservent*( )	*putchar_unlocked*( )
catgets( )	*getchar_unlocked*( )	*getutxent*( )	*putenv*( )
crypt( )	*getdate*( )	*getutxid*( )	*pututxline*( )
ctime( )	*getenv*( )	*getutxline*( )	*rand*( )
dbm_clearerr( )	*getgrent*( )	*gmtime*( )	*readdir*( )
dbm_close( )	*getgrgid*( )	*hcreate*( )	*setenv*( )
dbm_delete( )	*getgrnam*( )	*hdestroy*( )	*setgrent*( )
dbm_error( )	*gethostent*( )	*hsearch*( )	*setkey*( )
dbm_fetch( )	*getlogin*( )	*inet_ntoa*( )	*setpwent*( )
dbm_firstkey( )	*getnetbyaddr*( )	*l64a*( )	*setutxent*( )
dbm_nextkey( )	*getnetbyname*( )	*lgamma*( )	*strerror*( )
dbm_open( )	*getnetent*( )	*lgammaf*( )	*strsignal*( )
dbm_store( )	*getopt*( )	*lgammal*( )	*strtok*( )
dirname( )	*getprotobyname*( )	*localeconv*( )	*system*( )
dlerror( )	*getprotobynumber*( )	*localtime*( )	*ttyname*( )
drand48( )	*getprotoent*( )	*lrand48*( )	*unsetenv*( )
encrypt( )	*getpwent*( )	*mrand48*( )	*wcstombs*( )
endgrent( )	*getpwnam*( )	*nftw*( )	*wctomb*( )
endpwent( )	*getpwuid*( )	*nl_langinfo*( )	
endutxent( )	*getservbyname*( )	*ptsname*( )	

The *ctermid*( ) and *tmpnam*( ) functions need not be thread-safe if passed a NULL argument. The *wcrtomb*( ) and *wcsrtombs*( ) functions need not be thread-safe if passed a NULL *ps* argument.

Implementations shall provide internal synchronization as necessary in order to satisfy this

7. The functions in the table are not shaded to denote applicable options. Individual reference pages should be consulted.

requirement.

Since multi-threaded applications are not allowed to use the *environ* variable to access or modify any environment variable while any other thread is concurrently modifying any environment variable, any function dependent on any environment variable is not thread-safe if another thread is modifying the environment; see XSH *exec* (on page 772).

2.9.2 Thread IDs

Although implementations may have thread IDs that are unique in a system, applications should only assume that thread IDs are usable and unique within a single process. The effect of calling any of the functions defined in this volume of POSIX.1-200x and passing as an argument the thread ID of a thread from another process is unspecified. The lifetime of a thread ID ends after the thread terminates if it was created with the *detachstate* attribute set to PTHREAD_CREATE_DETACHED or if *pthread_detach*( ) or *pthread_join*( ) has been called for that thread. A conforming implementation is free to reuse a thread ID after its lifetime has ended. If an application attempts to use a thread ID whose lifetime has ended, the behavior is undefined.

If a thread is detached, its thread ID is invalid for use as an argument in a call to *pthread_detach*( ) or *pthread_join*( ).

2.9.3 Thread Mutexes

A thread that has blocked shall not prevent any unblocked thread that is eligible to use the same processing resources from eventually making forward progress in its execution. Eligibility for processing resources is determined by the scheduling policy.

A thread shall become the owner of a mutex, *m*, when one of the following occurs:

- It returns successfully from *pthread_mutex_lock*( ) with *m* as the *mutex* argument.
- It returns successfully from *pthread_mutex_trylock*( ) with *m* as the *mutex* argument.
- It returns successfully from *pthread_mutex_timedlock*( ) with *m* as the mutex argument.
- It returns (successfully or not) from *pthread_cond_wait*( ) with *m* as the *mutex* argument (except as explicitly indicated otherwise for certain errors).
- It returns (successfully or not) from *pthread_cond_timedwait*( ) with *m* as the *mutex* argument (except as explicitly indicated otherwise for certain errors).

The thread shall remain the owner of *m* until one of the following occurs:

- It executes *pthread_mutex_unlock*( ) with *m* as the *mutex* argument
- It blocks in a call to *pthread_cond_wait*( ) with *m* as the *mutex* argument.
- It blocks in a call to *pthread_cond_timedwait*( ) with *m* as the *mutex* argument.

The implementation shall behave as if at all times there is at most one owner of any mutex.

A thread that becomes the owner of a mutex is said to have "acquired" the mutex and the mutex is said to have become "locked"; when a thread gives up ownership of a mutex it is said to have "released" the mutex and the mutex is said to have become "unlocked".

A problem can occur if a process terminates while one of its threads holds a mutex lock. Depending on the mutex type, it might be possible for another thread to unlock the mutex and recover the state of the mutex. However, it is difficult to perform this recovery reliably.

Robust mutexes provide a means to enable the implementation to notify other threads in the event of a process terminating while one of its threads holds a mutex lock. The next thread that acquires the mutex is notified about the termination by the return value [EOWNERDEAD] from the locking function. The notified thread can then attempt to recover the state protected by the mutex, and if successful mark the state protected by the mutex as consistent by a call to *pthread_mutex_consistent*( ). If the notified thread is unable to recover the state, it can declare the state as not recoverable by a call to *pthread_mutex_unlock*( ) without a prior call to *pthread_mutex_consistent*( ).

Whether or not the state protected by a mutex can be recovered is dependent solely on the application using robust mutexes. The robust mutex support provided in the implementation provides notification only that a mutex owner has terminated while holding a lock, or that the state of the mutex is not recoverable.

2.9.4 Thread Scheduling

TPS The functionality described in this section shall be provided on implementations that support the Thread Execution Scheduling option (and the rest of this section is not further shaded for this option).

Thread Scheduling Attributes

In support of the scheduling function, threads have attributes which are accessed through the **pthread_attr_t** thread creation attributes object.

The *contentionscope* attribute defines the scheduling contention scope of the thread to be either PTHREAD_SCOPE_PROCESS or PTHREAD_SCOPE_SYSTEM.

The *inheritsched* attribute specifies whether a newly created thread is to inherit the scheduling attributes of the creating thread or to have its scheduling values set according to the other scheduling attributes in the **pthread_attr_t** object.

The *schedpolicy* attribute defines the scheduling policy for the thread. The *schedparam* attribute defines the scheduling parameters for the thread. The interaction of threads having different policies within a process is described as part of the definition of those policies.

If the Thread Execution Scheduling option is defined, and the *schedpolicy* attribute specifies one of the priority-based policies defined under this option, the *schedparam* attribute contains the scheduling priority of the thread. A conforming implementation ensures that the priority value in *schedparam* is in the range associated with the scheduling policy when the thread attributes object is used to create a thread, or when the scheduling attributes of a thread are dynamically modified. The meaning of the priority value in *schedparam* is the same as that of *priority*.

TSP If _POSIX_THREAD_SPORADIC_SERVER is defined, the *schedparam* attribute supports four new members that are used for the sporadic server scheduling policy. These members are *sched_ss_low_priority*, *sched_ss_repl_period*, *sched_ss_init_budget*, and *sched_ss_max_repl*. The meaning of these attributes is the same as in the definitions that appear under Section 2.8.4 (on page 501).

When a process is created, its single thread has a scheduling policy and associated attributes equal to the policy and attributes of the process. The default scheduling contention scope value is implementation-defined. The default values of other scheduling attributes are implementation-defined.

17599 **Thread Scheduling Contention Scope**

17600 The scheduling contention scope of a thread defines the set of threads with which the thread
17601 competes for use of the processing resources. The scheduling operation selects at most one
17602 thread to execute on each processor at any point in time and the thread's scheduling attributes
17603 (for example, *priority*), whether under process scheduling contention scope or system scheduling
17604 contention scope, are the parameters used to determine the scheduling decision.

17605 The scheduling contention scope, in the context of scheduling a mixed scope environment,
17606 affects threads as follows:

17607 • A thread created with PTHREAD_SCOPE_SYSTEM scheduling contention scope contends
17608 for resources with all other threads in the same scheduling allocation domain relative to
17609 their system scheduling attributes. The system scheduling attributes of a thread created
17610 with PTHREAD_SCOPE_SYSTEM scheduling contention scope are the scheduling
17611 attributes with which the thread was created. The system scheduling attributes of a thread
17612 created with PTHREAD_SCOPE_PROCESS scheduling contention scope are the
17613 implementation-defined mapping into system attribute space of the scheduling attributes
17614 with which the thread was created.

17615 • Threads created with PTHREAD_SCOPE_PROCESS scheduling contention scope contend
17616 directly with other threads within their process that were created with
17617 PTHREAD_SCOPE_PROCESS scheduling contention scope. The contention is resolved
17618 based on the threads' scheduling attributes and policies. It is unspecified how such threads
17619 are scheduled relative to threads in other processes or threads with
17620 PTHREAD_SCOPE_SYSTEM scheduling contention scope.

17621 • Conforming implementations shall support the PTHREAD_SCOPE_PROCESS scheduling
17622 contention scope, the PTHREAD_SCOPE_SYSTEM scheduling contention scope, or both.

17623 **Scheduling Allocation Domain**

17624 Implementations shall support scheduling allocation domains containing one or more
17625 processors. It should be noted that the presence of multiple processors does not automatically
17626 indicate a scheduling allocation domain size greater than one. Conforming implementations on
17627 multi-processors may map all or any subset of the CPUs to one or multiple scheduling allocation
17628 domains, and could define these scheduling allocation domains on a per-thread, per-process, or
17629 per-system basis, depending on the types of applications intended to be supported by the
17630 implementation. The scheduling allocation domain is independent of scheduling contention
17631 scope, as the scheduling contention scope merely defines the set of threads with which a thread
17632 contends for processor resources, while scheduling allocation domain defines the set of
17633 processors for which it contends. The semantics of how this contention is resolved among
17634 threads for processors is determined by the scheduling policies of the threads.

17635 The choice of scheduling allocation domain size and the level of application control over
17636 scheduling allocation domains is implementation-defined. Conforming implementations may
17637 change the size of scheduling allocation domains and the binding of threads to scheduling
17638 allocation domains at any time.

17639 For application threads with scheduling allocation domains of size equal to one, the scheduling
17640 rules defined for SCHED_FIFO and SCHED_RR shall be used; see Scheduling Policies (on page
17641 501). All threads with system scheduling contention scope, regardless of the processes in which
17642 they reside, compete for the processor according to their priorities. Threads with process
17643 scheduling contention scope compete only with other threads with process scheduling
17644 contention scope within their process.

17645 For application threads with scheduling allocation domains of size greater than one, the rules

17646 TSP defined for SCHED_FIFO, SCHED_RR, and SCHED_SPORADIC shall be used in an
17647 implementation-defined manner. Each thread with system scheduling contention scope
17648 competes for the processors in its scheduling allocation domain in an implementation-defined
17649 manner according to its priority. Threads with process scheduling contention scope are
17650 scheduled relative to other threads within the same scheduling contention scope in the process.

17651 TSP If _POSIX_THREAD_SPORADIC_SERVER is defined, the rules defined for SCHED_SPORADIC
17652 in Scheduling Policies (on page 501) shall be used in an implementation-defined manner for
17653 application threads whose scheduling allocation domain size is greater than one.

17654 **Scheduling Documentation**

17655 If _POSIX_PRIORITY_SCHEDULING is defined, then any scheduling policies beyond
17656 TSP SCHED_OTHER, SCHED_FIFO, SCHED_RR, and SCHED_SPORADIC, as well as the effects of
17657 the scheduling policies indicated by these other values, and the attributes required in order to
17658 support such a policy, are implementation-defined. Furthermore, the implementation shall
17659 document the effect of all processor scheduling allocation domain values supported for these
17660 policies.

17661 2.9.5 Thread Cancellation

17662 The thread cancellation mechanism allows a thread to terminate the execution of any other
17663 thread in the process in a controlled manner. The target thread (that is, the one that is being
17664 canceled) is allowed to hold cancellation requests pending in a number of ways and to perform
17665 application-specific cleanup processing when the notice of cancellation is acted upon.

17666 Cancellation is controlled by the cancellation control functions. Each thread maintains its own
17667 cancelability state. Cancellation may only occur at cancellation points or when the thread is
17668 asynchronously cancelable.

17669 The thread cancellation mechanism described in this section depends upon programs having set
17670 *deferred* cancelability state, which is specified as the default. Applications shall also carefully
17671 follow static lexical scoping rules in their execution behavior. For example, use of *setjmp*(),
17672 *return*, *goto*, and so on, to leave user-defined cancellation scopes without doing the necessary
17673 scope pop operation results in undefined behavior.

17674 Use of asynchronous cancelability while holding resources which potentially need to be released
17675 may result in resource loss. Similarly, cancellation scopes may only be safely manipulated
17676 (pushed and popped) when the thread is in the *deferred* or *disabled* cancelability states.

17677 2.9.5.1 *Cancelability States*

17678 The cancelability state of a thread determines the action taken upon receipt of a cancellation
17679 request. The thread may control cancellation in a number of ways.

17680 Each thread maintains its own cancelability state, which may be encoded in two bits:

17681 1. Cancelability-Enable: When cancelability is PTHREAD_CANCEL_DISABLE (as defined
17682 in the Base Definitions volume of POSIX.1-200x, **<pthread.h>**), cancellation requests
17683 against the target thread are held pending. By default, cancelability is set to
17684 PTHREAD_CANCEL_ENABLE (as defined in **<pthread.h>**).

17685 2. Cancelability Type: When cancelability is enabled and the cancelability type is
17686 PTHREAD_CANCEL_ASYNCHRONOUS (as defined in **<pthread.h>**), new or pending
17687 cancellation requests may be acted upon at any time. When cancelability is enabled and
17688 the cancelability type is PTHREAD_CANCEL_DEFERRED (as defined in **<pthread.h>**),

cancellation requests are held pending until a cancellation point (see below) is reached. If cancelability is disabled, the setting of the cancelability type has no immediate effect as all cancellation requests are held pending; however, once cancelability is enabled again the new type is in effect. The cancelability type is PTHREAD_CANCEL_DEFERRED in all newly created threads including the thread in which *main*() was first invoked.

2.9.5.2 *Cancellation Points*

Cancellation points shall occur when a thread is executing the following functions:

accept()
aio_suspend()
clock_nanosleep()
close()
connect()
creat()
fcntl()†
fdatasync()
fsync()
getmsg()
getpmsg()
lockf()††
mq_receive()
mq_send()
mq_timedreceive()
mq_timedsend()
msgrcv()
msgsnd()
msync()
nanosleep()
open()
openat()
pause()
poll()
pread()
pselect()
pthread_cond_timedwait()
pthread_cond_wait()
pthread_join()
pthread_testcancel()
putmsg()
putpmsg()
pwrite()
read()
readv()
recv()
recvfrom()
recvmsg()
select()
sem_timedwait()
sem_wait()
send()
sendmsg()
sendto()
sigsuspend()
sigtimedwait()
sigwait()
sigwaitinfo()
sleep()
system()
tcdrain()
wait()
waitid()
waitpid()
write()
writev()

† When the *cmd* argument is F_SETLKW.

†† When the *function* argument is F_LOCK.

A cancellation point may also occur when a thread is executing the following functions:

access()
asctime()
asctime_r()
catclose()
catgets()
catopen()
chmod()
chown()
closedir()
closelog()
ctermid()
ctime()
ctime_r()
dbm_close()
dbm_delete()
dbm_fetch()
dbm_nextkey()
dbm_open()
dbm_store()
dlclose()
dlopen()
dprintf()

17793 An implementation shall not introduce cancellation points into any other functions specified in
17794 this volume of POSIX.1-200x.

17795 The side-effects of acting upon a cancellation request while suspended during a call of a function
17796 are the same as the side-effects that may be seen in a single-threaded program when a call to a
17797 function is interrupted by a signal and the given function returns [EINTR]. Any such side-
17798 effects occur before any cancellation cleanup handlers are called.

17799 Whenever a thread has cancelability enabled and a cancellation request has been made with that
17800 thread as the target, and the thread then calls any function that is a cancellation point (such as
17801 *pthread_testcancel*( ) or *read*( )), the cancellation request shall be acted upon before the function
17802 returns. If a thread has cancelability enabled and a cancellation request is made with the thread
17803 as a target while the thread is suspended at a cancellation point, the thread shall be awakened
17804 and the cancellation request shall be acted upon. It is unspecified whether the cancellation
17805 request is acted upon or whether the cancellation request remains pending and the thread
17806 resumes normal execution if:

17807 • The thread is suspended at a cancellation point and the event for which it is waiting occurs

---

17808 † For any value of the *cmd* argument.

17809 †† If *opterr* is non-zero.

- A specified timeout expired

before the cancellation request is acted upon.

2.9.5.3 *Thread Cancellation Cleanup Handlers*

Each thread maintains a list of cancellation cleanup handlers. The programmer uses the *pthread_cleanup_push*( ) and *pthread_cleanup_pop*( ) functions to place routines on and remove routines from this list.

When a cancellation request is acted upon, or when a thread calls *pthread_exit*( ), the thread first disables cancellation by setting its cancelability state to PTHREAD_CANCEL_DISABLE and its cancelability type to PTHREAD_CANCEL_DEFERRED. The cancelability state shall remain set to PTHREAD_CANCEL_DISABLE until the thread has terminated. The behavior is undefined if a cancellation cleanup handler or thread-specific data destructor routine changes the cancelability state to PTHREAD_CANCEL_ENABLE.

The routines in the thread's list of cancellation cleanup handlers are invoked one by one in LIFO sequence; that is, the last routine pushed onto the list (Last In) is the first to be invoked (First Out). When the cancellation cleanup handler for a scope is invoked, the storage for that scope remains valid. If the last cancellation cleanup handler returns, thread-specific data destructors (if any) associated with thread-specific data keys for which the thread has non-NULL values will be run, in unspecified order, as described for *pthread_key_create*( ).

After all cancellation cleanup handlers and thread-specific data destructors have returned, thread execution is terminated. If the thread has terminated because of a call to *pthread_exit*( ), the *value_ptr* argument is made available to any threads joining with the target. If the thread has terminated by acting on a cancellation request, a status of PTHREAD_CANCELED is made available to any threads joining with the target. The symbolic constant PTHREAD_CANCELED expands to a constant expression of type (**void** *) whose value matches no pointer to an object in memory nor the value NULL.

A side-effect of acting upon a cancellation request while in a condition variable wait is that the mutex is re-acquired before calling the first cancellation cleanup handler. In addition, the thread is no longer considered to be waiting for the condition and the thread shall not have consumed any pending condition signals on the condition.

A cancellation cleanup handler cannot exit via *longjmp*( ) or *siglongjmp*( ).

2.9.5.4 *Async-Cancel Safety*

The *pthread_cancel*( ), *pthread_setcancelstate*( ), and *pthread_setcanceltype*( ) functions are defined to be async-cancel safe.

No other functions in this volume of POSIX.1-200x are required to be async-cancel-safe.

2.9.6 Thread Read-Write Locks

Multiple readers, single writer (read-write) locks allow many threads to have simultaneous read-only access to data while allowing only one thread to have exclusive write access at any given time. They are typically used to protect data that is read more frequently than it is changed.

One or more readers acquire read access to the resource by performing a read lock operation on the associated read-write lock. A writer acquires exclusive write access by performing a write lock operation. Basically, all readers exclude any writers and a writer excludes all readers and

any other writers.

A thread that has blocked on a read-write lock (for example, has not yet returned from a *pthread_rwlock_rdlock*( ) or *pthread_rwlock_wrlock*( ) call) shall not prevent any unblocked thread that is eligible to use the same processing resources from eventually making forward progress in its execution. Eligibility for processing resources shall be determined by the scheduling policy.

Read-write locks can be used to synchronize threads in the current process and other processes if they are allocated in memory that is writable and shared among the cooperating processes and have been initialized for this behavior.

2.9.7 Thread Interactions with Regular File Operations

All of the following functions shall be atomic with respect to each other in the effects specified in POSIX.1-200x when they operate on regular files or symbolic links:

chmod( )	*fchownat*( )	*lseek*( )	*readv*( )	*unlink*( )
chown( )	*fcntl*( )	*lstat*( )	*pwrite*( )	*unlinkat*( )
close( )	*fstat*( )	*open*( )	*rename*( )	*utime*( )
creat( )	*fstatat*( )	*openat*( )	*renameat*( )	*utimensat*( )
dup2( )	*ftruncate*( )	*pread*( )	*stat*( )	*utimes*( )
fchmod( )	*lchown*( )	*read*( )	*symlink*( )	*write*( )
fchmodat( )	*link*( )	*readlink*( )	*symlinkat*( )	*writev*( )
fchown( )	*linkat*( )	*readlinkat*( )	*truncate*( )	

If two threads each call one of these functions, each call shall either see all of the specified effects of the other call, or none of them.

2.9.8 Use of Application-Managed Thread Stacks

An "application-managed thread stack" is a region of memory allocated by the application—for example, memory returned by the *malloc*( ) or *mmap*( ) functions—and designated as a stack through the act of passing the address and size of the stack, respectively, as the *stackaddr* and *stacksize* arguments to *pthread_attr_setstack*( ). Application-managed stacks allow the application to precisely control the placement and size of a stack.

The application grants to the implementation permanent ownership of and control over the application-managed stack when the attributes object in which the *stack* or *stackaddr* attribute has been set is used, either by presenting that attribute's object as the *attr* argument in a call to *pthread_create*( ) that completes successfully, or by storing a pointer to the attributes object in the *sigev_notify_attributes* member of a **struct sigevent** and passing that **struct sigevent** to a function accepting such argument that completes successfully. The application may thereafter utilize the memory within the stack only within the normal context of stack usage within or properly synchronized with a thread that has been scheduled by the implementation with stack pointer value(s) that are within the range of that stack. In particular, the region of memory cannot be freed, nor can it be later specified as the stack for another thread.

When specifying an attributes object with an application-managed stack through the *sigev_notify_attributes* member of a **struct sigevent**, the results are undefined if the requested signal is generated multiple times (as for a repeating timer).

Until an attributes object in which the *stack* or *stackaddr* attribute has been set is used, the application retains ownership of and control over the memory allocated to the stack. It may free or reuse the memory as long as it either deletes the attributes object, or before using the

attributes object replaces the stack by making an additional call to *pthread_attr_setstack*(), that was used originally to designate the stack. There is no mechanism to retract the reference to an application-managed stack by an existing attributes object.

Once an attributes object with an application-managed stack has been used, that attributes object cannot be used again by a subsequent call to *pthread_create*() or any function accepting a **struct sigevent** with *sigev_notify_attributes* containing a pointer to the attributes object, without designating an unused application-managed stack by making an additional call to *pthread_attr_setstack*().

2.10 Sockets

A socket is an endpoint for communication using the facilities described in this section. A socket is created with a specific socket type, described in Section 2.10.6 (on page 518), and is associated with a specific protocol, detailed in Section 2.10.3. A socket is accessed via a file descriptor obtained when the socket is created.

2.10.1 Address Families

All network protocols are associated with a specific address family. An address family provides basic services to the protocol implementation to allow it to function within a specific network environment. These services may include packet fragmentation and reassembly, routing, addressing, and basic transport. An address family is normally comprised of a number of protocols, one per socket type. Each protocol is characterized by an abstract socket type. It is not required that an address family support all socket types. An address family may contain multiple protocols supporting the same socket abstraction.

Section 2.10.17 (on page 525), Section 2.10.19 (on page 526), and Section 2.10.20 (on page 526), respectively, describe the use of sockets for local UNIX connections, for Internet protocols based on IPv4, and for Internet protocols based on IPv6.

2.10.2 Addressing

An address family defines the format of a socket address. All network addresses are described using a general structure, called a **sockaddr**, as defined in the Base Definitions volume of POSIX.1-200x, **<sys/socket.h>**. However, each address family imposes finer and more specific structure, generally defining a structure with fields specific to the address family. The field *sa_family* in the **sockaddr** structure contains the address family identifier, specifying the format of the *sa_data* area. The size of the *sa_data* area is unspecified.

2.10.3 Protocols

A protocol supports one of the socket abstractions detailed in Section 2.10.6 (on page 518). Selecting a protocol involves specifying the address family, socket type, and protocol number to the *socket*() function. Certain semantics of the basic socket abstractions are protocol-specific. All protocols are expected to support the basic model for their particular socket type, but may, in addition, provide non-standard facilities or extensions to a mechanism.

2.10.4 Routing

Sockets provides packet routing facilities. A routing information database is maintained, which is used in selecting the appropriate network interface when transmitting packets.

2.10.5 Interfaces

Each network interface in a system corresponds to a path through which messages can be sent and received. A network interface usually has a hardware device associated with it, though certain interfaces such as the loopback interface, do not.

2.10.6 Socket Types

A socket is created with a specific type, which defines the communication semantics and which allows the selection of an appropriate communication protocol. Four types are defined: SOCK_DGRAM, SOCK_RAW, SOCK_SEQPACKET, and SOCK_STREAM. Implementations may specify additional socket types.

RS

The SOCK_STREAM socket type provides reliable, sequenced, full-duplex octet streams between the socket and a peer to which the socket is connected. A socket of type SOCK_STREAM must be in a connected state before any data may be sent or received. Record boundaries are not maintained; data sent on a stream socket using output operations of one size may be received using input operations of smaller or larger sizes without loss of data. Data may be buffered; successful return from an output function does not imply that the data has been delivered to the peer or even transmitted from the local system. If data cannot be successfully transmitted within a given time then the connection is considered broken, and subsequent operations shall fail. A SIGPIPE signal is raised if a thread attempts to send data on a broken stream (one that is no longer connected), except that the signal is suppressed if the MSG_NOSIGNAL flag is used in calls to *send*(), *sendto*(), and *sendmsg*(). Support for an out-of-band data transmission facility is protocol-specific.

The SOCK_SEQPACKET socket type is similar to the SOCK_STREAM type, and is also connection-oriented. The only difference between these types is that record boundaries are maintained using the SOCK_SEQPACKET type. A record can be sent using one or more output operations and received using one or more input operations, but a single operation never transfers parts of more than one record. Record boundaries are visible to the receiver via the MSG_EOR flag in the received message flags returned by the *recvmsg*() function. It is protocol-specific whether a maximum record size is imposed.

The SOCK_DGRAM socket type supports connectionless data transfer which is not necessarily acknowledged or reliable. Datagrams may be sent to the address specified (possibly multicast or broadcast) in each output operation, and incoming datagrams may be received from multiple sources. The source address of each datagram is available when receiving the datagram. An application may also pre-specify a peer address, in which case calls to output functions that do not specify a peer address shall send to the pre-specified peer. If a peer has been specified, only datagrams from that peer shall be received. A datagram must be sent in a single output operation, and must be received in a single input operation. The maximum size of a datagram is protocol-specific; with some protocols, the limit is implementation-defined. Output datagrams may be buffered within the system; thus, a successful return from an output function does not guarantee that a datagram is actually sent or received. However, implementations should attempt to detect any errors possible before the return of an output function, reporting any error by an unsuccessful return value.

17976 RS The SOCK_RAW socket type is similar to the SOCK_DGRAM type. It differs in that it is
17977 normally used with communication providers that underlie those used for the other socket
17978 types. For this reason, the creation of a socket with type SOCK_RAW shall require appropriate
17979 privileges. The format of datagrams sent and received with this socket type generally include
17980 specific protocol headers, and the formats are protocol-specific and implementation-defined.

17981 2.10.7 Socket I/O Mode

17982 The I/O mode of a socket is described by the O_NONBLOCK file status flag which pertains to
17983 the open file description for the socket. This flag is initially off when a socket is created, but may
17984 be set and cleared by the use of the F_SETFL command of the *fcntl*( ) function.

17985 When the O_NONBLOCK flag is set, certain functions that would normally block until they are
17986 complete shall return immediately.

17987 The *bind*( ) function initiates an address assignment and shall return without blocking when
17988 O_NONBLOCK is set; if the socket address cannot be assigned immediately, *bind*( ) shall return
17989 the [EINPROGRESS] error to indicate that the assignment was initiated successfully, but that it
17990 has not yet completed.

17991 The *connect*( ) function initiates a connection and shall return without blocking when
17992 O_NONBLOCK is set; it shall return the error [EINPROGRESS] to indicate that the connection
17993 was initiated successfully, but that it has not yet completed.

17994 Data transfer operations (the *read*( ), *write*( ), *send*( ), and *recv*( ) functions) shall complete
17995 immediately, transfer only as much as is available, and then return without blocking, or return
17996 an error indicating that no transfer could be made without blocking.

17997 2.10.8 Socket Owner

17998 The owner of a socket is unset when a socket is created. The owner may be set to a process ID or
17999 process group ID using the F_SETOWN command of the *fcntl*( ) function.

18000 2.10.9 Socket Queue Limits

18001 The transmit and receive queue sizes for a socket are set when the socket is created. The default
18002 sizes used are both protocol-specific and implementation-defined. The sizes may be changed
18003 using the *setsockopt*( ) function.

18004 2.10.10 Pending Error

18005 Errors may occur asynchronously, and be reported to the socket in response to input from the
18006 network protocol. The socket stores the pending error to be reported to a user of the socket at the
18007 next opportunity. The error is returned in response to a subsequent *send*( ), *recv*( ), or *getsockopt*( )
18008 operation on the socket, and the pending error is then cleared.

2.10.11 Socket Receive Queue

A socket has a receive queue that buffers data when it is received by the system until it is removed by a receive call. Depending on the type of the socket and the communication provider, the receive queue may also contain ancillary data such as the addressing and other protocol data associated with the normal data in the queue, and may contain out-of-band or expedited data. The limit on the queue size includes any normal, out-of-band data, datagram source addresses, and ancillary data in the queue. The description in this section applies to all sockets, even though some elements cannot be present in some instances.

The contents of a receive buffer are logically structured as a series of data segments with associated ancillary data and other information. A data segment may contain normal data or out-of-band data, but never both. A data segment may complete a record if the protocol supports records (always true for types SOCK_SEQPACKET and SOCK_DGRAM). A record may be stored as more than one segment; the complete record might never be present in the receive buffer at one time, as a portion might already have been returned to the application, and another portion might not yet have been received from the communications provider. A data segment may contain ancillary protocol data, which is logically associated with the segment. Ancillary data is received as if it were queued along with the first normal data octet in the segment (if any). A segment may contain ancillary data only, with no normal or out-of-band data. For the purposes of this section, a datagram is considered to be a data segment that terminates a record, and that includes a source address as a special type of ancillary data. Data segments are placed into the queue as data is delivered to the socket by the protocol. Normal data segments are placed at the end of the queue as they are delivered. If a new segment contains the same type of data as the preceding segment and includes no ancillary data, and if the preceding segment does not terminate a record, the segments are logically merged into a single segment.

The receive queue is logically terminated if an end-of-file indication has been received or a connection has been terminated. A segment shall be considered to be terminated if another segment follows it in the queue, if the segment completes a record, or if an end-of-file or other connection termination has been reported. The last segment in the receive queue shall also be considered to be terminated while the socket has a pending error to be reported.

A receive operation shall never return data or ancillary data from more than one segment.

2.10.12 Socket Out-of-Band Data State

The handling of received out-of-band data is protocol-specific. Out-of-band data may be placed in the socket receive queue, either at the end of the queue or before all normal data in the queue. In this case, out-of-band data is returned to an application program by a normal receive call. Out-of-band data may also be queued separately rather than being placed in the socket receive queue, in which case it shall be returned only in response to a receive call that requests out-of-band data. It is protocol-specific whether an out-of-band data mark is placed in the receive queue to demarcate data preceding the out-of-band data and following the out-of-band data. An out-of-band data mark is logically an empty data segment that cannot be merged with other segments in the queue. An out-of-band data mark is never returned in response to an input operation. The *sockatmark*( ) function can be used to test whether an out-of-band data mark is the first element in the queue. If an out-of-band data mark is the first element in the queue when an input function is called without the MSG_PEEK option, the mark is removed from the queue and the following data (if any) is processed as if the mark had not been present.

2.10.13 Connection Indication Queue

Sockets that are used to accept incoming connections maintain a queue of outstanding connection indications. This queue is a list of connections that are awaiting acceptance by the application; see *listen*( ).

2.10.14 Signals

One category of event at the socket interface is the generation of signals. These signals report protocol events or process errors relating to the state of the socket. The generation or delivery of a signal does not change the state of the socket, although the generation of the signal may have been caused by a state change.

The SIGPIPE signal shall be sent to a thread that attempts to send data on a socket that is no longer able to send (one that is no longer connected), except that the signal is suppressed if the MSG_NOSIGNAL flag is used in calls to *send*( ), *sendto*( ), and *sendmsg*( ). Regardless of whether the generation of the signal is suppressed, the send operation shall fail with the [EPIPE] error.

If a socket has an owner, the SIGURG signal is sent to the owner of the socket when it is notified of expedited or out-of-band data. The socket state at this time is protocol-dependent, and the status of the socket is specified in Section 2.10.17 (on page 525), Section 2.10.19 (on page 526), and Section 2.10.20 (on page 526). Depending on the protocol, the expedited data may or may not have arrived at the time of signal generation.

2.10.15 Asynchronous Errors

If any of the following conditions occur asynchronously for a socket, the corresponding value listed below shall become the pending error for the socket:

[ECONNABORTED]
The connection was aborted locally.

[ECONNREFUSED]
For a connection-mode socket attempting a non-blocking connection, the attempt to connect was forcefully rejected. For a connectionless-mode socket, an attempt to deliver a datagram was forcefully rejected.

[ECONNRESET]
The peer has aborted the connection.

[EHOSTDOWN]
The destination host has been determined to be down or disconnected.

[EHOSTUNREACH]
The destination host is not reachable.

[EMSGSIZE]
For a connectionless-mode socket, the size of a previously sent datagram prevented delivery.

[ENETDOWN]
The local network connection is not operational.

[ENETRESET]
The connection was aborted by the network.

[ENETUNREACH]
The destination network is not reachable.

2.10.16 Use of Options

There are a number of socket options which either specialize the behavior of a socket or provide useful information. These options may be set at different protocol levels and are always present at the uppermost "socket" level.

Socket options are manipulated by two functions, *getsockopt*( ) and *setsockopt*( ). These functions allow an application program to customize the behavior and characteristics of a socket to provide the desired effect.

All of the options have default values. The type and meaning of these values is defined by the protocol level to which they apply. Instead of using the default values, an application program may choose to customize one or more of the options. However, in the bulk of cases, the default values are sufficient for the application.

Some of the options are used to enable or disable certain behavior within the protocol modules (for example, turn on debugging) while others may be used to set protocol-specific information (for example, IP time-to-live on all the application's outgoing packets). As each of the options is introduced, its effect on the underlying protocol modules is described.

Table 2-1 shows the value for the socket level.

Table 2-1 Value of Level for Socket Options

Name	Description
SOL_SOCKET	Options are intended for the sockets level.

Table 2-2 (on page 523) lists those options present at the socket level; that is, when the *level* parameter of the *getsockopt*( ) or *setsockopt*( ) function is SOL_SOCKET, the types of the option value parameters associated with each option, and a brief synopsis of the meaning of the option value parameter. Unless otherwise noted, each may be examined with *getsockopt*( ) and set with *setsockopt*( ) on all types of socket. Options at other protocol levels vary in format and name.

Table 2-2 Socket-Level Options

Option	Parameter Type	Parameter Meaning
SO_ACCEPTCONN	**int**	Non-zero indicates that socket listening is enabled (*getsockopt*( ) only).
SO_BROADCAST	**int**	Non-zero requests permission to transmit broadcast datagrams (SOCK_DGRAM sockets only).
SO_DEBUG	**int**	Non-zero requests debugging in underlying protocol modules.
SO_DONTROUTE	**int**	Non-zero requests bypass of normal routing; route based on destination address only.
SO_ERROR	**int**	Requests and clears pending error information on the socket (*getsockopt*( ) only).
SO_KEEPALIVE	**int**	Non-zero requests periodic transmission of keepalive messages (protocol-specific).
SO_LINGER	**struct linger**	Specify actions to be taken for queued, unsent data on *close*( ): linger on/off and linger time in seconds.
SO_OOBINLINE	**int**	Non-zero requests that out-of-band data be placed into normal data input queue as received.
SO_RCVBUF	**int**	Size of receive buffer (in bytes).
SO_RCVLOWAT	**int**	Minimum amount of data to return to application for input operations (in bytes).
SO_RCVTIMEO	**struct timeval**	Timeout value for a socket receive operation.
SO_REUSEADDR	**int**	Non-zero requests reuse of local addresses in *bind*( ) (protocol-specific).
SO_SNDBUF	**int**	Size of send buffer (in bytes).
SO_SNDLOWAT	**int**	Minimum amount of data to send for output operations (in bytes).
SO_SNDTIMEO	**struct timeval**	Timeout value for a socket send operation.
SO_TYPE	**int**	Identify socket type (*getsockopt*( ) only).

The SO_ACCEPTCONN option is used only on *getsockopt*( ). When this option is specified, *getsockopt*( ) shall report whether socket listening is enabled for the socket. A value of zero shall indicate that socket listening is disabled; non-zero that it is enabled. SO_ACCEPTCONN has no default value.

The SO_BROADCAST option requests permission to send broadcast datagrams on the socket. Support for SO_BROADCAST is protocol-specific. The default for SO_BROADCAST is that the ability to send broadcast datagrams on a socket is disabled.

The SO_DEBUG option enables debugging in the underlying protocol modules. This can be useful for tracing the behavior of the underlying protocol modules during normal system operation. The semantics of the debug reports are implementation-defined. The default value for SO_DEBUG is for debugging to be turned off.

The SO_DONTROUTE option requests that outgoing messages bypass the standard routing facilities. The destination must be on a directly-connected network, and messages are directed to the appropriate network interface according to the destination address. It is protocol-specific whether this option has any effect and how the outgoing network interface is chosen. Support for this option with each protocol is implementation-defined.

The SO_ERROR option is used only on *getsockopt*( ). When this option is specified, *getsockopt*( )

shall return any pending error on the socket and clear the error status. It shall return a value of 0 if there is no pending error. SO_ERROR may be used to check for asynchronous errors on connected connectionless-mode sockets or for other types of asynchronous errors. SO_ERROR has no default value.

The SO_KEEPALIVE option enables the periodic transmission of messages on a connected socket. The behavior of this option is protocol-specific. On a connection-mode socket for which a connection has been established, if SO_KEEPALIVE is enabled and the connected socket fails to respond to the keep-alive messages, the connection shall be broken. The default value for SO_KEEPALIVE is zero, specifying that this capability is turned off.

The SO_LINGER option controls the action of the interface when unsent messages are queued on a socket and a *close*() is performed. The details of this option are protocol-specific. If SO_LINGER is enabled, the system shall block the calling thread during *close*() until it can transmit the data or until the end of the interval indicated by the *l_linger* member, whichever comes first. If SO_LINGER is not specified, and *close*() is issued, the system handles the call in a way that allows the calling thread to continue as quickly as possible. The default value for SO_LINGER is zero, or off, for the *l_onoff* element of the option value and zero seconds for the linger time specified by the *l_linger* element.

The SO_OOBINLINE option is valid only on protocols that support out-of-band data. The SO_OOBINLINE option requests that out-of-band data be placed in the normal data input queue as received; it is then accessible using the *read*() or *recv*() functions without the MSG_OOB flag set. The default for SO_OOBINLINE is off; that is, for out-of-band data not to be placed in the normal data input queue.

The SO_RCVBUF option requests that the buffer space allocated for receive operations on this socket be set to the value, in bytes, of the option value. Applications may wish to increase buffer size for high volume connections, or may decrease buffer size to limit the possible backlog of incoming data. The default value for the SO_RCVBUF option value is implementation-defined, and may vary by protocol.

The SO_RCVLOWAT option sets the minimum number of bytes to process for socket input operations. In general, receive calls block until any (non-zero) amount of data is received, then return the smaller of the amount available or the amount requested. The default value for SO_RCVLOWAT is 1, and does not affect the general case. If SO_RCVLOWAT is set to a larger value, blocking receive calls normally wait until they have received the smaller of the low water mark value or the requested amount. Receive calls may still return less than the low water mark if an error occurs, a signal is caught, or the type of data next in the receive queue is different from that returned (for example, out-of-band data). As mentioned previously, the default value for SO_RCVLOWAT is 1 byte. It is implementation-defined whether the SO_RCVLOWAT option can be set.

The SO_RCVTIMEO option is an option to set a timeout value for input operations. It accepts a **timeval** structure with the number of seconds and microseconds specifying the limit on how long to wait for an input operation to complete. If a receive operation has blocked for this much time without receiving additional data, it shall return with a partial count or *errno* shall be set to [EAGAIN] or [EWOULDBLOCK] if no data were received. The default for this option is the value zero, which indicates that a receive operation will not time out. It is implementation-defined whether the SO_RCVTIMEO option can be set.

The SO_REUSEADDR option indicates that the rules used in validating addresses supplied in a *bind*() should allow reuse of local addresses. Operation of this option is protocol-specific. The default value for SO_REUSEADDR is off; that is, reuse of local addresses is not permitted.

The SO_SNDBUF option requests that the buffer space allocated for send operations on this socket be set to the value, in bytes, of the option value. The default value for the SO_SNDBUF

option value is implementation-defined, and may vary by protocol.

The SO_SNDLOWAT option sets the minimum number of bytes to process for socket output operations. Most output operations process all of the data supplied by the call, delivering data to the protocol for transmission and blocking as necessary for flow control. Non-blocking output operations process as much data as permitted subject to flow control without blocking, but process no data if flow control does not allow the smaller of the send low water mark value or the entire request to be processed. A *select*() operation testing the ability to write to a socket shall return true only if the send low water mark could be processed. The default value for SO_SNDLOWAT is implementation-defined and protocol-specific. It is implementation-defined whether the SO_SNDLOWAT option can be set.

The SO_SNDTIMEO option is an option to set a timeout value for the amount of time that an output function shall block because flow control prevents data from being sent. As noted in Table 2-2 (on page 523), the option value is a **timeval** structure with the number of seconds and microseconds specifying the limit on how long to wait for an output operation to complete. If a send operation has blocked for this much time, it shall return with a partial count or *errno* set to [EAGAIN] or [EWOULDBLOCK] if no data were sent. The default for this option is the value zero, which indicates that a send operation will not time out. It is implementation-defined whether the SO_SNDTIMEO option can be set.

The SO_TYPE option is used only on *getsockopt*(). When this option is specified, *getsockopt*() shall return the type of the socket (for example, SOCK_STREAM). This option is useful to servers that inherit sockets on start-up. SO_TYPE has no default value.

2.10.17 Use of Sockets for Local UNIX Connections

Support for UNIX domain sockets is mandatory.

UNIX domain sockets provide process-to-process communication in a single system.

2.10.17.1 Headers

The symbolic constant AF_UNIX defined in the **<sys/socket.h>** header is used to identify the UNIX domain address family. The **<sys/un.h>** header contains other definitions used in connection with UNIX domain sockets. See XBD Chapter 13 (on page 219).

The **sockaddr_storage** structure defined in **<sys/socket.h>** shall be large enough to accommodate a **sockaddr_un** structure (see the **<sys/un.h>** header defined in XBD Chapter 13, on page 219) and shall be aligned at an appropriate boundary so that pointers to it can be cast as pointers to **sockaddr_un** structures and used to access the fields of those structures without alignment problems. When a **sockaddr_storage** structure is cast as a **sockaddr_un** structure, the *ss_family* field maps onto the *sun_family* field.

2.10.18 Use of Sockets over Internet Protocols

When a socket is created in the Internet family with a protocol value of zero, the implementation shall use the protocol listed below for the type of socket created.

SOCK_STREAM IPPROTO_TCP.

SOCK_DGRAM IPPROTO_UDP.

18256 RS SOCK_RAW IPPROTO_RAW.

18257 SOCK_SEQPACKET Unspecified.

18258 RS A raw interface to IP is available by creating an Internet socket of type SOCK_RAW. The default
18259 protocol for type SOCK_RAW shall be identified in the IP header with the value
18260 IPPROTO_RAW. Applications should not use the default protocol when creating a socket with
18261 type SOCK_RAW, but should identify a specific protocol by value. The ICMP control protocol is
18262 accessible from a raw socket by specifying a value of IPPROTO_ICMP for protocol.

18263 2.10.19 Use of Sockets over Internet Protocols Based on IPv4

18264 Support for sockets over Internet protocols based on IPv4 is mandatory.

18265 *2.10.19.1 Headers*

18266 The symbolic constant AF_INET defined in the **<sys/socket.h>** header is used to identify the
18267 IPv4 Internet address family. The **<netinet/in.h>** header contains other definitions used in
18268 connection with IPv4 Internet sockets. See XBD Chapter 13 (on page 219).

18269 The **sockaddr_storage** structure defined in **<sys/socket.h>** shall be large enough to
18270 accommodate a **sockaddr_in** structure (see the **<netinet/in.h>** header defined in XBD Chapter
18271 13, on page 219) and shall be aligned at an appropriate boundary so that pointers to it can be
18272 cast as pointers to **sockaddr_in** structures and used to access the fields of those structures
18273 without alignment problems. When a **sockaddr_storage** structure is cast as a **sockaddr_in**
18274 structure, the *ss_family* field maps onto the *sin_family* field.

18275 2.10.20 Use of Sockets over Internet Protocols Based on IPv6

18276 IP6 This section describes extensions to support sockets over Internet protocols based on IPv6. The
18277 functionality described in this section shall be provided on implementations that support the
18278 IPV6 option (and the rest of this section is not further shaded for this option).

18279 To enable smooth transition from IPv4 to IPv6, the features defined in this section may, in certain
18280 circumstances, also be used in connection with IPv4; see Section 2.10.20.2 (on page 527).

18281 *2.10.20.1 Addressing*

18282 IPv6 overcomes the addressing limitations of earlier versions by using 128-bit addresses instead
18283 of 32-bit addresses. The IPv6 address architecture is described in RFC 2373.

18284 There are three kinds of IPv6 address:

18285 Unicast
18286 Identifies a single interface.

18287 A unicast address can be global, link-local (designed for use on a single link), or site-local
18288 (designed for systems not connected to the Internet). Link-local and site-local addresses
18289 need not be globally unique.

18290 Anycast
18291 Identifies a set of interfaces such that a packet sent to the address can be delivered to any
18292 member of the set.

18293 An anycast address is similar to a unicast address; the nodes to which an anycast address is

assigned must be explicitly configured to know that it is an anycast address.

Multicast
: Identifies a set of interfaces such that a packet sent to the address should be delivered to every member of the set.

  An application can send multicast datagrams by simply specifying an IPv6 multicast address in the *address* argument of *sendto*(). To receive multicast datagrams, an application must join the multicast group (using *setsockopt*() with IPV6_JOIN_GROUP) and must bind to the socket the UDP port on which datagrams will be received. Some applications should also bind the multicast group address to the socket, to prevent other datagrams destined to that port from being delivered to the socket.

  A multicast address can be global, node-local, link-local, site-local, or organization-local.

The following special IPv6 addresses are defined:

Unspecified
: An address that is not assigned to any interface and is used to indicate the absence of an address.

Loopback
: A unicast address that is not assigned to any interface and can be used by a node to send packets to itself.

Two sets of IPv6 addresses are defined to correspond to IPv4 addresses:

IPv4-compatible addresses
: These are assigned to nodes that support IPv6 and can be used when traffic is ''tunneled'' through IPv4.

IPv4-mapped addresses
: These are used to represent IPv4 addresses in IPv6 address format; see Section 2.10.20.2.

Note that the unspecified address and the loopback address must not be treated as IPv4-compatible addresses.

2.10.20.2 *Compatibility with IPv4*

The API provides the ability for IPv6 applications to interoperate with applications using IPv4, by using IPv4-mapped IPv6 addresses. These addresses can be generated automatically by the *getaddrinfo*() function when the specified host has only IPv4 addresses.

Applications can use AF_INET6 sockets to open TCP connections to IPv4 nodes, or send UDP packets to IPv4 nodes, by simply encoding the destination's IPv4 address as an IPv4-mapped IPv6 address, and passing that address, within a **sockaddr_in6** structure, in the *connect*(), *sendto*(), or *sendmsg*() function. When applications use AF_INET6 sockets to accept TCP connections from IPv4 nodes, or receive UDP packets from IPv4 nodes, the system shall return the peer's address to the application in the *accept*(), *recvfrom*(), *recvmsg*(), or *getpeername*() function using a **sockaddr_in6** structure encoded this way. If a node has an IPv4 address, then the implementation shall allow applications to communicate using that address via an AF_INET6 socket. In such a case, the address will be represented at the API by the corresponding IPv4-mapped IPv6 address. Also, the implementation may allow an AF_INET6 socket bound to **in6addr_any** to receive inbound connections and packets destined to one of the node's IPv4 addresses.

An application can use AF_INET6 sockets to bind to a node's IPv4 address by specifying the address as an IPv4-mapped IPv6 address in a **sockaddr_in6** structure in the *bind*() function. For an AF_INET6 socket bound to a node's IPv4 address, the system shall return the address in the

getsockname( ) function as an IPv4-mapped IPv6 address in a **sockaddr_in6** structure.

2.10.20.3 *Interface Identification*

Each local interface is assigned a unique positive integer as a numeric index. Indexes start at 1; zero is not used. There may be gaps so that there is no current interface for a particular positive index. Each interface also has a unique implementation-defined name.

2.10.20.4 *Options*

The following options apply at the IPPROTO_IPV6 level:

IPV6_JOIN_GROUP
When set via *setsockopt*( ), it joins the application to a multicast group on an interface (identified by its index) and addressed by a given multicast address, enabling packets sent to that address to be read via the socket. If the interface index is specified as zero, the system selects the interface (for example, by looking up the address in a routing table and using the resulting interface).

An attempt to read this option using *getsockopt*( ) shall result in an [EOPNOTSUPP] error.

The parameter type of this option is a pointer to an **ipv6_mreq** structure.

IPV6_LEAVE_GROUP
When set via *setsockopt*( ), it removes the application from the multicast group on an interface (identified by its index) and addressed by a given multicast address.

An attempt to read this option using *getsockopt*( ) shall result in an [EOPNOTSUPP] error.

The parameter type of this option is a pointer to an **ipv6_mreq** structure.

IPV6_MULTICAST_HOPS
The value of this option is the hop limit for outgoing multicast IPv6 packets sent via the socket. Its possible values are the same as those of IPV6_UNICAST_HOPS. If the IPV6_MULTICAST_HOPS option is not set, a value of 1 is assumed. This option can be set via *setsockopt*( ) and read via *getsockopt*( ).

The parameter type of this option is a pointer to an **int**. (Default value: 1)

IPV6_MULTICAST_IF
The index of the interface to be used for outgoing multicast packets. It can be set via *setsockopt*( ) and read via *getsockopt*( ). If the interface index is specified as zero, the system selects the interface (for example, by looking up the address in a routing table and using the resulting interface).

The parameter type of this option is a pointer to an **unsigned int**. (Default value: 0)

IPV6_MULTICAST_LOOP
This option controls whether outgoing multicast packets should be delivered back to the local application when the sending interface is itself a member of the destination multicast group. If it is set to 1 they are delivered. If it is set to 0 they are not. Other values result in an [EINVAL] error. This option can be set via *setsockopt*( ) and read via *getsockopt*( ).

The parameter type of this option is a pointer to an **unsigned int** which is used as a Boolean value. (Default value: 1)

IPV6_UNICAST_HOPS
The value of this option is the hop limit for outgoing unicast IPv6 packets sent via the socket. If the option is not set, or is set to –1, the system selects a default value. Attempts to

set a value less than –1 or greater than 255 shall result in an [EINVAL] error. This option can be set via *setsockopt*( ) and read via *getsockopt*( ).

The parameter type of this option is a pointer to an **int**. (Default value: Unspecified)

IPV6_V6ONLY
This socket option restricts AF_INET6 sockets to IPv6 communications only. AF_INET6 sockets may be used for both IPv4 and IPv6 communications. Some applications may want to restrict their use of an AF_INET6 socket to IPv6 communications only. For these applications, the IPv6_V6ONLY socket option is defined. When this option is turned on, the socket can be used to send and receive IPv6 packets only. This is an IPPROTO_IPV6-level option.

The parameter type of this option is a pointer to an **int** which is used as a Boolean value. (Default value: 0)

An [EOPNOTSUPP] error shall result if IPV6_JOIN_GROUP or IPV6_LEAVE_GROUP is used with *getsockopt*( ).

2.10.20.5 *Headers*

The symbolic constant AF_INET6 is defined in the **<sys/socket.h>** header to identify the IPv6 Internet address family. See XBD Chapter 13 (on page 219).

The **sockaddr_storage** structure defined in **<sys/socket.h>** shall be large enough to accommodate a **sockaddr_in6** structure (see the **<netinet/in.h>** header defined in XBD Chapter 13, on page 219) and shall be aligned at an appropriate boundary so that pointers to it can be cast as pointers to **sockaddr_in6** structures and used to access the fields of those structures without alignment problems. When a **sockaddr_storage** structure is cast as a **sockaddr_in6** structure, the *ss_family* field maps onto the *sin6_family* field.

The **<netinet/in.h>**, **<arpa/inet.h>**, and **<netdb.h>** headers contain other definitions used in connection with IPv6 Internet sockets; see XBD Chapter 13 (on page 219).

2.11 Tracing

OB TRC This section describes extensions to support tracing of user applications. The functionality described in this section is dependent on support of the Trace option (and the rest of this section is not further shaded for this option).

The tracing facilities defined in POSIX.1-200x allow a process to select a set of trace event types, to activate a trace stream of the selected trace events as they occur in the flow of execution, and to retrieve the recorded trace events.

The tracing operation relies on three logically different components: the traced process, the controller process, and the analyzer process. During the execution of the traced process, when a trace point is reached, a trace event is recorded into the trace streams created for that process in which the associated trace event type identifier is not being filtered out. The controller process controls the operation of recording the trace events into the trace stream. It shall be able to:

- Initialize the attributes of a trace stream
- Create the trace stream (for a specified traced process) using those attributes

- Start and stop tracing for the trace stream
- Filter the type of trace events to be recorded, if the Trace Event Filter option is supported
- Shut a trace stream down

These operations can be done for an active trace stream. The analyzer process retrieves the traced events either at runtime, when the trace stream has not yet been shut down, but is still recording trace events; or after opening a trace log that had been previously recorded and shut down. These three logically different operations can be performed by the same process, or can be distributed into different processes.

A trace stream identifier can be created by a call to *posix_trace_create*(), *posix_trace_create_withlog*(), or *posix_trace_open*(). The *posix_trace_create*() and *posix_trace_create_withlog*() functions should be used by a controller process. The *posix_trace_open*() should be used by an analyzer process.

The tracing functions can serve different purposes. One purpose is debugging the possibly pre-instrumented code, while another is post-mortem fault analysis. These two potential uses differ in that the first requires pre-filtering capabilities to avoid overwhelming the trace stream and permits focusing on expected information; while the second needs comprehensive trace capabilities in order to be able to record all types of information.

The events to be traced belong to two classes:

1. User trace events (generated by the application instrumentation)
2. System trace events (generated by the operating system)

The trace interface defines several system trace event types associated with control of and operation of the trace stream. This small set of system trace events includes the minimum required to interpret correctly the trace event information present in the stream. Other desirable system trace events for some particular application profile may be implemented and are encouraged; for example, process and thread scheduling, signal occurrence, and so on.

Each traced process shall have a mapping of the trace event names to trace event type identifiers that have been defined for that process. Each active trace stream shall have a mapping that incorporates all the trace event type identifiers predefined by the trace system plus all the mappings of trace event names to trace event type identifiers of the processes that are being traced into that trace stream. These mappings are defined from the instrumented application by calling the *posix_trace_eventid_open*() function and from the controller process by calling the *posix_trace_trid_eventid_open*() function. For a pre-recorded trace stream, the list of trace event types is obtained from the pre-recorded trace log.

The last data modification and file status change timestamps of a file associated with an active trace stream shall be marked for update every time any of the tracing operations modifies that file.

The last data access timestamp of a file associated with a trace stream shall be marked for update every time any of the tracing operations causes data to be read from that file.

Results are undefined if the application performs any operation on a file descriptor associated with an active or pre-recorded trace stream until *posix_trace_shutdown*() or *posix_trace_close*() is called for that trace stream. Results are also undefined if the analyzer process and the traced process do not share the same programming environment (see *c99*, Programming Environments in the Shell and Utilities volume of POSIX.1-200x.

The main purpose of this option is to define a complete set of functions and concepts that allow a conforming application to be traced from creation to termination, whatever its realtime constraints and properties.

2.11.1 Tracing Data Definitions

2.11.1.1 *Structures*

The **<trace.h>** header shall define the *posix_trace_status_info* and *posix_trace_event_info* structures described below. Implementations may add extensions to these structures.

posix_trace_status_info Structure

To facilitate control of a trace stream, information about the current state of an active trace stream can be obtained dynamically. This structure is returned by a call to the *posix_trace_get_status*( ) function.

The **posix_trace_status_info** structure defined in **<trace.h>** shall contain at least the following members:

Member Type	Member Name	Description
int	*posix_stream_status*	The operating mode of the trace stream.
int	*posix_stream_full_status*	The full status of the trace stream.
int	*posix_stream_overrun_status*	Indicates whether trace events were lost in the trace stream.

If the Trace Log option is supported in addition to the Trace option, the **posix_trace_status_info** structure defined in **<trace.h>** shall contain at least the following additional members:

Member Type	Member Name	Description
int	*posix_stream_flush_status*	Indicates whether a flush is in progress.
int	*posix_stream_flush_error*	Indicates whether any error occurred during the last flush operation.
int	*posix_log_overrun_status*	Indicates whether trace events were lost in the trace log.
int	*posix_log_full_status*	The full status of the trace log.

The *posix_stream_status* member indicates the operating mode of the trace stream and shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_RUNNING
: Tracing is in progress; that is, the trace stream is accepting trace events.

POSIX_TRACE_SUSPENDED
: The trace stream is not accepting trace events. The tracing operation has not yet started or has stopped, either following a *posix_trace_stop*( ) function call or because the trace resources are exhausted.

The *posix_stream_full_status* member indicates the full status of the trace stream, and it shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_FULL
: The space in the trace stream for trace events is exhausted.

POSIX_TRACE_NOT_FULL
: There is still space available in the trace stream.

The combination of the *posix_stream_status* and *posix_stream_full_status* members also indicates the actual status of the stream. The status shall be interpreted as follows:

POSIX_TRACE_RUNNING and POSIX_TRACE_NOT_FULL
: This status combination indicates that tracing is in progress, and there is space available for recording more trace events.

POSIX_TRACE_RUNNING and POSIX_TRACE_FULL
: This status combination indicates that tracing is in progress and that the trace stream is full of trace events. This status combination cannot occur unless the *stream-full-policy* is set to POSIX_TRACE_LOOP. The trace stream contains trace events recorded during a moving time window of prior trace events, and some older trace events may have been overwritten and thus lost.

POSIX_TRACE_SUSPENDED and POSIX_TRACE_NOT_FULL
: This status combination indicates that tracing has not yet been started, has been stopped by the *posix_trace_stop*( ) function, or has been cleared by the *posix_trace_clear*( ) function.

POSIX_TRACE_SUSPENDED and POSIX_TRACE_FULL
: This status combination indicates that tracing has been stopped by the implementation because the *stream-full-policy* attribute was POSIX_TRACE_UNTIL_FULL and trace resources were exhausted, or that the trace stream was stopped by the function *posix_trace_stop*( ) at a time when trace resources were exhausted.

The *posix_stream_overrun_status* member indicates whether trace events were lost in the trace stream, and shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_OVERRUN
: At least one trace event was lost and thus was not recorded in the trace stream.

POSIX_TRACE_NO_OVERRUN
: No trace events were lost.

When the corresponding trace stream is created, the *posix_stream_overrun_status* member shall be set to POSIX_TRACE_NO_OVERRUN.

Whenever an overrun occurs, the *posix_stream_overrun_status* member shall be set to POSIX_TRACE_OVERRUN.

An overrun occurs when:

- The policy is POSIX_TRACE_LOOP and a recorded trace event is overwritten.
- The policy is POSIX_TRACE_UNTIL_FULL and the trace stream is full when a trace event is generated.
- If the Trace Log option is supported, the policy is POSIX_TRACE_FLUSH and at least one trace event is lost while flushing the trace stream to the trace log.

The *posix_stream_overrun_status* member is reset to zero after its value is read.

If the Trace Log option is supported in addition to the Trace option, the *posix_stream_flush_status*, *posix_stream_flush_error*, *posix_log_overrun_status*, and *posix_log_full_status* members are defined as follows; otherwise, they are undefined.

The *posix_stream_flush_status* member indicates whether a flush operation is being performed and shall have one of the following values defined by manifest constants in the header **<trace.h>**:

POSIX_TRACE_FLUSHING
: The trace stream is currently being flushed to the trace log.

POSIX_TRACE_NOT_FLUSHING
No flush operation is in progress.

The *posix_stream_flush_status* member shall be set to POSIX_TRACE_FLUSHING if a flush operation is in progress either due to a call to the *posix_trace_flush*( ) function (explicit or caused by a trace stream shutdown operation) or because the trace stream has become full with the *stream-full-policy* attribute set to POSIX_TRACE_FLUSH. The *posix_stream_flush_status* member shall be set to POSIX_TRACE_NOT_FLUSHING if no flush operation is in progress.

The *posix_stream_flush_error* member shall be set to zero if no error occurred during flushing. If an error occurred during a previous flushing operation, the *posix_stream_flush_error* member shall be set to the value of the first error that occurred. If more than one error occurs while flushing, error values after the first shall be discarded. The *posix_stream_flush_error* member is reset to zero after its value is read.

The *posix_log_overrun_status* member indicates whether trace events were lost in the trace log, and shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_OVERRUN
At least one trace event was lost.

POSIX_TRACE_NO_OVERRUN
No trace events were lost.

When the corresponding trace stream is created, the *posix_log_overrun_status* member shall be set to POSIX_TRACE_NO_OVERRUN. Whenever an overrun occurs, this status shall be set to POSIX_TRACE_OVERRUN. The *posix_log_overrun_status* member is reset to zero after its value is read.

The *posix_log_full_status* member indicates the full status of the trace log, and it shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_FULL
The space in the trace log is exhausted.

POSIX_TRACE_NOT_FULL
There is still space available in the trace log.

The *posix_log_full_status* member is only meaningful if the *log-full-policy* attribute is either POSIX_TRACE_UNTIL_FULL or POSIX_TRACE_LOOP.

For an active trace stream without log, that is created by the *posix_trace_create*( ) function, the *posix_log_overrun_status* member shall be set to POSIX_TRACE_NO_OVERRUN and the *posix_log_full_status* member shall be set to POSIX_TRACE_NOT_FULL.

posix_trace_event_info Structure

The trace event structure **posix_trace_event_info** contains the information for one recorded trace event. This structure is returned by the set of functions *posix_trace_getnext_event*( ), *posix_trace_timedgetnext_event*( ), and *posix_trace_trygetnext_event*( ).

The **posix_trace_event_info** structure defined in **<trace.h>** shall contain at least the following members:

Member Type	Member Name	Description
trace_event_id_t	*posix_event_id*	Trace event type identification.
pid_t	*posix_pid*	Process ID of the process that generated the trace event.
void *	*posix_prog_address*	Address at which the trace point was invoked.
int	*posix_truncation_status*	Status about the truncation of the data associated with this trace event.
struct timespec	*posix_timestamp*	Time at which the trace event was generated.

In addition, the **posix_trace_event_info** structure defined in **<trace.h>** shall contain the following additional member:

Member Type	Member Name	Description
pthread_t	*posix_thread_id*	Thread ID of the thread that generated the trace event.

The *posix_event_id* member represents the identification of the trace event type and its value is not directly defined by the user. This identification is returned by a call to one of the following functions: *posix_trace_trid_eventid_open*(), *posix_trace_eventtypelist_getnext_id*(), or *posix_trace_eventid_open*(). The name of the trace event type can be obtained by calling *posix_trace_eventid_get_name*().

The *posix_pid* is the process identifier of the traced process which generated the trace event. If the *posix_event_id* member is one of the implementation-defined system trace events and that trace event is not associated with any process, the *posix_pid* member shall be set to zero.

For a user trace event, the *posix_prog_address* member is the process mapped address of the point at which the associated call to the *posix_trace_event*() function was made. For a system trace event, if the trace event is caused by a system service explicitly called by the application, the *posix_prog_address* member shall be the address of the process at the point where the call to that system service was made.

The *posix_truncation_status* member defines whether the data associated with a trace event has been truncated at the time the trace event was generated, or at the time the trace event was read from the trace stream, or (if the Trace Log option is supported) from the trace log (see the *event* argument from the *posix_trace_getnext_event*() function). The *posix_truncation_status* member shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_NOT_TRUNCATED
: All the traced data is available.

POSIX_TRACE_TRUNCATED_RECORD
: Data was truncated at the time the trace event was generated.

POSIX_TRACE_TRUNCATED_READ
: Data was truncated at the time the trace event was read from a trace stream or a trace log because the reader's buffer was too small. This truncation status overrides the POSIX_TRACE_TRUNCATED_RECORD status.

The *posix_timestamp* member shall be the time at which the trace event was generated. The clock used is implementation-defined, but the resolution of this clock can be retrieved by a call to the *posix_trace_attr_getclockres*() function.

The *posix_thread_id* member is the identifier of the thread that generated the trace event. If the *posix_event_id* member is one of the implementation-defined system trace events and that trace event is not associated with any thread, the *posix_thread_id* member shall be set to zero.

18636 *2.11.1.2 Trace Stream Attributes*

18637 Trace streams have attributes that compose the **posix_trace_attr_t** trace stream attributes object.
18638 This object shall contain at least the following attributes:

18639 • The *generation-version* attribute identifies the origin and version of the trace system.

18640 • The *trace-name* attribute is a character string defined by the trace controller, and that
18641 identifies the trace stream.

18642 • The *creation-time* attribute represents the time of the creation of the trace stream.

18643 • The *clock-resolution* attribute defines the clock resolution of the clock used to generate
18644 timestamps.

18645 • The *stream-min-size* attribute defines the minimum size in bytes of the trace stream strictly
18646 reserved for the trace events.

18647 • The *stream-full-policy* attribute defines the policy followed when the trace stream is full; its
18648 value is POSIX_TRACE_LOOP, POSIX_TRACE_UNTIL_FULL, or POSIX_TRACE_FLUSH.

18649 • The *max-data-size* attribute defines the maximum record size in bytes of a trace event.

18650 In addition, if the Trace option and the Trace Inherit option are both supported, the
18651 **posix_trace_attr_t** trace stream creation attributes object shall contain at least the following
18652 attributes:

18653 • The *inheritance* attribute specifies whether a newly created trace stream will inherit tracing
18654 in its parent's process trace stream. It is either POSIX_TRACE_INHERITED or
18655 POSIX_TRACE_CLOSE_FOR_CHILD.

18656 In addition, if the Trace option and the Trace Log option are both supported, the
18657 **posix_trace_attr_t** trace stream creation attributes object shall contain at least the following
18658 attribute:

18659 • If the file type corresponding to the trace log supports the POSIX_TRACE_LOOP or the
18660 POSIX_TRACE_UNTIL_FULL policies, the *log-max-size* attribute defines the maximum
18661 size in bytes of the trace log associated with an active trace stream. Other stream data—for
18662 example, trace attribute values—shall not be included in this size.

18663 • The *log-full-policy* attribute defines the policy of a trace log associated with an active trace
18664 stream to be POSIX_TRACE_LOOP, POSIX_TRACE_UNTIL_FULL, or
18665 POSIX_TRACE_APPEND.

18666 2.11.2 Trace Event Type Definitions

18667

18668 *2.11.2.1 System Trace Event Type Definitions*

18669 The following system trace event types, defined in the **<trace.h>** header, track the invocation of
18670 the trace operations:

18671 • POSIX_TRACE_START shall be associated with a trace start operation.

18672 • POSIX_TRACE_STOP shall be associated with a trace stop operation.

18673 • If the Trace Event Filter option is supported, POSIX_TRACE_FILTER shall be associated
18674 with a trace event type filter change operation.

The following system trace event types, defined in the **<trace.h>** header, report operational trace events:

- POSIX_TRACE_OVERFLOW shall mark the beginning of a trace overflow condition.
- POSIX_TRACE_RESUME shall mark the end of a trace overflow condition.
- If the Trace Log option is supported, POSIX_TRACE_FLUSH_START shall mark the beginning of a flush operation.
- If the Trace Log option is supported, POSIX_TRACE_FLUSH_STOP shall mark the end of a flush operation.
- If an implementation-defined trace error condition is reported, it shall be marked POSIX_TRACE_ERROR.

The interpretation of a trace stream or a trace log by a trace analyzer process relies on the information recorded for each trace event, and also on system trace events that indicate the invocation of trace control operations and trace system operational trace events.

The POSIX_TRACE_START and POSIX_TRACE_STOP trace events specify the time windows during which the trace stream is running.

- The POSIX_TRACE_STOP trace event with an associated data that is equal to zero indicates a call of the function *posix_trace_stop*( ).
- The POSIX_TRACE_STOP trace event with an associated data that is different from zero indicates an automatic stop of the trace stream (see the definition of the *posix_trace_attr_getstreamfullpolicy*( ) function in *posix_trace_attr_getinherited*( )).

The POSIX_TRACE_FILTER trace event indicates that a trace event type filter value changed while the trace stream was running.

The POSIX_TRACE_ERROR serves to inform the analyzer process that an implementation-defined internal error of the trace system occurred.

The POSIX_TRACE_OVERFLOW trace event shall be reported with a timestamp equal to the timestamp of the first trace event overwritten. This is an indication that some generated trace events have been lost.

The POSIX_TRACE_RESUME trace event shall be reported with a timestamp equal to the timestamp of the first valid trace event reported after the overflow condition ends and shall be reported before this first valid trace event. This is an indication that the trace system is reliably recording trace events after an overflow condition.

Each of these trace event types shall be defined by a constant trace event name and a **trace_event_id_t** constant; trace event data is associated with some of these trace events.

If the Trace option is supported and the Trace Event Filter option and the Trace Log option are not supported, the following predefined system trace events in Table 2-3 (on page 537) shall be defined:

18711 **Table 2-3** Trace Option: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error
		int
posix_trace_start	POSIX_TRACE_START	None.
posix_trace_stop	POSIX_TRACE_STOP	auto
		int
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.

If the Trace option and the Trace Event Filter option are both supported, and if the Trace Log option is not supported, the following predefined system trace events in Table 2-4 shall be defined:

Table 2-4 Trace and Trace Event Filter Options: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error
		int
posix_trace_start	POSIX_TRACE_START	event_filter
		trace_event_set_t
posix_trace_stop	POSIX_TRACE_STOP	auto
		int
posix_trace_filter	POSIX_TRACE_FILTER	old_event_filter new_event_filter
		trace_event_set_t
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.

If the Trace option and the Trace Log option are both supported, and if the Trace Event Filter option is not supported, the following predefined system trace events in Table 2-5 (on page 538) shall be defined:

18741 **Table 2-5** Trace and Trace Log Options: System Trace Events

Event Name	Constant	Associated Data Type
posix_trace_error	POSIX_TRACE_ERROR	error **int**
posix_trace_start	POSIX_TRACE_START	None.
posix_trace_stop	POSIX_TRACE_STOP	auto **int**
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.
posix_trace_flush_start	POSIX_TRACE_FLUSH_START	None.
posix_trace_flush_stop	POSIX_TRACE_FLUSH_STOP	None.

If the Trace option, the Trace Event Filter option, and the Trace Log option are all supported, the following predefined system trace events in Table 2-6 shall be defined:

Table 2-6 Trace, Trace Log, and Trace Event Filter Options: System Trace Events

Event Name	Constant	Associated Data Type
posix_trace_error	POSIX_TRACE_ERROR	error **int**
posix_trace_start	POSIX_TRACE_START	event_filter **trace_event_set_t**
posix_trace_stop	POSIX_TRACE_STOP	auto **int**
posix_trace_filter	POSIX_TRACE_FILTER	old_event_filter new_event_filter **trace_event_set_t**
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.
posix_trace_flush_start	POSIX_TRACE_FLUSH_START	None.
posix_trace_flush_stop	POSIX_TRACE_FLUSH_STOP	None.

18771 *2.11.2.2 User Trace Event Type Definitions*

The user trace event POSIX_TRACE_UNNAMED_USEREVENT is defined in the **<trace.h>** header. If the limit of per-process user trace event names represented by {TRACE_USER_EVENT_MAX} has already been reached, this predefined user event shall be returned when the application tries to register more events than allowed. The data associated with this trace event is application-defined.

The following predefined user trace event in Table 2-7 (on page 539) shall be defined:

18778 **Table 2-7** Trace Option: User Trace Event

Event Name	Constant
posix_trace_unnamed_userevent	POSIX_TRACE_UNNAMED_USEREVENT

2.11.3 Trace Functions

The trace interface is built and structured to improve portability through use of trace data of opaque type. The object-oriented approach for the manipulation of trace attributes and trace event type identifiers requires definition of many constructor and selector functions which operate on these opaque types. Also, the trace interface must support several different tracing roles. To facilitate reading the trace interface, the trace functions are grouped into small functional sets supporting the three different roles:

- A trace controller process requires functions to set up and customize all the resources needed to run a trace stream, including:
  - Attribute initialization and destruction (*posix_trace_attr_init*())
  - Identification information manipulation (*posix_trace_attr_getgenversion*())
  - Trace system behavior modification (*posix_trace_attr_getinherited*())
  - Trace stream and trace log size set (*posix_trace_attr_getmaxusereventsize*())
  - Trace stream creation, flush, and shutdown (*posix_trace_create*())
  - Trace stream and trace log clear (*posix_trace_clear*())
  - Trace event type identifier manipulation (*posix_trace_trid_eventid_open*())
  - Trace event type identifier list exploration (*posix_trace_eventtypelist_getnext_id*())
  - Trace event type set manipulation (*posix_trace_eventset_empty*())
  - Trace event type filter set (*posix_trace_set_filter*())
  - Trace stream start and stop (*posix_trace_start*())
  - Trace stream information and status read (*posix_trace_get_attr*())
- A traced process requires functions to instrument trace points:
  - Trace event type identifiers definition and trace points insertion (*posix_trace_event*())
- A trace analyzer process requires functions to retrieve information from a trace stream and trace log:
  - Identification information read (*posix_trace_attr_getgenversion*())
  - Trace system behavior information read (*posix_trace_attr_getinherited*())
  - Trace stream and trace log size get (*posix_trace_attr_getmaxusereventsize*())
  - Trace event type identifier manipulation (*posix_trace_trid_eventid_open*())
  - Trace event type identifier list exploration (*posix_trace_eventtypelist_getnext_id*())
  - Trace log open, rewind, and close (*posix_trace_open*())

— Trace stream information and status read (*posix_trace_get_attr*( ))

— Trace event read (*posix_trace_getnext_event*( ))

2.12 Data Types

2.12.1 Defined Types

All of the data types used by various functions are defined by the implementation. The following table describes some of these types. Other types referenced in the description of a function, not mentioned here, can be found in the appropriate header for that function.

Defined Type	Description
cc_t	Type used for terminal special characters.
clock_t	Integer or real-floating type used for processor times, as defined in the ISO C standard.
clockid_t	Used for clock ID type in some timer functions.
dev_t	Arithmetic type used for device numbers.
DIR	Type representing a directory stream.
div_t	Structure type returned by the *div*( ) function.
FILE	Structure containing information about a file.
glob_t	Structure type used in pathname pattern matching.
fpos_t	Type containing all information needed to specify uniquely every position within a file.
gid_t	Integer type used for group IDs.
iconv_t	Type used for conversion descriptors.
id_t	Integer type used as a general identifier; can be used to contain at least the largest of a **pid_t**, **uid_t**, or **gid_t**.
ino_t	Unsigned integer type used for file serial numbers.
key_t	Arithmetic type used for XSI interprocess communication.
ldiv_t	Structure type returned by the *ldiv*( ) function.
mode_t	Integer type used for file attributes.
mqd_t	Used for message queue descriptors.
nfds_t	Integer type used for the number of file descriptors.
nlink_t	Integer type used for link counts.
off_t	Signed integer type used for file sizes.
pid_t	Signed integer type used for process and process group IDs.
pthread_attr_t	Used to identify a thread attribute object.
pthread_cond_t	Used for condition variables.
pthread_condattr_t	Used to identify a condition attribute object.
pthread_key_t	Used for thread-specific data keys.
pthread_mutex_t	Used for mutexes.
pthread_mutexattr_t	Used to identify a mutex attribute object.
pthread_once_t	Used for dynamic package initialization.
pthread_rwlock_t	Used for read-write locks.
pthread_rwlockattr_t	Used for read-write lock attributes.
pthread_t	Used to identify a thread.

Defined Type	Description
ptrdiff_t	Signed integer type of the result of subtracting two pointers.
regex_t	Structure type used in regular expression matching.
regmatch_t	Structure type used in regular expression matching.
rlim_t	Unsigned integer type used for limit values, to which objects of type **int** and **off_t** can be cast without loss of value.
sem_t	Type used in performing semaphore operations.
sig_atomic_t	Integer type of an object that can be accessed as an atomic entity, even in the presence of asynchronous interrupts.
sigset_t	Integer or structure type of an object used to represent sets of signals.
size_t	Unsigned integer type used for size of objects.
speed_t	Type used for terminal baud rates.
ssize_t	Signed integer type used for a count of bytes or an error indication.
suseconds_t	Signed integer type used for time in microseconds.
tcflag_t	Type used for terminal modes.
time_t	Integer or real-floating type used for time in seconds, as defined in the ISO C standard.
timer_t	Used for timer ID returned by the *timer_create*( ) function.
uid_t	Integer type used for user IDs.
va_list	Type used for traversing variable argument lists.
wchar_t	Integer type whose range of values can represent distinct codes for all members of the largest extended character set specified by the supported locales.
wctype_t	Scalar type which represents a character class descriptor.
wint_t	Integer type capable of storing any valid value of **wchar_t** or WEOF.
wordexp_t	Structure type used in word expansion.

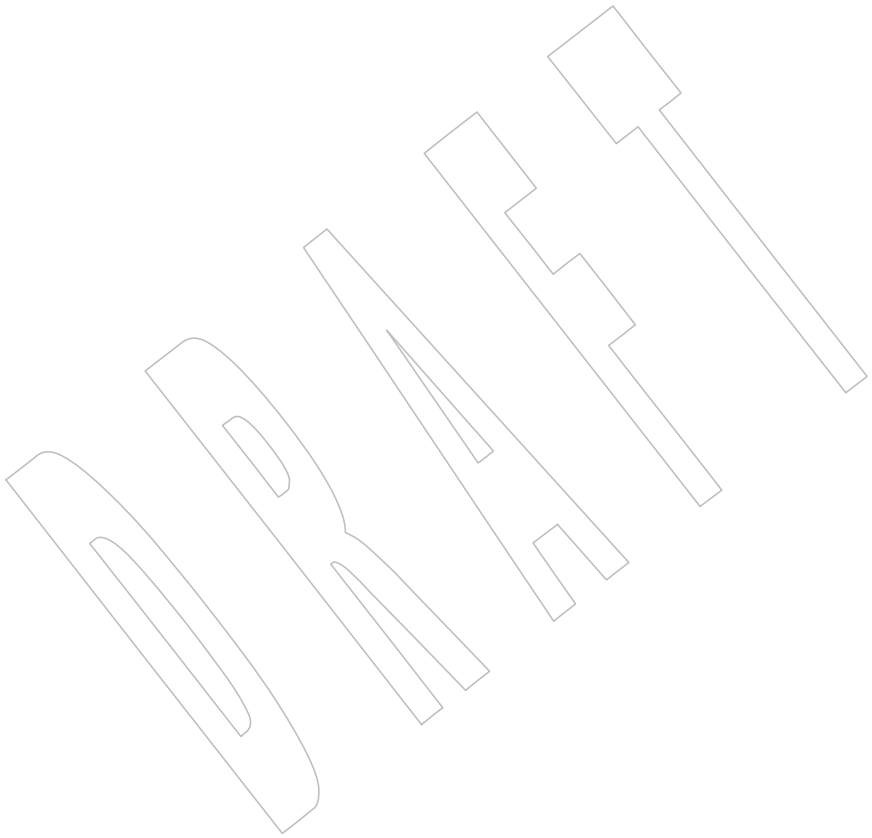
2.12.2 The char Type

The type **char** is defined as a single byte; see XBD Chapter 3 (on page 33) (Byte and Character).

2.12.3 Pointer Types

All function pointer types shall have the same representation as the type pointer to **void**. Conversion of a function pointer to **void** * shall not alter the representation. A **void** * value resulting from such a conversion can be converted back to the original function pointer type, using an explicit cast, without loss of information.

Note: The ISO C standard does not require this, but it is required for POSIX conformance.



18892 *Chapter 3*

18893 # *System Interfaces*

18894 This chapter describes the functions, macros, and external variables to support applications
18895 portability at the C-language source level.

FD_CLR( )

18896 **NAME**

18897 FD_CLR — macros for synchronous I/O multiplexing

18898 **SYNOPSIS**

18899
```
#include <sys/select.h>
```

18900
```
void FD_CLR(int fd, fd_set *fdset);
```
18901
```
int FD_ISSET(int fd, fd_set *fdset);
```
18902
```
void FD_SET(int fd, fd_set *fdset);
```
18903
```
void FD_ZERO(fd_set *fdset);
```

18904 **DESCRIPTION**

18905 Refer to *pselect( )*.

18906 **NAME**

18907 _Exit, _exit — terminate a process

18908 **SYNOPSIS**

18909
```
#include <stdlib.h>
```

18910
```
void _Exit(int status);
```

18911
```
#include <unistd.h>
```

18912
```
void _exit(int status);
```

18913 **DESCRIPTION**

18914 CX For *_Exit*( ): The functionality described on this reference page is aligned with the ISO C
18915 standard. Any conflict between the requirements described here and the ISO C standard is
18916 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

18917 CX The value of *status* may be 0, EXIT_SUCCESS, EXIT_FAILURE, or any other value, though only
18918 the least significant 8 bits (that is, *status* & 0377) shall be available to a waiting parent process.

18919 CX The *_Exit*( ) and *_exit*( ) functions shall be functionally equivalent.

18920 CX The *_Exit*( ) and *_exit*( ) functions shall not call functions registered with *atexit*( ) nor any
18921 CX registered signal handlers. Open streams shall not be flushed. Whether open streams are
18922 closed (without flushing) is implementation-defined. Finally, the calling process shall be
18923 terminated with the consequences described below.

18924 **Consequences of Process Termination**

18925 CX Process termination caused by any reason shall have the following consequences:

18926 **Note:** These consequences are all extensions to the ISO C standard and are not further CX shaded.
18927 However, functionality relating to the XSI option is shaded.

18928 • All of the file descriptors, directory streams, conversion descriptors, and message catalog
18929 descriptors open in the calling process shall be closed.

18930 XSI • If the parent process of the calling process is executing a *wait*( ), *waitid*( ), or *waitpid*( ), and
18931 has neither set its SA_NOCLDWAIT flag nor set SIGCHLD to SIG_IGN, it shall be notified
18932 of termination of the calling process and the low-order eight bits (that is, bits 0377) of *status*
18933 shall be made available to it. If the parent is not waiting, the child's status shall be made
18934 available to it when the parent subsequently executes *wait*( ), *waitid*( ), or *waitpid*( ).

18935 The semantics of the *waitid*( ) function shall be equivalent to *wait*( ).

18936 XSI • If the parent process of the calling process is not executing a *wait*( ), *waitid*( ), or *waitpid*( ),
18937 and has neither set its SA_NOCLDWAIT flag nor set SIGCHLD to SIG_IGN, the calling
18938 process shall be transformed into a *zombie process*. A *zombie process* is an inactive process
18939 and it shall be deleted at some later time when its parent process executes *wait*( ), *waitid*( ),
18940 or *waitpid*( ).

18941 XSI The semantics of the *waitid*( ) function shall be equivalent to *wait*( ).

18942 • Termination of a process does not directly terminate its children. The sending of a SIGHUP
18943 signal as described below indirectly terminates children in some circumstances.

18944 • Either:

18945 If the implementation supports the SIGCHLD signal, a SIGCHLD shall be sent to the
18946 parent process.

18947 Or:

18948 XSI If the parent process has set its SA_NOCLDWAIT flag, or set SIGCHLD to SIG_IGN, the
18949 status shall be discarded, and the lifetime of the calling process shall end immediately. If
18950 SA_NOCLDWAIT is set, it is implementation-defined whether a SIGCHLD signal is sent to
18951 the parent process.

18952 • The parent process ID of all of the existing child processes and zombie processes of the
18953 calling process shall be set to the process ID of an implementation-defined system process.
18954 That is, these processes shall be inherited by a special system process.

18955 XSI • Each attached shared-memory segment is detached and the value of *shm_nattch* (see
18956 *shmget*( )) in the data structure associated with its shared memory ID shall be decremented
18957 by 1.

18958 XSI • For each semaphore for which the calling process has set a *semadj* value (see *semop*( )), that
18959 value shall be added to the *semval* of the specified semaphore.

18960 • If the process is a controlling process, the SIGHUP signal shall be sent to each process in
18961 the foreground process group of the controlling terminal belonging to the calling process.

18962 • If the process is a controlling process, the controlling terminal associated with the session
18963 shall be disassociated from the session, allowing it to be acquired by a new controlling
18964 process.

18965 • If the exit of the process causes a process group to become orphaned, and if any member of
18966 the newly-orphaned process group is stopped, then a SIGHUP signal followed by a
18967 SIGCONT signal shall be sent to each process in the newly-orphaned process group.

18968 • All open named semaphores in the calling process shall be closed as if by appropriate calls
18969 to *sem_close*( ).

18970 ML • Any memory locks established by the process via calls to *mlockall*( ) or *mlock*( ) shall be
18971 removed. If locked pages in the address space of the calling process are also mapped into
18972 the address spaces of other processes and are locked by those processes, the locks
18973 established by the other processes shall be unaffected by the call by this process to *_Exit*( )
18974 or *_exit*( ).

18975 • Memory mappings that were created in the process shall be unmapped before the process
18976 is destroyed.

18977 TYM • Any blocks of typed memory that were mapped in the calling process shall be unmapped,
18978 as if *munmap*( ) was implicitly called to unmap them.

18979 MSG • All open message queue descriptors in the calling process shall be closed as if by
18980 appropriate calls to *mq_close*( ).

18981 • Any outstanding cancelable asynchronous I/O operations may be canceled. Those
18982 asynchronous I/O operations that are not canceled shall complete as if the *_Exit*( ) or
18983 *_exit*( ) operation had not yet occurred, but any associated signal notifications shall be
18984 suppressed. The *_Exit*( ) or *_exit*( ) operation may block awaiting such I/O completion.
18985 Whether any I/O is canceled, and which I/O may be canceled upon *_Exit*( ) or *_exit*( ), is
18986 implementation-defined.

18987 • Threads terminated by a call to *_Exit*( ) or *_exit*( ) shall not invoke their cancellation
18988 cleanup handlers or per-thread data destructors.

18989 OB TRC • If the calling process is a trace controller process, any trace streams that were created by
18990 the calling process shall be shut down as described by the *posix_trace_shutdown*( ) function,
18991 and mapping of trace event names to trace event type identifiers of any process built for
18992 these trace streams may be deallocated.

18993 **RETURN VALUE**

18994 These functions do not return.

18995 **ERRORS**

18996 No errors are defined.

18997 **EXAMPLES**

18998 None.

18999 **APPLICATION USAGE**

19000 Normally applications should use *exit*( ) rather than *_Exit*( ) or *_exit*( ).

19001 **RATIONALE**

19002 **Process Termination**

19003 Early proposals drew a distinction between normal and abnormal process termination.
19004 Abnormal termination was caused only by certain signals and resulted in implementation-
19005 defined "actions", as discussed below. Subsequent proposals distinguished three types of
19006 termination: *normal termination* (as in the current specification), *simple abnormal termination*, and
19007 *abnormal termination with actions*. Again the distinction between the two types of abnormal
19008 termination was that they were caused by different signals and that implementation-defined
19009 actions would result in the latter case. Given that these actions were completely implementation-
19010 defined, the early proposals were only saying when the actions could occur and how their
19011 occurrence could be detected, but not what they were. This was of little or no use to conforming
19012 applications, and thus the distinction is not made in this volume of POSIX.1-200x.

19013 The implementation-defined actions usually include, in most historical implementations, the
19014 creation of a file named **core** in the current working directory of the process. This file contains an
19015 image of the memory of the process, together with descriptive information about the process,
19016 perhaps sufficient to reconstruct the state of the process at the receipt of the signal.

19017 There is a potential security problem in creating a **core** file if the process was set-user-ID and the
19018 current user is not the owner of the program, if the process was set-group-ID and none of the
19019 user's groups match the group of the program, or if the user does not have permission to write
19020 in the current directory. In this situation, an implementation either should not create a **core** file
19021 or should make it unreadable by the user.

19022 Despite the silence of this volume of POSIX.1-200x on this feature, applications are advised not
19023 to create files named **core** because of potential conflicts in many implementations. Some
19024 implementations use a name other than **core** for the file; for example, by appending the process
19025 ID to the filename.

19026 **Terminating a Process**

19027 It is important that the consequences of process termination as described occur regardless of
19028 whether the process called *_exit*( ) (perhaps indirectly through *exit*( )) or instead was terminated
19029 due to a signal or for some other reason. Note that in the specific case of *exit*( ) this means that
19030 the *status* argument to *exit*( ) is treated in the same way as the *status* argument to *_exit*( ).

19031 A language other than C may have other termination primitives than the C-language *exit*( )
19032 function, and programs written in such a language should use its native termination primitives,
19033 but those should have as part of their function the behavior of *_exit*( ) as described.
19034 Implementations in languages other than C are outside the scope of this version of this volume
19035 of POSIX.1-200x, however.

19036 As required by the ISO C standard, using **return** from *main*( ) has the same behavior (other than

with respect to language scope issues) as calling *exit*( ) with the returned value. Reaching the end of the *main*( ) function has the same behavior as calling *exit*(0).

A value of zero (or EXIT_SUCCESS, which is required to be zero) for the argument *status* conventionally indicates successful termination. This corresponds to the specification for *exit*( ) in the ISO C standard. The convention is followed by utilities such as *make* and various shells, which interpret a zero status from a child process as success. For this reason, applications should not call *exit*(0) or *_exit*(0) when they terminate unsuccessfully; for example, in signal-catching functions.

Historically, the implementation-defined process that inherits children whose parents have terminated without waiting on them is called *init* and has a process ID of 1.

The sending of a SIGHUP to the foreground process group when a controlling process terminates corresponds to somewhat different historical implementations. In System V, the kernel sends a SIGHUP on termination of (essentially) a controlling process. In 4.2 BSD, the kernel does not send SIGHUP in a case like this, but the termination of a controlling process is usually noticed by a system daemon, which arranges to send a SIGHUP to the foreground process group with the *vhangup*( ) function. However, in 4.2 BSD, due to the behavior of the shells that support job control, the controlling process is usually a shell with no other processes in its process group. Thus, a change to make *_exit*( ) behave this way in such systems should not cause problems with existing applications.

The termination of a process may cause a process group to become orphaned in either of two ways. The connection of a process group to its parent(s) outside of the group depends on both the parents and their children. Thus, a process group may be orphaned by the termination of the last connecting parent process outside of the group or by the termination of the last direct descendant of the parent process(es). In either case, if the termination of a process causes a process group to become orphaned, processes within the group are disconnected from their job control shell, which no longer has any information on the existence of the process group. Stopped processes within the group would languish forever. In order to avoid this problem, newly orphaned process groups that contain stopped processes are sent a SIGHUP signal and a SIGCONT signal to indicate that they have been disconnected from their session. The SIGHUP signal causes the process group members to terminate unless they are catching or ignoring SIGHUP. Under most circumstances, all of the members of the process group are stopped if any of them are stopped.

The action of sending a SIGHUP and a SIGCONT signal to members of a newly orphaned process group is similar to the action of 4.2 BSD, which sends SIGHUP and SIGCONT to each stopped child of an exiting process. If such children exit in response to the SIGHUP, any additional descendants receive similar treatment at that time. In this volume of POSIX.1-200x, the signals are sent to the entire process group at the same time. Also, in this volume of POSIX.1-200x, but not in 4.2 BSD, stopped processes may be orphaned, but may be members of a process group that is not orphaned; therefore, the action taken at *_exit*( ) must consider processes other than child processes.

It is possible for a process group to be orphaned by a call to *setpgid*( ) or *setsid*( ), as well as by process termination. This volume of POSIX.1-200x does not require sending SIGHUP and SIGCONT in those cases, because, unlike process termination, those cases are not caused accidentally by applications that are unaware of job control. An implementation can choose to send SIGHUP and SIGCONT in those cases as an extension; such an extension must be documented as required in **<signal.h>**.

The ISO/IEC 9899: 1999 standard adds the *_Exit*( ) function that results in immediate program termination without triggering signals or *atexit*( )-registered functions. In POSIX.1-200x, this is

equivalent to the *_exit*( ) function.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Interactions with the SA_NOCLDWAIT flag and SIGCHLD signal are further clarified.

The values of *status* from *exit*( ) are better described.

Issue 6

Extensions beyond the ISO C standard are marked.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for typed memory.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The *_Exit*( ) function is included.
- The DESCRIPTION is updated.

The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

References to the *wait3*( ) function are removed.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/16 is applied, correcting grammar in the DESCRIPTION.

Issue 7

Austin Group Interpretation 1003.1-2001 #031 is applied, separating these functions from the *exit*( ) function.

Austin Group Interpretation 1003.1-2001 #085 is applied, clarifying the text regarding flushing of streams and closing of temporary files.

Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, and Semaphores options is moved to the Base.

NAME

_longjmp, _setjmp — non-local goto

SYNOPSIS

OB XSI

```
#include <setjmp.h>

void _longjmp(jmp_buf env, int val);
int _setjmp(jmp_buf env);
```

DESCRIPTION

The *_longjmp*( ) and *_setjmp*( ) functions shall be equivalent to *longjmp*( ) and *setjmp*( ), respectively, with the additional restriction that *_longjmp*( ) and *_setjmp*( ) shall not manipulate the signal mask.

If *_longjmp*( ) is called even though *env* was never initialized by a call to *_setjmp*( ), or when the last such call was in a function that has since returned, the results are undefined.

RETURN VALUE

Refer to *longjmp*( ) and *setjmp*( ).

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

If *_longjmp*( ) is executed and the environment in which *_setjmp*( ) was executed no longer exists, errors can occur. The conditions under which the environment of the *_setjmp*( ) no longer exists include exiting the function that contains the *_setjmp*( ) call, and exiting an inner block with temporary storage. This condition might not be detectable, in which case the *_longjmp*( ) occurs and, if the environment no longer exists, the contents of the temporary storage of an inner block are unpredictable. This condition might also cause unexpected process termination. If the function has returned, the results are undefined.

Passing *longjmp*( ) a pointer to a buffer not created by *setjmp*( ), passing *_longjmp*( ) a pointer to a buffer not created by *_setjmp*( ), passing *siglongjmp*( ) a pointer to a buffer not created by *sigsetjmp*( ), or passing any of these three functions a buffer that has been modified by the user can cause all the problems listed above, and more.

The *_longjmp*( ) and *_setjmp*( ) functions are included to support programs written to historical system interfaces. New applications should use *siglongjmp*( ) and *sigsetjmp*( ) respectively.

RATIONALE

None.

FUTURE DIRECTIONS

The *_longjmp*( ) and *_setjmp*( ) functions may be removed in a future version.

SEE ALSO

CHANGE HISTORY

First released in Issue 4, Version 2.

19158 **Issue 5**

19159 Moved from X/OPEN UNIX extension to BASE.

19160 **Issue 7**

19161 The *_longjmp*( ) and *_setjmp*( ) functions are marked obsolescent.

19162 **NAME**

19163 _tolower — transliterate uppercase characters to lowercase

19164 **SYNOPSIS**

19165 OB XSI
```
#include <ctype.h>

int _tolower(int c);
```
19166

19167 **DESCRIPTION**

19168 The *_tolower*( ) macro shall be equivalent to *tolower*(*c*) except that the application shall ensure
19169 that the argument *c* is an uppercase letter.

19170 **RETURN VALUE**

19171 Upon successful completion, *_tolower*( ) shall return the lowercase letter corresponding to the
19172 argument passed.

19173 **ERRORS**

19174 No errors are defined.

19175 **EXAMPLES**

19176 None.

19177 **APPLICATION USAGE**

19178 Applications should use the *tolower*( ) function instead of the obsolescent *_tolower*( ) function.

19179 **RATIONALE**

19180 None.

19181 **FUTURE DIRECTIONS**

19182 The *_tolower*( ) function may be removed in a future version.

19183 **SEE ALSO**

19189 The normative text is updated to avoid use of the term "must" for application requirements.

19190 **Issue 7**

19191 The *_tolower*( ) function is marked obsolescent.

19192 **NAME**

19193 _toupper — transliterate lowercase characters to uppercase

19194 **SYNOPSIS**

19195 OB XSI
```
#include <ctype.h>

int _toupper(int c);
```

19197 **DESCRIPTION**

19198 The *_toupper*( ) macro shall be equivalent to *toupper*( ) except that the application shall ensure
19199 that the argument *c* is a lowercase letter.

19200 **RETURN VALUE**

19201 Upon successful completion, *_toupper*( ) shall return the uppercase letter corresponding to the
19202 argument passed.

19203 **ERRORS**

19204 No errors are defined.

19205 **EXAMPLES**

19206 None.

19207 **APPLICATION USAGE**

19208 Applications should use the *toupper*( ) function instead of the obsolescent *_toupper*( ) function.

19209 **RATIONALE**

19210 None.

19211 **FUTURE DIRECTIONS**

19212 The *_toupper*( ) function may be removed in a future version.

19213 **SEE ALSO**

19214 *islower*( ), *toupper*( )

19218 **Issue 6**

19219 The normative text is updated to avoid use of the term "must" for application requirements.

19220 **Issue 7**

19221 The *_toupper*( ) function is marked obsolescent.

19222 **NAME**

19223 a64l, l64a — convert between a 32-bit integer and a radix-64 ASCII string

19224 **SYNOPSIS**

19225 XSI
```
#include <stdlib.h>

long a64l(const char *s);
char *l64a(long value);
```

19228 **DESCRIPTION**

19229 These functions maintain numbers stored in radix-64 ASCII characters. This is a notation by
19230 which 32-bit integers can be represented by up to six characters; each character represents a digit
19231 in radix-64 notation. If the type **long** contains more than 32 bits, only the low-order 32 bits shall
19232 be used for these operations.

19233 The characters used to represent digits are `'.'` (dot) for 0, `'/'` for 1, `'0'` through `'9'` for [2,11],
19234 `'A'` through `'Z'` for [12,37], and `'a'` through `'z'` for [38,63].

19235 The *a64l*( ) function shall take a pointer to a radix-64 representation, in which the first digit is the
19236 least significant, and return the corresponding **long** value. If the string pointed to by *s* contains
19237 more than six characters, *a64l*( ) shall use the first six. If the first six characters of the string
19238 contain a null terminator, *a64l*( ) shall use only characters preceding the null terminator. The
19239 *a64l*( ) function shall scan the character string from left to right with the least significant digit on
19240 the left, decoding each character as a 6-bit radix-64 number. If the type **long** contains more than
19241 32 bits, the resulting value is sign-extended. The behavior of *a64l*( ) is unspecified if *s* is a null
19242 pointer or the string pointed to by *s* was not generated by a previous call to *l64a*( ).

19243 The *l64a*( ) function shall take a **long** argument and return a pointer to the corresponding
19244 radix-64 representation. The behavior of *l64a*( ) is unspecified if *value* is negative.

19245 The value returned by *l64a*( ) may be a pointer into a static buffer. Subsequent calls to *l64a*( ) may
19246 overwrite the buffer.

19247 The *l64a*( ) function need not be thread-safe.

19248 **RETURN VALUE**

19249 Upon successful completion, *a64l*( ) shall return the **long** value resulting from conversion of the
19250 input string. If a string pointed to by *s* is an empty string, *a64l*( ) shall return 0L.

19251 The *l64a*( ) function shall return a pointer to the radix-64 representation. If *value* is 0L, *l64a*( ) shall
19252 return a pointer to an empty string.

19253 **ERRORS**

19254 No errors are defined.

19255 **EXAMPLES**

19256 None.

19257 **APPLICATION USAGE**

19258 If the type **long** contains more than 32 bits, the result of *a64l*(*l64a*(*x*)) is *x* in the low-order 32 bits.

19259 **RATIONALE**

19260 This is not the same encoding as used by either encoding variant of the *uuencode* utility.

19261 **FUTURE DIRECTIONS**

19262 None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

A note indicating that the *l64a( )* function need not be reentrant is added to the DESCRIPTION.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

19276 **NAME**

19277 abort — generate an abnormal process abort

19278 **SYNOPSIS**

19279
```
#include <stdlib.h>
```

19280
```
void abort(void);
```

19281 **DESCRIPTION**

19282 CX The functionality described on this reference page is aligned with the ISO C standard. Any
19283 conflict between the requirements described here and the ISO C standard is unintentional. This
19284 volume of POSIX.1-200x defers to the ISO C standard.

19285 The *abort*( ) function shall cause abnormal process termination to occur, unless the signal
19286 SIGABRT is being caught and the signal handler does not return.

19287 CX The abnormal termination processing shall include the default actions defined for SIGABRT and
19288 may include an attempt to effect *fclose*( ) on all open streams.

19289 The SIGABRT signal shall be sent to the calling process as if by means of *raise*( ) with the
19290 argument SIGABRT.

19291 CX The status made available to *wait*( ), *waitid*( ), or *waitpid*( ) by *abort*( ) shall be that of a process
19292 terminated by the SIGABRT signal. The *abort*( ) function shall override blocking or ignoring the
19293 SIGABRT signal.

19294 **RETURN VALUE**

19295 The *abort*( ) function shall not return.

19296 **ERRORS**

19297 No errors are defined.

19298 **EXAMPLES**

19299 None.

19300 **APPLICATION USAGE**

19301 Catching the signal is intended to provide the application developer with a portable means to
19302 abort processing, free from possible interference from any implementation-supplied functions.

19303 **RATIONALE**

19304 The ISO/IEC 9899:1999 standard requires the *abort*( ) function to be async-signal-safe. Since
19305 POSIX.1-200x defers to the ISO C standard, this required a change to the DESCRIPTION from
19306 "shall include the effect of *fclose*( )" to "may include an attempt to effect *fclose*( )."

19307 The revised wording permits some backwards-compatibility and avoids a potential deadlock
19308 situation.

19309 The Open Group Base Resolution bwg2002-003 is applied, removing the following XSI shaded
19310 paragraph from the DESCRIPTION:

19311 "On XSI-conformant systems, in addition the abnormal termination processing shall include the
19312 effect of *fclose*( ) on message catalog descriptors."

19313 There were several reasons to remove this paragraph:

19314 • No special processing of open message catalogs needs to be performed prior to abnormal
19315 process termination.

19316 • The main reason to specifically mention that *abort*( ) includes the effect of *fclose*( ) on open
19317 streams is to flush output queued on the stream. Message catalogs in this context are read-
19318 only and, therefore, do not need to be flushed.

- The effect of *fclose*( ) on a message catalog descriptor is unspecified. Message catalog descriptors are allowed, but not required to be implemented using a file descriptor, but there is no mention in POSIX.1-200x of a message catalog descriptor using a standard I/O stream FILE object as would be expected by *fclose*( ).

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

Changes are made to the DESCRIPTION for alignment with the ISO/IEC 9899: 1999 standard.

The Open Group Base Resolution bwg2002-003 is applied.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/10 is applied, changing the DESCRIPTION of abnormal termination processing and adding to the RATIONALE section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/9 is applied, changing "implementation-defined functions" to "implementation-supplied functions" in the APPLICATION USAGE section.

19339 **NAME**

19340 abs — return an integer absolute value

19341 **SYNOPSIS**

19342
```
#include <stdlib.h>
```

19343
```
int abs(int i);
```

19344 **DESCRIPTION**

19345 CX The functionality described on this reference page is aligned with the ISO C standard. Any
19346 conflict between the requirements described here and the ISO C standard is unintentional. This
19347 volume of POSIX.1-200x defers to the ISO C standard.

19348 The *abs*( ) function shall compute the absolute value of its integer operand, *i*. If the result cannot
19349 be represented, the behavior is undefined.

19350 **RETURN VALUE**

19351 The *abs*( ) function shall return the absolute value of its integer operand.

19352 **ERRORS**

19353 No errors are defined.

19354 **EXAMPLES**

19355 None.

19356 **APPLICATION USAGE**

19357 In two's-complement representation, the absolute value of the negative integer with largest
19358 magnitude {INT_MIN} might not be representable.

19359 **RATIONALE**

19360 None.

19361 **FUTURE DIRECTIONS**

19362 None.

19363 **SEE ALSO**

19364 *fabs*( ), *labs*( )

19365 XBD **<stdlib.h>**

19366 **CHANGE HISTORY**

19367 First released in Issue 1. Derived from Issue 1 of the SVID.

19368 **Issue 6**

19369 Extensions beyond the ISO C standard are marked.

NAME

accept — accept a new connection on a socket

SYNOPSIS

```
#include <sys/socket.h>

int accept(int socket, struct sockaddr *restrict address,
    socklen_t *restrict address_len);
```

DESCRIPTION

The *accept*( ) function shall extract the first connection on the queue of pending connections, create a new socket with the same socket type protocol and address family as the specified socket, and allocate a new file descriptor for that socket.

The *accept*( ) function takes the following arguments:

socket Specifies a socket that was created with *socket*( ), has been bound to an address with *bind*( ), and has issued a successful call to *listen*( ).

address Either a null pointer, or a pointer to a **sockaddr** structure where the address of the connecting socket shall be returned.

address_len Points to a **socklen_t** structure which on input specifies the length of the supplied **sockaddr** structure, and on output specifies the length of the stored address.

If *address* is not a null pointer, the address of the peer for the accepted connection shall be stored in the **sockaddr** structure pointed to by *address*, and the length of this address shall be stored in the object pointed to by *address_len*.

If the actual length of the address is greater than the length of the supplied **sockaddr** structure, the stored address shall be truncated.

If the protocol permits connections by unbound clients, and the peer is not bound, then the value stored in the object pointed to by *address* is unspecified.

If the listen queue is empty of connection requests and O_NONBLOCK is not set on the file descriptor for the socket, *accept*( ) shall block until a connection is present. If the *listen*( ) queue is empty of connection requests and O_NONBLOCK is set on the file descriptor for the socket, *accept*( ) shall fail and set *errno* to [EAGAIN] or [EWOULDBLOCK].

The accepted socket cannot itself accept more connections. The original socket remains open and can accept more connections.

RETURN VALUE

Upon successful completion, *accept*( ) shall return the non-negative file descriptor of the accepted socket. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *accept*( ) function shall fail if:

[EAGAIN] or [EWOULDBLOCK]
O_NONBLOCK is set for the socket file descriptor and no connections are present to be accepted.

[EBADF] The *socket* argument is not a valid file descriptor.

[ECONNABORTED]
A connection has been aborted.

19412 [EINTR] The *accept*( ) function was interrupted by a signal that was caught before a
19413 valid connection arrived.

19414 [EINVAL] The *socket* is not accepting connections.

19415 [EMFILE] All file descriptors available to the process are currently open.

19416 [ENFILE] The maximum number of file descriptors in the system are already open.

19417 [ENOBUFS] No buffer space is available.

19418 [ENOMEM] There was insufficient memory available to complete the operation.

19419 [ENOTSOCK] The *socket* argument does not refer to a socket.

19420 [EOPNOTSUPP] The socket type of the specified socket does not support accepting
19421 connections.

19422 The *accept*( ) function may fail if:

19423 OB XSR [EPROTO] A protocol error has occurred; for example, the STREAMS protocol stack has
19424 not been initialized.

19425 **EXAMPLES**

19426 None.

19427 **APPLICATION USAGE**

19428 When a connection is available, *select*( ) indicates that the file descriptor for the socket is ready
19429 for reading.

19430 **RATIONALE**

19431 None.

19432 **FUTURE DIRECTIONS**

19433 None.

19434 **SEE ALSO**

19435 *bind*( ), *connect*( ), *listen*( ), *socket*( )

19436 XBD **<sys/socket.h>**

19437 **CHANGE HISTORY**

19438 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19439 The **restrict** keyword is added to the *accept*( ) prototype for alignment with the
19440 ISO/IEC 9899: 1999 standard.

19441 **Issue 7**

19442 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

19443 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the "may fail" [ENOBUFS]
19444 and [ENOMEM] errors to become "shall fail" errors.

19445 Functionality relating to XSI STREAMS is marked obsolescent.

19446 **NAME**

19447 access, faccessat — determine accessibility of a file relative to directory file descriptor

19448 **SYNOPSIS**

19449 ```
#include <unistd.h>
```

19450 ```
int access(const char *path, int amode);
```
19451 ```
int faccessat(int fd, const char *path, int amode, int flag);
```

19452 **DESCRIPTION**

19453 The *access*( ) function shall check the file named by the pathname pointed to by the *path*
19454 argument for accessibility according to the bit pattern contained in *amode*, using the real user ID
19455 in place of the effective user ID and the real group ID in place of the effective group ID.

19456 The value of *amode* is either the bitwise-inclusive OR of the access permissions to be checked
19457 (R_OK, W_OK, X_OK) or the existence test (F_OK).

19458 If any access permissions are checked, each shall be checked individually, as described in XBD
19459 Section 4.4 (on page 108), except that where that description refers to execute permission for a
19460 process with appropriate privileges, an implementation may indicate success for X_OK even if
19461 execute permission is not granted to any user.

19462 The *faccessat*( ) function shall be equivalent to the *access*( ) function, except in the case where *path*
19463 specifies a relative path. In this case the file whose accessibility is to be determined shall be
19464 located relative to the directory associated with the file descriptor *fd* instead of the current
19465 working directory. If the file descriptor was opened without O_SEARCH, the function shall
19466 check whether directory searches are permitted using the current permissions of the directory
19467 underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function
19468 shall not perform the check.

19469 If *faccessat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working
19470 directory is used and the behavior shall be identical to a call to *access*( ).

19471 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined
19472 in **<fcntl.h>**:

19473 AT_EACCESS The checks for accessibility are performed using the effective user and group
19474 IDs instead of the real user and group ID as required in a call to *access*( ).

19475 **RETURN VALUE**

19476 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
19477 return –1 and set *errno* to indicate the error.

19478 **ERRORS**

19479 These functions shall fail if:

19480 [EACCES] Permission bits of the file mode do not permit the requested access, or search
19481 permission is denied on a component of the path prefix.

19482 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
19483 argument.

19484 [ENAMETOOLONG]
19485 The length of a component of a pathname is longer than {NAME_MAX}.

19486 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

19487 [ENOTDIR] A component of the path prefix is not a directory, or the *path* argument
19488 contains at least one non-<slash> character and ends with one or more trailing
19489 <slash> characters and the last pathname component names an existing file
```

that is neither a directory nor a symbolic link to a directory.

[EROFS] Write access is requested for a file on a read-only file system.

The *faccessat*( ) function shall fail if:

[EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

These functions may fail if:

[EINVAL] The value of the *amode* argument is invalid.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[ETXTBSY] Write access is requested for a pure procedure (shared text) file that is being executed.

The *faccessat*( ) function may fail if:

[EINVAL] The value of the *flag* argument is not valid.

[ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a file descriptor associated with a directory.

EXAMPLES

Testing for the Existence of a File

The following example tests whether a file named **myfile** exists in the **/tmp** directory.

```
#include <unistd.h>
...
int result;
const char *filename = "/tmp/myfile";

result = access (filename, F_OK);
```

APPLICATION USAGE

Additional values of *amode* other than the set defined in the description may be valid; for example, if a system has extended access controls.

The use of the AT_EACCESS value for *flag* enables functionality not available in *access*( ).

RATIONALE

In early proposals, some inadequacies in the *access*( ) function led to the creation of an *eaccess*( ) function because:

1. Historical implementations of *access*( ) do not test file access correctly when the process' real user ID is superuser. In particular, they always return zero when testing execute permissions without regard to whether the file is executable.

2. The superuser has complete access to all files on a system. As a consequence, programs started by the superuser and switched to the effective user ID with lesser privileges cannot use *access*( ) to test their file access permissions.

However, the historical model of *eaccess*( ) does not resolve problem (1), so this volume of POSIX.1-200x now allows *access*( ) to behave in the desired way because several implementations have corrected the problem. It was also argued that problem (2) is more easily solved by using *open*( ), *chdir*( ), or one of the *exec* functions as appropriate and responding to the error, rather than creating a new function that would not be as reliable. Therefore, *eaccess*( ) is not included in this volume of POSIX.1-200x.

The sentence concerning appropriate privileges and execute permission bits reflects the two possibilities implemented by historical implementations when checking superuser access for X_OK.

New implementations are discouraged from returning X_OK unless at least one execution permission bit is set.

The purpose of the *faccessat*( ) function is to enable the checking of the accessibility of files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *access*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *faccessat*( ) function it can be guaranteed that the file tested for accessibility is located relative to the desired directory.

FUTURE DIRECTIONS

None.

chmod( ), *fstatat*( )

XBD Section 4.4 (on page 108), **<fcntl.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretations 1003.1-2001 #046 and #143 are applied.

The *faccessat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made to allow a directory to be opened for searching.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory. +

19570 **NAME**

19571 acos, acosf, acosl — arc cosine functions

19572 **SYNOPSIS**

19573
```
#include <math.h>
```

19574
```
double acos(double x);
```
19575
```
float acosf(float x);
```
19576
```
long double acosl(long double x);
```

19577 **DESCRIPTION**

19578 CX The functionality described on this reference page is aligned with the ISO C standard. Any
19579 conflict between the requirements described here and the ISO C standard is unintentional. This
19580 volume of POSIX.1-200x defers to the ISO C standard.

19581 These functions shall compute the principal value of the arc cosine of their argument *x*. The
19582 value of *x* should be in the range [–1,1].

19583 An application wishing to check for error situations should set *errno* to zero and call
19584 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
19585 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
19586 zero, an error has occurred.

19587 **RETURN VALUE**

19588 Upon successful completion, these functions shall return the arc cosine of *x*, in the range [0,*π*]
19589 radians.

19590 MX For finite values of *x* not in the range [–1,1], a domain error shall occur, and either a NaN (if
19591 supported), or an implementation-defined value shall be returned.

19592 MX If *x* is NaN, a NaN shall be returned.

19593 If *x* is +1, +0 shall be returned.

19594 If *x* is ±Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-
19595 defined value shall be returned.

19596 **ERRORS**

19597 These functions shall fail if:

19598 MX Domain Error The *x* argument is finite and is not in the range [–1,1], or is ±Inf.

19599 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
19600 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
19601 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
19602 shall be raised.

19603 **EXAMPLES**

19604 None.

19605 **APPLICATION USAGE**

19606 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
19607 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

19608 **RATIONALE**

19609 None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *acosf( )* and *acosl( )* functions are added for alignment with the ISO/IEC 9899: 1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899: 1999 standard.

IEC 60559: 1989 standard floating-point extensions over the ISO/IEC 9899: 1999 standard are marked.

19626 **NAME**

19627 acosh, acoshf, acoshl — inverse hyperbolic cosine functions

19628 **SYNOPSIS**

19629
```
#include <math.h>
```

19630
```
double acosh(double x);
```
19631
```
float acoshf(float x);
```
19632
```
long double acoshl(long double x);
```

19633 **DESCRIPTION**

19634 CX The functionality described on this reference page is aligned with the ISO C standard. Any
19635 conflict between the requirements described here and the ISO C standard is unintentional. This
19636 volume of POSIX.1-200x defers to the ISO C standard.

19637 These functions shall compute the inverse hyperbolic cosine of their argument *x*.

19638 An application wishing to check for error situations should set *errno* to zero and call
19639 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
19640 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
19641 zero, an error has occurred.

19642 **RETURN VALUE**

19643 Upon successful completion, these functions shall return the inverse hyperbolic cosine of their
19644 argument.

19645 MX For finite values of $x < 1$, a domain error shall occur, and either a NaN (if supported), or an
19646 implementation-defined value shall be returned.

19647 MX If *x* is NaN, a NaN shall be returned.

19648 If *x* is +1, +0 shall be returned.

19649 If *x* is +Inf, +Inf shall be returned.

19650 If *x* is –Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-
19651 defined value shall be returned.

19652 **ERRORS**

19653 These functions shall fail if:

19654 MX Domain Error The *x* argument is finite and less than +1.0, or is –Inf.

19655 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
19656 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
19657 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
19658 shall be raised.

19659 **EXAMPLES**

19660 None.

19661 **APPLICATION USAGE**

19662 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
19663 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

19664 **RATIONALE**

19665 None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The *acosh*( ) function is no longer marked as an extension.

The *acoshf*( ) and *acoshl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

19683 **NAME**

19684 acosl — arc cosine functions

19685 **SYNOPSIS**

19686 `#include <math.h>`

19687 `long double acosl(long double x);`

19688 **DESCRIPTION**

19689 Refer to *acos( )*.

19690 **NAME**

19691 aio_cancel — cancel an asynchronous I/O request

19692 **SYNOPSIS**

19693 `#include <aio.h>`

19694 `int aio_cancel(int fildes, struct aiocb *aiocbp);`

19695 **DESCRIPTION**

19696 The *aio_cancel*( ) function shall attempt to cancel one or more asynchronous I/O requests
19697 currently outstanding against file descriptor *fildes*. The *aiocbp* argument points to the
19698 asynchronous I/O control block for a particular request to be canceled. If *aiocbp* is NULL, then
19699 all outstanding cancelable asynchronous I/O requests against *fildes* shall be canceled.

19700 Normal asynchronous notification shall occur for asynchronous I/O operations that are
19701 successfully canceled. If there are requests that cannot be canceled, then the normal
19702 asynchronous completion process shall take place for those requests when they are completed.

19703 For requested operations that are successfully canceled, the associated error status shall be set to
19704 [ECANCELED] and the return status shall be –1. For requested operations that are not
19705 successfully canceled, the *aiocbp* shall not be modified by *aio_cancel*( ).

19706 If *aiocbp* is not NULL, then if *fildes* does not have the same value as the file descriptor with which
19707 the asynchronous operation was initiated, unspecified results occur.

19708 Which operations are cancelable is implementation-defined.

19709 **RETURN VALUE**

19710 The *aio_cancel*( ) function shall return the value AIO_CANCELED if the requested operation(s)
19711 were canceled. The value AIO_NOTCANCELED shall be returned if at least one of the
19712 requested operation(s) cannot be canceled because it is in progress. In this case, the state of the
19713 other operations, if any, referenced in the call to *aio_cancel*( ) is not indicated by the return value
19714 of *aio_cancel*( ). The application may determine the state of affairs for these operations by using
19715 *aio_error*( ). The value AIO_ALLDONE is returned if all of the operations have already
19716 completed. Otherwise, the function shall return –1 and set *errno* to indicate the error.

19717 **ERRORS**

19718 The *aio_cancel*( ) function shall fail if:

19719 [EBADF] The *fildes* argument is not a valid file descriptor.

19720 **EXAMPLES**

19721 None.

19722 **APPLICATION USAGE**

19723 None.

19724 **RATIONALE**

19725 None.

19726 **FUTURE DIRECTIONS**

19727 None.

19728 **SEE ALSO**

19729 *aio_read*( ), *aio_write*( )

19730 XBD **<aio.h>**

19731 **CHANGE HISTORY**

19732 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

19733 **Issue 6**

19734 The [ENOSYS] error condition has been removed as stubs need not be provided if an
19735 implementation does not support the Asynchronous Input and Output option.

19736 The APPLICATION USAGE section is added.

19737 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/10 is applied, removing the words "to the
19738 calling process" in the RETURN VALUE section. The term was unnecessary and precluded
19739 threads.

19740 **Issue 7**

19741 The *aio_cancel*( ) function is moved from the Asynchronous Input and Output option to the Base.

19742 **NAME**

19743 aio_error — retrieve errors status for an asynchronous I/O operation

19744 **SYNOPSIS**

19745
```
#include <aio.h>
```

19746
```
int aio_error(const struct aiocb *aiocbp);
```

19747 **DESCRIPTION**

19748 The *aio_error*( ) function shall return the error status associated with the **aiocb** structure
19749 referenced by the *aiocbp* argument. The error status for an asynchronous I/O operation is the
19750 SIO *errno* value that would be set by the corresponding *read*( ), *write*( ), *fdatasync*( ), or *fsync*( )
19751 operation. If the operation has not yet completed, then the error status shall be equal to
19752 [EINPROGRESS].

19753 If the **aiocb** structure pointed to by *aiocbp* is not associated with an operation that has been
19754 scheduled, the results are undefined.

19755 **RETURN VALUE**

19756 If the asynchronous I/O operation has completed successfully, then 0 shall be returned. If the
19757 asynchronous operation has completed unsuccessfully, then the error status, as described for
19758 SIO *read*( ), *write*( ), *fdatasync*( ), and *fsync*( ), shall be returned. If the asynchronous I/O operation has
19759 not yet completed, then [EINPROGRESS] shall be returned.

19760 If the *aio_error*( ) function fails, it shall return –1 and set *errno* to indicate the error.

19761 **ERRORS**

19762 The *aio_error*( ) function may fail if:

19763 [EINVAL] The *aiocbp* argument does not refer to an asynchronous operation whose
19764 return status has not yet been retrieved.

19765 **EXAMPLES**

19766 None.

19767 **APPLICATION USAGE**

19768 None.

19769 **RATIONALE**

19770 None.

19771 **FUTURE DIRECTIONS**

19772 None.

19777 **CHANGE HISTORY**

19778 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

19779 **Issue 6**

19780 The [ENOSYS] error condition has been removed as stubs need not be provided if an
19781 implementation does not support the Asynchronous Input and Output option.

19782 The APPLICATION USAGE section is added.

19783 **Issue 7**

19784 Austin Group Interpretation 1003.1-2001 #045 is applied.

19785 SD5-XSH-ERN-148 is applied.

19786 The *aio_error*( ) function is moved from the Asynchronous Input and Output option to the Base.

19787 **NAME**

19788 aio_fsync — asynchronous file synchronization

19789 **SYNOPSIS**

19790 `#include <aio.h>`

19791 `int aio_fsync(int op, struct aiocb *aiocbp);`

19792 **DESCRIPTION**

19793 The *aio_fsync*( ) function shall asynchronously force all I/O operations associated with the file
19794 indicated by the file descriptor *aio_fildes* member of the **aiocb** structure referenced by the *aiocbp*
19795 argument and queued at the time of the call to *aio_fsync*( ) to the synchronized I/O completion
19796 state. The function call shall return when the synchronization request has been initiated or
19797 queued to the file or device (even when the data cannot be synchronized immediately).

19798 If *op* is O_DSYNC, all currently queued I/O operations shall be completed as if by a call to
19799 *fdatasync*( ); that is, as defined for synchronized I/O data integrity completion. If *op* is O_SYNC,
19800 all currently queued I/O operations shall be completed as if by a call to *fsync*( ); that is, as
19801 defined for synchronized I/O file integrity completion. If the *aio_fsync*( ) function fails, or if the
19802 operation queued by *aio_fsync*( ) fails, then, as for *fsync*( ) and *fdatasync*( ), outstanding I/O
19803 operations are not guaranteed to have been completed.

19804 If *aio_fsync*( ) succeeds, then it is only the I/O that was queued at the time of the call to
19805 *aio_fsync*( ) that is guaranteed to be forced to the relevant completion state. The completion of
19806 subsequent I/O on the file descriptor is not guaranteed to be completed in a synchronized
19807 fashion.

19808 The *aiocbp* argument refers to an asynchronous I/O control block. The *aiocbp* value may be used
19809 as an argument to *aio_error*( ) and *aio_return*( ) in order to determine the error status and return
19810 status, respectively, of the asynchronous operation while it is proceeding. When the request is
19811 queued, the error status for the operation is [EINPROGRESS]. When all data has been
19812 successfully transferred, the error status shall be reset to reflect the success or failure of the
19813 operation. If the operation does not complete successfully, the error status for the operation shall
19814 be set to indicate the error. The *aio_sigevent* member determines the asynchronous notification to
19815 occur as specified in Section 2.4.1 (on page 484) when all operations have achieved synchronized
19816 I/O completion. All other members of the structure referenced by *aiocbp* are ignored. If the
19817 control block referenced by *aiocbp* becomes an illegal address prior to asynchronous I/O
19818 completion, then the behavior is undefined.

19819 If the *aio_fsync*( ) function fails or *aiocbp* indicates an error condition, data is not guaranteed to
19820 have been successfully transferred.

19821 **RETURN VALUE**

19822 The *aio_fsync*( ) function shall return the value 0 if the I/O operation is successfully queued;
19823 otherwise, the function shall return the value –1 and set *errno* to indicate the error.

19824 **ERRORS**

19825 The *aio_fsync*( ) function shall fail if:

19826 [EAGAIN] The requested asynchronous operation was not queued due to temporary
19827 resource limitations.

19828 [EBADF] The *aio_fildes* member of the **aiocb** structure referenced by the *aiocbp* argument
19829 is not a valid file descriptor open for writing.

19830 [EINVAL] This implementation does not support synchronized I/O for this file.

[EINVAL] A value of *op* other than O_DSYNC or O_SYNC was specified.

In the event that any of the queued I/O operations fail, *aio_fsync*( ) shall return the error condition defined for *read*( ) and *write*( ). The error is returned in the error status for the asynchronous *fsync*( ) operation, which can be retrieved using *aio_error*( ).

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/11 is applied, removing the words "to the calling process" in the RETURN VALUE section. The term was unnecessary and precluded threads.

Issue 7

The *aio_fsync*( ) function is moved from the Asynchronous Input and Output option to the Base.

19857 **NAME**

19858 aio_read — asynchronous read from a file

19859 **SYNOPSIS**

19860 `#include <aio.h>`

19861 `int aio_read(struct aiocb *aiocbp);`

19862 **DESCRIPTION**

19863 The *aio_read*( ) function shall read *aiocbp−>aio_nbytes* from the file associated with
19864 *aiocbp−>aio_fildes* into the buffer pointed to by *aiocbp−>aio_buf*. The function call shall return
19865 when the read request has been initiated or queued to the file or device (even when the data
19866 cannot be delivered immediately).

19867 PIO If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted
19868 at a priority equal to a base scheduling priority minus *aiocbp−>aio_reqprio*. If Thread Execution
19869 Scheduling is not supported, then the base scheduling priority is that of the calling process;
19870 PIO TPS otherwise, the base scheduling priority is that of the calling thread.

19871 The *aiocbp* value may be used as an argument to *aio_error*( ) and *aio_return*( ) in order to
19872 determine the error status and return status, respectively, of the asynchronous operation while it
19873 is proceeding. If an error condition is encountered during queuing, the function call shall return
19874 without having initiated or queued the request. The requested operation takes place at the
19875 absolute position in the file as given by *aio_offset*, as if *lseek*( ) were called immediately prior to
19876 the operation with an *offset* equal to *aio_offset* and a *whence* equal to SEEK_SET. After a
19877 successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file
19878 is unspecified.

19879 The *aio_sigevent* member specifies the notification which occurs when the request is completed.

19880 The *aiocbp−>aio_lio_opcode* field shall be ignored by *aio_read*( ).

19881 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp−>aio_buf* or
19882 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O
19883 completion, then the behavior is undefined.

19884 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

19885 SIO If synchronized I/O is enabled on the file associated with *aiocbp−>aio_fildes*, the behavior of this
19886 function shall be according to the definitions of synchronized I/O data integrity completion and
19887 synchronized I/O file integrity completion.

19888 For any system action that changes the process memory space while an asynchronous I/O is
19889 outstanding to the address range being changed, the result of that action is undefined.

19890 For regular files, no data transfer shall occur past the offset maximum established in the open
19891 file description associated with *aiocbp−>aio_fildes*.

19892 **RETURN VALUE**

19893 The *aio_read*( ) function shall return the value zero if the I/O operation is successfully queued;
19894 otherwise, the function shall return the value −1 and set *errno* to indicate the error.

19895 **ERRORS**

19896 The *aio_read*( ) function shall fail if:

19897 [EAGAIN] The requested asynchronous I/O operation was not queued due to system
19898 resource limitations.

19899 Each of the following conditions may be detected synchronously at the time of the call to
19900 *aio_read*( ), or asynchronously. If any of the conditions below are detected synchronously, the

19901 *aio_read*( ) function shall return –1 and set *errno* to the corresponding value. If any of the
19902 conditions below are detected asynchronously, the return status of the asynchronous operation
19903 is set to –1, and the error status of the asynchronous operation is set to the corresponding value.

19904 [EBADF] The *aiocbp–>aio_fildes* argument is not a valid file descriptor open for reading.

19905 [EINVAL] The file offset value implied by *aiocbp–>aio_offset* would be invalid,
19906 PIO *aiocbp–>aio_reqprio* is not a valid value, or *aiocbp–>aio_nbytes* is an invalid
19907 value.

19908 In the case that the *aio_read*( ) successfully queues the I/O operation but the operation is
19909 subsequently canceled or encounters an error, the return status of the asynchronous operation is
19910 one of the values normally returned by the *read*( ) function call. In addition, the error status of
19911 the asynchronous operation is set to one of the error statuses normally set by the *read*( ) function
19912 call, or one of the following values:

19913 [EBADF] The *aiocbp–>aio_fildes* argument is not a valid file descriptor open for reading.

19914 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit
19915 *aio_cancel*( ) request.

19916 [EINVAL] The file offset value implied by *aiocbp–>aio_offset* would be invalid.

19917 The following condition may be detected synchronously or asynchronously:

19918 [EOVERFLOW] The file is a regular file, *aiobcp–>aio_nbytes* is greater than 0, and the starting
19919 offset in *aiobcp–>aio_offset* is before the end-of-file and is at or beyond the
19920 offset maximum in the open file description associated with *aiocbp–>aio_fildes*.

19932 XBD **<aio.h>**

19933 **CHANGE HISTORY**

19934 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

19935 Large File Summit extensions are added.

19936 **Issue 6**

19937 The [ENOSYS] error condition has been removed as stubs need not be provided if an
19938 implementation does not support the Asynchronous Input and Output option.

19939 The APPLICATION USAGE section is added.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support large files.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/12 is applied, rewording the DESCRIPTION when prioritized I/O is supported to account for threads, and removing the words "to the calling process" in the RETURN VALUE section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/13 is applied, updating the [EINVAL] error, so that detection of an [EINVAL] error for an invalid value of *aiocbp->aio_reqprio* is only required if the Prioritized Input and Output option is supported.

Issue 7

Austin Group Interpretation 1003.1-2001 #082 is applied.

The *aio_read*( ) function is moved from the Asynchronous Input and Output option to the Base.

19955 **NAME**

19956 aio_return — retrieve return status of an asynchronous I/O operation

19957 **SYNOPSIS**

19958 ```
#include <aio.h>
```

19959 ```
ssize_t aio_return(struct aiocb *aiocbp);
```

19960 **DESCRIPTION**

19961 The *aio_return*( ) function shall return the return status associated with the **aiocb** structure
19962 referenced by the *aiocbp* argument. The return status for an asynchronous I/O operation is the
19963 value that would be returned by the corresponding *read*( ), *write*( ), or *fsync*( ) function call. If the
19964 error status for the operation is equal to [EINPROGRESS], then the return status for the
19965 operation is undefined. The *aio_return*( ) function may be called exactly once to retrieve the
19966 return status of a given asynchronous operation; thereafter, if the same **aiocb** structure is used in
19967 a call to *aio_return*( ) or *aio_error*( ), an error may be returned. When the **aiocb** structure referred
19968 to by *aiocbp* is used to submit another asynchronous operation, then *aio_return*( ) may be
19969 successfully used to retrieve the return status of that operation.

19970 **RETURN VALUE**

19971 If the asynchronous I/O operation has completed, then the return status, as described for *read*( ),
19972 *write*( ), and *fsync*( ), shall be returned. If the asynchronous I/O operation has not yet completed,
19973 the results of *aio_return*( ) are undefined.

19974 If the *aio_return*( ) function fails, it shall return –1 and set *errno* to indicate the error.

19975 **ERRORS**

19976 The *aio_return*( ) function may fail if:

19977 [EINVAL] The *aiocbp* argument does not refer to an asynchronous operation whose
19978 return status has not yet been retrieved.

19979 **EXAMPLES**

19980 None.

19990 XBD **<aio.h>**

19991 **CHANGE HISTORY**

19992 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

19993 **Issue 6**

19994 The [ENOSYS] error condition has been removed as stubs need not be provided if an
19995 implementation does not support the Asynchronous Input and Output option.

19996 The APPLICATION USAGE section is added.

19997 The [EINVAL] error condition is made optional. This is for consistency with the DESCRIPTION.

19998 **Issue 7**

19999 SD5-XSH-ERN-148 is applied.

20000 The *aio_return*( ) function is moved from the Asynchronous Input and Output option to the Base.

20001 **NAME**

20002 aio_suspend — wait for an asynchronous I/O request

20003 **SYNOPSIS**

20004
```
#include <aio.h>
```

20005
```
int aio_suspend(const struct aiocb *const list[], int nent,
```
20006
```
    const struct timespec *timeout);
```

20007 **DESCRIPTION**

20008 The *aio_suspend*( ) function shall suspend the calling thread until at least one of the asynchronous
20009 I/O operations referenced by the *list* argument has completed, until a signal interrupts the
20010 function, or, if *timeout* is not NULL, until the time interval specified by *timeout* has passed. If any
20011 of the **aiocb** structures in the list correspond to completed asynchronous I/O operations (that is,
20012 the error status for the operation is not equal to [EINPROGRESS]) at the time of the call, the
20013 function shall return without suspending the calling thread. The *list* argument is an array of
20014 pointers to asynchronous I/O control blocks. The *nent* argument indicates the number of
20015 elements in the array. Each **aiocb** structure pointed to has been used in initiating an
20016 asynchronous I/O request via *aio_read*( ), *aio_write*( ), or *lio_listio*( ). This array may contain null
20017 pointers, which are ignored. If this array contains pointers that refer to **aiocb** structures that have
20018 not been used in submitting asynchronous I/O, the effect is undefined.

20019 If the time interval indicated in the **timespec** structure pointed to by *timeout* passes before any of
20020 the I/O operations referenced by *list* are completed, then *aio_suspend*( ) shall return with an error.
20021 MON If the Monotonic Clock option is supported, the clock that shall be used to measure this time
20022 interval shall be the CLOCK_MONOTONIC clock.

20023 **RETURN VALUE**

20024 If the *aio_suspend*( ) function returns after one or more asynchronous I/O operations have
20025 completed, the function shall return zero. Otherwise, the function shall return a value of –1 and
20026 set *errno* to indicate the error.

20027 The application may determine which asynchronous I/O completed by scanning the associated
20028 error and return status using *aio_error*( ) and *aio_return*( ), respectively.

20029 **ERRORS**

20030 The *aio_suspend*( ) function shall fail if:

20031 [EAGAIN] No asynchronous I/O indicated in the list referenced by *list* completed in the
20032 time interval indicated by *timeout*.

20033 [EINTR] A signal interrupted the *aio_suspend*( ) function. Note that, since each
20034 asynchronous I/O operation may possibly provoke a signal when it
20035 completes, this error return may be caused by the completion of one (or more)
20036 of the very I/O operations being awaited.

20037 **EXAMPLES**

20038 None.

20039 **APPLICATION USAGE**

20040 None.

20041 **RATIONALE**

20042 None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the CLOCK_MONOTONIC clock, if supported, is used.

Issue 7

The *aio_suspend*( ) function is moved from the Asynchronous Input and Output option to the Base.

20059 **NAME**

20060 aio_write — asynchronous write to a file

20061 **SYNOPSIS**

20062 ```
#include <aio.h>
```

20063 ```
int aio_write(struct aiocb *aiocbp);
```

20064 **DESCRIPTION**

20065 The *aio_write*( ) function shall write *aiocbp−>aio_nbytes* to the file associated with
20066 *aiocbp−>aio_fildes* from the buffer pointed to by *aiocbp−>aio_buf*. The function shall return when
20067 the write request has been initiated or, at a minimum, queued to the file or device.

20068 PIO If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted
20069 at a priority equal to a base scheduling priority minus *aiocbp−>aio_reqprio*. If Thread Execution
20070 Scheduling is not supported, then the base scheduling priority is that of the calling process;
20071 PIO TPS otherwise, the base scheduling priority is that of the calling thread.

20072 The *aiocbp* argument may be used as an argument to *aio_error*( ) and *aio_return*( ) in order to
20073 determine the error status and return status, respectively, of the asynchronous operation while it
20074 is proceeding.

20075 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp−>aio_buf* or
20076 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O
20077 completion, then the behavior is undefined.

20078 If O_APPEND is not set for the file descriptor *aio_fildes*, then the requested operation shall take
20079 place at the absolute position in the file as given by *aio_offset*, as if *lseek*( ) were called
20080 immediately prior to the operation with an *offset* equal to *aio_offset* and a *whence* equal to
20081 SEEK_SET. If O_APPEND is set for the file descriptor, write operations append to the file in the
20082 same order as the calls were made. After a successful call to enqueue an asynchronous I/O
20083 operation, the value of the file offset for the file is unspecified.

20084 The *aio_sigevent* member specifies the notification which occurs when the request is completed.

20085 The *aiocbp−>aio_lio_opcode* field shall be ignored by *aio_write*( ).

20086 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

20087 SIO If synchronized I/O is enabled on the file associated with *aiocbp−>aio_fildes*, the behavior of this
20088 function shall be according to the definitions of synchronized I/O data integrity completion, and
20089 synchronized I/O file integrity completion.

20090 For any system action that changes the process memory space while an asynchronous I/O is
20091 outstanding to the address range being changed, the result of that action is undefined.

20092 For regular files, no data transfer shall occur past the offset maximum established in the open
20093 file description associated with *aiocbp−>aio_fildes*.

20094 **RETURN VALUE**

20095 The *aio_write*( ) function shall return the value zero if the I/O operation is successfully queued;
20096 otherwise, the function shall return the value −1 and set *errno* to indicate the error.

20097 **ERRORS**

20098 The *aio_write*( ) function shall fail if:

20099 [EAGAIN] The requested asynchronous I/O operation was not queued due to system
20100 resource limitations.

20101 Each of the following conditions may be detected synchronously at the time of the call to
20102 *aio_write*( ), or asynchronously. If any of the conditions below are detected synchronously, the

aio_write( ) function shall return –1 and set *errno* to the corresponding value. If any of the conditions below are detected asynchronously, the return status of the asynchronous operation shall be set to –1, and the error status of the asynchronous operation is set to the corresponding value.

[EBADF] The *aiocbp–>aio_fildes* argument is not a valid file descriptor open for writing.

[EINVAL] The file offset value implied by *aiocbp–>aio_offset* would be invalid,
PIO *aiocbp–>aio_reqprio* is not a valid value, or *aiocbp–>aio_nbytes* is an invalid value.

In the case that the *aio_write*( ) successfully queues the I/O operation, the return status of the asynchronous operation shall be one of the values normally returned by the *write*( ) function call. If the operation is successfully queued but is subsequently canceled or encounters an error, the error status for the asynchronous operation contains one of the values normally set by the *write*( ) function call, or one of the following:

[EBADF] The *aiocbp–>aio_fildes* argument is not a valid file descriptor open for writing.

[EINVAL] The file offset value implied by *aiocbp–>aio_offset* would be invalid.

[ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit *aio_cancel*( ) request.

The following condition may be detected synchronously or asynchronously:

[EFBIG] The file is a regular file, *aiobcp–>aio_nbytes* is greater than 0, and the starting offset in *aiobcp–>aio_offset* is at or beyond the offset maximum in the open file description associated with *aiocbp–>aio_fildes*.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs past the offset maximum established in the open file description associated with *aiocbp->aio_fildes*.
- The [EFBIG] error is added as part of the large file support extensions.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/14 is applied, rewording the DESCRIPTION when prioritized I/O is supported to account for threads, and removing the words "to the calling process" in the RETURN VALUE section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/15 is applied, updating the [EINVAL] error, so that detection of an [EINVAL] error for an invalid value of *aiocbp->aio_reqprio* is only required if the Prioritized Input and Output option is supported.

Issue 7

Austin Group Interpretation 1003.1-2001 #082 is applied.

The *aio_write*( ) function is moved from the Asynchronous Input and Output option to the Base.

NAME

alarm — schedule an alarm signal

SYNOPSIS

```
#include <unistd.h>

unsigned alarm(unsigned seconds);
```

DESCRIPTION

The *alarm*( ) function shall cause the system to generate a SIGALRM signal for the process after the number of realtime seconds specified by *seconds* have elapsed. Processor scheduling delays may prevent the process from handling the signal as soon as it is generated.

If *seconds* is 0, a pending alarm request, if any, is canceled.

Alarm requests are not stacked; only one SIGALRM generation can be scheduled in this manner. If the SIGALRM signal has not yet been generated, the call shall result in rescheduling the time at which the SIGALRM signal is generated.

XSI Interactions between *alarm*( ) and *setitimer*( ) are unspecified.

RETURN VALUE

If there is a previous *alarm*( ) request with time remaining, *alarm*( ) shall return a non-zero value that is the number of seconds until the previous request would have generated a SIGALRM signal. Otherwise, *alarm*( ) shall return 0.

ERRORS

The *alarm*( ) function is always successful, and no return value is reserved to indicate an error.

EXAMPLES

None.

APPLICATION USAGE

The *fork*( ) function clears pending alarms in the child process. A new process image created by one of the *exec* functions inherits the time left to an alarm signal in the image of the old process.

Application developers should note that the type of the argument *seconds* and the return value of *alarm*( ) is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces Application cannot pass a value greater than the minimum guaranteed value for {UINT_MAX}, which the ISO C standard sets as 65 535, and any application passing a larger value is restricting its portability. A different type was considered, but historical implementations, including those with a 16-bit **int** type, consistently use either **unsigned** or **int**.

Application developers should be aware of possible interactions when the same process uses both the *alarm*( ) and *sleep*( ) functions.

RATIONALE

Many historical implementations (including Version 7 and System V) allow an alarm to occur up to a second early. Other implementations allow alarms up to half a second or one clock tick early or do not allow them to occur early at all. The latter is considered most appropriate, since it gives the most predictable behavior, especially since the signal can always be delayed for an indefinite amount of time due to scheduling. Applications can thus choose the *seconds* argument as the minimum amount of time they wish to have elapse before the signal.

The term "realtime" here and elsewhere (*sleep*( ), *times*( )) is intended to mean "wall clock" time as common English usage, and has nothing to do with "realtime operating systems". It is in contrast to *virtual time*, which could be misinterpreted if just *time* were used.

In some implementations, including 4.3 BSD, very large values of the *seconds* argument are silently rounded down to an implementation-specific maximum value. This maximum is large

enough (to the order of several months) that the effect is not noticeable.

There were two possible choices for alarm generation in multi-threaded applications: generation for the calling thread or generation for the process. The first option would not have been particularly useful since the alarm state is maintained on a per-process basis and the alarm that is established by the last invocation of *alarm*( ) is the only one that would be active.

Furthermore, allowing generation of an asynchronous signal for a thread would have introduced an exception to the overall signal model. This requires a compelling reason in order to be justified.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to indicate that interactions with the *setitimer*( ), *ualarm*( ), and *usleep*( ) functions are unspecified.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/16 is applied, replacing "an implementation-defined maximum value" with "an implementation-specific maximum value" in the RATIONALE.

NAME

alphasort, scandir — scan a directory

SYNOPSIS

```
#include <dirent.h>

int alphasort(const struct dirent **d1, const struct dirent **d2);
int scandir(const char *dir, struct dirent ***namelist,
    int (*sel)(const struct dirent *),
    int (*compar)(const struct dirent **, const struct dirent **));
```

DESCRIPTION

The *alphasort*( ) function can be used as the comparison function for the *scandir*( ) function to sort the directory entries, *d1* and *d2*, into alphabetical order. Sorting happens as if by calling the *strcoll*( ) function on the *d_name* element of the **dirent** structures passed as the two parameters. If the *strcoll*( ) function fails, the return value of *alphasort*( ) is unspecified.

The *alphasort*( ) function shall not change the setting of *errno* if successful. Since no return value is reserved to indicate an error, an application wishing to check for error situations should set *errno* to 0, then call *alphasort*( ), then check *errno*.

The *scandir*( ) function shall scan the directory *dir*, calling the function referenced by *sel* on each directory entry. Entries for which the function referenced by *sel* returns non-zero shall be stored in strings allocated as if by a call to *malloc*( ), and sorted as if by a call to *qsort*( ) with the comparison function *compar*, except that *compar* need not provide total ordering. The strings are collected in array *namelist* which shall be allocated as if by a call to *malloc*( ). If *sel* is a null pointer, all entries shall be selected. If the comparison function *compar* does not provide total ordering, the order in which the directory entries are stored is unspecified.

RETURN VALUE

Upon successful completion, the *alphasort*( ) function shall return an integer greater than, equal to, or less than 0, according to whether the name of the directory entry pointed to by *d1* is lexically greater than, equal to, or less than the directory pointed to by *d2* when both are interpreted as appropriate to the current locale. There is no return value reserved to indicate an error.

Upon successful completion, the *scandir*( ) function shall return the number of entries in the array and a pointer to the array through the parameter *namelist*. Otherwise, the *scandir*( ) function shall return –1.

ERRORS

The *scandir*( ) function shall fail if:

[EACCES] Search permission is denied for the component of the path prefix of *dir* or read permission is denied for *dir*.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *dir* argument.

[ENAMETOOLONG] The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *dir* does not name an existing directory or *dir* is an empty string.

[ENOMEM] Insufficient storage space is available.

[ENOTDIR] A component of *dir* is not a directory.

The *scandir*( ) function may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *dir* argument.

[EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[ENFILE] Too many files are currently open in the system.

EXAMPLES

An example to print the files in the current directory:

```
#include <dirent.h>
#include <stdio.h>
#include <stdlib.h>
...
struct dirent **namelist;
int i,n;

    n = scandir(".", &namelist, 0, alphasort);
    if (n < 0)
        perror("scandir");
    else {
        for (i = 0; i < n; i++) {
            printf("%s\n", namelist[i]->d_name);
            free(namelist[i]);
            }
        }
    free(namelist);
...
```

APPLICATION USAGE

If *dir* contains filenames that contain characters outside the domain of the collating sequence of the current locale, the *alphasort*( ) function need not provide a total ordering.

The *scandir*( ) function may allocate dynamic storage during its operation. If *scandir*( ) is forcibly terminated, such as by *longjmp*( ) or *siglongjmp*( ) being executed by the function pointed to by *sel* or *compar*, or by an interrupt routine, *scandir*( ) does not have a chance to free that storage, so it remains permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has occurred, then wait until *scandir*( ) returns to act on the interrupt.

For functions that allocate memory as if by *malloc*( ), the application should release such memory when it is no longer required by a call to *free*( ). For *scandir*( ), this is *namelist* (including all of the individual strings in *namelist*).

NAME

asctime, asctime_r — convert date and time to a string

SYNOPSIS

OB
```
#include <time.h>

char *asctime(const struct tm *timeptr);
```
OB CX
```
char *asctime_r(const struct tm *restrict tm, char *restrict buf);
```

DESCRIPTION

CX For *asctime*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *asctime*( ) function shall convert the broken-down time in the structure pointed to by *timeptr* into a string in the form:

```
Sun Sep 16 01:03:52 1973\n\0
```

using the equivalent of the following algorithm:

```
char *asctime(const struct tm *timeptr)
{
    static char wday_name[7][3] = {
        "Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat"
    };
    static char mon_name[12][3] = {
        "Jan", "Feb", "Mar", "Apr", "May", "Jun",
        "Jul", "Aug", "Sep", "Oct", "Nov", "Dec"
    };
    static char result[26];

    sprintf(result, "%.3s %.3s%3d %.2d:%.2d:%.2d %d\n",
        wday_name[timeptr->tm_wday],
        mon_name[timeptr->tm_mon],
        timeptr->tm_mday, timeptr->tm_hour,
        timeptr->tm_min, timeptr->tm_sec,
        1900 + timeptr->tm_year);
    return result;
}
```

However, the behavior is undefined if *timeptr*–>*tm_wday* or *timeptr*–>*tm_mon* are not within the normal ranges as defined in **<time.h>**, or if *timeptr*–>*tm_year* exceeds {INT_MAX}–1990, or if the above algorithm would attempt to generate more than 26 bytes of output (including the terminating null).

The **tm** structure is defined in the **<time.h>** header.

CX The *asctime*( ), *ctime*( ), *gmtime*( ), and *localtime*( ) functions shall return values in one of two static objects: a broken-down time structure and an array of type **char**. Execution of any of the functions may overwrite the information returned in either of these objects by any of the other functions.

The *asctime*( ) function need not be thread-safe.

The *asctime_r*( ) function shall convert the broken-down time in the structure pointed to by *tm* into a string (of the same form as that returned by *asctime*( ), and with the same undefined behavior when input or output is out of range) that is placed in the user-supplied buffer pointed

to by *buf* (which shall contain at least 26 bytes) and then return *buf*.

RETURN VALUE

CX Upon successful completion, *asctime*( ) shall return a pointer to the string. If the function is unsuccessful, it shall return NULL.

Upon successful completion, *asctime_r*( ) shall return a pointer to a character string containing the date and time. This string is pointed to by the argument *buf*. If the function is unsuccessful, it shall return NULL.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

These functions are included only for compatibility with older implementations. They have undefined behavior if the resulting string would be too long, so the use of these functions should be discouraged. On implementations that do not detect output string length overflow, it is possible to overflow the output buffers in such a way as to cause applications to fail, or possible system security violations. Also, these functions do not support localized date and time formats. To avoid these problems, applications should use *strftime*( ) to generate strings from broken-down times.

Values for the broken-down time structure can be obtained by calling *gmtime*( ) or *localtime*( ).

The *asctime_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

The standard developers decided to mark the *asctime*( ) and *asctime_r*( ) functions obsolescent even though they are in the ISO C standard due to the possibility of buffer overflow. The ISO C standard also provides the *strftime*( ) function which can be used to avoid these problems.

FUTURE DIRECTIONS

These functions may be removed in a future version.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

The *asctime_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *asctime*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *asctime_r*( ) function is marked as part of the Thread-Safe Functions option.

Extensions beyond the ISO C standard are marked.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and

its avoidance of possibly using a static data area.

The DESCRIPTION of *asctime_r*( ) is updated to describe the format of the string returned.

The **restrict** keyword is added to the *asctime_r*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/17 is applied, adding the CX extension in the RETURN VALUE section requiring that if the *asctime*( ) function is unsuccessful it returns NULL.

Issue 7

Austin Group Interpretation 1003.1-2001 #053 is applied, marking these functions obsolescent.

Austin Group Interpretation 1003.1-2001 #156 is applied.

The *asctime_r*( ) function is moved from the Thread-Safe Functions option to the Base.

NAME

asin, asinf, asinl — arc sine function

SYNOPSIS

```
#include <math.h>

double asin(double x);
float asinf(float x);
long double asinl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the principal value of the arc sine of their argument x. The value of x should be in the range [−1,1].

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the arc sine of x, in the range $[-\pi/2,\pi/2]$ radians.

MX For finite values of x not in the range [−1,1], a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

MX If x is NaN, a NaN shall be returned.

If x is ±0, x shall be returned.

If x is ±Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If x is subnormal, a range error may occur and x should be returned.

ERRORS

These functions shall fail if:

MX Domain Error — The x argument is finite and is not in the range [−1,1], or is ±Inf.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

MX Range Error — The value of x is subnormal.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

asinh, asinhf, asinhl — inverse hyperbolic sine functions

SYNOPSIS

```
#include <math.h>

double asinh(double x);
float asinhf(float x);
long double asinhl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the inverse hyperbolic sine of their argument *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the inverse hyperbolic sine of their argument.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, or ±Inf, *x* shall be returned.

If *x* is subnormal, a range error may occur and *x* should be returned.

ERRORS

These functions may fail if:

MX

Range Error	The value of *x* is subnormal.
	If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

NAME

assert — insert program diagnostics

SYNOPSIS

```
#include <assert.h>

void assert(scalar expression);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *assert*( ) macro shall insert diagnostics into programs; it shall expand to a **void** expression. When it is executed, if *expression* (which shall have a **scalar** type) is false (that is, compares equal to 0), *assert*( ) shall write information about the particular call that failed on *stderr* and shall call *abort*( ).

The information written about the call that failed shall include the text of the argument, the name of the source file, the source file line number, and the name of the enclosing function; the latter are, respectively, the values of the preprocessing macros __FILE__ and __LINE__ and of the identifier __func__.

Forcing a definition of the name NDEBUG, either from the compiler command line or with the preprocessor control statement **#define** NDEBUG ahead of the **#include <assert.h>** statement, shall stop assertions from being compiled into the program.

RETURN VALUE

The *assert*( ) macro shall not return a value.

ERRORS

No errors are defined.

NAME

atan2, atan2f, atan2l — arc tangent functions

SYNOPSIS

```
#include <math.h>

double atan2(double y, double x);
float atan2f(float y, float x);
long double atan2l(long double y, long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the principal value of the arc tangent of y/x, using the signs of both arguments to determine the quadrant of the return value.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the arc tangent of y/x in the range $[-\pi,\pi]$ radians.

If y is ±0 and x is < 0, $\pm\pi$ shall be returned.

If y is ±0 and x is > 0, ±0 shall be returned.

If y is < 0 and x is ±0, $-\pi/2$ shall be returned.

If y is > 0 and x is ±0, $\pi/2$ shall be returned.

If x is 0, a pole error shall not occur.

MX If either x or y is NaN, a NaN shall be returned.

If the result underflows, a range error may occur and y/x should be returned.

If y is ±0 and x is –0, $\pm\pi$ shall be returned.

If y is ±0 and x is +0, ±0 shall be returned.

For finite values of $\pm y > 0$, if x is –Inf, $\pm\pi$ shall be returned.

For finite values of $\pm y > 0$, if x is +Inf, ±0 shall be returned.

For finite values of x, if y is ±Inf, $\pm\pi/2$ shall be returned.

If y is ±Inf and x is –Inf, $\pm 3\pi/4$ shall be returned.

If y is ±Inf and x is +Inf, $\pm\pi/4$ shall be returned.

If both arguments are 0, a domain error shall not occur.

ERRORS

These functions may fail if:

MX Range Error — The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression

(*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

Converting Cartesian to Polar Coordinates System

The function below uses *atan2*( ) to convert a 2d vector expressed in cartesian coordinates (*x*,*y*) to the polar coordinates (*rho*,*theta*). There are other ways to compute the angle *theta*, using *asin*( ) *acos*( ), or *atan*( ). However, *atan2*( ) presents here two advantages:

- The angle's quadrant is automatically determined.
- The singular cases (0,*y*) are taken into account.

Finally, this example uses *hypot*( ) rather than *sqrt*( ) since it is better for special cases; see *hypot*( ) for more information.

```
#include <math.h>

void
cartesian_to_polar(const double x, const double y,
                   double *rho, double *theta
    )
{
    *rho   = hypot (x,y); /* better than sqrt(x*x+y*y) */
    *theta = atan2 (y,x);
}
```

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

float atanf(float x);
```

20722 **DESCRIPTION**

20723 Refer to *atan( )*.

NAME

atanh, atanhf, atanhl — inverse hyperbolic tangent functions

SYNOPSIS

```
#include <math.h>

double atanh(double x);
float atanhf(float x);
long double atanhl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the inverse hyperbolic tangent of their argument *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the inverse hyperbolic tangent of their argument.

If *x* is ±1, a pole error shall occur, and *atanh*( ), *atanhf*( ), and *atanhl*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively, with the same sign as the correct value of the function.

MX For finite $|x|>1$, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, *x* shall be returned.

If *x* is ±Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If *x* is subnormal, a range error may occur and *x* should be returned.

ERRORS

These functions shall fail if:

MX Domain Error — The *x* argument is finite and not in the range [–1,1], or is ±Inf.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

Pole Error — The *x* argument is ±1.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero floating-point exception shall be raised.

These functions may fail if:

MX | Range Error | The value of *x* is subnormal.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

feclearexcept( ), *fetestexcept( )*, *tanh( )*

XBD Section 4.19 (on page 116), **<math.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The *atanh( )* function is no longer marked as an extension.

The *atanhf( )* and *atanhl( )* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

20795 **NAME**

20796 atanl — arc tangent function

20797 **SYNOPSIS**

20798 `#include <math.h>`

20799 `long double atanl(long double x);`

20800 **DESCRIPTION**

20801 Refer to *atan( )*.

20802 **NAME**

20803 atexit — register a function to run at process termination

20804 **SYNOPSIS**

20805
```
#include <stdlib.h>
```

20806
```
int atexit(void (*func)(void));
```

20807 **DESCRIPTION**

20808 CX The functionality described on this reference page is aligned with the ISO C standard. Any
20809 conflict between the requirements described here and the ISO C standard is unintentional. This
20810 volume of POSIX.1-200x defers to the ISO C standard.

20811 The *atexit*( ) function shall register the function pointed to by *func*, to be called without
20812 arguments at normal program termination. At normal program termination, all functions
20813 registered by the *atexit*( ) function shall be called, in the reverse order of their registration, except
20814 that a function is called after any previously registered functions that had already been called at
20815 the time it was registered. Normal termination occurs either by a call to *exit*( ) or a return from
20816 *main*( ).

20817 At least 32 functions can be registered with *atexit*( ).

20818 CX After a successful call to any of the *exec* functions, any functions previously registered by *atexit*( )
20819 shall no longer be registered.

20820 **RETURN VALUE**

20821 Upon successful completion, *atexit*( ) shall return 0; otherwise, it shall return a non-zero value.

20822 **ERRORS**

20823 No errors are defined.

20824 **EXAMPLES**

20825 None.

20826 **APPLICATION USAGE**

20827 The functions registered by a call to *atexit*( ) must return to ensure that all registered functions
20828 are called.

20829 The application should call *sysconf*( ) to obtain the value of {ATEXIT_MAX}, the number of
20830 functions that can be registered. There is no way for an application to tell how many functions
20831 have already been registered with *atexit*( ).

20832 Since the behavior is undefined if the *exit*( ) function is called more than once, portable
20833 applications calling *atexit*( ) must ensure that the *exit*( ) function is not called at normal process
20834 termination when all functions registered by the *atexit*( ) function are called.

20835 All functions registered by the *atexit*( ) function are called at normal process termination, which
20836 occurs by a call to the *exit*( ) function or a return from *main*( ) or on the last thread termination,
20837 when the behavior is as if the implementation called *exit*( ) with a zero argument at thread
20838 termination time.

20839 If, at normal process termination, a function registered by the *atexit*( ) function is called and a
20840 portable application needs to stop further *exit*( ) processing, it must call the *_exit*( ) function or
20841 the *_Exit*( ) function or one of the functions which cause abnormal process termination.

20842 **RATIONALE**

20843 None.

FUTURE DIRECTIONS

None.

exec, *exit*( ), *sysconf*( )

XBD **<stdlib.h>**

CHANGE HISTORY

First released in Issue 4. Derived from the ANSI C standard.

Issue 6

Extensions beyond the ISO C standard are marked.

The DESCRIPTION is updated for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/19 is applied, adding further clarification to the APPLICATION USAGE section.

NAME

atof — convert a string to a double-precision number

SYNOPSIS

```
#include <stdlib.h>

double atof(const char *str);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The call *atof*(*str*) shall be equivalent to:

```
strtod(str,(char **)NULL),
```

except that the handling of errors may differ. If the value cannot be represented, the behavior is undefined.

RETURN VALUE

The *atof*( ) function shall return the converted value if the value can be represented.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *atof*( ) function is subsumed by *strtod*( ) but is retained because it is used extensively in existing code. If the number is not known to be in range, *strtod*( ) should be used because *atof*( ) is not required to perform any error checking.

RATIONALE

None.

FUTURE DIRECTIONS

None.

strtod( )

XBD **<stdlib.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

20888 **NAME**

20889 atoi — convert a string to an integer

20890 **SYNOPSIS**

20891
```
#include <stdlib.h>
```

20892
```
int atoi(const char *str);
```

20893 **DESCRIPTION**

20894 CX The functionality described on this reference page is aligned with the ISO C standard. Any
20895 conflict between the requirements described here and the ISO C standard is unintentional. This
20896 volume of POSIX.1-200x defers to the ISO C standard.

20897 The call *atoi*(*str*) shall be equivalent to:

20898
```
(int) strtol(str, (char **)NULL, 10)
```

20899 except that the handling of errors may differ. If the value cannot be represented, the behavior is
20900 undefined.

20901 **RETURN VALUE**

20902 The *atoi*( ) function shall return the converted value if the value can be represented.

20903 **ERRORS**

20904 No errors are defined.

20905 **EXAMPLES**

20906 **Converting an Argument**

20907 The following example checks for proper usage of the program. If there is an argument and the
20908 decimal conversion of this argument (obtained using *atoi*( )) is greater than 0, then the program
20909 has a valid number of minutes to wait for an event.

20910
```
#include <stdlib.h>
#include <stdio.h>
...
int minutes_to_event;
...
if (argc < 2 || ((minutes_to_event = atoi (argv[1]))) <= 0) {
   fprintf(stderr, "Usage: %s minutes\n", argv[0]); exit(1);
}
...
```

20919 **APPLICATION USAGE**

20920 The *atoi*( ) function is subsumed by *strtol*( ) but is retained because it is used extensively in
20921 existing code. If the number is not known to be in range, *strtol*( ) should be used because *atoi*( ) is
20922 not required to perform any error checking.

20923 **RATIONALE**

20924 None.

20925 **FUTURE DIRECTIONS**

20926 None.

20930 **CHANGE HISTORY**
20931 First released in Issue 1. Derived from Issue 1 of the SVID.

20932 **NAME**

20933 atol, atoll — convert a string to a long integer

20934 **SYNOPSIS**

20935 ```
#include <stdlib.h>
```

20936 ```
long atol(const char *str);
```

20937 ```
long long atoll(const char *nptr);
```

20938 **DESCRIPTION**

20939 CX The functionality described on this reference page is aligned with the ISO C standard. Any
20940 conflict between the requirements described here and the ISO C standard is unintentional. This
20941 volume of POSIX.1-200x defers to the ISO C standard.

20942 The call *atol*(*str*) shall be equivalent to:

20943 ```
strtol(str, (char **)NULL, 10)
```

20944 The call *atoll*(*nptr*) shall be equivalent to:

20945 ```
strtoll(nptr, (char **)NULL, 10)
```

20946 except that the handling of errors may differ. If the value cannot be represented, the behavior is
20947 undefined.

20948 **RETURN VALUE**

20949 These functions shall return the converted value if the value can be represented.

20950 **ERRORS**

20951 No errors are defined.

20952 **EXAMPLES**

20953 None.

20954 **APPLICATION USAGE**

20955 The *atol*( ) function is subsumed by *strtol*( ) but is retained because it is used extensively in
20956 existing code. If the number is not known to be in range, *strtol*( ) should be used because *atol*( ) is
20957 not required to perform any error checking.

20958 **RATIONALE**

20966 First released in Issue 1. Derived from Issue 1 of the SVID.

20967 **Issue 6**

20968 The *atoll*( ) function is added for alignment with the ISO/IEC 9899:1999 standard.

20969 **Issue 7**

20970 SD5-XSH-ERN-61 is applied, correcting the DESCRIPTION of *atoll*( ).
```

NAME

basename — return the last component of a pathname

SYNOPSIS

XSI
```
#include <libgen.h>

char *basename(char *path);
```

DESCRIPTION

The *basename*( ) function shall take the pathname pointed to by *path* and return a pointer to the final component of the pathname, deleting any trailing '/' characters.

If the string pointed to by *path* consists entirely of the '/' character, *basename*( ) shall return a pointer to the string "/". If the string pointed to by *path* is exactly "//", it is implementation-defined whether '/' or "//" is returned.

If *path* is a null pointer or points to an empty string, *basename*( ) shall return a pointer to the string ".".

The *basename*( ) function may modify the string pointed to by *path*, and may return a pointer to static storage that may then be overwritten by a subsequent call to *basename*( ).

The *basename*( ) function need not be thread-safe.

RETURN VALUE

The *basename*( ) function shall return a pointer to the final component of *path*.

ERRORS

No errors are defined.

EXAMPLES

Using basename( )

The following program fragment returns a pointer to the value *lib*, which is the base name of **/usr/lib**.

```
#include <libgen.h>
...
char *name = "/usr/lib";
char *base;

base = basename(name);
...
```

Sample Input and Output Strings for basename( )

In the following table, the input string is the value pointed to by *path*, and the output string is the return value of the *basename*( ) function.

Input String	Output String
"/usr/lib"	"lib"
"/usr/"	"usr"
"/"	"/"
"///"	"/"
"//usr//lib//"	"lib"

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/20 is applied, changing the DESCRIPTION to make it clear that the string referenced is the string pointed to by *path*.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

21033 **NAME**

21034 bind — bind a name to a socket

21035 **SYNOPSIS**

21036
```
#include <sys/socket.h>
```

21037
```
int bind(int socket, const struct sockaddr *address,
```
21038
```
    socklen_t address_len);
```

21039 **DESCRIPTION**

21040 The *bind*( ) function shall assign a local socket address *address* to a socket identified by descriptor
21041 *socket* that has no local socket address assigned. Sockets created with the *socket*( ) function are
21042 initially unnamed; they are identified only by their address family.

21043 The *bind*( ) function takes the following arguments:

21044 *socket* Specifies the file descriptor of the socket to be bound.

21045 *address* Points to a **sockaddr** structure containing the address to be bound to the
21046 socket. The length and format of the address depend on the address family of
21047 the socket.

21048 *address_len* Specifies the length of the **sockaddr** structure pointed to by the *address*
21049 argument.

21050 The socket specified by *socket* may require the process to have appropriate privileges to use the
21051 *bind*( ) function.

21052 If the socket address cannot be assigned immediately and O_NONBLOCK is set for the file
21053 descriptor for the socket, *bind*( ) shall fail and set *errno* to [EINPROGRESS], but the assignment
21054 request shall not be aborted, and the assignment shall be completed asynchronously. Subsequent
21055 calls to *bind*( ) for the same socket, before the assignment is completed, shall fail and set *errno* to
21056 [EALREADY].

21057 When the assignment has been performed asynchronously, *pselect*( ), *select*( ), and *poll*( ) shall
21058 indicate that the file descriptor for the socket is ready for reading and writing.

21059 **RETURN VALUE**

21060 Upon successful completion, *bind*( ) shall return 0; otherwise, −1 shall be returned and *errno* set
21061 to indicate the error.

21062 **ERRORS**

21063 The *bind*( ) function shall fail if:

21064 [EADDRINUSE] The specified address is already in use.

21065 [EADDRNOTAVAIL]
21066 The specified address is not available from the local machine.

21067 [EAFNOSUPPORT]
21068 The specified address is not a valid address for the address family of the
21069 specified socket.

21070 [EALREADY] An assignment request is already in progress for the specified socket.

21071 [EBADF] The *socket* argument is not a valid file descriptor.

21072 [EINPROGRESS] O_NONBLOCK is set for the file descriptor for the socket and the assignment
21073 cannot be immediately performed; the assignment shall be performed
21074 asynchronously.

[EINVAL] The socket is already bound to an address, and the protocol does not support binding to a new address; or the socket has been shut down.

[ENOBUFS] Insufficient resources were available to complete the call.

[ENOTSOCK] The *socket* argument does not refer to a socket.

[EOPNOTSUPP] The socket type of the specified socket does not support binding to an address.

If the address family of the socket is AF_UNIX, then *bind*( ) shall fail if:

[EACCES] A component of the path prefix denies search permission, or the requested name requires writing in a directory with a mode that denies write permission.

[EDESTADDRREQ] or [EISDIR]
The *address* argument is a null pointer.

[EIO] An I/O error occurred.

[ELOOP] A loop exists in symbolic links encountered during resolution of the pathname in *address*.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of the pathname does not name an existing file or the pathname is an empty string.

[ENOTDIR] A component of the path prefix of the pathname in *address* is not a directory, or the pathname in *address* contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

[EROFS] The name would reside on a read-only file system.

The *bind*( ) function may fail if:

[EACCES] The specified address is protected and the current user does not have permission to bind to it.

[EINVAL] The *address_len* argument is not a valid length for the address family.

[EISCONN] The socket is already connected.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in *address*.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

EXAMPLES

The following code segment shows how to create a socket and bind it to a name in the AF_UNIX domain.

```
#define MY_SOCK_PATH "/somepath"

int sfd;
struct sockaddr_un my_addr;

sfd = socket(AF_UNIX, SOCK_STREAM, 0);
if (sfd == -1)
    /* Handle error */;

memset(&my_addr, '\0', sizeof(struct sockaddr_un));
                        /* Clear structure */
my_addr.sun_family = AF_UNIX;
strncpy(my_addr.sun_path, MY_SOCK_PATH, sizeof(my_addr.sun_path) -1);

if (bind(sfd, (struct sockaddr *) &my_addr,
    sizeof(struct sockaddr_un)) == -1)
    /* Handle error */;
```

APPLICATION USAGE

An application program can retrieve the assigned socket name with the *getsockname*( ) function.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

Issue 7

Austin Group Interpretation 1003.1-2001 #044 is applied, changing the "may fail" [ENOBUFS] error to become a "shall fail" error.

Austin Group Interpretation 1003.1-2001 #143 is applied.

SD5-XSH-ERN-185 is applied.

An example is added.

21143 **NAME**

21144 bsearch — binary search a sorted table

21145 **SYNOPSIS**

21146
```
#include <stdlib.h>
```

21147
```
void *bsearch(const void *key, const void *base, size_t nel,
```
21148
```
    size_t width, int (*compar)(const void *, const void *));
```

21149 **DESCRIPTION**

21150 CX The functionality described on this reference page is aligned with the ISO C standard. Any
21151 conflict between the requirements described here and the ISO C standard is unintentional. This
21152 volume of POSIX.1-200x defers to the ISO C standard.

21153 The *bsearch*( ) function shall search an array of *nel* objects, the initial element of which is pointed
21154 to by *base*, for an element that matches the object pointed to by *key*. The size of each element in
21155 the array is specified by *width*. If the *nel* argument has the value zero, the comparison function
21156 pointed to by *compar* shall not be called and no match shall be found.

21157 The comparison function pointed to by *compar* shall be called with two arguments that point to
21158 the *key* object and to an array element, in that order.

21159 The application shall ensure that the comparison function pointed to by *compar* does not alter the
21160 contents of the array. The implementation may reorder elements of the array between calls to the
21161 comparison function, but shall not alter the contents of any individual element.

21162 The implementation shall ensure that the first argument is always a pointer to the key.

21163 When the same objects (consisting of width bytes, irrespective of their current positions in the
21164 array) are passed more than once to the comparison function, the results shall be consistent with
21165 one another. That is, the same object shall always compare the same way with the key.

21166 The application shall ensure that the function returns an integer less than, equal to, or greater
21167 than 0 if the *key* object is considered, respectively, to be less than, to match, or to be greater than
21168 the array element. The application shall ensure that the array consists of all the elements that
21169 compare less than, all the elements that compare equal to, and all the elements that compare
21170 greater than the *key* object, in that order.

21171 **RETURN VALUE**

21172 The *bsearch*( ) function shall return a pointer to a matching member of the array, or a null pointer
21173 if no match is found. If two or more members compare equal, which member is returned is
21174 unspecified.

21175 **ERRORS**

21176 No errors are defined.

21177 **EXAMPLES**

21178 The example below searches a table containing pointers to nodes consisting of a string and its
21179 length. The table is ordered alphabetically on the string in the node pointed to by each entry.

21180 The code fragment below reads in strings and either finds the corresponding node and prints
21181 out the string and its length, or prints an error message.

21182
```
#include <stdio.h>
```
21183
```
#include <stdlib.h>
```
21184
```
#include <string.h>
```

21185
```
#define TABSIZE    1000
```

21186
```
struct node {                  /* These are stored in the table. */
```

```
21187           char *string;
21188           int length;
21189       };
21190       struct node table[TABSIZE];    /* Table to be searched. */
21191           .
21192           .
21193           .
21194       {
21195           struct node *node_ptr, node;
21196           /* Routine to compare 2 nodes. */
21197           int node_compare(const void *, const void *);
21198           .
21199           .
21200           .
21201           while (scanf("%ms", &node.string) != EOF) {
21202               node_ptr = (struct node *)bsearch((void *)(&node),
21203                      (void *)table, TABSIZE,
21204                      sizeof(struct node), node_compare);
21205               if (node_ptr != NULL) {
21206                   (void)printf("string = %20s, length = %d\n",
21207                       node_ptr->string, node_ptr->length);
21208               } else {
21209                   (void)printf("not found: %s\n", node.string);
21210               }
21211               free(node.string);
21212           }
21213       }
21214       /*
21215           This routine compares two nodes based on an
21216           alphabetical ordering of the string field.
21217       */
21218       int
21219       node_compare(const void *node1, const void *node2)
21220       {
21221           return strcoll(((const struct node *)node1)->string,
21222               ((const struct node *)node2)->string);
21223       }
```

APPLICATION USAGE

The pointers to the key and the element at the base of the table should be of type pointer-to-element.

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

In practice, the array is usually sorted according to the comparison function.

RATIONALE

The requirement that the second argument (hereafter referred to as *p*) to the comparison function is a pointer to an element of the array implies that for every call all of the following expressions are non-zero:

```
((char *)p – (char *(base) % width == 0
(char *)p >= (char *)base
```

```
(char *)p < (char *)base + nel * width
```

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/11 is applied, adding to the DESCRIPTION the last sentence of the first non-shaded paragraph, and the following three paragraphs. The RATIONALE section is also updated. These changes are for alignment with the ISO C standard.

Issue 7

The EXAMPLES section is revised.

21252 **NAME**

21253 btowc — single byte to wide character conversion

21254 **SYNOPSIS**

21255 ```
#include <stdio.h>
```

21256 ```
#include <wchar.h>
```

21257 ```
wint_t btowc(int c);
```

21258 **DESCRIPTION**

21259 CX The functionality described on this reference page is aligned with the ISO C standard. Any
21260 conflict between the requirements described here and the ISO C standard is unintentional. This
21261 volume of POSIX.1-200x defers to the ISO C standard.

21262 The *btowc*( ) function shall determine whether *c* constitutes a valid (one-byte) character in the
21263 initial shift state.

21264 The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale.

21265 **RETURN VALUE**

21266 The *btowc*( ) function shall return WEOF if *c* has the value EOF or if **(unsigned char)** *c* does not
21267 constitute a valid (one-byte) character in the initial shift state. Otherwise, it shall return the
21268 wide-character representation of that character.

21269 **ERRORS**

21270 No errors are defined.

21271 **EXAMPLES**

21272 None.

21273 **APPLICATION USAGE**

21274 None.

21275 **RATIONALE**

21276 None.

21277 **FUTURE DIRECTIONS**

21278 None.

21282 **CHANGE HISTORY**

21283 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
21284 (E).
```

21285 **NAME**

21286 cabs, cabsf, cabsl — return a complex absolute value

21287 **SYNOPSIS**

21288
```
#include <complex.h>
```

21289
```
double cabs(double complex z);
```
21290
```
float cabsf(float complex z);
```
21291
```
long double cabsl(long double complex z);
```

21292 **DESCRIPTION**

21293 CX The functionality described on this reference page is aligned with the ISO C standard. Any
21294 conflict between the requirements described here and the ISO C standard is unintentional. This
21295 volume of POSIX.1-200x defers to the ISO C standard.

21296 These functions shall compute the complex absolute value (also called norm, modulus, or
21297 magnitude) of *z*.

21298 **RETURN VALUE**

21299 These functions shall return the complex absolute value.

21300 **ERRORS**

21301 No errors are defined.

21302 **EXAMPLES**

21303 None.

21375 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

cacosl( )

21376 **NAME**

21377 cacosl — complex arc cosine functions

21378 **SYNOPSIS**

21379 `#include <complex.h>`

21380 `long double complex cacosl(long double complex z);`

21381 **DESCRIPTION**

21382 Refer to *cacos( )*.

21383 **NAME**

21384 calloc — a memory allocator

21385 **SYNOPSIS**

21386
```
#include <stdlib.h>
```

21387
```
void *calloc(size_t nelem, size_t elsize);
```

21388 **DESCRIPTION**

21389 CX The functionality described on this reference page is aligned with the ISO C standard. Any
21390 conflict between the requirements described here and the ISO C standard is unintentional. This
21391 volume of POSIX.1-200x defers to the ISO C standard.

21392 The *calloc*( ) function shall allocate unused space for an array of *nelem* elements each of whose
21393 size in bytes is *elsize*. The space shall be initialized to all bits 0.

21394 The order and contiguity of storage allocated by successive calls to *calloc*( ) is unspecified. The
21395 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to
21396 a pointer to any type of object and then used to access such an object or an array of such objects
21397 in the space allocated (until the space is explicitly freed or reallocated). Each such allocation shall
21398 yield a pointer to an object disjoint from any other object. The pointer returned shall point to the
21399 start (lowest byte address) of the allocated space. If the space cannot be allocated, a null pointer
21400 shall be returned. If the size of the space requested is 0, the behavior is implementation-defined:
21401 the value returned shall be either a null pointer or a unique pointer.

21402 **RETURN VALUE**

21403 Upon successful completion with both *nelem* and *elsize* non-zero, *calloc*( ) shall return a pointer to
21404 the allocated space. If either *nelem* or *elsize* is 0, then either a null pointer or a unique pointer
21405 value that can be successfully passed to *free*( ) shall be returned. Otherwise, it shall return a null
21406 CX pointer and set *errno* to indicate the error.

21407 **ERRORS**

21408 The *calloc*( ) function shall fail if:

21409 CX [ENOMEM] Insufficient memory is available.

21410 **EXAMPLES**

21411 None.

21412 **APPLICATION USAGE**

21413 There is now no requirement for the implementation to support the inclusion of **<malloc.h>**.

21414 **RATIONALE**

21415 None.

21416 **FUTURE DIRECTIONS**

21417 None.

21418 **SEE ALSO**

21419 *free*( ), *malloc*( ), *realloc*( )

21420 XBD **<stdlib.h>**

21421 **CHANGE HISTORY**

21422 First released in Issue 1. Derived from Issue 1 of the SVID.

21423 **Issue 6**

21424 Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The setting of *errno* and the [ENOMEM] error condition are mandatory if an insufficient memory condition occurs.

21429 **NAME**

21430 carg, cargf, cargl — complex argument functions

21431 **SYNOPSIS**

21432
```
#include <complex.h>
```

21433
```
double carg(double complex z);
```
21434
```
float cargf(float complex z);
```
21435
```
long double cargl(long double complex z);
```

21436 **DESCRIPTION**

21437 CX The functionality described on this reference page is aligned with the ISO C standard. Any
21438 conflict between the requirements described here and the ISO C standard is unintentional. This
21439 volume of POSIX.1-200x defers to the ISO C standard.

21440 These functions shall compute the argument (also called phase angle) of z, with a branch cut
21441 along the negative real axis.

21442 **RETURN VALUE**

21443 These functions shall return the value of the argument in the interval $[-\pi, +\pi]$.

21444 **ERRORS**

21445 No errors are defined.

NAME

casinh, casinhf, casinhl — complex arc hyperbolic sine functions

SYNOPSIS

```
#include <complex.h>

double complex casinh(double complex z);
float complex casinhf(float complex z);
long double complex casinhl(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the complex arc hyperbolic sine of z, with branch cuts outside the interval $[-i, +i]$ along the imaginary axis.

RETURN VALUE

These functions shall return the complex arc hyperbolic sine value, in the range of a strip mathematically unbounded along the real axis and in the interval $[-i\pi/2, +i\pi/2]$ along the imaginary axis.

NAME

catclose — close a message catalog descriptor

SYNOPSIS

```
#include <nl_types.h>

int catclose(nl_catd catd);
```

DESCRIPTION

The *catclose*( ) function shall close the message catalog identified by *catd*. If a file descriptor is used to implement the type **nl_catd**, that file descriptor shall be closed.

RETURN VALUE

Upon successful completion, *catclose*( ) shall return 0; otherwise, –1 shall be returned, and *errno* set to indicate the error.

ERRORS

The *catclose*( ) function may fail if:

[EBADF] The catalog descriptor is not valid.

[EINTR] The *catclose*( ) function was interrupted by a signal.

Issue 7

The *catclose*( ) function is moved from the XSI option to the Base.

NAME

catgets — read a program message

SYNOPSIS

```
#include <nl_types.h>

char *catgets(nl_catd catd, int set_id, int msg_id, const char *s);
```

DESCRIPTION

The *catgets*( ) function shall attempt to read message *msg_id*, in set *set_id*, from the message catalog identified by *catd*. The *catd* argument is a message catalog descriptor returned from an earlier call to *catopen*( ). The results are undefined if *catd* is not a value returned by *catopen*( ) for a message catalog still open in the process. The *s* argument points to a default message string which shall be returned by *catgets*( ) if it cannot retrieve the identified message.

The *catgets*( ) function need not be thread-safe.

RETURN VALUE

If the identified message is retrieved successfully, *catgets*( ) shall return a pointer to an internal buffer area containing the null-terminated message string. If the call is unsuccessful for any reason, *s* shall be returned and *errno* shall be set to indicate the error.

ERRORS

The *catgets*( ) function shall fail if:

[EINTR] The read operation was terminated due to the receipt of a signal, and no data was transferred.

[ENOMSG] The message identified by *set_id* and *msg_id* is not in the message catalog.

The *catgets*( ) function may fail if:

[EBADF] The *catd* argument is not a valid message catalog descriptor open for reading.

[EBADMSG] The message identified by *set_id* and *msg_id* in the specified message catalog did not satisfy implementation-defined security criteria.

[EINVAL] The message catalog identified by *catd* is corrupted.

CHANGE HISTORY

First released in Issue 2.

Issue 5

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

Issue 7

Austin Group Interpretation 1003.1-2001 #044 is applied, changing the "may fail" [EINTR] and [ENOMSG] errors to become "shall fail" errors, updating the RETURN VALUE section, and updating the DESCRIPTION to note that: "The results are undefined if *catd* is not a value returned by *catopen*( ) for a message catalog still open in the process.

Austin Group Interpretation 1003.1-2001 #148 is applied, adding

The *catgets*( ) function is moved from the XSI option to the Base.

NAME

catopen — open a message catalog

SYNOPSIS

```
#include <nl_types.h>

nl_catd catopen(const char *name, int oflag);
```

DESCRIPTION

The *catopen*( ) function shall open a message catalog and return a message catalog descriptor. The *name* argument specifies the name of the message catalog to be opened. If *name* contains a `'/'`, then *name* specifies a complete name for the message catalog. Otherwise, the environment variable *NLSPATH* is used with *name* substituted for the `%N` conversion specification (see XBD Chapter 8, on page 173). If *NLSPATH* exists in the environment when the process starts, then if the process has appropriate privileges, the behavior of *catopen*( ) is undefined. If *NLSPATH* does not exist in the environment, or if a message catalog cannot be found in any of the components specified by *NLSPATH*, then an implementation-defined default path shall be used. This default may be affected by the setting of *LC_MESSAGES* if the value of *oflag* is NL_CAT_LOCALE, or the *LANG* environment variable if *oflag* is 0.

A message catalog descriptor shall remain valid in a process until that process closes it, or a successful call to one of the *exec* functions. A change in the setting of the *LC_MESSAGES* category may invalidate existing open catalogs.

If a file descriptor is used to implement message catalog descriptors, the FD_CLOEXEC flag shall be set; see **<fcntl.h>**.

If the value of the *oflag* argument is 0, the *LANG* environment variable is used to locate the catalog without regard to the *LC_MESSAGES* category. If the *oflag* argument is NL_CAT_LOCALE, the *LC_MESSAGES* category is used to locate the message catalog (see XBD Section 8.2, on page 174).

RETURN VALUE

Upon successful completion, *catopen*( ) shall return a message catalog descriptor for use on subsequent calls to *catgets*( ) and *catclose*( ). Otherwise, *catopen*( ) shall return (**nl_catd**) –1 and set *errno* to indicate the error.

ERRORS

The *catopen*( ) function may fail if:

[EACCES] Search permission is denied for the component of the path prefix of the message catalog or read permission is denied for the message catalog.

[EMFILE] All file descriptors available to the process are currently open.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[ENFILE] Too many files are currently open in the system.

[ENOENT] The message catalog does not exist or the *name* argument points to an empty string.

21723 [ENOMEM] Insufficient storage space is available.

21724 [ENOTDIR] A component of the path prefix of the message catalog is not a directory, or the
21725 pathname of the message catalog contains at least one non-<slash> character
21726 and ends with one or more trailing <slash> characters and the last pathname
21727 component names an existing file that is neither a directory nor a symbolic
21728 link to a directory.

21729 **EXAMPLES**

21730 None.

21731 **APPLICATION USAGE**

21732 Some implementations of *catopen*( ) use *malloc*( ) to allocate space for internal buffer areas. The
21733 *catopen*( ) function may fail if there is insufficient storage space available to accommodate these
21734 buffers.

21735 Conforming applications must assume that message catalog descriptors are not valid after a call
21736 to one of the *exec* functions.

21737 Application developers should be aware that guidelines for the location of message catalogs
21738 have not yet been developed. Therefore they should take care to avoid conflicting with catalogs
21739 used by other applications and the standard utilities.

21740 **RATIONALE**

21741 None.

21742 **FUTURE DIRECTIONS**

21743 None.

21744 **SEE ALSO**

21745 *catclose*( ), *catgets*( )

21746 XBD Chapter 8 (on page 173), **<fcntl.h>**, **<nl_types.h>**,

21748 First released in Issue 2.

21749 **Issue 7**

21750 Austin Group Interpretation 1003.1-2001 #143 is applied.

21751 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

21752 The *catopen*( ) function is moved from the XSI option to the Base.

21753 **NAME**

21754 cbrt, cbrtf, cbrtl — cube root functions

21755 **SYNOPSIS**

21756
```
#include <math.h>
```

21757
```
double cbrt(double x);
```
21758
```
float cbrtf(float x);
```
21759
```
long double cbrtl(long double x);
```

21760 **DESCRIPTION**

21761 CX The functionality described on this reference page is aligned with the ISO C standard. Any
21762 conflict between the requirements described here and the ISO C standard is unintentional. This
21763 volume of POSIX.1-200x defers to the ISO C standard.

21764 These functions shall compute the real cube root of their argument *x*.

21765 **RETURN VALUE**

21766 Upon successful completion, these functions shall return the cube root of *x*.

21767 MX If *x* is NaN, a NaN shall be returned.

21768 If *x* is ±0 or ±Inf, *x* shall be returned.

21769 **ERRORS**

21770 No errors are defined.

21771 **EXAMPLES**

21772 None.

21773 **APPLICATION USAGE**

21774 None.

21775 **RATIONALE**

21776 For some applications, a true cube root function, which returns negative results for negative
21777 arguments, is more appropriate than *pow*(*x*, 1.0/3.0), which returns a NaN for *x* less than 0.

21778 **FUTURE DIRECTIONS**

21779 None.

21848 XBD **<complex.h>**

21849 **CHANGE HISTORY**

21850 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

21851 **NAME**

21852 ccosl — complex cosine functions

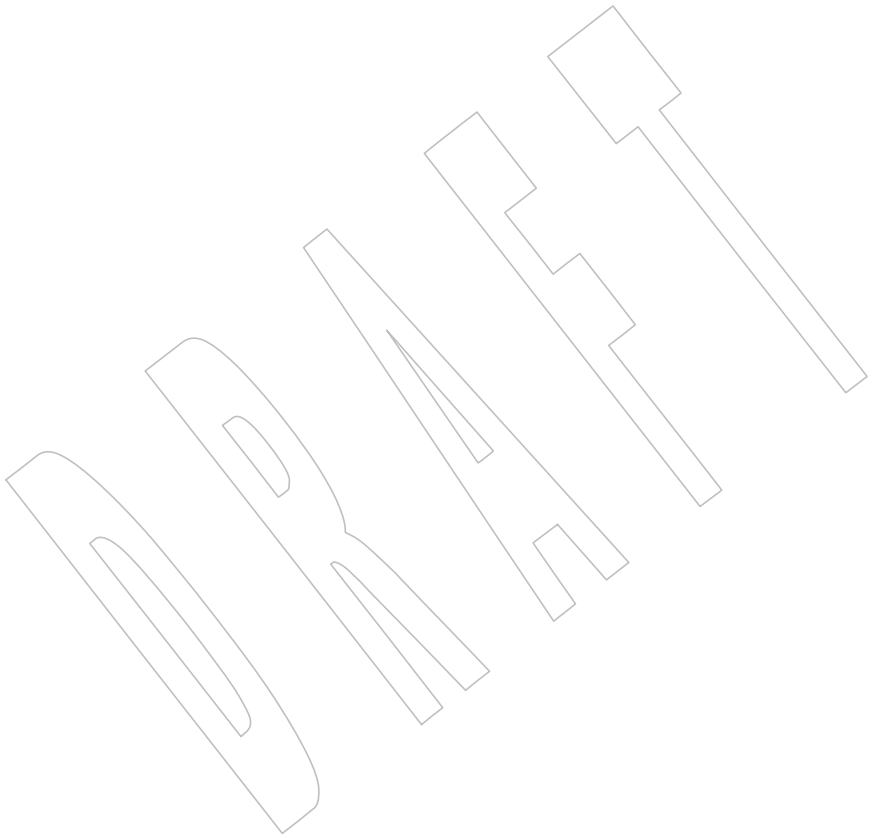
21853 **SYNOPSIS**

21854 `#include <complex.h>`

21855 `long double complex ccosl(long double complex z);`

21856 **DESCRIPTION**

21857 Refer to *ccos( )*.



21858 **NAME**

21859 ceil, ceilf, ceill — ceiling value function

21860 **SYNOPSIS**

21861 `#include <math.h>`

21862 `double ceil(double x);`
21863 `float ceilf(float x);`
21864 `long double ceill(long double x);`

21865 **DESCRIPTION**

21866 CX The functionality described on this reference page is aligned with the ISO C standard. Any
21867 conflict between the requirements described here and the ISO C standard is unintentional. This
21868 volume of POSIX.1-200x defers to the ISO C standard.

21869 These functions shall compute the smallest integral value not less than *x*.

21870 An application wishing to check for error situations should set *errno* to zero and call
21871 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
21872 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
21873 zero, an error has occurred.

21874 **RETURN VALUE**

21875 Upon successful completion, *ceil*( ), *ceilf*( ), and *ceill*( ) shall return the smallest integral value not
21876 less than *x*, expressed as a type **double**, **float**, or **long double**, respectively.

21877 MX If *x* is NaN, a NaN shall be returned.

21878 If *x* is ±0 or ±Inf, *x* shall be returned.

21879 XSI If the correct value would cause overflow, a range error shall occur and *ceil*( ), *ceilf*( ), and *ceill*( )
21880 shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

21881 **ERRORS**

21882 These functions shall fail if:

21883 XSI Range Error — The result overflows.

21884 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
21885 then *errno* shall be set to [ERANGE]. If the integer expression
21886 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
21887 floating-point exception shall be raised.

21888 **EXAMPLES**

21889 None.

21890 **APPLICATION USAGE**

21891 The integral value returned by these functions need not be expressible as an **int** or **long**. The
21892 return value should be tested before assigning it to an integer type to avoid the undefined
21893 results of an integer overflow.

21894 The *ceil*( ) function can only overflow when the floating-point representation has
21895 DBL_MANT_DIG > DBL_MAX_EXP.

21896 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
21897 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

NAME

cfgetispeed — get input baud rate

SYNOPSIS

```
#include <termios.h>

speed_t cfgetispeed(const struct termios *termios_p);
```

DESCRIPTION

The *cfgetispeed*( ) function shall extract the input baud rate from the **termios** structure to which the *termios_p* argument points.

This function shall return exactly the value in the **termios** data structure, without interpretation.

RETURN VALUE

Upon successful completion, *cfgetispeed*( ) shall return a value of type **speed_t** representing the input baud rate.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The term "baud" is used historically here, but is not technically correct. This is properly "bits per second", which may not be the same as baud. However, the term is used because of the historical usage and understanding.

The *cfgetospeed*( ), *cfgetispeed*( ), *cfsetospeed*( ), and *cfsetispeed*( ) functions do not take arguments as numbers, but rather as symbolic names. There are two reasons for this:

1. Historically, numbers were not used because of the way the rate was stored in the data structure. This is retained even though a function is now used.
2. More importantly, only a limited set of possible rates is at all portable, and this constrains the application to that set.

There is nothing to prevent an implementation accepting as an extension a number (such as 126), and since the encoding of the Bxxx symbols is not specified, this can be done to avoid introducing ambiguity.

Setting the input baud rate to zero was a mechanism to allow for split baud rates. Clarifications in this volume of POSIX.1-200x have made it possible to determine whether split rates are supported and to support them without having to treat zero as a special case. Since this functionality is also confusing, it has been declared obsolescent. The 0 argument referred to is the literal constant 0, not the symbolic constant B0. This volume of POSIX.1-200x does not preclude B0 from being defined as the value 0; in fact, implementations would likely benefit from the two being equivalent. This volume of POSIX.1-200x does not fully specify whether the previous *cfsetispeed*( ) value is retained after a *tcgetattr*( ) as the actual value or as zero. Therefore, conforming applications should always set both the input speed and output speed when setting either.

In historical implementations, the baud rate information is traditionally kept in **c_cflag**. Applications should be written to presume that this might be the case (and thus not blindly copy **c_cflag**), but not to rely on it in case it is in some other field of the structure. Setting the **c_cflag** field absolutely after setting a baud rate is a non-portable action because of this. In general, the

unused parts of the flag fields might be used by the implementation and should not be blindly copied from the descriptions of one terminal device to another.

FUTURE DIRECTIONS

None.

NAME

cfsetispeed — set input baud rate

SYNOPSIS

```
#include <termios.h>

int cfsetispeed(struct termios *termios_p, speed_t speed);
```

DESCRIPTION

The *cfsetispeed*( ) function shall set the input baud rate stored in the structure pointed to by *termios_p* to *speed.*

There shall be no effect on the baud rates set in the hardware until a subsequent successful call to *tcsetattr*( ) with the same **termios** structure. Similarly, errors resulting from attempts to set baud rates not supported by the terminal device need not be detected until the *tcsetattr*( ) function is called.

RETURN VALUE

Upon successful completion, *cfsetispeed*( ) shall return 0; otherwise, –1 shall be returned, and *errno* may be set to indicate the error.

ERRORS

The *cfsetispeed*( ) function may fail if:

[EINVAL] The *speed* value is not a valid baud rate.

[EINVAL] The value of *speed* is outside the range of possible speed values as specified in **<termios.h>**.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Refer to *cfgetispeed*( ).

22094 **CHANGE HISTORY**

22095 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

22096 **Issue 6**

22097 The following new requirements on POSIX implementations derive from alignment with the
22098 Single UNIX Specification:

22099 • The optional setting of *errno* and the [EINVAL] error conditions are added.

NAME

chdir — change working directory

SYNOPSIS

```
#include <unistd.h>

int chdir(const char *path);
```

DESCRIPTION

The *chdir*( ) function shall cause the directory named by the pathname pointed to by the *path* argument to become the current working directory; that is, the starting point for path searches for pathnames not beginning with '/'.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned, the current working directory shall remain unchanged, and *errno* shall be set to indicate the error.

ERRORS

The *chdir*( ) function shall fail if:

[EACCES] Search permission is denied for any component of the pathname.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing directory or *path* is an empty string.

[ENOTDIR] A component of the pathname is not a directory.

The *chdir*( ) function may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

EXAMPLES

Changing the Current Working Directory

The following example makes the value pointed to by **directory**, **/tmp**, the current working directory.

```
#include <unistd.h>
...
char *directory = "/tmp";
int ret;

ret = chdir (directory);
```

APPLICATION USAGE

None.

RATIONALE

The *chdir*( ) function only affects the working directory of the current process.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The APPLICATION USAGE section is added.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

NAME

chmod, fchmodat — change mode of a file relative to directory file descriptor

SYNOPSIS

```
#include <sys/stat.h>

int chmod(const char *path, mode_t mode);
int fchmodat(int fd, const char *path, mode_t mode, int flag);
```

DESCRIPTION

XSI The *chmod*( ) function shall change S_ISUID, S_ISGID, S_ISVTX, and the file permission bits of the file named by the pathname pointed to by the *path* argument to the corresponding bits in the *mode* argument. The application shall ensure that the effective user ID of the process matches the owner of the file or the process has appropriate privileges in order to do this.

XSI S_ISUID, S_ISGID, S_ISVTX, and the file permission bits are described in **<sys/stat.h>**.

If the calling process does not have appropriate privileges, and if the group ID of the file does not match the effective group ID or one of the supplementary group IDs and if the file is a regular file, bit S_ISGID (set-group-ID on execution) in the file's mode shall be cleared upon successful return from *chmod*( ).

Additional implementation-defined restrictions may cause the S_ISUID and S_ISGID bits in *mode* to be ignored.

The effect on file descriptors for files open at the time of a call to *chmod*( ) is implementation-defined.

Upon successful completion, *chmod*( ) shall mark for update the last file status change timestamp of the file.

The *fchmodat*( ) function shall be equivalent to the *chmod*( ) function except in the case where *path* specifies a relative path. In this case the file to be changed is determined relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function shall not perform the check.

Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in **<fcntl.h>**:

AT_SYMLINK_NOFOLLOW
: If *path* names a symbolic link, then the mode of the symbolic link is changed.

If *fchmodat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working directory is used. If also *flag* is zero, the behavior shall be identical to a call to *chmod*( ).

RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return −1 and set *errno* to indicate the error. If −1 is returned, no change to the file mode occurs.

ERRORS

These functions shall fail if:

[EACCES] Search permission is denied on a component of the path prefix.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}. -

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix is not a directory, or the *path* argument + contains at least one non-<slash> character and ends with one or more trailing + <slash> characters and the last pathname component names an existing file + that is neither a directory nor a symbolic link to a directory.

[EPERM] The effective user ID does not match the owner of the file and the process does not have appropriate privileges.

[EROFS] The named file resides on a read-only file system.

The *fchmodat*( ) function shall fail if:

[EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

These functions may fail if:

[EINTR] A signal was caught during execution of the function.

[EINVAL] The value of the *mode* argument is invalid.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

The *fchmodat*( ) function may fail if:

[EINVAL] The value of the *flag* argument is invalid.

[ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a file descriptor associated with a directory.

[EOPNOTSUPP] The AT_SYMLINK_NOFOLLOW bit is set in the *flag* argument, *path* names a symbolic link, and the system does not support changing the mode of a symbolic link.

EXAMPLES

Setting Read Permissions for User, Group, and Others

The following example sets read permissions for the owner, group, and others.

```
#include <sys/stat.h>

const char *path;
...
chmod(path, S_IRUSR|S_IRGRP|S_IROTH);
```

22239 **Setting Read, Write, and Execute Permissions for the Owner Only**

22240 The following example sets read, write, and execute permissions for the owner, and no
22241 permissions for group and others.

```
22242 #include <sys/stat.h>

22243 const char *path;
22244 ...
22245 chmod(path, S_IRWXU);
```

22246 **Setting Different Permissions for Owner, Group, and Other**

22247 The following example sets owner permissions for CHANGEFILE to read, write, and execute,
22248 group permissions to read and execute, and other permissions to read.

```
22249 #include <sys/stat.h>

22250 #define CHANGEFILE "/etc/myfile"
22251 ...
22252 chmod(CHANGEFILE, S_IRWXU|S_IRGRP|S_IXGRP|S_IROTH);
```

22253 **Setting and Checking File Permissions**

22254 The following example sets the file permission bits for a file named **/home/cnd/mod1**, then calls
22255 the *stat*( ) function to verify the permissions.

```
22256 #include <sys/types.h>
22257 #include <sys/stat.h>

22258 int status;
22259 struct stat buffer
22260 ...
22261 chmod("home/cnd/mod1", S_IRWXU|S_IRWXG|S_IROTH|S_IWOTH);
22262 status = stat("home/cnd/mod1", &buffer;);
```

22263 **APPLICATION USAGE**

22264 In order to ensure that the S_ISUID and S_ISGID bits are set, an application requiring this
22265 should use *stat*( ) after a successful *chmod*( ) to verify this.

22266 Any file descriptors currently open by any process on the file could possibly become invalid if
22267 the mode of the file is changed to a value which would deny access to that process. One
22268 situation where this could occur is on a stateless file system. This behavior will not occur in a
22269 conforming environment.

22270 **RATIONALE**

22271 This volume of POSIX.1-200x specifies that the S_ISGID bit is cleared by *chmod*( ) on a regular file
22272 under certain conditions. This is specified on the assumption that regular files may be executed,
22273 and the system should prevent users from making executable *setgid*( ) files perform with
22274 privileges that the caller does not have. On implementations that support execution of other file
22275 types, the S_ISGID bit should be cleared for those file types under the same circumstances.

22276 Implementations that use the S_ISUID bit to indicate some other function (for example,
22277 mandatory record locking) on non-executable files need not clear this bit on writing. They
22278 should clear the bit for executable files and any other cases where the bit grants special powers
22279 to processes that change the file contents. Similar comments apply to the S_ISGID bit.

22280 The purpose of the *fchmodat*( ) function is to enable changing the mode of files in directories

other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *chmod*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *fchmodat*( ) function it can be guaranteed that the changed file is located relative to the desired directory. Some implementations might allow changing the mode of symbolic links. This is not supported by the interfaces in the POSIX specification. Systems with such support provide an interface named *lchmod*( ). To support such implementations *fchmodat*( ) has a *flag* parameter.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EINVAL] and [EINTR] optional error conditions are added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *fchmodat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory. +

NAME

chown, fchownat — change owner and group of a file relative to directory file descriptor

SYNOPSIS

```
#include <unistd.h>

int chown(const char *path, uid_t owner, gid_t group);
int fchownat(int fd, const char *path, uid_t owner, gid_t group,
    int flag);
```

DESCRIPTION

The *chown*( ) function shall change the user and group ownership of a file.

The *path* argument points to a pathname naming a file. The user ID and group ID of the named file shall be set to the numeric values contained in *owner* and *group*, respectively.

Only processes with an effective user ID equal to the user ID of the file or with appropriate privileges may change the ownership of a file. If _POSIX_CHOWN_RESTRICTED is in effect for *path*:

- Changing the user ID is restricted to processes with appropriate privileges.
- Changing the group ID is permitted to a process with an effective user ID equal to the user ID of the file, but without appropriate privileges, if and only if *owner* is equal to the file's user ID or (**uid_t**)–1 and *group* is equal either to the calling process' effective group ID or to one of its supplementary group IDs.

If the specified file is a regular file, one or more of the S_IXUSR, S_IXGRP, or S_IXOTH bits of the file mode are set, and the process does not have appropriate privileges, the set-user-ID (S_ISUID) and set-group-ID (S_ISGID) bits of the file mode shall be cleared upon successful return from *chown*( ). If the specified file is a regular file, one or more of the S_IXUSR, S_IXGRP, or S_IXOTH bits of the file mode are set, and the process has appropriate privileges, it is implementation-defined whether the set-user-ID and set-group-ID bits are altered. If the *chown*( ) function is successfully invoked on a file that is not a regular file and one or more of the S_IXUSR, S_IXGRP, or S_IXOTH bits of the file mode are set, the set-user-ID and set-group-ID bits may be cleared.

If *owner* or *group* is specified as (**uid_t**)–1 or (**gid_t**)–1, respectively, the corresponding ID of the file shall not be changed. If both owner and group are –1, the times need not be updated.

Upon successful completion, *chown*( ) shall mark for update the last file status change timestamp of the file.

The *fchownat*( ) function shall be equivalent to the *chown*( ) and *lchown*( ) functions except in the case where *path* specifies a relative path. In this case the file to be changed is determined relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function shall not perform the check.

Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in **<fcntl.h>**:

AT_SYMLINK_NOFOLLOW
: If *path* names a symbolic link, ownership of the symbolic link is changed.

If *fchownat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working directory is used and the behavior shall be identical to a call to *chown*( ) or *lchown*( ) respectively,

22359 depending on whether or not the AT_SYMLINK_NOFOLLOW bit is set in the *flag* argument.

22360 **RETURN VALUE**

22361 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
22362 return −1 and set *errno* to indicate the error. If −1 is returned, no changes are made in the user ID
22363 and group ID of the file.

22364 **ERRORS**

22365 These functions shall fail if:

22366 [EACCES] Search permission is denied on a component of the path prefix.

22367 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
22368 argument.

22369 [ENAMETOOLONG]
22370 The length of a component of a pathname is longer than {NAME_MAX}. -

22371 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

22372 [ENOTDIR] A component of the path prefix is not a directory, or the *path* argument +
22373 contains at least one non-<slash> character and ends with one or more trailing +
22374 <slash> characters and the last pathname component names an existing file +
22375 that is neither a directory nor a symbolic link to a directory.

22376 [EPERM] The effective user ID does not match the owner of the file, or the calling
22377 process does not have appropriate privileges and
22378 _POSIX_CHOWN_RESTRICTED indicates that such privilege is required.

22379 [EROFS] The named file resides on a read-only file system.

22380 The *fchownat*( ) function shall fail if:

22381 [EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory
22382 underlying *fd* do not permit directory searches.

22383 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is
22384 neither AT_FDCWD nor a valid file descriptor open for reading or searching.

22385 These functions may fail if:

22386 [EIO] An I/O error occurred while reading or writing to the file system.

22387 [EINTR] The *chown*( ) function was interrupted by a signal which was caught.

22388 [EINVAL] The owner or group ID supplied is not a value supported by the
22389 implementation.

22390 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
22391 resolution of the *path* argument.

22392 [ENAMETOOLONG]
22393 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
22394 symbolic link produced an intermediate result with a length that exceeds
22395 {PATH_MAX}.

22396 The *fchownat*( ) function may fail if:

22397 [EINVAL] The value of the *flag* argument is not valid.

[ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a file descriptor associated with a directory.

EXAMPLES

None.

APPLICATION USAGE

Although *chown*( ) can be used on some implementations by the file owner to change the owner and group to any desired values, the only portable use of this function is to change the group of a file to the effective GID of the calling process or to a member of its group set.

RATIONALE

System III and System V allow a user to give away files; that is, the owner of a file may change its user ID to anything. This is a serious problem for implementations that are intended to meet government security regulations. Version 7 and 4.3 BSD permit only the superuser to change the user ID of a file. Some government agencies (usually not ones concerned directly with security) find this limitation too confining. This volume of POSIX.1-200x uses *may* to permit secure implementations while not disallowing System V.

System III and System V allow the owner of a file to change the group ID to anything. Version 7 permits only the superuser to change the group ID of a file. 4.3 BSD permits the owner to change the group ID of a file to its effective group ID or to any of the groups in the list of supplementary group IDs, but to no others.

The POSIX.1-1990 standard requires that the *chown*( ) function invoked by a non-appropriate privileged process clear the S_ISGID and the S_ISUID bits for regular files, and permits them to be cleared for other types of files. This is so that changes in accessibility do not accidentally cause files to become security holes. Unfortunately, requiring these bits to be cleared on non-executable data files also clears the mandatory file locking bit (shared with S_ISGID), which is an extension on many implementations (it first appeared in System V). These bits should only be required to be cleared on regular files that have one or more of their execute bits set.

The purpose of the *fchownat*( ) function is to enable changing ownership of files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *chown*( ) or *lchown*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *fchownat*( ) function it can be guaranteed that the changed file is located relative to the desired directory.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The wording describing the optional dependency on _POSIX_CHOWN_RESTRICTED is restored.

- The [EPERM] error is restored as an error dependent on _POSIX_CHOWN_RESTRICTED. This is since its operand is a pathname and applications should be aware that the error may not occur for that pathname if the file system does not support _POSIX_CHOWN_RESTRICTED.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The value for *owner* of (**uid_t**)–1 allows the use of –1 by the owner of a file to change the group ID only. A corresponding change is made for group.
- The [ELOOP] mandatory error condition is added.
- The [EIO] and [EINTR] optional error conditions are added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that the S_ISUID and S_ISGID bits do not need to be cleared when the process has appropriate privileges.
- The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *fchownat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory. +

22467 **NAME**

22468 cimag, cimagf, cimagl — complex imaginary functions

22469 **SYNOPSIS**

22470
```
#include <complex.h>
```

22471
```
double cimag(double complex z);
```
22472
```
float cimagf(float complex z);
```
22473
```
long double cimagl(long double complex z);
```

22474 **DESCRIPTION**

22475 CX The functionality described on this reference page is aligned with the ISO C standard. Any
22476 conflict between the requirements described here and the ISO C standard is unintentional. This
22477 volume of POSIX.1-200x defers to the ISO C standard.

22478 These functions shall compute the imaginary part of *z*.

22479 **RETURN VALUE**

22480 These functions shall return the imaginary part value (as a real).

22481 **ERRORS**

22482 No errors are defined.

22483 **EXAMPLES**

22484 None.

22485 **APPLICATION USAGE**

22486 For a variable *z* of complex type:

22487
```
z == creal(z) + cimag(z)*I
```

22488 **RATIONALE**

22489 None.

22497 **NAME**

22498 clearerr — clear indicators on a stream

22499 **SYNOPSIS**

22500
```
#include <stdio.h>
```

22501
```
void clearerr(FILE *stream);
```

22502 **DESCRIPTION**

22503 CX The functionality described on this reference page is aligned with the ISO C standard. Any
22504 conflict between the requirements described here and the ISO C standard is unintentional. This
22505 volume of POSIX.1-200x defers to the ISO C standard.

22506 The *clearerr*( ) function shall clear the end-of-file and error indicators for the stream to which
22507 *stream* points.

22508 **RETURN VALUE**

22509 The *clearerr*( ) function shall not return a value.

22510 **ERRORS**

22511 No errors are defined.

22512 **EXAMPLES**

22513 None.

22514 **APPLICATION USAGE**

22515 None.

22516 **RATIONALE**

22517 None.

22518 **FUTURE DIRECTIONS**

22519 None.

22520 **SEE ALSO**

22521 XBD **<stdio.h>**

22522 **CHANGE HISTORY**

22523 First released in Issue 1. Derived from Issue 1 of the SVID.

22524 **NAME**

22525 clock — report CPU time used

22526 **SYNOPSIS**

22527
```
#include <time.h>
```

22528
```
clock_t clock(void);
```

22529 **DESCRIPTION**

22530 CX The functionality described on this reference page is aligned with the ISO C standard. Any
22531 conflict between the requirements described here and the ISO C standard is unintentional. This
22532 volume of POSIX.1-200x defers to the ISO C standard.

22533 The *clock*( ) function shall return the implementation's best approximation to the processor time
22534 used by the process since the beginning of an implementation-defined era related only to the
22535 process invocation.

22536 **RETURN VALUE**

22537 To determine the time in seconds, the value returned by *clock*( ) should be divided by the value
22538 XSI of the macro CLOCKS_PER_SEC. CLOCKS_PER_SEC is defined to be one million in **<time.h>**.
22539 If the processor time used is not available or its value cannot be represented, the function shall
22540 return the value (**clock_t**)–1.

22541 **ERRORS**

22542 No errors are defined.

22543 **EXAMPLES**

22544 None.

22545 **APPLICATION USAGE**

22546 In order to measure the time spent in a program, *clock*( ) should be called at the start of the
22547 program and its return value subtracted from the value returned by subsequent calls. The value
22548 returned by *clock*( ) is defined for compatibility across systems that have clocks with different
22549 resolutions. The resolution on any particular system need not be to microsecond accuracy.

22550 The value returned by *clock*( ) may wrap around on some implementations. For example, on a
22551 machine with 32-bit values for **clock_t**, it wraps after 2 147 seconds or 36 minutes.

22552 **RATIONALE**

22553 None.

22554 **FUTURE DIRECTIONS**

22555 None.

22556 **SEE ALSO**

22558 XBD **<time.h>**

22559 **CHANGE HISTORY**

22560 First released in Issue 1. Derived from Issue 1 of the SVID.

22561 **NAME**

22562 clock_getcpuclockid — access a process CPU-time clock (**ADVANCED REALTIME**)

22563 **SYNOPSIS**

22564 CPT
```
#include <time.h>
```

22565
```
int clock_getcpuclockid(pid_t pid, clockid_t *clock_id);
```

22566 **DESCRIPTION**

22567 The *clock_getcpuclockid*( ) function shall return the clock ID of the CPU-time clock of the process
22568 specified by *pid*. If the process described by *pid* exists and the calling process has permission, the
22569 clock ID of this clock shall be returned in *clock_id*.

22570 If *pid* is zero, the *clock_getcpuclockid*( ) function shall return the clock ID of the CPU-time clock of
22571 the process making the call, in *clock_id*.

22572 The conditions under which one process has permission to obtain the CPU-time clock ID of
22573 other processes are implementation-defined.

22574 **RETURN VALUE**

22575 Upon successful completion, *clock_getcpuclockid*( ) shall return zero; otherwise, an error number
22576 shall be returned to indicate the error.

22577 **ERRORS**

22578 The *clock_getcpuclockid*( ) function shall fail if:

22579 [EPERM] The requesting process does not have permission to access the CPU-time clock
22580 for the process.

22581 The *clock_getcpuclockid*( ) function may fail if:

22582 [ESRCH] No process can be found corresponding to the process specified by *pid*.

22583 **EXAMPLES**

22584 None.

22585 **APPLICATION USAGE**

22586 The *clock_getcpuclockid*( ) function is part of the Process CPU-Time Clocks option and need not be
22587 provided on all implementations.

22588 **RATIONALE**

22589 None.

22590 **FUTURE DIRECTIONS**

22591 None.

22592 **SEE ALSO**

22593 *clock_getres*( ), *timer_create*( )

22594 XBD **<time.h>**

22595 **CHANGE HISTORY**

22596 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

22597 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

NAME

clock_getres, clock_gettime, clock_settime — clock and timer functions

SYNOPSIS

CX
```
#include <time.h>

int clock_getres(clockid_t clock_id, struct timespec *res);
int clock_gettime(clockid_t clock_id, struct timespec *tp);
int clock_settime(clockid_t clock_id, const struct timespec *tp);
```

DESCRIPTION

The *clock_getres*( ) function shall return the resolution of any clock. Clock resolutions are implementation-defined and cannot be set by a process. If the argument *res* is not NULL, the resolution of the specified clock shall be stored in the location pointed to by *res*. If *res* is NULL, the clock resolution is not returned. If the *time* argument of *clock_settime*( ) is not a multiple of *res*, then the value is truncated to a multiple of *res*.

The *clock_gettime*( ) function shall return the current value *tp* for the specified clock, *clock_id*.

The *clock_settime*( ) function shall set the specified clock, *clock_id*, to the value specified by *tp*. Time values that are between two consecutive non-negative integer multiples of the resolution of the specified clock shall be truncated down to the smaller multiple of the resolution.

A clock may be system-wide (that is, visible to all processes) or per-process (measuring time that is meaningful only within a process). All implementations shall support a *clock_id* of CLOCK_REALTIME as defined in **<time.h>**. This clock represents the clock measuring real time for the system. For this clock, the values returned by *clock_gettime*( ) and specified by *clock_settime*( ) represent the amount of time (in seconds and nanoseconds) since the Epoch. An implementation may also support additional clocks. The interpretation of time values for these clocks is unspecified.

If the value of the CLOCK_REALTIME clock is set via *clock_settime*( ), the new value of the clock shall be used to determine the time of expiration for absolute time services based upon the CLOCK_REALTIME clock. This applies to the time at which armed absolute timers expire. If the absolute time requested at the invocation of such a time service is before the new value of the clock, the time service shall expire immediately as if the clock had reached the requested time normally.

Setting the value of the CLOCK_REALTIME clock via *clock_settime*( ) shall have no effect on threads that are blocked waiting for a relative time service based upon this clock, including the *nanosleep*( ) function; nor on the expiration of relative timers based upon this clock. Consequently, these time services shall expire when the requested relative interval elapses, independently of the new or old value of the clock.

MON If the Monotonic Clock option is supported, all implementations shall support a *clock_id* of CLOCK_MONOTONIC defined in **<time.h>**. This clock represents the monotonic clock for the system. For this clock, the value returned by *clock_gettime*( ) represents the amount of time (in seconds and nanoseconds) since an unspecified point in the past (for example, system start-up time, or the Epoch). This point does not change after system start-up time. The value of the CLOCK_MONOTONIC clock cannot be set via *clock_settime*( ). This function shall fail if it is invoked with a *clock_id* argument of CLOCK_MONOTONIC.

The effect of setting a clock via *clock_settime*( ) on armed per-process timers associated with a clock other than CLOCK_REALTIME is implementation-defined.

If the value of the CLOCK_REALTIME clock is set via *clock_settime*( ), the new value of the clock shall be used to determine the time at which the system shall awaken a thread blocked on an

absolute *clock_nanosleep*( ) call based upon the CLOCK_REALTIME clock. If the absolute time requested at the invocation of such a time service is before the new value of the clock, the call shall return immediately as if the clock had reached the requested time normally.

Setting the value of the CLOCK_REALTIME clock via *clock_settime*( ) shall have no effect on any thread that is blocked on a relative *clock_nanosleep*( ) call. Consequently, the call shall return when the requested relative interval elapses, independently of the new or old value of the clock.

Appropriate privileges to set a particular clock are implementation-defined.

CPT If _POSIX_CPUTIME is defined, implementations shall support clock ID values obtained by invoking *clock_getcpuclockid*( ), which represent the CPU-time clock of a given process. Implementations shall also support the special **clockid_t** value CLOCK_PROCESS_CPUTIME_ID, which represents the CPU-time clock of the calling process when invoking one of the *clock_*( ) or *timer_*( ) functions. For these clock IDs, the values returned by *clock_gettime*( ) and specified by *clock_settime*( ) represent the amount of execution time of the process associated with the clock. Changing the value of a CPU-time clock via *clock_settime*( ) shall have no effect on the behavior of the sporadic server scheduling policy (see Scheduling Policies, on page 501).

TCT If _POSIX_THREAD_CPUTIME is defined, implementations shall support clock ID values obtained by invoking *pthread_getcpuclockid*( ), which represent the CPU-time clock of a given thread. Implementations shall also support the special **clockid_t** value CLOCK_THREAD_CPUTIME_ID, which represents the CPU-time clock of the calling thread when invoking one of the *clock_*( ) or *timer_*( ) functions. For these clock IDs, the values returned by *clock_gettime*( ) and specified by *clock_settime*( ) shall represent the amount of execution time of the thread associated with the clock. Changing the value of a CPU-time clock via *clock_settime*( ) shall have no effect on the behavior of the sporadic server scheduling policy (see Scheduling Policies, on page 501).

RETURN VALUE

A return value of 0 shall indicate that the call succeeded. A return value of –1 shall indicate that an error occurred, and *errno* shall be set to indicate the error.

ERRORS

The *clock_getres*( ), *clock_gettime*( ), and *clock_settime*( ) functions shall fail if:

[EINVAL] The *clock_id* argument does not specify a known clock.

The *clock_settime*( ) function shall fail if:

[EINVAL] The *tp* argument to *clock_settime*( ) is outside the range for the given clock ID.

[EINVAL] The *tp* argument specified a nanosecond value less than zero or greater than or equal to 1 000 million.

MON [EINVAL] The value of the *clock_id* argument is CLOCK_MONOTONIC.

The *clock_settime*( ) function may fail if:

[EPERM] The requesting process does not have appropriate privileges to set the specified clock.

EXAMPLES

None.

APPLICATION USAGE

Note that the absolute value of the monotonic clock is meaningless (because its origin is arbitrary), and thus there is no need to set it. Furthermore, realtime applications can rely on the fact that the value of this clock is never set and, therefore, that time intervals measured with this clock will not be affected by calls to *clock_settime*( ).

RATIONALE

None.

FUTURE DIRECTIONS

None.

clock_getcpuclockid( ), *clock_nanosleep*( ), *ctime*( ), *mq_receive*( ), *mq_send*( ), *nanosleep*( ), *pthread_mutex_timedlock*( ), *sem_timedwait*( ), *time*( ), *timer_create*( ), *timer_getoverrun*( )

XBD **<time.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.

The APPLICATION USAGE section is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added of the effect of resetting the clock resolution.

CPU-time clocks and the *clock_getcpuclockid*( ) function are added for alignment with IEEE Std 1003.1d-1999.

The following changes are added for alignment with IEEE Std 1003.1j-2000:

- The DESCRIPTION is updated as follows:
  - — The value returned by *clock_gettime*( ) for CLOCK_MONOTONIC is specified.
  - — The *clock_settime*( ) function failing for CLOCK_MONOTONIC is specified.
  - — The effects of *clock_settime*( ) on the *clock_nanosleep*( ) function with respect to CLOCK_REALTIME are specified.
- An [EINVAL] error is added to the ERRORS section, indicating that *clock_settime*( ) fails for CLOCK_MONOTONIC.
- The APPLICATION USAGE section notes that the CLOCK_MONOTONIC clock need not and shall not be set by *clock_settime*( ) since the absolute value of the CLOCK_MONOTONIC clock is meaningless.
- The *clock_nanosleep*( ), *mq_timedreceive*( ), *mq_timedsend*( ), *pthread_mutex_timedlock*( ), *sem_timedwait*( ), *timer_create*( ), and *timer_settime*( ) functions are added to the SEE ALSO section.

22722 **Issue 7**

22723 Functionality relating to the Clock Selection option is moved to the Base.

22724 The *clock_getres*( ), *clock_gettime*( ), and *clock_settime*( ) functions are moved from the Timers
22725 option to the Base.

22726 **NAME**

22727 clock_nanosleep — high resolution sleep with specifiable clock

22728 **SYNOPSIS**

22729 CX
```
#include <time.h>

int clock_nanosleep(clockid_t clock_id, int flags,
    const struct timespec *rqtp, struct timespec *rmtp);
```

22732 **DESCRIPTION**

22733 If the flag TIMER_ABSTIME is not set in the *flags* argument, the *clock_nanosleep*( ) function shall
22734 cause the current thread to be suspended from execution until either the time interval specified
22735 by the *rqtp* argument has elapsed, or a signal is delivered to the calling thread and its action is to
22736 invoke a signal-catching function, or the process is terminated. The clock used to measure the
22737 time shall be the clock specified by *clock_id*.

22738 If the flag TIMER_ABSTIME is set in the *flags* argument, the *clock_nanosleep*( ) function shall
22739 cause the current thread to be suspended from execution until either the time value of the clock
22740 specified by *clock_id* reaches the absolute time specified by the *rqtp* argument, or a signal is
22741 delivered to the calling thread and its action is to invoke a signal-catching function, or the
22742 process is terminated. If, at the time of the call, the time value specified by *rqtp* is less than or
22743 equal to the time value of the specified clock, then *clock_nanosleep*( ) shall return immediately
22744 and the calling process shall not be suspended.

22745 The suspension time caused by this function may be longer than requested because the
22746 argument value is rounded up to an integer multiple of the sleep resolution, or because of the
22747 scheduling of other activity by the system. But, except for the case of being interrupted by a
22748 signal, the suspension time for the relative *clock_nanosleep*( ) function (that is, with the
22749 TIMER_ABSTIME flag not set) shall not be less than the time interval specified by *rqtp*, as
22750 measured by the corresponding clock. The suspension for the absolute *clock_nanosleep*( ) function
22751 (that is, with the TIMER_ABSTIME flag set) shall be in effect at least until the value of the
22752 corresponding clock reaches the absolute time specified by *rqtp*, except for the case of being
22753 interrupted by a signal.

22754 The use of the *clock_nanosleep*( ) function shall have no effect on the action or blockage of any
22755 signal.

22756 The *clock_nanosleep*( ) function shall fail if the *clock_id* argument refers to the CPU-time clock of
22757 the calling thread. It is unspecified whether *clock_id* values of other CPU-time clocks are allowed.

22758 **RETURN VALUE**

22759 If the *clock_nanosleep*( ) function returns because the requested time has elapsed, its return value
22760 shall be zero.

22761 If the *clock_nanosleep*( ) function returns because it has been interrupted by a signal, it shall
22762 return the corresponding error value. For the relative *clock_nanosleep*( ) function, if the *rmtp*
22763 argument is non-NULL, the **timespec** structure referenced by it shall be updated to contain the
22764 amount of time remaining in the interval (the requested time minus the time actually slept). If
22765 the *rmtp* argument is NULL, the remaining time is not returned. The absolute *clock_nanosleep*( )
22766 function has no effect on the structure referenced by *rmtp*.

22767 If *clock_nanosleep*( ) fails, it shall return the corresponding error value.

22768 **ERRORS**

22769 The *clock_nanosleep*( ) function shall fail if:

22770 [EINTR] The *clock_nanosleep*( ) function was interrupted by a signal.

22771 [EINVAL] The *rqtp* argument specified a nanosecond value less than zero or greater than
22772 or equal to 1 000 million; or the TIMER_ABSTIME flag was specified in flags
22773 and the *rqtp* argument is outside the range for the clock specified by *clock_id*;
22774 or the *clock_id* argument does not specify a known clock, or specifies the CPU-
22775 time clock of the calling thread.

22776 [ENOTSUP] The *clock_id* argument specifies a clock for which *clock_nanosleep*( ) is not
22777 supported, such as a CPU-time clock.

22778 **EXAMPLES**

22779 None.

22780 **APPLICATION USAGE**

22781 Calling *clock_nanosleep*( ) with the value TIMER_ABSTIME not set in the *flags* argument and with
22782 a *clock_id* of CLOCK_REALTIME is equivalent to calling *nanosleep*( ) with the same *rqtp* and *rmtp*
22783 arguments.

22784 **RATIONALE**

22785 The *nanosleep*( ) function specifies that the system-wide clock CLOCK_REALTIME is used to
22786 measure the elapsed time for this time service. However, with the introduction of the monotonic
22787 clock CLOCK_MONOTONIC a new relative sleep function is needed to allow an application to
22788 take advantage of the special characteristics of this clock.

22789 There are many applications in which a process needs to be suspended and then activated
22790 multiple times in a periodic way; for example, to poll the status of a non-interrupting device or
22791 to refresh a display device. For these cases, it is known that precise periodic activation cannot be
22792 achieved with a relative *sleep*( ) or *nanosleep*( ) function call. Suppose, for example, a periodic
22793 process that is activated at time $T0$, executes for a while, and then wants to suspend itself until
22794 time $T0+T$, the period being T. If this process wants to use the *nanosleep*( ) function, it must first
22795 call *clock_gettime*( ) to get the current time, then calculate the difference between the current time
22796 and $T0+T$ and, finally, call *nanosleep*( ) using the computed interval. However, the process could
22797 be preempted by a different process between the two function calls, and in this case the interval
22798 computed would be wrong; the process would wake up later than desired. This problem would
22799 not occur with the absolute *clock_nanosleep*( ) function, since only one function call would be
22800 necessary to suspend the process until the desired time. In other cases, however, a relative sleep
22801 is needed, and that is why both functionalities are required.

22802 Although it is possible to implement periodic processes using the timers interface, this
22803 implementation would require the use of signals, and the reservation of some signal numbers. In
22804 this regard, the reasons for including an absolute version of the *clock_nanosleep*( ) function in
22805 POSIX.1-200x are the same as for the inclusion of the relative *nanosleep*( ).

22806 It is also possible to implement precise periodic processes using *pthread_cond_timedwait*( ), in
22807 which an absolute timeout is specified that takes effect if the condition variable involved is never
22808 signaled. However, the use of this interface is unnatural, and involves performing other
22809 operations on mutexes and condition variables that imply an unnecessary overhead.
22810 Furthermore, *pthread_cond_timedwait*( ) is not available in implementations that do not support
22811 threads.

22812 Although the interface of the relative and absolute versions of the new high resolution sleep
22813 service is the same *clock_nanosleep*( ) function, the *rmtp* argument is only used in the relative
22814 sleep. This argument is needed in the relative *clock_nanosleep*( ) function to reissue the function

call if it is interrupted by a signal, but it is not needed in the absolute *clock_nanosleep*( ) function call; if the call is interrupted by a signal, the absolute *clock_nanosleep*( ) function can be invoked again with the same *rqtp* argument used in the interrupted call.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

Issue 7

The *clock_nanosleep*( ) function is moved from the Clock Selection option to the Base.

clock_settime( )

22827 **NAME**

22828 clock_settime — clock and timer functions

22829 **SYNOPSIS**

22830 CX
```
#include <time.h>

int clock_settime(clockid_t clock_id, const struct timespec *tp);
```

22832 **DESCRIPTION**

22833 Refer to *clock_getres( )*.

22834 **NAME**

22835 clog, clogf, clogl — complex natural logarithm functions

22836 **SYNOPSIS**

22837
```
#include <complex.h>
```

22838
```
double complex clog(double complex z);
```
22839
```
float complex clogf(float complex z);
```
22840
```
long double complex clogl(long double complex z);
```

22841 **DESCRIPTION**

22842 CX The functionality described on this reference page is aligned with the ISO C standard. Any
22843 conflict between the requirements described here and the ISO C standard is unintentional. This
22844 volume of POSIX.1-200x defers to the ISO C standard.

22845 These functions shall compute the complex natural (base *e*) logarithm of *z*, with a branch cut
22846 along the negative real axis.

22847 **RETURN VALUE**

22848 These functions shall return the complex natural logarithm value, in the range of a strip
22849 mathematically unbounded along the real axis and in the interval $[-i\pi, +i\pi]$ along the imaginary
22850 axis.

22851 **ERRORS**

22852 No errors are defined.

22864 **CHANGE HISTORY**

22865 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

close — close a file descriptor

SYNOPSIS

```
#include <unistd.h>

int close(int fildes);
```

DESCRIPTION

The *close*( ) function shall deallocate the file descriptor indicated by *fildes*. To deallocate means to make the file descriptor available for return by subsequent calls to *open*( ) or other functions that allocate file descriptors. All outstanding record locks owned by the process on the file associated with the file descriptor shall be removed (that is, unlocked).

If *close*( ) is interrupted by a signal that is to be caught, it shall return –1 with *errno* set to [EINTR] and the state of *fildes* is unspecified. If an I/O error occurred while reading from or writing to the file system during *close*( ), it may return –1 with *errno* set to [EIO]; if this error is returned, the state of *fildes* is unspecified.

When all file descriptors associated with a pipe or FIFO special file are closed, any data remaining in the pipe or FIFO shall be discarded.

When all file descriptors associated with an open file description have been closed, the open file description shall be freed.

If the link count of the file is 0, when all file descriptors associated with the file are closed, the space occupied by the file shall be freed and the file shall no longer be accessible.

OB XSR If a STREAMS-based *fildes* is closed and the calling process was previously registered to receive a SIGPOLL signal for events associated with that STREAM, the calling process shall be unregistered for events associated with the STREAM. The last *close*( ) for a STREAM shall cause the STREAM associated with *fildes* to be dismantled. If O_NONBLOCK is not set and there have been no signals posted for the STREAM, and if there is data on the module's write queue, *close*( ) shall wait for an unspecified time (for each module and driver) for any output to drain before dismantling the STREAM. The time delay can be changed via an I_SETCLTIME *ioctl*( ) request. If the O_NONBLOCK flag is set, or if there are any pending signals, *close*( ) shall not wait for output to drain, and shall dismantle the STREAM immediately.

If the implementation supports STREAMS-based pipes, and *fildes* is associated with one end of a pipe, the last *close*( ) shall cause a hangup to occur on the other end of the pipe. In addition, if the other end of the pipe has been named by *fattach*( ), then the last *close*( ) shall force the named end to be detached by *fdetach*( ). If the named end has no open file descriptors associated with it and gets detached, the STREAM associated with that end shall also be dismantled.

XSI If *fildes* refers to the master side of a pseudo-terminal, and this is the last close, a SIGHUP signal shall be sent to the controlling process, if any, for which the slave side of the pseudo-terminal is the controlling terminal. It is unspecified whether closing the master side of the pseudo-terminal flushes all queued input and output.

OB XSR If *fildes* refers to the slave side of a STREAMS-based pseudo-terminal, a zero-length message may be sent to the master.

When there is an outstanding cancelable asynchronous I/O operation against *fildes* when *close*( ) is called, that I/O operation may be canceled. An I/O operation that is not canceled completes as if the *close*( ) operation had not yet occurred. All operations that are not canceled shall complete as if the *close*( ) blocked until the operations completed. The *close*( ) operation itself need not block awaiting such I/O completion. Whether any I/O operation is canceled, and which I/O operation may be canceled upon *close*( ), is implementation-defined.

SHM If a memory mapped file or a shared memory object remains referenced at the last close (that is, a process has it mapped), then the entire contents of the memory object shall persist until the SHM memory object becomes unreferenced. If this is the last close of a memory mapped file or a shared memory object and the close results in the memory object becoming unreferenced, and the memory object has been unlinked, then the memory object shall be removed.

If *fildes* refers to a socket, *close*( ) shall cause the socket to be destroyed. If the socket is in connection-mode, and the SO_LINGER option is set for the socket with non-zero linger time, and the socket has untransmitted data, then *close*( ) shall block for up to the current linger interval until all data is transmitted.

RETURN VALUE

Upon successful completion, 0 shall be returned; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *close*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

[EINTR] The *close*( ) function was interrupted by a signal.

The *close*( ) function may fail if:

[EIO] An I/O error occurred while reading from or writing to the file system.

EXAMPLES

Reassigning a File Descriptor

The following example closes the file descriptor associated with standard output for the current process, re-assigns standard output to a new file descriptor, and closes the original file descriptor to clean up. This example assumes that the file descriptor 0 (which is the descriptor for standard input) is not closed.

```
#include <unistd.h>
...
int pfd;
...
close(1);
dup(pfd);
close(pfd);
...
```

Incidentally, this is exactly what could be achieved using:

```
dup2(pfd, 1);
close(pfd);
```

Closing a File Descriptor

In the following example, *close*( ) is used to close a file descriptor after an unsuccessful attempt is made to associate that file descriptor with a stream.

```
#include <stdio.h>
#include <unistd.h>
#include <stdlib.h>

#define LOCKFILE "/etc/ptmp"
...
int pfd;
FILE *fpfd;
...
if ((fpfd = fdopen (pfd, "w")) == NULL) {
    close(pfd);
    unlink(LOCKFILE);
    exit(1);
}
...
```

APPLICATION USAGE

An application that had used the *stdio* routine *fopen*( ) to open a file should use the corresponding *fclose*( ) routine rather than *close*( ). Once a file is closed, the file descriptor no longer exists, since the integer corresponding to it no longer refers to a file.

RATIONALE

The use of interruptible device close routines should be discouraged to avoid problems with the implicit closes of file descriptors by *exec* and *exit*( ). This volume of POSIX.1-200x only intends to permit such behavior by specifying the [EINTR] error condition.

Note that the requirement for *close*( ) on a socket to block for up to the current linger interval is not conditional on the O_NONBLOCK setting.

FUTURE DIRECTIONS

None.

Section 2.6 (on page 494), *exec*, *fattach*( ), *fclose*( ), *fdetach*( ), *fopen*( ), *ioctl*( ), *open*( ), *unlink*( )

XBD **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Issue 6

The DESCRIPTION related to a STREAMS-based file or pseudo-terminal is marked as part of the XSI STREAMS Option Group.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] error condition is added as an optional error.

- The DESCRIPTION is updated to describe the state of the *fildes* file descriptor as unspecified if an I/O error occurs and an [EIO] error condition is returned.

Text referring to sockets is added to the DESCRIPTION.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that shared memory objects and memory mapped files (and not typed memory objects) are the types of memory objects to which the paragraph on last closes applies.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/12 is applied, correcting the XSH shaded text relating to the master side of a pseudo-terminal. The reason for the change is that the behavior of pseudo-terminals and regular terminals should be as much alike as possible in this case; the change achieves that and matches historical behavior.

Issue 7

Functionality relating to the XSI STREAMS option is marked obsolescent.

Functionality relating to the Asynchronous Input and Output and Memory Mapped Files options is moved to the Base.

Austin Group Interpretation 1003.1-2001 #139 is applied, clarifying that the requirement for *close*( ) on a socket to block for up to the current linger interval is not conditional on the O_NONBLOCK setting.

NAME

closedir — close a directory stream

SYNOPSIS

```
#include <dirent.h>

int closedir(DIR *dirp);
```

DESCRIPTION

The *closedir*( ) function shall close the directory stream referred to by the argument *dirp*. Upon return, the value of *dirp* may no longer point to an accessible object of the type **DIR**. If a file descriptor is used to implement type **DIR**, that file descriptor shall be closed.

RETURN VALUE

Upon successful completion, *closedir*( ) shall return 0; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *closedir*( ) function may fail if:

[EBADF] The *dirp* argument does not refer to an open directory stream.

[EINTR] The *closedir*( ) function was interrupted by a signal.

EXAMPLES

Closing a Directory Stream

The following program fragment demonstrates how the *closedir*( ) function is used.

```
...
    DIR *dir;
    struct dirent *dp;
...
    if ((dir = opendir (".")) == NULL) {
...
    }
    while ((dp = readdir (dir)) != NULL) {
...
    }
    closedir(dir);
...
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

dirfd( ), *fdopendir*( )

XBD **<dirent.h>**

CHANGE HISTORY

First released in Issue 2.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EINTR] error condition is added as an optional error condition.

NAME

closelog, openlog, setlogmask, syslog — control system log

SYNOPSIS

XSI
```
#include <syslog.h>

void closelog(void);
void openlog(const char *ident, int logopt, int facility);
int setlogmask(int maskpri);
void syslog(int priority, const char *message, ... /* arguments */);
```

DESCRIPTION

The *syslog*( ) function shall send a message to an implementation-defined logging facility, which may log it in an implementation-defined system log, write it to the system console, forward it to a list of users, or forward it to the logging facility on another host over the network. The logged message shall include a message header and a message body. The message header contains at least a timestamp and a tag string.

The message body is generated from the *message* and following arguments in the same manner as if these were arguments to *printf*( ), except that the additional conversion specification `%m` shall be recognized; it shall convert no arguments, shall cause the output of the error message string associated with the value of *errno* on entry to *syslog*( ), and may be mixed with argument specifications of the "`%`*n*`$`" form. If a complete conversion specification with the `m` conversion specifier character is not just `%m`, the behavior is undefined. A trailing <newline> may be added if needed.

Values of the *priority* argument are formed by OR'ing together a severity-level value and an optional facility value. If no facility value is specified, the current default facility value is used.

Possible values of severity level include:

LOG_EMERG — A panic condition.

LOG_ALERT — A condition that should be corrected immediately, such as a corrupted system database.

LOG_CRIT — Critical conditions, such as hard device errors.

LOG_ERR — Errors.

LOG_WARNING — Warning messages.

LOG_NOTICE — Conditions that are not error conditions, but that may require special handling.

LOG_INFO — Informational messages.

LOG_DEBUG — Messages that contain information normally of use only when debugging a program.

The facility indicates the application or system component generating the message. Possible facility values include:

LOG_USER — Messages generated by arbitrary processes. This is the default facility identifier if none is specified.

LOG_LOCAL0 — Reserved for local use.

LOG_LOCAL1 Reserved for local use.

LOG_LOCAL2 Reserved for local use.

LOG_LOCAL3 Reserved for local use.

LOG_LOCAL4 Reserved for local use.

LOG_LOCAL5 Reserved for local use.

LOG_LOCAL6 Reserved for local use.

LOG_LOCAL7 Reserved for local use.

The *openlog*( ) function shall set process attributes that affect subsequent calls to *syslog*( ). The *ident* argument is a string that is prepended to every message. The *logopt* argument indicates logging options. Values for *logopt* are constructed by a bitwise-inclusive OR of zero or more of the following:

LOG_PID Log the process ID with each message. This is useful for identifying specific processes.

LOG_CONS Write messages to the system console if they cannot be sent to the logging facility. The *syslog*( ) function ensures that the process does not acquire the console as a controlling terminal in the process of writing the message.

LOG_NDELAY Open the connection to the logging facility immediately. Normally the open is delayed until the first message is logged. This is useful for programs that need to manage the order in which file descriptors are allocated.

LOG_ODELAY Delay open until *syslog*( ) is called.

LOG_NOWAIT Do not wait for child processes that may have been created during the course of logging the message. This option should be used by processes that enable notification of child termination using SIGCHLD, since *syslog*( ) may otherwise block waiting for a child whose exit status has already been collected.

The *facility* argument encodes a default facility to be assigned to all messages that do not have an explicit facility already encoded. The initial default facility is LOG_USER.

The *openlog*( ) and *syslog*( ) functions may allocate a file descriptor. It is not necessary to call *openlog*( ) prior to calling *syslog*( ).

The *closelog*( ) function shall close any open file descriptors allocated by previous calls to *openlog*( ) or *syslog*( ).

The *setlogmask*( ) function shall set the log priority mask for the current process to *maskpri* and return the previous mask. If the *maskpri* argument is 0, the current log mask is not modified. Calls by the current process to *syslog*( ) with a priority not set in *maskpri* shall be rejected. The default log mask allows all priorities to be logged. A call to *openlog*( ) is not required prior to calling *setlogmask*( ).

Symbolic constants for use as values of the *logopt*, *facility*, *priority*, and *maskpri* arguments are defined in the **<syslog.h>** header.

RETURN VALUE

The *setlogmask*( ) function shall return the previous log priority mask. The *closelog*( ), *openlog*( ), and *syslog*( ) functions shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

Using openlog( )

The following example causes subsequent calls to *syslog*( ) to log the process ID with each message, and to write messages to the system console if they cannot be sent to the logging facility.

```
#include <syslog.h>

char *ident = "Process demo";
int logopt = LOG_PID | LOG_CONS;
int facility = LOG_USER;
...
openlog(ident, logopt, facility);
```

Using setlogmask( )

The following example causes subsequent calls to *syslog*( ) to accept error messages, and to reject all other messages.

```
#include <syslog.h>

int result;
int mask = LOG_MASK (LOG_ERR);
...
result = setlogmask(mask);
```

Using syslog

The following example sends the message `"This is a message"` to the default logging facility, marking the message as an error message generated by random processes.

```
#include <syslog.h>

char *message = "This is a message";
int priority = LOG_ERR | LOG_USER;
...
syslog(priority, message);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/13 is applied, correcting the EXAMPLES section.

23183 **NAME**

23184 confstr — get configurable variables

23185 **SYNOPSIS**

23186 `#include <unistd.h>`

23187 `size_t confstr(int name, char *buf, size_t len);`

23188 **DESCRIPTION**

23189 The *confstr*( ) function shall return configuration-defined string values. Its use and purpose are
23190 similar to *sysconf*( ), but it is used where string values rather than numeric values are returned.

23191 The *name* argument represents the system variable to be queried. The implementation shall
23192 support the following name values, defined in **<unistd.h>**. It may support others:

23193 _CS_PATH
23194 _CS_POSIX_V7_ILP32_OFF32_CFLAGS
23195 _CS_POSIX_V7_ILP32_OFF32_LDFLAGS
23196 _CS_POSIX_V7_ILP32_OFF32_LIBS
23197 _CS_POSIX_V7_ILP32_OFFBIG_CFLAGS
23198 _CS_POSIX_V7_ILP32_OFFBIG_LDFLAGS
23199 _CS_POSIX_V7_ILP32_OFFBIG_LIBS
23200 _CS_POSIX_V7_LP64_OFF64_CFLAGS
23201 _CS_POSIX_V7_LP64_OFF64_LDFLAGS
23202 _CS_POSIX_V7_LP64_OFF64_LIBS
23203 _CS_POSIX_V7_LPBIG_OFFBIG_CFLAGS
23204 _CS_POSIX_V7_LPBIG_OFFBIG_LDFLAGS
23205 _CS_POSIX_V7_LPBIG_OFFBIG_LIBS
23206 _CS_POSIX_V7_THREADS_CFLAGS
23207 _CS_POSIX_V7_THREADS_LDFLAGS
23208 _CS_POSIX_V7_WIDTH_RESTRICTED_ENVS
23209 _CS_V7_ENV
23210 OB _CS_POSIX_V6_ILP32_OFF32_CFLAGS
23211 _CS_POSIX_V6_ILP32_OFF32_LDFLAGS
23212 _CS_POSIX_V6_ILP32_OFF32_LIBS
23213 _CS_POSIX_V6_ILP32_OFFBIG_CFLAGS
23214 _CS_POSIX_V6_ILP32_OFFBIG_LDFLAGS
23215 _CS_POSIX_V6_ILP32_OFFBIG_LIBS
23216 _CS_POSIX_V6_LP64_OFF64_CFLAGS
23217 _CS_POSIX_V6_LP64_OFF64_LDFLAGS
23218 _CS_POSIX_V6_LP64_OFF64_LIBS
23219 _CS_POSIX_V6_LPBIG_OFFBIG_CFLAGS
23220 _CS_POSIX_V6_LPBIG_OFFBIG_LDFLAGS
23221 _CS_POSIX_V6_LPBIG_OFFBIG_LIBS
23222 _CS_POSIX_V6_WIDTH_RESTRICTED_ENVS
23223 _CS_V6_ENV

23224 If *len* is not 0, and if *name* has a configuration-defined value, *confstr*( ) shall copy that value into
23225 the *len*-byte buffer pointed to by *buf*. If the string to be returned is longer than *len* bytes,
23226 including the terminating null, then *confstr*( ) shall truncate the string to *len*–1 bytes and null-
23227 terminate the result. The application can detect that the string was truncated by comparing the
23228 value returned by *confstr*( ) with *len*.

23229 If *len* is 0 and *buf* is a null pointer, then *confstr*( ) shall still return the integer value as defined
23230 below, but shall not return a string. If *len* is 0 but *buf* is not a null pointer, the result is

unspecified.

After a call to:

```
confstr(_CS_V7_ENV, buf, sizeof(buf))
```

the string stored in *buf* will contain the <space>-separated list of variable=value environment variable pairs required by the implementation to create a conforming environment, as described in the implementations' conformance documentation.

If the implementation supports the POSIX shell option, the string stored in *buf* after a call to:

```
confstr(_CS_PATH, buf, sizeof(buf))
```

can be used as a value of the *PATH* environment variable that accesses all of the standard utilities of POSIX.1-200x, if the return value is less than or equal to *sizeof* (*buf*).

RETURN VALUE

If *name* has a configuration-defined value, *confstr*( ) shall return the size of buffer that would be needed to hold the entire configuration-defined value including the terminating null. If this return value is greater than *len*, the string returned in *buf* is truncated.

If *name* is invalid, *confstr*( ) shall return 0 and set *errno* to indicate the error.

If *name* does not have a configuration-defined value, *confstr*( ) shall return 0 and leave *errno* unchanged.

ERRORS

The *confstr*( ) function shall fail if:

[EINVAL] The value of the *name* argument is invalid.

EXAMPLES

None.

APPLICATION USAGE

An application can distinguish between an invalid *name* parameter value and one that corresponds to a configurable variable that has no configuration-defined value by checking if *errno* is modified. This mirrors the behavior of *sysconf*( ).

The original need for this function was to provide a way of finding the configuration-defined default value for the environment variable *PATH*. Since *PATH* can be modified by the user to include directories that could contain utilities replacing the standard utilities in the Shell and Utilities volume of POSIX.1-200x, applications need a way to determine the system-supplied *PATH* environment variable value that contains the correct search path for the standard utilities.

An application could use:

```
confstr(name, (char *)NULL, (size_t)0)
```

to find out how big a buffer is needed for the string value; use *malloc*( ) to allocate a buffer to hold the string; and call *confstr*( ) again to get the string. Alternately, it could allocate a fixed, static buffer that is big enough to hold most answers (perhaps 512 or 1 024 bytes), but then use *malloc*( ) to allocate a larger buffer if it finds that this is too small.

RATIONALE

Application developers can normally determine any configuration variable by means of reading from the stream opened by a call to:

```
popen("command -p getconf variable", "r");
```

The *confstr*( ) function with a *name* argument of _CS_PATH returns a string that can be used as a

PATH environment variable setting that will reference the standard shell and utilities as described in the Shell and Utilities volume of POSIX.1-200x.

The *confstr*( ) function copies the returned string into a buffer supplied by the application instead of returning a pointer to a string. This allows a cleaner function in some implementations (such as those with lightweight threads) and resolves questions about when the application must copy the string returned.

FUTURE DIRECTIONS

None.

XCU *c99*

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 5

A table indicating the permissible values of *name* is added to the DESCRIPTION. All those marked EX are new in this version.

Issue 6

The Open Group Corrigendum U033/7 is applied. The return value for the case returning the size of the buffer now explicitly states that this includes the terminating null.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated with new arguments which can be used to determine configuration strings for C compiler flags, linker/loader flags, and libraries for each different supported programming environment. This is a change to support data size neutrality.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The DESCRIPTION is updated to include text describing how _CS_PATH can be used to obtain a *PATH* to access the standard utilities.

The macros associated with the *c89* programming models are marked LEGACY and new equivalent macros associated with *c99* are introduced.

Issue 7

Austin Group Interpretation 1003.1-2001 #047 is applied, adding the _CS_V7_ENV variable.

Austin Group Interpretations 1003.1-2001 #166 is applied to permit an additional compiler flag to enable threads.

The V6 variables for the supported programming environments are marked obsolescent.

The variables for the supported programming environments are updated to be V7.

The LEGACY variables and obsolescent values are removed.

23311 **NAME**

23312 conj, conjf, conjl — complex conjugate functions

23313 **SYNOPSIS**

23314 `#include <complex.h>`

23315 `double complex conj(double complex z);`
23316 `float complex conjf(float complex z);`
23317 `long double complex conjl(long double complex z);`

23318 **DESCRIPTION**

23319 CX The functionality described on this reference page is aligned with the ISO C standard. Any
23320 conflict between the requirements described here and the ISO C standard is unintentional. This
23321 volume of POSIX.1-200x defers to the ISO C standard.

23322 These functions shall compute the complex conjugate of *z*, by reversing the sign of its imaginary
23323 part.

23324 **RETURN VALUE**

23325 These functions return the complex conjugate value.

23326 **ERRORS**

23327 No errors are defined.

23328 **EXAMPLES**

23329 None.

23330 **APPLICATION USAGE**

23331 None.

23332 **RATIONALE**

23340 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

connect — connect a socket

SYNOPSIS

```
#include <sys/socket.h>

int connect(int socket, const struct sockaddr *address,
    socklen_t address_len);
```

DESCRIPTION

The *connect*( ) function shall attempt to make a connection on a connection-mode socket or to set or reset the peer address of a connectionless-mode socket. The function takes the following arguments:

socket Specifies the file descriptor associated with the socket.

address Points to a **sockaddr** structure containing the peer address. The length and format of the address depend on the address family of the socket.

address_len Specifies the length of the **sockaddr** structure pointed to by the *address* argument.

If the socket has not already been bound to a local address, *connect*( ) shall bind it to an address which, unless the socket's address family is AF_UNIX, is an unused local address.

If the initiating socket is not connection-mode, then *connect*( ) shall set the socket's peer address, and no connection is made. For SOCK_DGRAM sockets, the peer address identifies where all datagrams are sent on subsequent *send*( ) functions, and limits the remote sender for subsequent *recv*( ) functions. If the *sa_family* member of *address* is AF_UNSPEC, the socket's peer address shall be reset. Note that despite no connection being made, the term "connected" is used to describe a connectionless-mode socket for which a peer address has been set.

If the initiating socket is connection-mode, then *connect*( ) shall attempt to establish a connection to the address specified by the *address* argument. If the connection cannot be established immediately and O_NONBLOCK is not set for the file descriptor for the socket, *connect*( ) shall block for up to an unspecified timeout interval until the connection is established. If the timeout interval expires before the connection is established, *connect*( ) shall fail and the connection attempt shall be aborted. If *connect*( ) is interrupted by a signal that is caught while blocked waiting to establish a connection, *connect*( ) shall fail and set *errno* to [EINTR], but the connection request shall not be aborted, and the connection shall be established asynchronously.

If the connection cannot be established immediately and O_NONBLOCK is set for the file descriptor for the socket, *connect*( ) shall fail and set *errno* to [EINPROGRESS], but the connection request shall not be aborted, and the connection shall be established asynchronously. Subsequent calls to *connect*( ) for the same socket, before the connection is established, shall fail and set *errno* to [EALREADY].

When the connection has been established asynchronously, *pselect*( ), *select*( ), and *poll*( ) shall indicate that the file descriptor for the socket is ready for writing.

The socket in use may require the process to have appropriate privileges to use the *connect*( ) function.

RETURN VALUE

Upon successful completion, *connect*( ) shall return 0; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *connect*( ) function shall fail if:

[EADDRNOTAVAIL]
The specified address is not available from the local machine.

[EAFNOSUPPORT]
The specified address is not a valid address for the address family of the specified socket.

[EALREADY] A connection request is already in progress for the specified socket.

[EBADF] The *socket* argument is not a valid file descriptor.

[ECONNREFUSED]
The target address was not listening for connections or refused the connection request.

[EINPROGRESS] O_NONBLOCK is set for the file descriptor for the socket and the connection cannot be immediately established; the connection shall be established asynchronously.

[EINTR] The attempt to establish a connection was interrupted by delivery of a signal that was caught; the connection shall be established asynchronously.

[EISCONN] The specified socket is connection-mode and is already connected.

[ENETUNREACH]
No route to the network is present.

[ENOTSOCK] The *socket* argument does not refer to a socket.

[EPROTOTYPE] The specified address has a different type than the socket bound to the specified peer address.

[ETIMEDOUT] The attempt to connect timed out before a connection was made.

If the address family of the socket is AF_UNIX, then *connect*( ) shall fail if:

[EIO] An I/O error occurred while reading from or writing to the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the pathname in *address*.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of the pathname does not name an existing file or the pathname is an empty string.

[ENOTDIR] A component of the path prefix of the pathname in *address* is not a directory, or the pathname in *address* contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

The *connect*( ) function may fail if:

[EACCES] Search permission is denied for a component of the path prefix; or write access to the named socket is denied.

[EADDRINUSE] Attempt to establish a connection that uses addresses that are already in use.

[ECONNRESET] Remote host reset the connection request.

[EHOSTUNREACH]
The destination host cannot be reached (probably because the host is down or a remote router cannot reach it).

[EINVAL] The *address_len* argument is not a valid length for the address family; or invalid address family in the **sockaddr** structure.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in *address*.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[ENETDOWN] The local network interface used to reach the destination is down.

[ENOBUFS] No buffer space is available.

[EOPNOTSUPP] The socket is listening and cannot be connected.

EXAMPLES

None.

APPLICATION USAGE

If *connect*( ) fails, the state of the socket is unspecified. Conforming applications should close the file descriptor and create a new socket before attempting to reconnect.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #035 is applied, clarifying the description of connected sockets.

Austin Group Interpretation 1003.1-2001 #143 is applied.

Austin Group Interpretation 1003.1-2001 #188 is applied, changing the method used to reset a peer address for a datagram socket.

SD5-XSH-ERN-185 is applied.

23463 **NAME**

23464 copysign, copysignf, copysignl — number manipulation function

23465 **SYNOPSIS**

23466
```
#include <math.h>
```

23467
```
double copysign(double x, double y);
```
23468
```
float copysignf(float x, float y);
```
23469
```
long double copysignl(long double x, long double y);
```

23470 **DESCRIPTION**

23471 CX The functionality described on this reference page is aligned with the ISO C standard. Any
23472 conflict between the requirements described here and the ISO C standard is unintentional. This
23473 volume of POSIX.1-200x defers to the ISO C standard.

23474 These functions shall produce a value with the magnitude of *x* and the sign of *y*. On
23475 implementations that represent a signed zero but do not treat negative zero consistently in
23476 arithmetic operations, these functions regard the sign of zero as positive.

23477 **RETURN VALUE**

23478 Upon successful completion, these functions shall return a value with the magnitude of *x* and
23479 the sign of *y*.

23480 **ERRORS**

23481 No errors are defined.

23494 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

cos, cosf, cosl — cosine function

SYNOPSIS

```
#include <math.h>

double cos(double x);
float cosf(float x);
long double cosl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the cosine of their argument x, measured in radians.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the cosine of x.

MX If x is NaN, a NaN shall be returned.

If x is ±0, the value 1.0 shall be returned.

If x is ±Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

ERRORS

These functions shall fail if:

MX

Domain Error	The x argument is ±Inf.
	If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

Taking the Cosine of a 45-Degree Angle

```
#include <math.h>
...
double radians = 45 * M_PI / 180;
double result;
...
result = cos(radians);
```

APPLICATION USAGE

These functions may lose accuracy when their argument is near an odd multiple of $\pi/2$ or is far from 0.

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.19 (on page 116), **<math.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *cosf( )* and *cosl( )* functions are added for alignment with the ISO/IEC 9899: 1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899: 1999 standard.

IEC 60559: 1989 standard floating-point extensions over the ISO/IEC 9899: 1999 standard are marked.

NAME

cosh, coshf, coshl — hyperbolic cosine functions

SYNOPSIS

```
#include <math.h>

double cosh(double x);
float coshf(float x);
long double coshl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the hyperbolic cosine of their argument *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the hyperbolic cosine of *x*.

If the correct value would cause overflow, a range error shall occur and *cosh*( ), *coshf*( ), and *coshl*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, the value 1.0 shall be returned.

If *x* is ±Inf, +Inf shall be returned.

ERRORS

These functions shall fail if:

Range Error — The result would cause an overflow.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

For IEEE Std 754-1985 **double**, 710.5 < |*x*| implies that *cosh*(*x*) has overflowed.

RATIONALE

None.

FUTURE DIRECTIONS

None.

23648 **NAME**

23649 cproj, cprojf, cprojl — complex projection functions

23650 **SYNOPSIS**

23651
```
#include <complex.h>
```

23652
```
double complex cproj(double complex z);
```
23653
```
float complex cprojf(float complex z);
```
23654
```
long double complex cprojl(long double complex z);
```

23655 **DESCRIPTION**

23656 CX The functionality described on this reference page is aligned with the ISO C standard. Any
23657 conflict between the requirements described here and the ISO C standard is unintentional. This
23658 volume of POSIX.1-200x defers to the ISO C standard.

23659 These functions shall compute a projection of *z* onto the Riemann sphere: *z* projects to *z*, except
23660 that all complex infinities (even those with one infinite part and one NaN part) project to
23661 positive infinity on the real axis. If *z* has an infinite part, then *cproj*(*z*) shall be equivalent to:

23662
```
INFINITY + I * copysign(0.0, cimag(z))
```

23663 **RETURN VALUE**

23664 These functions shall return the value of the projection onto the Riemann sphere.

23665 **ERRORS**

23666 No errors are defined.

23667 **EXAMPLES**

23668 None.

23669 **APPLICATION USAGE**

23670 None.

23671 **RATIONALE**

23672 Two topologies are commonly used in complex mathematics: the complex plane with its
23673 continuum of infinities, and the Riemann sphere with its single infinity. The complex plane is
23674 better suited for transcendental functions, the Riemann sphere for algebraic functions. The
23675 complex types with their multiplicity of infinities provide a useful (though imperfect) model for
23676 the complex plane. The *cproj*( ) function helps model the Riemann sphere by mapping all
23677 infinities to one, and should be used just before any operation, especially comparisons, that
23678 might give spurious results for any of the other infinities. Note that a complex value with one
23679 infinite part and one NaN part is regarded as an infinity, not a NaN, because if one part is
23680 infinite, the complex value is infinite independent of the value of the other part. For the same
23681 reason, *cabs*( ) returns an infinity if its argument has an infinite part and a NaN part.

23713 None.

23714 **SEE ALSO**

23715 *carg*( ), *cimag*( ), *conj*( ), *cproj*( )

23716 XBD **<complex.h>**

23717 **CHANGE HISTORY**

23718 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

23719 **NAME**

23720 creat — create a new file or rewrite an existing one

23721 **SYNOPSIS**

23722 OH
```
#include <sys/stat.h>
```
23723
```
#include <fcntl.h>
```

23724
```
int creat(const char *path, mode_t mode);
```

23725 **DESCRIPTION**

23726 The *creat*( ) function shall behave as if it is implemented as follows:

23727
```
int creat(const char *path, mode_t mode)
```
23728
```
{
```
23729
```
    return open(path, O_WRONLY|O_CREAT|O_TRUNC, mode);
```
23730
```
}
```

23731 **RETURN VALUE**

23732 Refer to *open*( ).

23733 **ERRORS**

23734 Refer to *open*( ).

23735 **EXAMPLES**

23736 **Creating a File**

23737 The following example creates the file **/tmp/file** with read and write permissions for the file
23738 owner and read permission for group and others. The resulting file descriptor is assigned to the
23739 *fd* variable.

23740
```
#include <fcntl.h>
```
23741
```
...
```
23742
```
int fd;
```
23743
```
mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;
```
23744
```
char *filename = "/tmp/file";
```
23745
```
...
```
23746
```
fd = creat(filename, mode);
```
23747
```
...
```

23748 **APPLICATION USAGE**

23749 None.

23750 **RATIONALE**

23751 The *creat*( ) function is redundant. Its services are also provided by the *open*( ) function. It has
23752 been included primarily for historical purposes since many existing applications depend on it. It
23753 is best considered a part of the C binding rather than a function that should be provided in other
23754 languages.

23755 **FUTURE DIRECTIONS**

23756 None.

23757 **SEE ALSO**

23758 *mknod*( ), *open*( )

23759 XBD **<fcntl.h>**, **<sys/stat.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

Issue 7

SD5-XSH-ERN-186 is applied.

NAME

crypt — string encoding function (**CRYPT**)

SYNOPSIS

XSI
```
#include <unistd.h>

char *crypt(const char *key, const char *salt);
```

DESCRIPTION

The *crypt*( ) function is a string encoding function. The algorithm is implementation-defined.

The *key* argument points to a string to be encoded. The *salt* argument shall be a string of at least two bytes in length not including the null character chosen from the set:

```
a b c d e f g h i j k l m n o p q r s t u v w x y z
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
0 1 2 3 4 5 6 7 8 9 . /
```

The first two bytes of this string may be used to perturb the encoding algorithm.

The return value of *crypt*( ) points to static data that is overwritten by each call.

The *crypt*( ) function need not be thread-safe.

RETURN VALUE

Upon successful completion, *crypt*( ) shall return a pointer to the encoded string. The first two bytes of the returned value shall be those of the *salt* argument. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

ERRORS

The *crypt*( ) function shall fail if:

[ENOSYS] The functionality is not supported on this implementation.

EXAMPLES

Encoding Passwords

The following example finds a user database entry matching a particular user name and changes the current password to a new password. The *crypt*( ) function generates an encoded version of each password. The first call to *crypt*( ) produces an encoded version of the old password; that encoded password is then compared to the password stored in the user database. The second call to *crypt*( ) encodes the new password before it is stored.

The *putpwent*( ) function, used in the following example, is not part of POSIX.1-200x.

```
#include <unistd.h>
#include <pwd.h>
#include <string.h>
#include <stdio.h>
...
int valid_change;
int pfd;  /* Integer for file descriptor returned by open(). */
FILE *fpfd;  /* File pointer for use in putpwent(). */
struct passwd *p;
char user[100];
char oldpasswd[100];
char newpasswd[100];
char savepasswd[100];
```

```
        ...
        valid_change = 0;
        while ((p = getpwent()) != NULL) {
            /* Change entry if found. */
            if (strcmp(p->pw_name, user) == 0) {
                if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
                    strcpy(savepasswd, crypt(newpasswd, user));
                    p->pw_passwd = savepasswd;
                    valid_change = 1;
                }
                else {
                    fprintf(stderr, "Old password is not valid\n");
                }
            }
            /* Put passwd entry into ptmp. */
            putpwent(p, fpfd);
        }
```

APPLICATION USAGE

The values returned by this function need not be portable among XSI-conformant systems.

RATIONALE

None.

FUTURE DIRECTIONS

None.

ctanl( )

NAME

ctanl — complex tangent functions

SYNOPSIS

```
#include <complex.h>

long double complex ctanl(long double complex z);
```

DESCRIPTION

Refer to *ctan( )*.

NAME

ctermid — generate a pathname for the controlling terminal

SYNOPSIS

CX
```
#include <stdio.h>

char *ctermid(char *s);
```

DESCRIPTION

The *ctermid*( ) function shall generate a string that, when used as a pathname, refers to the current controlling terminal for the current process. If *ctermid*( ) returns a pathname, access to the file is not guaranteed.

The *ctermid*( ) function need not be thread-safe if called with a NULL parameter.

RETURN VALUE

If *s* is a null pointer, the string shall be generated in an area that may be static (and therefore may be overwritten by each call), the address of which shall be returned. Otherwise, *s* is assumed to point to a character array of at least L_ctermid bytes; the string is placed in this array and the value of *s* shall be returned. The symbolic constant L_ctermid is defined in **<stdio.h>**, and shall have a value greater than 0.

The *ctermid*( ) function shall return an empty string if the pathname that would refer to the controlling terminal cannot be determined, or if the function is unsuccessful.

ERRORS

No errors are defined.

EXAMPLES

Determining the Controlling Terminal for the Current Process

The following example returns a pointer to a string that identifies the controlling terminal for the current process. The pathname for the terminal is stored in the array pointed to by the *ptr* argument, which has a size of L_ctermid bytes, as indicated by the *term* argument.

```
#include <stdio.h>
...
char term[L_ctermid];
char *ptr;

ptr = ctermid(term);
```

APPLICATION USAGE

The difference between *ctermid*( ) and *ttyname*( ) is that *ttyname*( ) must be handed a file descriptor and return a path of the terminal associated with that file descriptor, while *ctermid*( ) returns a string (such as `"/dev/tty"`) that refers to the current controlling terminal if used as a pathname.

RATIONALE

L_ctermid must be defined appropriately for a given implementation and must be greater than zero so that array declarations using it are accepted by the compiler. The value includes the terminating null byte.

Conforming applications that use multiple threads cannot call *ctermid*( ) with NULL as the parameter. If *s* is not NULL, the *ctermid*( ) function generates a string that, when used as a pathname, refers to the current controlling terminal for the current process. If *s* is NULL, the return value of *ctermid*( ) is undefined.

There is no additional burden on the programmer—changing to use a hypothetical thread-safe version of *ctermid*( ) along with allocating a buffer is more of a burden than merely allocating a buffer. Application code should not assume that the returned string is short, as some implementations have more than two pathname components before reaching a logical device name.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #148 is applied, updating the RATIONALE.

NAME

ctime, ctime_r — convert a time value to a date and time string

SYNOPSIS

OB
```
#include <time.h>

char *ctime(const time_t *clock);
```
OB CX
```
char *ctime_r(const time_t *clock, char *buf);
```

DESCRIPTION

CX For *ctime*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *ctime*( ) function shall convert the time pointed to by *clock*, representing time in seconds since the Epoch, to local time in the form of a string. It shall be equivalent to:

```
asctime(localtime(clock))
```

CX The *asctime*( ), *ctime*( ), *gmtime*( ), and *localtime*( ) functions shall return values in one of two static objects: a broken-down time structure and an array of **char**. Execution of any of the functions may overwrite the information returned in either of these objects by any of the other functions.

The *ctime*( ) function need not be thread-safe.

The *ctime_r*( ) function shall convert the calendar time pointed to by *clock* to local time in exactly the same form as *ctime*( ) and put the string into the array pointed to by *buf* (which shall be at least 26 bytes in size) and return *buf*.

Unlike *ctime*( ), the thread-safe version *ctime_r*( ) is not required to set *tzname*.

RETURN VALUE

The *ctime*( ) function shall return the pointer returned by *asctime*( ) with that broken-down time as an argument.

CX Upon successful completion, *ctime_r*( ) shall return a pointer to the string pointed to by *buf*. When an error is encountered, a null pointer shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

These functions are included only for compatibility with older implementations. They have undefined behavior if the resulting string would be too long, so the use of these functions should be discouraged. On implementations that do not detect output string length overflow, it is possible to overflow the output buffers in such a way as to cause applications to fail, or possible system security violations. Also, these functions do not support localized date and time formats. To avoid these problems, applications should use *strftime*( ) to generate strings from broken-down times.

Values for the broken-down time structure can be obtained by calling *gmtime*( ) or *localtime*( ).

The *ctime_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Attempts to use *ctime*( ) or *ctime_r*( ) for times before the Epoch or for times beyond the year 9999 produce undefined results. Refer to *asctime( )* (on page 590).

RATIONALE

The standard developers decided to mark the *ctime*( ) and *ctime_r*( ) functions obsolescent even though they are in the ISO C standard due to the possibility of buffer overflow. The ISO C standard also provides the *strftime*( ) function which can be used to avoid these problems.

FUTURE DIRECTIONS

These functions may be removed in a future version.

SEE ALSO

asctime( ), *clock*( ), *difftime*( ), *gmtime*( ), *localtime*( ), *mktime*( ), *strftime*( ), *strptime*( ), *time*( ), *utime*( )

XBD **<time.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

The *ctime_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *ctime*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

Extensions beyond the ISO C standard are marked.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XSH-ERN-25 is applied, updating the APPLICATION USAGE.

Austin Group Interpretation 1003.1-2001 #053 is applied, marking these functions obsolescent.

The *ctime_r*( ) function is moved from the Thread-Safe Functions option to the Base.

NAME

daylight — daylight savings time flag

SYNOPSIS

XSI

DESCRIPTION

Refer to *tzset*( ).

NAME

dbm_clearerr, dbm_close, dbm_delete, dbm_error, dbm_fetch, dbm_firstkey, dbm_nextkey, dbm_open, dbm_store — database functions

SYNOPSIS

XSI

```
#include <ndbm.h>

int dbm_clearerr(DBM *db);
void dbm_close(DBM *db);
int dbm_delete(DBM *db, datum key);
int dbm_error(DBM *db);
datum dbm_fetch(DBM *db, datum key);
datum dbm_firstkey(DBM *db);
datum dbm_nextkey(DBM *db);
DBM *dbm_open(const char *file, int open_flags, mode_t file_mode);
int dbm_store(DBM *db, datum key, datum content, int store_mode);
```

DESCRIPTION

These functions create, access, and modify a database.

A **datum** consists of at least two members, *dptr* and *dsize*. The *dptr* member points to an object that is *dsize* bytes in length. Arbitrary binary data, as well as character strings, may be stored in the object pointed to by *dptr*.

A database shall be stored in one or two files. When one file is used, the name of the database file shall be formed by appending the suffix **.db** to the *file* argument given to *dbm_open*( ). When two files are used, the names of the database files shall be formed by appending the suffixes **.dir** and **.pag** respectively to the *file* argument.

The *dbm_open*( ) function shall open a database. The *file* argument to the function is the pathname of the database. The *open_flags* argument has the same meaning as the *flags* argument of *open*( ) except that a database opened for write-only access opens the files for read and write access and the behavior of the O_APPEND flag is unspecified. The *file_mode* argument has the same meaning as the third argument of *open*( ).

The *dbm_open*( ) function need not accept pathnames longer than {PATH_MAX}−4 bytes (including the terminating null), or pathnames with a last component longer than {NAME_MAX}−4 bytes (excluding the terminating null).

The *dbm_close*( ) function shall close a database. The application shall ensure that argument *db* is a pointer to a **dbm** structure that has been returned from a call to *dbm_open*( ).

These database functions shall support an internal block size large enough to support key/content pairs of at least 1 023 bytes.

The *dbm_fetch*( ) function shall read a record from a database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ). The argument *key* is a **datum** that has been initialized by the application to the value of the key that matches the key of the record the program is fetching.

The *dbm_store*( ) function shall write a record to a database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ). The argument *key* is a **datum** that has been initialized by the application to the value of the key that identifies (for subsequent reading, writing, or deleting) the record the application is writing. The argument *content* is a **datum** that has been initialized by the application to the value of the record the program is writing. The argument *store_mode* controls whether *dbm_store*( ) replaces any pre-existing record that has the same key that is specified by the *key* argument. The application shall

set *store_mode* to either DBM_INSERT or DBM_REPLACE. If the database contains a record that matches the *key* argument and *store_mode* is DBM_REPLACE, the existing record shall be replaced with the new record. If the database contains a record that matches the *key* argument and *store_mode* is DBM_INSERT, the existing record shall be left unchanged and the new record ignored. If the database does not contain a record that matches the *key* argument and *store_mode* is either DBM_INSERT or DBM_REPLACE, the new record shall be inserted in the database.

If the sum of a key/content pair exceeds the internal block size, the result is unspecified. Moreover, the application shall ensure that all key/content pairs that hash together fit on a single block. The *dbm_store*( ) function shall return an error in the event that a disk block fills with inseparable data.

The *dbm_delete*( ) function shall delete a record and its key from the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ). The argument *key* is a **datum** that has been initialized by the application to the value of the key that identifies the record the program is deleting.

The *dbm_firstkey*( ) function shall return the first key in the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ).

The *dbm_nextkey*( ) function shall return the next key in the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ). The application shall ensure that the *dbm_firstkey*( ) function is called before calling *dbm_nextkey*( ). Subsequent calls to *dbm_nextkey*( ) return the next key until all of the keys in the database have been returned.

The *dbm_error*( ) function shall return the error condition of the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ).

The *dbm_clearerr*( ) function shall clear the error condition of the database. The argument *db* is a pointer to a database structure that has been returned from a call to *dbm_open*( ).

The *dptr* pointers returned by these functions may point into static storage that may be changed by subsequent calls.

These functions need not be thread-safe.

RETURN VALUE

The *dbm_store*( ) and *dbm_delete*( ) functions shall return 0 when they succeed and a negative value when they fail.

The *dbm_store*( ) function shall return 1 if it is called with a *flags* value of DBM_INSERT and the function finds an existing record with the same key.

The *dbm_error*( ) function shall return 0 if the error condition is not set and return a non-zero value if the error condition is set.

The return value of *dbm_clearerr*( ) is unspecified.

The *dbm_firstkey*( ) and *dbm_nextkey*( ) functions shall return a key **datum**. When the end of the database is reached, the *dptr* member of the key is a null pointer. If an error is detected, the *dptr* member of the key shall be a null pointer and the error condition of the database shall be set.

The *dbm_fetch*( ) function shall return a content **datum**. If no record in the database matches the key or if an error condition has been detected in the database, the *dptr* member of the content shall be a null pointer.

The *dbm_open*( ) function shall return a pointer to a database structure. If an error is detected during the operation, *dbm_open*( ) shall return a (**DBM** *)0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The following code can be used to traverse the database:

```
for(key = dbm_firstkey(db); key.dptr != NULL; key = dbm_nextkey(db))
```

The *dbm_** functions provided in this library should not be confused in any way with those of a general-purpose database management system. These functions do not provide for multiple search keys per entry, they do not protect against multi-user access (in other words they do not lock records or files), and they do not provide the many other useful database functions that are found in more robust database management systems. Creating and updating databases by use of these functions is relatively slow because of data copies that occur upon hash collisions. These functions are useful for applications requiring fast lookup of relatively static information that is to be indexed by a single key.

Note that a strictly conforming application is extremely limited by these functions: since there is no way to determine that the keys in use do not all hash to the same value (although that would be rare), a strictly conforming application cannot be guaranteed that it can store more than one block's worth of data in the database. As long as a key collision does not occur, additional data may be stored, but because there is no way to determine whether an error is due to a key collision or some other error condition (*dbm_error*( ) being effectively a Boolean), once an error is detected, the application is effectively limited to guessing what the error might be if it wishes to continue using these functions.

The *dbm_delete*( ) function need not physically reclaim file space, although it does make it available for reuse by the database.

After calling *dbm_store*( ) or *dbm_delete*( ) during a pass through the keys by *dbm_firstkey*( ) and *dbm_nextkey*( ), the application should reset the database by calling *dbm_firstkey*( ) before again calling *dbm_nextkey*( ). The contents of these files are unspecified and may not be portable.

Applications should take care that database pathname arguments specified to *dbm_open*( ) are not prefixes of unrelated files. This might be done, for example, by placing databases in a separate directory.

Since some implementations use three characters for a suffix and others use four characters for a suffix, applications should ensure that the maximum portable pathname length passed to *dbm_open*( ) is no greater than {PATH_MAX}–4 bytes, with the last component of the pathname no greater than {NAME_MAX}–4 bytes.

RATIONALE

Previously the standard required the database to be stored in two files, one file being a directory containing a bitmap of keys and having **.dir** as its suffix. The second file containing all data and having **.pag** as its suffix. This has been changed not to specify the use of the files and to allow newer implementations of the Berkeley DB interface using a single file that have evolved while remaining compatible with the application programming interface. The standard developers considered removing the specific suffixes altogether but decided to retain them so as not to pollute the application file name space more than necessary and to allow for portable backups of the database.

NAME

difftime — compute the difference between two calendar time values

SYNOPSIS

```
#include <time.h>

double difftime(time_t time1, time_t time0);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *difftime*( ) function shall compute the difference between two calendar times (as returned by *time*( )): *time*1– *time*0.

RETURN VALUE

The *difftime*( ) function shall return the difference expressed in seconds as a type **double**.

ERRORS

No errors are defined.

NAME

dirfd — extract the file descriptor used by a DIR stream

SYNOPSIS

```
#include <dirent.h>

int dirfd(DIR *dirp);
```

DESCRIPTION

The *dirfd*( ) function shall return a file descriptor referring to the same directory as the *dirp* argument. This file descriptor shall be closed by a call to *closedir*( ). If any attempt is made to close the file descriptor, or to modify the state of the associated description, other than by means of *closedir*( ), *readdir*( ), *readdir_r*( ), or *rewinddir*( ), the behavior is undefined.

RETURN VALUE

Upon successful completion, the *dirfd*( ) function shall return an integer which contains a file descriptor for the stream pointed to by *dirp*. Otherwise, it shall return –1 and may set *errno* to indicate the error.

ERRORS

The *dirfd*( ) function may fail if:

[EINVAL] The *dirp* argument does not refer to a valid directory stream.

[ENOTSUP] The implementation does not support the association of a file descriptor with a directory.

EXAMPLES

None.

APPLICATION USAGE

The *dirfd*( ) function is intended to be a mechanism by which an application may obtain a file descriptor to use for the *fchdir*( ) function.

RATIONALE

This interface was introduced because the Base Definitions volume of POSIX.1-200x does not make public the **DIR** data structure. Applications tend to use the *fchdir*( ) function on the file descriptor returned by this interface, and this has proven useful for security reasons; in particular, it is a better technique than others where directory names might change.

The description uses the term "a file descriptor" rather than "the file descriptor". The implication intended is that an implementation that does not use an *fd* for *diropen*( ) could still *open*( ) the directory to implement the *dirfd*( ) function. Such a descriptor must be closed later during a call to *closedir*( ).

An implementation that does not support file descriptors referring to directories may fail with [ENOTSUP].

If it is necessary to allocate an *fd* to be returned by *dirfd*( ), it should be done at the time of a call to *opendir*( ).

FUTURE DIRECTIONS

None.

NAME

dirname — report the parent directory name of a file pathname

SYNOPSIS

XSI
```
#include <libgen.h>

char *dirname(char *path);
```

DESCRIPTION

The *dirname*( ) function shall take a pointer to a character string that contains a pathname, and return a pointer to a string that is a pathname of the parent directory of that file. Trailing '//' characters in the path are not counted as part of the path.

If *path* does not contain a '//', then *dirname*( ) shall return a pointer to the string ".". If *path* is a null pointer or points to an empty string, *dirname*( ) shall return a pointer to the string ".".

The *dirname*( ) function need not be thread-safe.

RETURN VALUE

The *dirname*( ) function shall return a pointer to a string that is the parent directory of *path*. If *path* is a null pointer or points to an empty string, a pointer to a string "." is returned.

The *dirname*( ) function may modify the string pointed to by *path*, and may return a pointer to static storage that may then be overwritten by subsequent calls to *dirname*( ).

ERRORS

No errors are defined.

EXAMPLES

The following code fragment reads a pathname, changes the current working directory to the parent directory, and opens the file.

```
char *path = NULL, *pathcopy;
size_t buflen = 0;
ssize_t linelen = 0;
int fd;

linelen = getline(&path, &buflen, stdin);

path[linelen-1] = 0;
pathcopy = strdup(path);
if (chdir(dirname(pathcopy)) < 0) {
    ...
}
if ((fd = open(basename(path), O_RDONLY)) >= 0) {
    ...
    close (fd);
}
...
free (pathcopy);
free (path);
```

Sample Input and Output Strings for dirname( )

In the following table, the input string is the value pointed to by *path*, and the output string is the return value of the *dirname*( ) function.

Input String	Output String
"/usr/lib"	"/usr"
"/usr/"	"/"
"usr"	"."
"/"	"/"
"."	"."
".."	"."

APPLICATION USAGE

The *dirname*( ) and *basename*( ) functions together yield a complete pathname. The expression *dirname*(*path*) obtains the pathname of the directory where *basename*(*path*) is found.

Since the meaning of the leading "//" is implementation-defined, *dirname*("**//foo**) may return either "//" or '//' (but nothing else).

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

div — compute the quotient and remainder of an integer division

SYNOPSIS

```
#include <stdlib.h>

div_t div(int numer, int denom);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *div*( ) function shall compute the quotient and remainder of the division of the numerator *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the integer of lesser magnitude that is the nearest to the algebraic quotient. If the result cannot be represented, the behavior is undefined; otherwise, *quot***denom*+*rem* shall equal *numer*.

RETURN VALUE

The *div*( ) function shall return a structure of type **div_t**, comprising both the quotient and the remainder. The structure includes the following members, in any order:

```
int  quot;  /* quotient */
int  rem;   /* remainder */
```

ERRORS

No errors are defined.

NAME

dlclose — close a *dlopen*( ) object

SYNOPSIS

```
#include <dlfcn.h>

int dlclose(void *handle);
```

DESCRIPTION

The *dlclose*( ) function shall inform the system that the object referenced by a *handle* returned from a previous *dlopen*( ) invocation is no longer needed by the application.

The use of *dlclose*( ) reflects a statement of intent on the part of the process, but does not create any requirement upon the implementation, such as removal of the code or symbols referenced by *handle*. Once an object has been closed using *dlclose*( ) an application should assume that its symbols are no longer available to *dlsym*( ). All objects loaded automatically as a result of invoking *dlopen*( ) on the referenced object shall also be closed if this is the last reference to it.

Although a *dlclose*( ) operation is not required to remove structures from an address space, neither is an implementation prohibited from doing so. The only restriction on such a removal is that no object shall be removed to which references have been relocated, until or unless all such references are removed. For instance, an object that had been loaded with a *dlopen*( ) operation specifying the RTLD_GLOBAL flag might provide a target for dynamic relocations performed in the processing of other objects—in such environments, an application may assume that no relocation, once made, shall be undone or remade unless the object requiring the relocation has itself been removed.

RETURN VALUE

If the referenced object was successfully closed, *dlclose*( ) shall return 0. If the object could not be closed, or if *handle* does not refer to an open object, *dlclose*( ) shall return a non-zero value. More detailed diagnostic information shall be available through *dlerror*( ).

ERRORS

No errors are defined.

EXAMPLES

The following example illustrates use of *dlopen*( ) and *dlclose*( ):

```
...
/* Open a dynamic library and then close it ... */

#include <dlfcn.h>
void *mylib;
int eret;

mylib = dlopen("mylib.so", RTLD_LOCAL | RTLD_LAZY);
...
eret = dlclose(mylib);
...
```

APPLICATION USAGE

A conforming application should employ a *handle* returned from a *dlopen*( ) invocation only within a given scope bracketed by the *dlopen*( ) and *dlclose*( ) operations. Implementations are free to use reference counting or other techniques such that multiple calls to *dlopen*( ) referencing the same object may return the same object for *handle*. Implementations are also free to reuse a *handle*. For these reasons, the value of a *handle* must be treated as an opaque object by the application, used only in calls to *dlsym*( ) and *dlclose*( ).

RATIONALE

None.

FUTURE DIRECTIONS

None.

dlerror( ), *dlopen( )*, *dlsym( )*

XBD **<dlfcn.h>**

CHANGE HISTORY

First released in Issue 5.

Issue 6

The DESCRIPTION is updated to say that the referenced object is closed "if this is the last reference to it".

Issue 7

The *dlopen( )* function is moved from the XSI option to Base.

NAME

dlerror — get diagnostic information

SYNOPSIS

```
#include <dlfcn.h>

char *dlerror(void);
```

DESCRIPTION

The *dlerror*( ) function shall return a null-terminated character string (with no trailing <newline>) that describes the last error that occurred during dynamic linking processing. If no dynamic linking errors have occurred since the last invocation of *dlerror*( ), *dlerror*( ) shall return NULL. Thus, invoking *dlerror*( ) a second time, immediately following a prior invocation, shall result in NULL being returned.

The *dlerror*( ) function need not be thread-safe.

RETURN VALUE

If successful, *dlerror*( ) shall return a null-terminated character string; otherwise, NULL shall be returned.

ERRORS

No errors are defined.

EXAMPLES

The following example prints out the last dynamic linking error:

```
...
#include <dlfcn.h>

char *errstr;

errstr = dlerror();
if (errstr != NULL)
printf ("A dynamic linking error occurred: (%s)\n", errstr);
...
```

APPLICATION USAGE

The messages returned by *dlerror*( ) may reside in a static buffer that is overwritten on each call to *dlerror*( ). Application code should not write to this buffer. Programs wishing to preserve an error message should make their own copies of that message. Depending on the application environment with respect to asynchronous execution events, such as signals or other asynchronous computation sharing the address space, conforming applications should use a critical section to retrieve the error pointer and buffer.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

dlopen — gain access to an executable object file

SYNOPSIS

```
#include <dlfcn.h>

void *dlopen(const char *file, int mode);
```

DESCRIPTION

The *dlopen*( ) function shall make an executable object file specified by *file* available to the calling program. The class of files eligible for this operation and the manner of their construction are implementation-defined, though typically such files are executable objects such as shared libraries, relocatable files, or programs. Note that some implementations permit the construction of dependencies between such objects that are embedded within files. In such cases, a *dlopen*( ) operation shall load such dependencies in addition to the object referenced by *file*. Implementations may also impose specific constraints on the construction of programs that can employ *dlopen*( ) and its related services.

A successful *dlopen*( ) shall return a *handle* which the caller may use on subsequent calls to *dlsym*( ) and *dlclose*( ). The value of this *handle* should not be interpreted in any way by the caller.

The *file* argument is used to construct a pathname to the object file. If *file* contains a <slash> character, the *file* argument is used as the pathname for the file. Otherwise, *file* is used in an implementation-defined manner to yield a pathname.

If the value of *file* is 0, *dlopen*( ) shall provide a *handle* on a global symbol object. This object shall provide access to the symbols from an ordered set of objects consisting of the original program image file, together with any objects loaded at program start-up as specified by that process image file (for example, shared libraries), and the set of objects loaded using a *dlopen*( ) operation together with the RTLD_GLOBAL flag. As the latter set of objects can change during execution, the set identified by *handle* can also change dynamically.

Only a single copy of an object file is brought into the address space, even if *dlopen*( ) is invoked multiple times in reference to the file, and even if different pathnames are used to reference the file.

The *mode* parameter describes how *dlopen*( ) shall operate upon *file* with respect to the processing of relocations and the scope of visibility of the symbols provided within *file*. When an object is brought into the address space of a process, it may contain references to symbols whose addresses are not known until the object is loaded. These references shall be relocated before the symbols can be accessed. The *mode* parameter governs when these relocations take place and may have the following values:

RTLD_LAZY
: Relocations shall be performed at an implementation-defined time, ranging from the time of the *dlopen*( ) call until the first reference to a given symbol occurs. Specifying RTLD_LAZY should improve performance on implementations supporting dynamic symbol binding as a process may not reference all of the functions in any given object. And, for systems supporting dynamic symbol resolution for normal process execution, this behavior mimics the normal handling of process execution.

RTLD_NOW
: All necessary relocations shall be performed when the object is first loaded. This may waste some processing if relocations are performed for functions that are never referenced. This behavior may be useful for applications that need to know as soon as an object is loaded that all symbols referenced during execution are available.

Any object loaded by *dlopen*( ) that requires relocations against global symbols can reference the symbols in the original process image file, any objects loaded at program start-up, from the object itself as well as any other object included in the same *dlopen*( ) invocation, and any objects that were loaded in any *dlopen*( ) invocation and which specified the RTLD_GLOBAL flag. To determine the scope of visibility for the symbols loaded with a *dlopen*( ) invocation, the *mode* parameter should be a bitwise-inclusive OR with one of the following values:

RTLD_GLOBAL — The object's symbols shall be made available for the relocation processing of any other object. In addition, symbol lookup using *dlopen*(*0, mode*) and an associated *dlsym*( ) allows objects loaded with this *mode* to be searched.

RTLD_LOCAL — The object's symbols shall not be made available for the relocation processing of any other object.

If neither RTLD_GLOBAL nor RTLD_LOCAL are specified, then the default behavior is unspecified.

If a *file* is specified in multiple *dlopen*( ) invocations, *mode* is interpreted at each invocation. Note, however, that once RTLD_NOW has been specified all relocations shall have been completed rendering further RTLD_NOW operations redundant and any further RTLD_LAZY operations irrelevant. Similarly, note that once RTLD_GLOBAL has been specified the object shall maintain the RTLD_GLOBAL status regardless of any previous or future specification of RTLD_LOCAL, as long as the object remains in the address space (see *dlclose*( )).

Symbols introduced into a program through calls to *dlopen*( ) may be used in relocation activities. Symbols so introduced may duplicate symbols already defined by the program or previous *dlopen*( ) operations. To resolve the ambiguities such a situation might present, the resolution of a symbol reference to symbol definition is based on a symbol resolution order. Two such resolution orders are defined: *load* or *dependency* ordering. Load order establishes an ordering among symbol definitions, such that the definition first loaded (including definitions from the image file and any dependent objects loaded with it) has priority over objects added later (via *dlopen*( )). Load ordering is used in relocation processing. Dependency ordering uses a breadth-first order starting with a given object, then all of its dependencies, then any dependents of those, iterating until all dependencies are satisfied. With the exception of the global symbol object obtained via a *dlopen*( ) operation on a *file* of 0, dependency ordering is used by the *dlsym*( ) function. Load ordering is used in *dlsym*( ) operations upon the global symbol object.

When an object is first made accessible via *dlopen*( ) it and its dependent objects are added in dependency order. Once all the objects are added, relocations are performed using load order. Note that if an object or its dependencies had been previously loaded, the load and dependency orders may yield different resolutions.

The symbols introduced by *dlopen*( ) operations and available through *dlsym*( ) are at a minimum those which are exported as symbols of global scope by the object. Typically such symbols shall be those that were specified in (for example) C source code as having *extern* linkage. The precise manner in which an implementation constructs the set of exported symbols for a *dlopen*( ) object is specified by that implementation.

RETURN VALUE

If *file* cannot be found, cannot be opened for reading, is not of an appropriate object format for processing by *dlopen*( ), or if an error occurs during the process of loading *file* or relocating its symbolic references, *dlopen*( ) shall return NULL. More detailed diagnostic information shall be available through *dlerror*( ).

ERRORS

No errors are defined.

EXAMPLES

Refer to *dlsym( )* (on page 735).

XBD **<dlfcn.h>**

CHANGE HISTORY

First released in Issue 5.

Issue 6

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/21 is applied, changing the default behavior in the DESCRIPTION when neither RTLD_GLOBAL nor RTLD_LOCAL are specified from implementation-defined to unspecified.

Issue 7

The *dlopen( )* function is moved from the XSI option to the Base.

The EXAMPLES section is updated to refer to *dlsym( )*.

NAME

dlsym — obtain the address of a symbol from a *dlopen*( ) object

SYNOPSIS

```
#include <dlfcn.h>

void *dlsym(void *restrict handle, const char *restrict name);
```

DESCRIPTION

The *dlsym*( ) function shall obtain the address of a symbol defined within an object made accessible through a *dlopen*( ) call. The *handle* argument is the value returned from a call to *dlopen*( ) (and which has not since been released via a call to *dlclose*( )), and *name* is the symbol's name as a character string.

The *dlsym*( ) function shall search for the named symbol in all objects loaded automatically as a result of loading the object referenced by *handle* (see *dlopen*( )). Load ordering is used in *dlsym*( ) operations upon the global symbol object. The symbol resolution algorithm used shall be dependency order as described in *dlopen*( ).

The RTLD_DEFAULT and RTLD_NEXT flags are reserved for future use.

RETURN VALUE

If *handle* does not refer to a valid object opened by *dlopen*( ), or if the named symbol cannot be found within any of the objects associated with *handle*, *dlsym*( ) shall return NULL. More detailed diagnostic information shall be available through *dlerror*( ).

ERRORS

No errors are defined.

EXAMPLES

The following example shows how *dlopen*( ) and *dlsym*( ) can be used to access either function or data objects. For simplicity, error checking has been omitted.

```
void    *handle;
int     *iptr, (*fptr)(int);

/* open the needed object */
handle = dlopen("/usr/home/me/libfoo.so", RTLD_LOCAL | RTLD_LAZY);

/* find the address of function and data objects */
*(void **)(&fptr) = dlsym(handle, "my_function");
iptr = (int *)dlsym(handle, "my_object");

/* invoke function, passing value of integer as a parameter */
(*fptr)(*iptr);
```

APPLICATION USAGE

Special purpose values for *handle* are reserved for future use. These values and their meanings are:

RTLD_DEFAULT The symbol lookup happens in the normal global scope; that is, a search for a symbol using this handle would find the same definition as a direct use of this symbol in the program code.

RTLD_NEXT Specifies the next object after this one that defines *name*. *This one* refers to the object containing the invocation of *dlsym*( ). The *next* object is the one found upon the application of a load order symbol resolution algorithm (see *dlopen*( )). The next object is either one of global scope (because it was introduced as part of the original process image or because it was added with a *dlopen*( ) operation including the RTLD_GLOBAL flag), or is an object that

was included in the same *dlopen*( ) operation that loaded this one.

The RTLD_NEXT flag is useful to navigate an intentionally created hierarchy of multiply-defined symbols created through *interposition*. For example, if a program wished to create an implementation of *malloc*( ) that embedded some statistics gathering about memory allocations, such an implementation could use the real *malloc*( ) definition to perform the memory allocation—and itself only embed the necessary logic to implement the statistics gathering function.

RATIONALE

The ISO C standard does not require that pointers to functions can be cast back and forth to pointers to data. However, POSIX-conforming implementations are required to support this, as noted in Section 2.12.3 (on page 541). The result of converting a pointer to a function into a pointer to another data type (except **void** *) is still undefined, however.

Note that compilers conforming to the ISO C standard are required to generate a warning if a conversion from a **void** * pointer to a function pointer is attempted as in:

```
fptr = (int (*)(int))dlsym(handle, "my_function");
```

FUTURE DIRECTIONS

None.

SEE ALSO

double erand48(unsigned short xsubi[3]);
long jrand48(unsigned short xsubi[3]);
void lcong48(unsigned short param[7]);
long lrand48(void);
long mrand48(void);
long nrand48(unsigned short xsubi[3]);
unsigned short *seed48(unsigned short seed16v[3]);
void srand48(long seedval);
```

DESCRIPTION

This family of functions shall generate pseudo-random numbers using a linear congruential algorithm and 48-bit integer arithmetic.

The *drand48*( ) and *erand48*( ) functions shall return non-negative, double-precision, floating-point values, uniformly distributed over the interval [0.0,1.0).

The *lrand48*( ) and *nrand48*( ) functions shall return non-negative, long integers, uniformly distributed over the interval $[0,2^{31})$.

The *mrand48*( ) and *jrand48*( ) functions shall return signed long integers uniformly distributed over the interval $[-2^{31},2^{31})$.

The *srand48*( ), *seed48*( ), and *lcong48*( ) functions are initialization entry points, one of which should be invoked before either *drand48*( ), *lrand48*( ), or *mrand48*( ) is called. (Although it is not recommended practice, constant default initializer values shall be supplied automatically if *drand48*( ), *lrand48*( ), or *mrand48*( ) is called without a prior call to an initialization entry point.) The *erand48*( ), *nrand48*( ), and *jrand48*( ) functions do not require an initialization entry point to be called first.

All the routines work by generating a sequence of 48-bit integer values, X_i, according to the linear congruential formula:

$$X_{n+1} = (aX_n + c)_{\mathrm{mod}\ m} \qquad n \geq 0$$

The parameter $m = 2^{48}$; hence 48-bit integer arithmetic is performed. Unless *lcong48*( ) is invoked, the multiplier value a and the addend value c are given by:

$$a = 5\mathrm{DEECE66D}_{16} = 273673163155_8$$

$$c = \mathrm{B}_{16} = 13_8$$

The value returned by any of the *drand48*( ), *erand48*( ), *jrand48*( ), *lrand48*( ), *mrand48*( ), or *nrand48*( ) functions is computed by first generating the next 48-bit X_i in the sequence. Then the appropriate number of bits, according to the type of data item to be returned, are copied from the high-order (leftmost) bits of X_i and transformed into the returned value.

The *drand48*( ), *lrand48*( ), and *mrand48*( ) functions store the last 48-bit X_i generated in an internal buffer; that is why the application shall ensure that these are initialized prior to being invoked. The *erand48*( ), *nrand48*( ), and *jrand48*( ) functions require the calling program to

provide storage for the successive X_i values in the array specified as an argument when the functions are invoked. That is why these routines do not have to be initialized; the calling program merely has to place the desired initial value of X_i into the array and pass it as an argument. By using different arguments, *erand48*( ), *nrand48*( ), and *jrand48*( ) allow separate modules of a large program to generate several *independent* streams of pseudo-random numbers; that is, the sequence of numbers in each stream shall *not* depend upon how many times the routines are called to generate numbers for the other streams.

The initializer function *srand48*( ) sets the high-order 32 bits of X_i to the low-order 32 bits contained in its argument. The low-order 16 bits of X_i are set to the arbitrary value $330E_{16}$.

The initializer function *seed48*( ) sets the value of X_i to the 48-bit value specified in the argument array. The low-order 16 bits of X_i are set to the low-order 16 bits of *seed16v*[*0*]. The mid-order 16 bits of X_i are set to the low-order 16 bits of *seed16v*[*1*]. The high-order 16 bits of X_i are set to the low-order 16 bits of *seed16v*[*2*]. In addition, the previous value of X_i is copied into a 48-bit internal buffer, used only by *seed48*( ), and a pointer to this buffer is the value returned by *seed48*( ). This returned pointer, which can just be ignored if not needed, is useful if a program is to be restarted from a given point at some future time—use the pointer to get at and store the last X_i value, and then use this value to reinitialize via *seed48*( ) when the program is restarted.

The initializer function *lcong48*( ) allows the user to specify the initial X_i, the multiplier value *a*, and the addend value *c*. Argument array elements *param*[*0-2*] specify X_i, *param*[*3-5*] specify the multiplier *a*, and *param*[*6*] specifies the 16-bit addend *c*. After *lcong48*( ) is called, a subsequent call to either *srand48*( ) or *seed48*( ) shall restore the standard multiplier and addend values, *a* and *c*, specified above.

The *drand48*( ), *lrand48*( ), and *mrand48*( ) functions need not be thread-safe.

RETURN VALUE

As described in the DESCRIPTION above.

ERRORS

No errors are defined.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A note indicating that the *drand48*( ), *lrand48*( ), and *mrand48*( ) functions need not be reentrant is added to the DESCRIPTION.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

NAME

dup, dup2 — duplicate an open file descriptor

SYNOPSIS

```
#include <unistd.h>

int dup(int fildes);
int dup2(int fildes, int fildes2);
```

DESCRIPTION

The *dup*( ) function provides an alternative interface to the service provided by *fcntl*( ) using the F_DUPFD command. The call *dup*(*fildes*) shall be equivalent to:

```
fcntl(fildes, F_DUPFD, 0);
```

The *dup2*( ) function shall cause the file descriptor *fildes2* to refer to the same open file description as the file descriptor *fildes* and to share any locks, and shall return *fildes2*. If *fildes2* is already a valid open file descriptor, it shall be closed first, unless *fildes* is equal to *fildes2* in which case *dup2*( ) shall return *fildes2* without closing it. If the close operation fails to close *fildes2*, *dup2*( ) shall return –1 without changing the open file description to which *fildes2* refers. If *fildes* is not a valid file descriptor, *dup2*( ) shall return –1 and shall not close *fildes2*. If *fildes2* is less than 0 or greater than or equal to {OPEN_MAX}, *dup2*( ) shall return –1 with *errno* set to [EBADF].

Upon successful completion, if *fildes* is not equal to *fildes2*, the FD_CLOEXEC flag associated with *fildes2* shall be cleared. If *fildes* is equal to *fildes2*, the FD_CLOEXEC flag associated with *fildes2* shall not be changed.

TYM If *fildes* refers to a typed memory object, the result of the *dup2*( ) function is unspecified.

RETURN VALUE

Upon successful completion a non-negative integer, namely the file descriptor, shall be returned; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *dup*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid open file descriptor.

[EMFILE] All file descriptors available to the process are currently open.

The *dup2*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid open file descriptor or the argument *fildes2* is negative or greater than or equal to {OPEN_MAX}.

[EINTR] The *dup2*( ) function was interrupted by a signal.

The *dup2*( ) function may fail if:

[EIO] An I/O error occurred while attempting to close *fildes2*.

EXAMPLES

Redirecting Standard Output to a File

The following example closes standard output for the current processes, re-assigns standard output to go to the file referenced by *pfd*, and closes the original file descriptor to clean up.

```
#include <unistd.h>
...
int pfd;
...
```

```
close(1);
dup(pfd);
close(pfd);
...
```

Redirecting Error Messages

The following example redirects messages from *stderr* to *stdout*.

```
#include <unistd.h>
...
dup2(1, 2);
...
```

APPLICATION USAGE

None.

RATIONALE

The *dup*( ) and *dup2*( ) functions are redundant. Their services are also provided by the *fcntl*( ) function. They have been included in this volume of POSIX.1-200x primarily for historical reasons, since many existing applications use them.

The *dup2*( ) function is not marked obsolescent because it presents a type-safe version of functionality provided in a type-unsafe version by *fcntl*( ). It is used in the POSIX Ada binding.

The *dup2*( ) function is not intended for use in critical regions as a synchronization mechanism.

In the description of [EBADF], the case of *fildes* being out of range is covered by the given case of *fildes* not being valid. The descriptions for *fildes* and *fildes2* are different because the only kind of invalidity that is relevant for *fildes2* is whether it is out of range; that is, it does not matter whether *fildes2* refers to an open file when the *dup2*( ) call is made.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 7

SD5-XSH-ERN-187 is applied.

NAME

duplocale — duplicate a locale object

SYNOPSIS

CX
```
#include <locale.h>

locale_t duplocale(locale_t locobj);
```

DESCRIPTION

The *duplocale*( ) function shall create a duplicate copy of the locale object referenced by the *locobj* argument.

RETURN VALUE

Upon successful completion, the *duplocale*( ) function shall return a handle for a new locale object. Otherwise, *duplocale*( ) shall return (**locale_t**)0 and set *errno* to indicate the error.

ERRORS

The *duplocale*( ) function shall fail if:

[ENOMEM] There is not enough memory available to create the locale object or load the locale data.

The *duplocale*( ) function may fail if:

[EINVAL] *locobj* is not a handle for a locale object.

EXAMPLES

Constructing an Altered Version of an Existing Locale Object

The following example shows a code fragment to create a slightly altered version of an existing locale object. The function takes a locale object and a locale name and it replaces the *LC_TIME* category data in the locale object with that from the named locale.

```
#include <locale.h>
...

locale_t
with_changed_lc_time (locale_t obj, const char *name)
{
    locale_t retval = duplocale (obj);
    if (retval != (locale_t) 0)
    {
        locale_t changed = newlocale (LC_TIME_MASK, name, retval);
        if (changed == (locale_t) 0)
            /* An error occurred. Free all allocated resources. */
            freelocale (retval);
        retval = changed;
    }
    return retval; }
}
```

APPLICATION USAGE

The use of the *duplocale*( ) function is recommended for situations where a locale object is being used in multiple places, and it is possible that the lifetime of the locale object might end before all uses are finished. Another reason to duplicate a locale object is if a slightly modified form is needed. This can be achieved by a call to *newlocale*( ) following the *duplocale*( ) call.

As with the *newlocale*( ) function, handles for locale objects created by the *duplocale*( ) function should be released by a corresponding call to *freelocale*( ).

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 7.

NAME

encrypt — encoding function (**CRYPT**)

SYNOPSIS

XSI
```
#include <unistd.h>

void encrypt(char block[64], int edflag);
```

DESCRIPTION

The *encrypt*( ) function shall provide access to an implementation-defined encoding algorithm. The key generated by *setkey*( ) is used to encrypt the string *block* with *encrypt*( ).

The *block* argument to *encrypt*( ) shall be an array of length 64 bytes containing only the bytes with values of 0 and 1. The array is modified in place to a similar array using the key set by *setkey*( ). If *edflag* is 0, the argument is encoded. If *edflag* is 1, the argument may be decoded (see the APPLICATION USAGE section); if the argument is not decoded, *errno* shall be set to [ENOSYS].

The *encrypt*( ) function shall not change the setting of *errno* if successful. An application wishing to check for error situations should set *errno* to 0 before calling *encrypt*( ). If *errno* is non-zero on return, an error has occurred.

The *encrypt*( ) function need not be thread-safe.

RETURN VALUE

The *encrypt*( ) function shall not return a value.

ERRORS

The *encrypt*( ) function shall fail if:

[ENOSYS] The functionality is not supported on this implementation.

EXAMPLES

None.

APPLICATION USAGE

Historical implementations of the *encrypt*( ) function used a rather primitive encoding algorithm.

In some environments, decoding might not be implemented. This is related to some Government restrictions on encryption and decryption routines. Historical practice has been to ship a different version of the encryption library without the decryption feature in the routines supplied. Thus the exported version of *encrypt*( ) does encoding but not decoding.

25040 **NAME**

25041 endgrent, getgrent, setgrent — group database entry functions

25042 **SYNOPSIS**

25043 XSI
```
#include <grp.h>

void endgrent(void);
struct group *getgrent(void);
void setgrent(void);
```

25047 **DESCRIPTION**

25048 The *getgrent*( ) function shall return a pointer to a structure containing the broken-out fields of an
25049 entry in the group database. When first called, *getgrent*( ) shall return a pointer to a **group**
25050 structure containing the first entry in the group database. Thereafter, it shall return a pointer to a
25051 **group** structure containing the next group structure in the group database, so successive calls
25052 may be used to search the entire database.

25053 An implementation that provides extended security controls may impose further
25054 implementation-defined restrictions on accessing the group database. In particular, the system
25055 may deny the existence of some or all of the group database entries associated with groups other
25056 than those groups associated with the caller and may omit users other than the caller from the
25057 list of members of groups in database entries that are returned.

25058 The *setgrent*( ) function shall rewind the group database to allow repeated searches.

25059 The *endgrent*( ) function may be called to close the group database when processing is complete.

25060 These functions need not be thread-safe.

25061 **RETURN VALUE**

25062 When first called, *getgrent*( ) shall return a pointer to the first group structure in the group
25063 database. Upon subsequent calls it shall return the next group structure in the group database.
25064 The *getgrent*( ) function shall return a null pointer on end-of-file or an error and *errno* may be set
25065 to indicate the error.

25066 The return value may point to a static area which is overwritten by a subsequent call to
25067 *getgrgid*( ), *getgrnam*( ), or *getgrent*( ).

25068 **ERRORS**

25069 The *getgrent*( ) function may fail if:

25070 [EINTR] A signal was caught during the operation.

25071 [EIO] An I/O error has occurred.

25072 [EMFILE] All file descriptors available to the process are currently open.

25073 [ENFILE] The maximum allowable number of files is currently open in the system.

25074 **EXAMPLES**

25075 None.

25076 **APPLICATION USAGE**

25077 These functions are provided due to their historical usage. Applications should avoid
25078 dependencies on fields in the group database, whether the database is a single file, or where in
25079 the file system name space the database resides. Applications should use *getgrnam*( ) and
25080 *getgrgid*( ) whenever possible because it avoids these dependencies.

25081 **RATIONALE**

25082 None.

25083 **FUTURE DIRECTIONS**

NAME

endhostent, gethostent, sethostent — network host database functions

SYNOPSIS

```
#include <netdb.h>

void endhostent(void);
struct hostent *gethostent(void);
void sethostent(int stayopen);
```

DESCRIPTION

These functions shall retrieve information about hosts. This information is considered to be stored in a database that can be accessed sequentially or randomly. The implementation of this database is unspecified.

Note: In many cases this database is implemented by the Domain Name System, as documented in RFC 1034, RFC 1035, and RFC 1886.

The *sethostent*( ) function shall open a connection to the database and set the next entry for retrieval to the first entry in the database. If the *stayopen* argument is non-zero, the connection shall not be closed by a call to *gethostent*( ), and the implementation may maintain an open file descriptor.

The *gethostent*( ) function shall read the next entry in the database, opening and closing a connection to the database as necessary.

Entries shall be returned in **hostent** structures.

The *endhostent*( ) function shall close the connection to the database, releasing any open file descriptor.

These functions need not be thread-safe.

RETURN VALUE

Upon successful completion, the *gethostent*( ) function shall return a pointer to a **hostent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found.

ERRORS

No errors are defined for *endhostent*( ), *gethostent*( ), and *sethostent*( ).

EXAMPLES

None.

APPLICATION USAGE

The *gethostent*( ) function may return pointers to static data, which may be overwritten by subsequent calls to any of these functions.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

endnetent, getnetbyaddr, getnetbyname, getnetent, setnetent — network database functions

SYNOPSIS

```
#include <netdb.h>

void endnetent(void);
struct netent *getnetbyaddr(uint32_t net, int type);
struct netent *getnetbyname(const char *name);
struct netent *getnetent(void);
void setnetent(int stayopen);
```

DESCRIPTION

These functions shall retrieve information about networks. This information is considered to be stored in a database that can be accessed sequentially or randomly. The implementation of this database is unspecified.

The *setnetent*( ) function shall open and rewind the database. If the *stayopen* argument is non-zero, the connection to the *net* database shall not be closed after each call to *getnetent*( ) (either directly, or indirectly through one of the other *getnet**( ) functions), and the implementation may maintain an open file descriptor to the database.

The *getnetent*( ) function shall read the next entry of the database, opening and closing a connection to the database as necessary.

The *getnetbyaddr*( ) function shall search the database from the beginning, and find the first entry for which the address family specified by *type* matches the *n_addrtype* member and the network number *net* matches the *n_net* member, opening and closing a connection to the database as necessary. The *net* argument shall be the network number in host byte order.

The *getnetbyname*( ) function shall search the database from the beginning and find the first entry for which the network name specified by *name* matches the *n_name* member, opening and closing a connection to the database as necessary.

The *getnetbyaddr*( ), *getnetbyname*( ), and *getnetent*( ) functions shall each return a pointer to a **netent** structure, the members of which shall contain the fields of an entry in the network database.

The *endnetent*( ) function shall close the database, releasing any open file descriptor.

These functions need not be thread-safe.

RETURN VALUE

Upon successful completion, *getnetbyaddr*( ), *getnetbyname*( ), and *getnetent*( ) shall return a pointer to a **netent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found. Otherwise, a null pointer shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *getnetbyaddr*( ), *getnetbyname*( ), and *getnetent*( ) functions may return pointers to static data, which may be overwritten by subsequent calls to any of these functions.

NAME

endprotoent, getprotobyname, getprotobynumber, getprotoent, setprotoent — network protocol database functions

SYNOPSIS

```
#include <netdb.h>

void endprotoent(void);
struct protoent *getprotobyname(const char *name);
struct protoent *getprotobynumber(int proto);
struct protoent *getprotoent(void);
void setprotoent(int stayopen);
```

DESCRIPTION

These functions shall retrieve information about protocols. This information is considered to be stored in a database that can be accessed sequentially or randomly. The implementation of this database is unspecified.

The *setprotoent*( ) function shall open a connection to the database, and set the next entry to the first entry. If the *stayopen* argument is non-zero, the connection to the network protocol database shall not be closed after each call to *getprotoent*( ) (either directly, or indirectly through one of the other *getproto**( ) functions), and the implementation may maintain an open file descriptor for the database.

The *getprotobyname*( ) function shall search the database from the beginning and find the first entry for which the protocol name specified by *name* matches the *p_name* member, opening and closing a connection to the database as necessary.

The *getprotobynumber*( ) function shall search the database from the beginning and find the first entry for which the protocol number specified by *proto* matches the *p_proto* member, opening and closing a connection to the database as necessary.

The *getprotoent*( ) function shall read the next entry of the database, opening and closing a connection to the database as necessary.

The *getprotobyname*( ), *getprotobynumber*( ), and *getprotoent*( ) functions shall each return a pointer to a **protoent** structure, the members of which shall contain the fields of an entry in the network protocol database.

The *endprotoent*( ) function shall close the connection to the database, releasing any open file descriptor.

These functions need not be thread-safe.

RETURN VALUE

Upon successful completion, *getprotobyname*( ), *getprotobynumber*( ), and *getprotoent*( ) return a pointer to a **protoent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found. Otherwise, a null pointer is returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *getprotobyname*( ), *getprotobynumber*( ), and *getprotoent*( ) functions may return pointers to static data, which may be overwritten by subsequent calls to any of these functions.

NAME

endpwent, getpwent, setpwent — user database functions

SYNOPSIS

XSI
```
#include <pwd.h>

void endpwent(void);
struct passwd *getpwent(void);
void setpwent(void);
```

DESCRIPTION

These functions shall retrieve information about users.

The *getpwent*( ) function shall return a pointer to a structure containing the broken-out fields of an entry in the user database. Each entry in the user database contains a **passwd** structure. When first called, *getpwent*( ) shall return a pointer to a **passwd** structure containing the first entry in the user database. Thereafter, it shall return a pointer to a **passwd** structure containing the next entry in the user database. Successive calls can be used to search the entire user database.

If an end-of-file or an error is encountered on reading, *getpwent*( ) shall return a null pointer.

An implementation that provides extended security controls may impose further implementation-defined restrictions on accessing the user database. In particular, the system may deny the existence of some or all of the user database entries associated with users other than the caller.

The *setpwent*( ) function effectively rewinds the user database to allow repeated searches.

The *endpwent*( ) function may be called to close the user database when processing is complete.

These functions need not be thread-safe.

RETURN VALUE

The *getpwent*( ) function shall return a null pointer on end-of-file or error.

ERRORS

These functions may fail if:

[EIO] An I/O error has occurred.

In addition, *getpwent*( ) and *setpwent*( ) may fail if:

[EMFILE] All file descriptors available to the process are currently open.

[ENFILE] The maximum allowable number of files is currently open in the system.

The return value may point to a static area which is overwritten by a subsequent call to *getpwuid*( ), *getpwnam*( ), or *getpwent*( ).

EXAMPLES

Searching the User Database

The following example uses the *getpwent*( ) function to get successive entries in the user database, returning a pointer to a **passwd** structure that contains information about each user. The call to *endpwent*( ) closes the user database and cleans up.

```
#include <pwd.h>
#include <stdio.h>

void printname(uid_t uid)
{
    struct passwd *pwd;

    setpwent();
    while((pwd = getpwent()) != NULL) {
        if (pwd->pw_uid == uid) {
            printf("name=%s\n",pwd->pw_name);
            break;
        }
    }
    endpwent();
}
```

APPLICATION USAGE

These functions are provided due to their historical usage. Applications should avoid dependencies on fields in the password database, whether the database is a single file, or where in the file system name space the database resides. Applications should use *getpwuid*( ) whenever possible because it avoids these dependencies.

The EXAMPLES section is revised.

NAME

endservent, getservbyname, getservbyport, getservent, setservent — network services database functions

SYNOPSIS

```
#include <netdb.h>

void endservent(void);
struct servent *getservbyname(const char *name, const char *proto);
struct servent *getservbyport(int port, const char *proto);
struct servent *getservent(void);
void setservent(int stayopen);
```

DESCRIPTION

These functions shall retrieve information about network services. This information is considered to be stored in a database that can be accessed sequentially or randomly. The implementation of this database is unspecified.

The *setservent*( ) function shall open a connection to the database, and set the next entry to the first entry. If the *stayopen* argument is non-zero, the *net* database shall not be closed after each call to the *getservent*( ) function (either directly, or indirectly through one of the other *getserv**( ) functions), and the implementation may maintain an open file descriptor for the database.

The *getservent*( ) function shall read the next entry of the database, opening and closing a connection to the database as necessary.

The *getservbyname*( ) function shall search the database from the beginning and find the first entry for which the service name specified by *name* matches the *s_name* member and the protocol name specified by *proto* matches the *s_proto* member, opening and closing a connection to the database as necessary. If *proto* is a null pointer, any value of the *s_proto* member shall be matched.

The *getservbyport*( ) function shall search the database from the beginning and find the first entry for which the port specified by *port* matches the *s_port* member and the protocol name specified by *proto* matches the *s_proto* member, opening and closing a connection to the database as necessary. If *proto* is a null pointer, any value of the *s_proto* member shall be matched. The *port* argument shall be a value obtained by converting a **uint16_t** in network byte order to **int**.

The *getservbyname*( ), *getservbyport*( ), and *getservent*( ) functions shall each return a pointer to a **servent** structure, the members of which shall contain the fields of an entry in the network services database.

The *endservent*( ) function shall close the database, releasing any open file descriptor.

These functions need not be thread-safe.

RETURN VALUE

Upon successful completion, *getservbyname*( ), *getservbyport*( ), and *getservent*( ) return a pointer to a **servent** structure if the requested entry was found, and a null pointer if the end of the database was reached or the requested entry was not found. Otherwise, a null pointer is returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *port* argument of *getservbyport*( ) need not be compatible with the port values of all address families.

The *getservbyname*( ), *getservbyport*( ), and *getservent*( ) functions may return pointers to static data, which may be overwritten by subsequent calls to any of these functions.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

endutxent, getutxent, getutxid, getutxline, pututxline, setutxent — user accounting database functions

SYNOPSIS

XSI

```
#include <utmpx.h>

void endutxent(void);
struct utmpx *getutxent(void);
struct utmpx *getutxid(const struct utmpx *id);
struct utmpx *getutxline(const struct utmpx *line);
struct utmpx *pututxline(const struct utmpx *utmpx);
void setutxent(void);
```

DESCRIPTION

These functions shall provide access to the user accounting database.

The *getutxent*( ) function shall read the next entry from the user accounting database. If the database is not already open, it shall open it. If it reaches the end of the database, it shall fail.

The *getutxid*( ) function shall search forward from the current point in the database. If the *ut_type* value of the **utmpx** structure pointed to by *id* is BOOT_TIME, OLD_TIME, or NEW_TIME, then it shall stop when it finds an entry with a matching *ut_type* value. If the *ut_type* value is INIT_PROCESS, LOGIN_PROCESS, USER_PROCESS, or DEAD_PROCESS, then it shall stop when it finds an entry whose type is one of these four and whose *ut_id* member matches the *ut_id* member of the **utmpx** structure pointed to by *id*. If the end of the database is reached without a match, *getutxid*( ) shall fail.

The *getutxline*( ) function shall search forward from the current point in the database until it finds an entry of the type LOGIN_PROCESS or USER_PROCESS which also has a *ut_line* value matching that in the **utmpx** structure pointed to by *line*. If the end of the database is reached without a match, *getutxline*( ) shall fail.

The *getutxid*( ) or *getutxline*( ) function may cache data. For this reason, to use *getutxline*( ) to search for multiple occurrences, the application shall zero out the static data after each success, or *getutxline*( ) may return a pointer to the same **utmpx** structure.

There is one exception to the rule about clearing the structure before further reads are done. The implicit read done by *pututxline*( ) (if it finds that it is not already at the correct place in the user accounting database) shall not modify the static structure returned by *getutxent*( ), *getutxid*( ), or *getutxline*( ), if the application has modified this structure and passed the pointer back to *pututxline*( ).

For all entries that match a request, the *ut_type* member indicates the type of the entry. Other members of the entry shall contain meaningful data based on the value of the *ut_type* member as follows:

ut_type Member	Other Members with Meaningful Data
EMPTY	No others
BOOT_TIME	*ut_tv*
OLD_TIME	*ut_tv*
NEW_TIME	*ut_tv*
USER_PROCESS	*ut_id*, *ut_user* (login name of the user), *ut_line*, *ut_pid*, *ut_tv*
INIT_PROCESS	*ut_id*, *ut_pid*, *ut_tv*
LOGIN_PROCESS	*ut_id*, *ut_user* (implementation-defined name of the login process), *ut_pid*, *ut_tv*
DEAD_PROCESS	*ut_id*, *ut_pid*, *ut_tv*

An implementation that provides extended security controls may impose implementation-defined restrictions on accessing the user accounting database. In particular, the system may deny the existence of some or all of the user accounting database entries associated with users other than the caller.

If the process has appropriate privileges, the *pututxline*( ) function shall write out the structure into the user accounting database. It shall use *getutxid*( ) to search for a record that satisfies the request. If this search succeeds, then the entry shall be replaced. Otherwise, a new entry shall be made at the end of the user accounting database.

The *endutxent*( ) function shall close the user accounting database.

The *setutxent*( ) function shall reset the input to the beginning of the database. This should be done before each search for a new entry if it is desired that the entire database be examined.

These functions need not be thread-safe.

RETURN VALUE

Upon successful completion, *getutxent*( ), *getutxid*( ), and *getutxline*( ) shall return a pointer to a **utmpx** structure containing a copy of the requested entry in the user accounting database. Otherwise, a null pointer shall be returned.

The return value may point to a static area which is overwritten by a subsequent call to *getutxid*( ) or *getutxline*( ).

Upon successful completion, *pututxline*( ) shall return a pointer to a **utmpx** structure containing a copy of the entry added to the user accounting database. Otherwise, a null pointer shall be returned.

The *endutxent*( ) and *setutxent*( ) functions shall not return a value.

ERRORS

No errors are defined for the *endutxent*( ), *getutxent*( ), *getutxid*( ), *getutxline*( ), and *setutxent*( ) functions.

The *pututxline*( ) function may fail if:

[EPERM] The process does not have appropriate privileges.

EXAMPLES

None.

APPLICATION USAGE

The sizes of the arrays in the structure can be found using the *sizeof* operator.

RATIONALE

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

Issue 6

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

25484 **NAME**

25485 environ — array of character pointers to the environment strings

25486 **SYNOPSIS**

25487
```
extern char **environ;
```

25488 **DESCRIPTION**

25489 Refer to *exec* and XBD Chapter 8 (on page 173).

NAME

erand48 — generate uniformly distributed pseudo-random numbers

SYNOPSIS

XSI

```
#include <stdlib.h>

double erand48(unsigned short xsubi[3]);
```

DESCRIPTION

Refer to *drand48( )*.

25497 **NAME**

25498 erf, erff, erfl — error functions

25499 **SYNOPSIS**

25500
```
#include <math.h>
```

25501
```
double erf(double x);
```
25502
```
float erff(float x);
```
25503
```
long double erfl(long double x);
```

25504 **DESCRIPTION**

25505 CX The functionality described on this reference page is aligned with the ISO C standard. Any
25506 conflict between the requirements described here and the ISO C standard is unintentional. This
25507 volume of POSIX.1-200x defers to the ISO C standard.

25508 These functions shall compute the error function of their argument *x*, defined as:

25509
$$\frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$$

25510 An application wishing to check for error situations should set *errno* to zero and call
25511 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
25512 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
25513 zero, an error has occurred.

25514 **RETURN VALUE**

25515 Upon successful completion, these functions shall return the value of the error function.

25516 MX If *x* is NaN, a NaN shall be returned.

25517 If *x* is ±0, ±0 shall be returned.

25518 If *x* is ±Inf, ±1 shall be returned.

25519 If *x* is subnormal, a range error may occur, and 2 * *x*/*sqrt*(π) should be returned.

25520 **ERRORS**

25521 These functions may fail if:

25522 MX Range Error The result underflows.

25523 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
25524 then *errno* shall be set to [ERANGE]. If the integer expression
25525 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
25526 floating-point exception shall be raised.

25527 **EXAMPLES**

25528 **Computing the Probability for a Normal Variate**

25529 This example shows how to use *erf*( ) to compute the probability that a normal variate assumes a
25530 value in the range [*x*1,*x*2] with *x*1≤*x*2.

25531 This example uses the constant M_SQRT1_2 which is part of the XSI option.

25532
```
#include <math.h>
```

25533
```
double
```
25534
```
Phi(const double x1, const double x2)
```
25535
```
{
```
25536
```
    return ( erf(x2*M_SQRT1_2) – erf(x1*M_SQRT1_2) ) / 2;
```

```
}
```

APPLICATION USAGE

Underflow occurs when $|x| < \text{DBL\_MIN} * (sqrt(\pi)/2)$.

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.19 (on page 116), **<math.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *erf*( ) function is no longer marked as an extension.

The *erfc*( ) function is split out onto its own reference page.

The *erff*( ) and *erfl*( ) functions are added for alignment with the ISO/IEC 9899: 1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899: 1999 standard.

IEC 60559: 1989 standard floating-point extensions over the ISO/IEC 9899: 1999 standard are marked.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/22 is applied, adding the example to the EXAMPLES section.

NAME

erfc, erfcf, erfcl — complementary error functions

SYNOPSIS

```
#include <math.h>

double erfc(double x);
float erfcf(float x);
long double erfcl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the complementary error function 1.0 – *erf* (*x*).

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the value of the complementary error function.

If the correct value would cause underflow and is not representable, a range error may occur and MX either 0.0 (if representable), or an implementation-defined value shall be returned.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, +1 shall be returned.

If *x* is –Inf, +2 shall be returned.

If *x* is +Inf, +0 shall be returned.

If the correct value would cause underflow and is representable, a range error may occur and the correct value shall be returned.

ERRORS

These functions may fail if:

Range Error — The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

The *erfc*( ) function is provided because of the extreme loss of relative accuracy if *erf* (*x*) is called for large *x* and the result subtracted from 1.0.

Note for IEEE Std 754-1985 **double**, 26.55 < *x* implies *erfc*(*x*) has underflowed.

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *erfc( )* function is no longer marked as an extension.

These functions are split out from the *erf( )* reference page.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

25625 **NAME**

25626 erff, erfl — error functions

25627 **SYNOPSIS**

25628 `#include <math.h>`

25629 `float erff(float x);`

25630 `long double erfl(long double x);`

25631 **DESCRIPTION**

25632 Refer to *erf( )*.

25633 **NAME**

25634 errno — error return value

25635 **SYNOPSIS**

25636 `#include <errno.h>`

25637 **DESCRIPTION**

25638 The lvalue *errno* is used by many functions to return error values.

25639 Many functions provide an error number in *errno*, which has type **int** and is defined in
25640 **<errno.h>**. The value of *errno* shall be defined only after a call to a function for which it is
25641 explicitly stated to be set and until it is changed by the next function call or if the application
25642 assigns it a value. The value of *errno* should only be examined when it is indicated to be valid by
25643 a function's return value. Applications shall obtain the definition of *errno* by the inclusion of
25644 **<errno.h>**. No function in this volume of POSIX.1-200x shall set *errno* to 0. The setting of *errno*
25645 after a successful call to a function is unspecified unless the description of that function specifies
25646 that *errno* shall not be modified.

25647 It is unspecified whether *errno* is a macro or an identifier declared with external linkage. If a
25648 macro definition is suppressed in order to access an actual object, or a program defines an
25649 identifier with the name *errno*, the behavior is undefined.

25650 The symbolic values stored in *errno* are documented in the ERRORS sections on all relevant
25651 pages.

25652 **RETURN VALUE**

25653 None.

25654 **ERRORS**

25655 None.

25656 **EXAMPLES**

25657 None.

25658 **APPLICATION USAGE**

25659 Previously both POSIX and X/Open documents were more restrictive than the ISO C standard
25660 in that they required *errno* to be defined as an external variable, whereas the ISO C standard
25661 required only that *errno* be defined as a modifiable lvalue with type **int**.

25662 An application that needs to examine the value of *errno* to determine the error should set it to 0
25663 before a function call, then inspect it before a subsequent function call.

25664 **RATIONALE**

25665 None.

25666 **FUTURE DIRECTIONS**

25667 None.

25668 **SEE ALSO**

25669 Section 2.3

25670 XBD **<errno.h>**

25671 **CHANGE HISTORY**

25672 First released in Issue 1. Derived from Issue 1 of the SVID.

25673 **Issue 5**

25674 The following sentence is deleted from the DESCRIPTION: "The value of *errno* is 0 at program
25675 start-up, but is never set to 0 by any XSI function".

The DESCRIPTION also no longer states that conforming implementations may support the declaration:

```
extern int errno;
```

Issue 6

Obsolescent text regarding defining *errno* as:

```
extern int errno
```

is removed.

Text regarding no function setting *errno* to zero to indicate an error is changed to no function shall set *errno* to zero. This is for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/23 is applied, adding text to the DESCRIPTION stating that the setting of *errno* after a successful call to a function is unspecified unless the description of the function requires that it will not be modified.

NAME

environ, execl, execle, execlp, execv, execve, execvp, fexecve — execute a file

SYNOPSIS

```
#include <unistd.h>

extern char **environ;
int execl(const char *path, const char *arg0, ... /*, (char *)0 */);
int execle(const char *path, const char *arg0, ... /*,
    (char *)0, char *const envp[]*/);
int execlp(const char *file, const char *arg0, ... /*, (char *)0 */);
int execv(const char *path, char *const argv[]);
int execve(const char *path, char *const argv[], char *const envp[]);
int execvp(const char *file, char *const argv[]);
int fexecve(int fd, char *const argv[], char *const envp[]);
```

DESCRIPTION

The *exec* family of functions shall replace the current process image with a new process image. The new image shall be constructed from a regular, executable file called the *new process image file*. There shall be no return from a successful *exec*, because the calling process image is overlaid by the new process image.

The *fexecve*() function shall be equivalent to the *execve*() function except that the file to be executed is determined by the file descriptor *fd* instead of a pathname. The file offset of *fd* is ignored.

When a C-language program is executed as a result of a call to one of the *exec* family of functions, it shall be entered as a C-language function call as follows:

```
int main (int argc, char *argv[]);
```

where *argc* is the argument count and *argv* is an array of character pointers to the arguments themselves. In addition, the following variable:

```
extern char **environ;
```

is initialized as a pointer to an array of character pointers to the environment strings. The *argv* and *environ* arrays are each terminated by a null pointer. The null pointer terminating the *argv* array is not counted in *argc*.

Conforming multi-threaded applications shall not use the *environ* variable to access or modify any environment variable while any other thread is concurrently modifying any environment variable. A call to any function dependent on any environment variable shall be considered a use of the *environ* variable to access that environment variable.

The arguments specified by a program with one of the *exec* functions shall be passed on to the new process image in the corresponding *main*() arguments.

The argument *path* points to a pathname that identifies the new process image file.

The argument *file* is used to construct a pathname that identifies the new process image file. If the *file* argument contains a <slash> character, the *file* argument shall be used as the pathname for this file. Otherwise, the path prefix for this file is obtained by a search of the directories passed as the environment variable *PATH* (see XBD Chapter 8, on page 173). If this environment variable is not present, the results of the search are implementation-defined.

There are two distinct ways in which the contents of the process image file may cause the execution to fail, distinguished by the setting of *errno* to either [ENOEXEC] or [EINVAL] (see the ERRORS section). In the cases where the other members of the *exec* family of functions would

fail and set *errno* to [ENOEXEC], the *execlp*() and *execvp*() functions shall execute a command interpreter and the environment of the executed command shall be as if the process invoked the *sh* utility using *execl*() as follows:

```
execl(<shell path>, arg0, file, arg1, ..., (char *)0);
```

where <*shell path*> is an unspecified pathname for the *sh* utility, *file* is the process image file, and for *execvp*(), where *arg*0, *arg*1, and so on correspond to the values passed to *execvp*() in *argv*[0], *argv*[1], and so on.

The arguments represented by *arg0*,... are pointers to null-terminated character strings. These strings shall constitute the argument list available to the new process image. The list is terminated by a null pointer. The argument *arg0* should point to a filename that is associated with the process being started by one of the *exec* functions.

The argument *argv* is an array of character pointers to null-terminated strings. The application shall ensure that the last member of this array is a null pointer. These strings shall constitute the argument list available to the new process image. The value in *argv*[0] should point to a filename that is associated with the process being started by one of the *exec* functions.

The argument *envp* is an array of character pointers to null-terminated strings. These strings shall constitute the environment for the new process image. The *envp* array is terminated by a null pointer.

For those forms not containing an *envp* pointer (*execl*(), *execv*(), *execlp*(), and *execvp*()), the environment for the new process image shall be taken from the external variable *environ* in the calling process.

The number of bytes available for the new process' combined argument and environment lists is {ARG_MAX}. It is implementation-defined whether null terminators, pointers, and/or any alignment bytes are included in this total.

File descriptors open in the calling process image shall remain open in the new process image, except for those whose close-on-*exec* flag FD_CLOEXEC is set. For those file descriptors that remain open, all attributes of the open file description remain unchanged. For any file descriptor that is closed for this reason, file locks are removed as a result of the close as described in *close*(). Locks that are not removed by closing of file descriptors remain unchanged.

If file descriptors 0, 1, and 2 would otherwise be closed after a successful call to one of the *exec* family of functions, and the new process image file has the set-user-ID or set-group-ID file mode bits set, XSI and the ST_NOSUID bit is not set for the file system containing the new process image file, implementations may open an unspecified file for each of these file descriptors in the new process image.

Directory streams open in the calling process image shall be closed in the new process image.

The state of the floating-point environment in the initial thread of the new process image shall be set to the default.

The state of conversion descriptors and message catalog descriptors in the new process image is undefined.

For the new process image, the equivalent of:

```
setlocale(LC_ALL, "C")
```

shall be executed at start-up.

Signals set to the default action (SIG_DFL) in the calling process image shall be set to the default action in the new process image. Except for SIGCHLD, signals set to be ignored (SIG_IGN) by

the calling process image shall be set to be ignored by the new process image. Signals set to be caught by the calling process image shall be set to the default action in the new process image (see **<signal.h>**).

If the SIGCHLD signal is set to be ignored by the calling process image, it is unspecified whether the SIGCHLD signal is set to be ignored or to the default action in the new process image.

XSI After a successful call to any of the *exec* functions, alternate signal stacks are not preserved and the SA_ONSTACK flag shall be cleared for all signals.

After a successful call to any of the *exec* functions, any functions previously registered by the *atexit*( ) or *pthread_atfork*( ) functions are no longer registered.

XSI If the ST_NOSUID bit is set for the file system containing the new process image file, then the effective user ID, effective group ID, saved set-user-ID, and saved set-group-ID are unchanged in the new process image. Otherwise, if the set-user-ID mode bit of the new process image file is set, the effective user ID of the new process image shall be set to the user ID of the new process image file. Similarly, if the set-group-ID mode bit of the new process image file is set, the effective group ID of the new process image shall be set to the group ID of the new process image file. The real user ID, real group ID, and supplementary group IDs of the new process image shall remain the same as those of the calling process image. The effective user ID and effective group ID of the new process image shall be saved (as the saved set-user-ID and the saved set-group-ID) for use by *setuid*( ).

XSI Any shared memory segments attached to the calling process image shall not be attached to the new process image.

Any named semaphores open in the calling process shall be closed as if by appropriate calls to *sem_close*( ).

TYM Any blocks of typed memory that were mapped in the calling process are unmapped, as if *munmap*( ) was implicitly called to unmap them.

ML Memory locks established by the calling process via calls to *mlockall*( ) or *mlock*( ) shall be removed. If locked pages in the address space of the calling process are also mapped into the address spaces of other processes and are locked by those processes, the locks established by the other processes shall be unaffected by the call by this process to the *exec* function. If the *exec* function fails, the effect on memory locks is unspecified.

Memory mappings created in the process are unmapped before the address space is rebuilt for the new process image.

SS When the calling process image does not use the SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC scheduling policies, the scheduling policy and parameters of the new process image and the initial thread in that new process image are implementation-defined.

PS When the calling process image uses the SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC scheduling policies, the process policy and scheduling parameter settings shall not be changed
TPS by a call to an *exec* function. The initial thread in the new process image shall inherit the process scheduling policy and parameters. It shall have the default system contention scope, but shall inherit its allocation domain from the calling process image.

Per-process timers created by the calling process shall be deleted before replacing the current process image with the new process image.

MSG All open message queue descriptors in the calling process shall be closed, as described in *mq_close*( ).

Any outstanding asynchronous I/O operations may be canceled. Those asynchronous I/O

operations that are not canceled shall complete as if the *exec* function had not yet occurred, but any associated signal notifications shall be suppressed. It is unspecified whether the *exec* function itself blocks awaiting such I/O completion. In no event, however, shall the new process image created by the *exec* function be affected by the presence of outstanding asynchronous I/O operations at the time the *exec* function is called. Whether any I/O is canceled, and which I/O may be canceled upon *exec*, is implementation-defined.

CPT The new process image shall inherit the CPU-time clock of the calling process image. This inheritance means that the process CPU-time clock of the process being *exec*-ed shall not be reinitialized or altered as a result of the *exec* function other than to reflect the time spent by the process executing the *exec* function itself.

TCT The initial value of the CPU-time clock of the initial thread of the new process image shall be set to zero.

OB TRC If the calling process is being traced, the new process image shall continue to be traced into the same trace stream as the original process image, but the new process image shall not inherit the mapping of trace event names to trace event type identifiers that was defined by calls to the *posix_trace_eventid_open*() or the *posix_trace_trid_eventid_open*() functions in the calling process image.

If the calling process is a trace controller process, any trace streams that were created by the calling process shall be shut down as described in the *posix_trace_shutdown*() function.

The thread ID of the initial thread in the new process image is unspecified.

The size and location of the stack on which the initial thread in the new process image runs is unspecified.

The initial thread in the new process image shall have its cancellation type set to PTHREAD_CANCEL_DEFERRED and its cancellation state set to PTHREAD_CANCEL_ENABLED.

The initial thread in the new process image shall have all thread-specific data values set to NULL and all thread-specific data keys shall be removed by the call to *exec* without running destructors.

The initial thread in the new process image shall be joinable, as if created with the *detachstate* attribute set to PTHREAD_CREATE_JOINABLE.

The new process shall inherit at least the following attributes from the calling process image:

- XSI Nice value (see *nice*())
- XSI *semadj* values (see *semop*())
- Process ID
- Parent process ID
- Process group ID
- Session membership
- Real user ID
- Real group ID
- Supplementary group IDs

- Time left until an alarm clock signal (see *alarm*())
- Current working directory
- Root directory
- File mode creation mask (see *umask*())

XSI
- File size limit (see *getrlimit*() and *setrlimit*())

- Process signal mask (see *pthread_sigmask*())
- Pending signal (see *sigpending*())
- *tms_utime*, *tms_stime*, *tms_cutime*, and *tms_cstime* (see *times*())

XSI
- Resource limits

- Controlling terminal

XSI
- Interval timers

The initial thread of the new process shall inherit at least the following attributes from the calling thread:

- Signal mask (see *sigprocmask*() and *pthread_sigmask*())
- Pending signals (see *sigpending*())

All other process attributes defined in this volume of POSIX.1-200x shall be inherited in the new process image from the old process image. All other thread attributes defined in this volume of POSIX.1-200x shall be inherited in the initial thread in the new process image from the calling thread in the old process image. The inheritance of process or thread attributes not defined by this volume of POSIX.1-200x is implementation-defined.

A call to any *exec* function from a process with more than one thread shall result in all threads being terminated and the new executable image being loaded and executed. No destructor functions or cleanup handlers shall be called.

Upon successful completion, the *exec* functions shall mark for update the last data access timestamp of the file. If an *exec* function failed but was able to locate the process image file, whether the last data access timestamp is marked for update is unspecified. Should the *exec* function succeed, the process image file shall be considered to have been opened with *open*(). The corresponding *close*() shall be considered to occur at a time after this open, but before process termination or successful completion of a subsequent call to one of the *exec* functions, *posix_spawn*(), or *posix_spawnp*(). The *argv*[] and *envp*[] arrays of pointers and the strings to which those arrays point shall not be modified by a call to one of the *exec* functions, except as a consequence of replacing the process image.

XSI
The saved resource limits in the new process image are set to be a copy of the process' corresponding hard and soft limits.

RETURN VALUE

If one of the *exec* functions returns to the calling process image, an error has occurred; the return value shall be –1, and *errno* shall be set to indicate the error.

ERRORS

The *exec* functions shall fail if:

[E2BIG] The number of bytes used by the new process image's argument list and environment list is greater than the system-imposed limit of {ARG_MAX} bytes.

[EACCES] Search permission is denied for a directory listed in the new process image file's path prefix, or the new process image file denies execution permission, or the new process image file is not a regular file and the implementation does not support execution of files of its type.

[EINVAL] The new process image file has appropriate privileges and has a recognized executable binary format, but the system does not support execution of a file with this format.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* or *file* argument.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* or *file* does not name an existing file or *path* or *file* is an empty string.

[ENOTDIR] A component of the new process image file's path prefix is not a directory, or the new process image file's pathname contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

The *exec* functions, except for *execlp*( ) and *execvp*( ), shall fail if:

[ENOEXEC] The new process image file has the appropriate access permission but has an unrecognized format.

The *fexecve*( ) function shall fail if:

[EBADF] The *fd* argument is not a valid file descriptor open for executing.

The *exec* functions may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* or *file* argument.

[ENAMETOOLONG]
The length of the *path* argument or the length of the pathname constructed from the *file* argument exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[ENOMEM] The new process image requires more memory than is allowed by the hardware or system-imposed memory management constraints.

[ETXTBSY] The new process image file is a pure procedure (shared text) file that is currently open for writing by some process.

EXAMPLES

Using execl()

The following example executes the *ls* command, specifying the pathname of the executable (**/bin/ls**) and using arguments supplied directly to the command to produce single-column output.

```
#include <unistd.h>

int ret;
...
ret = execl ("/bin/ls", "ls", "-1", (char *)0);
```

Using execle()

The following example is similar to Using execl( ). In addition, it specifies the environment for the new process image using the *env* argument.

```
#include <unistd.h>

int ret;
char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
...
ret = execle ("/bin/ls", "ls", "-l", (char *)0, env);
```

Using execlp()

The following example searches for the location of the *ls* command among the directories specified by the *PATH* environment variable.

```
#include <unistd.h>

int ret;
...
ret = execlp ("ls", "ls", "-l", (char *)0);
```

Using execv()

The following example passes arguments to the *ls* command in the *cmd* array.

```
#include <unistd.h>

int ret;
char *cmd[] = { "ls", "-l", (char *)0 };
...
ret = execv ("/bin/ls", cmd);
```

25970 **Using execve()**

25971 The following example passes arguments to the *ls* command in the *cmd* array, and specifies the
25972 environment for the new process image using the *env* argument.

25973
```
#include <unistd.h>
```

25974
```
int ret;
```
25975
```
char *cmd[] = { "ls", "-l", (char *)0 };
```
25976
```
char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
```
25977
```
...
```
25978
```
ret = execve ("/bin/ls", cmd, env);
```

25979 **Using execvp()**

25980 The following example searches for the location of the *ls* command among the directories
25981 specified by the *PATH* environment variable, and passes arguments to the *ls* command in the
25982 *cmd* array.

25983
```
#include <unistd.h>
```

25984
```
int ret;
```
25985
```
char *cmd[] = { "ls", "-l", (char *)0 };
```
25986
```
...
```
25987
```
ret = execvp ("ls", cmd);
```

25988 **APPLICATION USAGE**

25989 As the state of conversion descriptors and message catalog descriptors in the new process image
25990 is undefined, conforming applications should not rely on their use and should close them prior
25991 to calling one of the *exec* functions.

25992 Applications that require other than the default POSIX locale should call *setlocale*() with the
25993 appropriate parameters to establish the locale of the new process.

25994 The *environ* array should not be accessed directly by the application.

25995 The new process might be invoked in a non-conforming environment if the *envp* array does not
25996 contain implementation-defined variables required by the implementation to provide a
25997 conforming environment. See the _CS_V7_ENV entry in **<unistd.h>** and *confstr*() for details.

25998 Applications should not depend on file descriptors 0, 1, and 2 being closed after an *exec*. A
25999 future version may allow these file descriptors to be automatically opened for any process.

26000 If an application wants to perform a checksum test of the file being executed before executing it,
26001 the file will need to be opened with read permission to perform the checksum test.

26002 Since execute permission is checked by *fexecve*(), the file description *fd* need not have been
26003 opened with the O_EXEC flag. However, if the file to be executed denies read and write
26004 permission for the process preparing to do the *exec*, the only way to provide the *fd* to *fexecve*()
26005 will be to use the O_EXEC flag when opening *fd*. In this case, the application will not be able to
26006 perform a checksum test since it will not be able to read the contents of the file.

26007 Note that when a file descriptor is opened with O_RDONLY, O_RDWR, or O_WRONLY mode,
26008 the file descriptor can be used to read, read and write, or write the file, respectively, even if the
26009 mode of the file changes after the file was opened. Using the O_EXEC open mode is different;
26010 *fexecve*() will ignore the mode that was used when the file descriptor was opened and the *exec*
26011 will fail if the mode of the file associated with *fd* does not grant execute permission to the calling
26012 process at the time *fexecve*() is called.

RATIONALE

Early proposals required that the value of *argc* passed to *main*() be "one or greater". This was driven by the same requirement in drafts of the ISO C standard. In fact, historical implementations have passed a value of zero when no arguments are supplied to the caller of the *exec* functions. This requirement was removed from the ISO C standard and subsequently removed from this volume of POSIX.1-200x as well. The wording, in particular the use of the word *should*, requires a Strictly Conforming POSIX Application to pass at least one argument to the *exec* function, thus guaranteeing that *argc* be one or greater when invoked by such an application. In fact, this is good practice, since many existing applications reference *argv*[0] without first checking the value of *argc*.

The requirement on a Strictly Conforming POSIX Application also states that the value passed as the first argument be a filename associated with the process being started. Although some existing applications pass a pathname rather than a filename in some circumstances, a filename is more generally useful, since the common usage of *argv*[0] is in printing diagnostics. In some cases the filename passed is not the actual filename of the file; for example, many implementations of the *login* utility use a convention of prefixing a <hyphen> (`'-'`) to the actual filename, which indicates to the command interpreter being invoked that it is a "login shell".

Historically, there have been two ways that implementations can *exec* shell scripts.

One common historical implementation is that the *execl*(), *execv*(), *execle*(), and *execve*() functions return an [ENOEXEC] error for any file not recognizable as executable, including a shell script. When the *execlp*() and *execvp*() functions encounter such a file, they assume the file to be a shell script and invoke a known command interpreter to interpret such files. This is now required by POSIX.1-200x. These implementations of *execvp*() and *execlp*() only give the [ENOEXEC] error in the rare case of a problem with the command interpreter's executable file. Because of these implementations, the [ENOEXEC] error is not mentioned for *execlp*() or *execvp*(), although implementations can still give it.

Another way that some historical implementations handle shell scripts is by recognizing the first two bytes of the file as the character string `"#!"` and using the remainder of the first line of the file as the name of the command interpreter to execute.

One potential source of confusion noted by the standard developers is over how the contents of a process image file affect the behavior of the *exec* family of functions. The following is a description of the actions taken:

1. If the process image file is a valid executable (in a format that is executable and valid and having appropriate privileges) for this system, then the system executes the file.
2. If the process image file has appropriate privileges and is in a format that is executable but not valid for this system (such as a recognized binary for another architecture), then this is an error and *errno* is set to [EINVAL] (see later RATIONALE on [EINVAL]).
3. If the process image file has appropriate privileges but is not otherwise recognized:
    a. If this is a call to *execlp*() or *execvp*(), then they invoke a command interpreter assuming that the process image file is a shell script.
    b. If this is not a call to *execlp*() or *execvp*(), then an error occurs and *errno* is set to [ENOEXEC].

Applications that do not require to access their arguments may use the form:

```
main(void)
```

as specified in the ISO C standard. However, the implementation will always provide the two

arguments *argc* and *argv*, even if they are not used.

Some implementations provide a third argument to *main*() called *envp*. This is defined as a pointer to the environment. The ISO C standard specifies invoking *main*() with two arguments, so implementations must support applications written this way. Since this volume of POSIX.1-200x defines the global variable *environ*, which is also provided by historical implementations and can be used anywhere that *envp* could be used, there is no functional need for the *envp* argument. Applications should use the *getenv*() function rather than accessing the environment directly via either *envp* or *environ*. Implementations are required to support the two-argument calling sequence, but this does not prohibit an implementation from supporting *envp* as an optional third argument.

This volume of POSIX.1-200x specifies that signals set to SIG_IGN remain set to SIG_IGN, and that the new process image inherits the signal mask of the thread that called *exec* in the old process image. This is consistent with historical implementations, and it permits some useful functionality, such as the *nohup* command. However, it should be noted that many existing applications wrongly assume that they start with certain signals set to the default action and/or unblocked. In particular, applications written with a simpler signal model that does not include blocking of signals, such as the one in the ISO C standard, may not behave properly if invoked with some signals blocked. Therefore, it is best not to block or ignore signals across *exec*s without explicit reason to do so, and especially not to block signals across *exec*s of arbitrary (not closely co-operating) programs.

The *exec* functions always save the value of the effective user ID and effective group ID of the process at the completion of the *exec*, whether or not the set-user-ID or the set-group-ID bit of the process image file is set.

The statement about *argv*[ ] and *envp*[ ] being constants is included to make explicit to future writers of language bindings that these objects are completely constant. Due to a limitation of the ISO C standard, it is not possible to state that idea in standard C. Specifying two levels of *const–qualification* for the *argv*[ ] and *envp*[ ] parameters for the *exec* functions may seem to be the natural choice, given that these functions do not modify either the array of pointers or the characters to which the function points, but this would disallow existing correct code. Instead, only the array of pointers is noted as constant. The table of assignment compatibility for *dst=src* derived from the ISO C standard summarizes the compatibility:

dst:	**char *[ ]**	**const char *[ ]**	**char *const[ ]**	**const char *const[ ]**
src:				
char *[ ]	VALID	—	VALID	—
const char *[ ]	—	VALID	—	VALID
char * const [ ]	—	—	VALID	—
const char *const[ ]	—	—	—	VALID

Since all existing code has a source type matching the first row, the column that gives the most valid combinations is the third column. The only other possibility is the fourth column, but using it would require a cast on the *argv* or *envp* arguments. It is unfortunate that the fourth column cannot be used, because the declaration a non-expert would naturally use would be that in the second row.

The ISO C standard and this volume of POSIX.1-200x do not conflict on the use of *environ*, but some historical implementations of *environ* may cause a conflict. As long as *environ* is treated in the same way as an entry point (for example, *fork*()), it conforms to both standards. A library can contain *fork*(), but if there is a user-provided *fork*(), that *fork*() is given precedence and no problem ensues. The situation is similar for *environ*: the definition in this volume of POSIX.1-200x is to be used if there is no user-provided *environ* to take precedence. At least three

implementations are known to exist that solve this problem.

[E2BIG] The limit {ARG_MAX} applies not just to the size of the argument list, but to the sum of that and the size of the environment list.

[EFAULT] Some historical systems return [EFAULT] rather than [ENOEXEC] when the new process image file is corrupted. They are non-conforming.

[EINVAL] This error condition was added to POSIX.1-200x to allow an implementation to detect executable files generated for different architectures, and indicate this situation to the application. Historical implementations of shells, *execvp*( ), and *execlp*( ) that encounter an [ENOEXEC] error will execute a shell on the assumption that the file is a shell script. This will not produce the desired effect when the file is a valid executable for a different architecture. An implementation may now choose to avoid this problem by returning [EINVAL] when a valid executable for a different architecture is encountered. Some historical implementations return [EINVAL] to indicate that the *path* argument contains a character with the high order bit set. The standard developers chose to deviate from historical practice for the following reasons:

1. The new utilization of [EINVAL] will provide some measure of utility to the user community.
2. Historical use of [EINVAL] is not acceptable in an internationalized operating environment.

[ENAMETOOLONG]
Since the file pathname may be constructed by taking elements in the *PATH* variable and putting them together with the filename, the [ENAMETOOLONG] error condition could also be reached this way.

[ETXTBSY] System V returns this error when the executable file is currently open for writing by some process. This volume of POSIX.1-200x neither requires nor prohibits this behavior.

Other systems (such as System V) may return [EINTR] from *exec*. This is not addressed by this volume of POSIX.1-200x, but implementations may have a window between the call to *exec* and the time that a signal could cause one of the *exec* calls to return with [EINTR].

An explicit statement regarding the floating-point environment (as defined in the **<fenv.h>** header) was added to make it clear that the floating-point environment is set to its default when a call to one of the *exec* functions succeeds. The requirements for inheritance or setting to the default for other process and thread start-up functions is covered by more generic statements in their descriptions and can be summarized as follows:

posix_spawn( )	Set to default.
fork( )	Inherit.
pthread_create( )	Inherit.

The purpose of the *fexecve*( ) function is to enable executing a file which has been verified to be the intended file. It is possible to actively check the file by reading from the file descriptor and be sure that the file is not exchanged for another between the reading and the execution. Alternatively, an function like *openat*( ) can be used to open a file which has been found by reading the content of a directory using *readdir*( ).

FUTURE DIRECTIONS

None.

XBD Chapter 8 (on page 173), **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, behavior is defined for when the process image file is not a valid executable.
- In this version, _POSIX_SAVED_IDS is mandated, thus the effective user ID and effective group ID of the new process image shall be saved (as the saved set-user-ID and the saved set-group-ID) for use by the *setuid*( ) function.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [EINVAL] mandatory error condition is added.
- The [ELOOP] optional error condition is added.

The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for typed memory.

The normative text is updated to avoid use of the term "must" for application requirements.

The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

IEEE PASC Interpretation 1003.1 #132 is applied.

The DESCRIPTION is updated to make it explicit that the floating-point environment in the new process image is set to the default.

The DESCRIPTION and RATIONALE are updated to include clarifications of how the contents of a process image file affect the behavior of the *exec* functions.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/15 is applied, adding a new paragraph to the DESCRIPTION and text to the end of the APPLICATION USAGE section. This change

addresses a security concern, where implementations may want to reopen file descriptors 0, 1, and 2 for programs with the set-user-id or set-group-id file mode bits calling the *exec* family of functions.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/24 is applied, applying changes to the DESCRIPTION, addressing which attributes are inherited by threads, and behavioral requirements for threads attributes.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/25 is applied, updating text in the RATIONALE from "the process signal mask be unchanged across an *exec*" to "the new process image inherits the signal mask of the thread that called *exec* in the old process image".

Issue 7

Austin Group Interpretation 1003.1-2001 #047 is applied, adding the description of _CS_V7_ENV to the APPLICATION USAGE.

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *fexecve*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, Threads, and Timers options is moved to the Base.

Changes are made related to support for finegrained timestamps.

NAME

exit — terminate a process

SYNOPSIS

```
#include <stdlib.h>

void exit(int status);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The value of *status* may be 0, EXIT_SUCCESS, EXIT_FAILURE, or any other value, though only the least significant 8 bits (that is, *status* & 0377) shall be available to a waiting parent process.

The *exit*( ) function shall first call all functions registered by *atexit*( ), in the reverse order of their registration, except that a function is called after any previously registered functions that had already been called at the time it was registered. Each function is called as many times as it was registered. If, during the call to any such function, a call to the *longjmp*( ) function is made that would terminate the call to the registered function, the behavior is undefined.

If a function registered by a call to *atexit*( ) fails to return, the remaining registered functions shall not be called and the rest of the *exit*( ) processing shall not be completed. If *exit*( ) is called more than once, the behavior is undefined.

The *exit*( ) function shall then flush all open streams with unwritten buffered data and close all CX open streams. Finally, the process shall be terminated with the same consequences as described in Consequences of Process Termination (on page 545).

RETURN VALUE

The *exit*( ) function does not return.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

See *_Exit*( ).

FUTURE DIRECTIONS

None.

SEE ALSO

_Exit( ), *atexit*( ), *exec*, *longjmp*( ), *tmpfile*( )

XBD **<stdlib.h>**

CHANGE HISTORY

Issue 7

Austin Group Interpretation 1003.1-2001 #031 is applied, separating the *_Exit*( ) and *_exit*( ) functions from the *exit*( ) function.

Austin Group Interpretation 1003.1-2001 #085 is applied.

NAME

exp, expf, expl — exponential function

SYNOPSIS

```
#include <math.h>

double exp(double x);
float expf(float x);
long double expl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the base-*e* exponential of *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the exponential value of *x*.

If the correct value would cause overflow, a range error shall occur and *exp*( ), *expf*( ), and *expl*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

If the correct value would cause underflow, and is not representable, a range error may occur, and MX either 0.0 (if supported), or an implementation-defined value shall be returned.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, 1 shall be returned.

If *x* is –Inf, +0 shall be returned.

If *x* is +Inf, *x* shall be returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

ERRORS

These functions shall fail if:

Range Error — The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

Range Error — The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

Computing the Density of the Standard Normal Distribution

This function shows an implementation for the density of the standard normal distribution using *exp*( ). This example uses the constant M_PI which is part of the XSI option.

```
#include <math.h>

double
normal_density (double  x)
{
    return exp(-x*x/2) / sqrt (2*M_PI);
}
```

APPLICATION USAGE

Note that for IEEE Std 754-1985 **double**, 709.8 < *x* implies *exp*(*x*) has overflowed. The value *x*< –708.4 implies *exp*(*x*) has underflowed.

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *expf*( ) and *expl*( ) functions are added for alignment with the ISO/IEC 9899: 1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899: 1999 standard.

IEC 60559: 1989 standard floating-point extensions over the ISO/IEC 9899: 1999 standard are marked.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/26 is applied, adding the example to the EXAMPLES section.

NAME

exp2, exp2f, exp2l — exponential base 2 functions

SYNOPSIS

```
#include <math.h>

double exp2(double x);
float exp2f(float x);
long double exp2l(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the base-2 exponential of *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return 2^x.

If the correct value would cause overflow, a range error shall occur and *exp2*( ), *exp2f*( ), and *exp2l*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

If the correct value would cause underflow, and is not representable, a range error may occur, and MX either 0.0 (if supported), or an implementation-defined value shall be returned.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, 1 shall be returned.

If *x* is –Inf, +0 shall be returned.

If *x* is +Inf, *x* shall be returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

ERRORS

These functions shall fail if:

Range Error — The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

Range Error — The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

For IEEE Std 754-1985 **double**, 1024 <= *x* implies *exp2*(*x*) has overflowed. The value *x*< –1022 implies *exp*(*x*) has underflowed.

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

expm1, expm1f, expm1l — compute exponential functions

SYNOPSIS

```
#include <math.h>

double expm1(double x);
float expm1f(float x);
long double expm1l(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute e^x–1.0.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions return e^x–1.0.

If the correct value would cause overflow, a range error shall occur and *expm1*( ), *expm1f*( ), and *expm1l*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, ±0 shall be returned.

If *x* is –Inf, –1 shall be returned.

If *x* is +Inf, *x* shall be returned.

If *x* is subnormal, a range error may occur and *x* should be returned.

ERRORS

These functions shall fail if:

Range Error — The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

MX Range Error — The value of *x* is subnormal.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

The value of *expm1*(*x*) may be more accurate than *exp*(*x*)−1.0 for small values of *x*.

The *expm1*( ) and *log1p*( ) functions are useful for financial calculations of $((1+x)^n-1)/x$, namely:

```
expm1(n * log1p(x))/x
```

when *x* is very small (for example, when calculating small daily interest rates). These functions also simplify writing accurate inverse hyperbolic functions.

For IEEE Std 754-1985 **double**, 709.8 < *x* implies *expm1*(*x*) has overflowed.

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The *expm1f*( ) and *expm1l*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The *expm1*( ) function is no longer marked as an extension.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

fabs, fabsf, fabsl — absolute value function

SYNOPSIS

```
#include <math.h>

double fabs(double x);
float fabsf(float x);
long double fabsl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the absolute value of their argument x, $|x|$.

RETURN VALUE

Upon successful completion, these functions shall return the absolute value of x.

MX If x is NaN, a NaN shall be returned.

If x is ±0, +0 shall be returned.

If x is ±Inf, +Inf shall be returned.

ERRORS

No errors are defined.

EXAMPLES

Computing the 1-Norm of a Floating-Point Vector

This example shows the use of *fabs*( ) to compute the 1-norm of a vector defined as follows:

```
norm1(v) = |v[0]| + |v[1]| + ... + |v[n–1]|
```

where $|x|$ denotes the absolute value of x, n denotes the vector's dimension $v[i]$ denotes the i-th component of v ($0 \le i < n$).

```
#include <math.h>

double
norm1(const double v[], const int n)
{
    int     i;
    double  n1_v;  /* 1-norm of v */

    n1_v = 0;
    for (i=0; i<n; i++) {
        n1_v += fabs (v[i]);
    }

    return n1_v;
}
```

APPLICATION USAGE

faccessat( )

NAME

faccessat — determine accessibility of a file relative to directory file descriptor

SYNOPSIS

```
#include <unistd.h>

int faccessat(int fd, const char *path, int amode, int flag);
```

DESCRIPTION

Refer to *access( )*.

NAME

fattach — attach a STREAMS-based file descriptor to a file in the file system name space (**STREAMS**)

SYNOPSIS

OB XSR

```
#include <stropts.h>

int fattach(int fildes, const char *path);
```

DESCRIPTION

The *fattach*( ) function shall attach a STREAMS-based file descriptor to a file, effectively associating a pathname with *fildes*. The application shall ensure that the *fildes* argument is a valid open file descriptor associated with a STREAMS file. The *path* argument points to a pathname of an existing file. The application shall have appropriate privileges or be the owner of the file named by *path* and have write permission. A successful call to *fattach*( ) shall cause all pathnames that name the file named by *path* to name the STREAMS file associated with *fildes*, until the STREAMS file is detached from the file. A STREAMS file can be attached to more than one file and can have several pathnames associated with it.

The attributes of the named STREAMS file shall be initialized as follows: the permissions, user ID, group ID, and times are set to those of the file named by *path*, the number of links is set to 1, and the size and device identifier are set to those of the STREAMS file associated with *fildes*. If any attributes of the named STREAMS file are subsequently changed (for example, by *chmod*( )), neither the attributes of the underlying file nor the attributes of the STREAMS file to which *fildes* refers shall be affected.

File descriptors referring to the underlying file, opened prior to an *fattach*( ) call, shall continue to refer to the underlying file.

RETURN VALUE

Upon successful completion, *fattach*( ) shall return 0. Otherwise, −1 shall be returned and *errno* set to indicate the error.

ERRORS

The *fattach*( ) function shall fail if:

[EACCES] Search permission is denied for a component of the path prefix, or the process is the owner of *path* but does not have write permissions on the file named by *path*.

[EBADF] The *fildes* argument is not a valid open file descriptor.

[EBUSY] The file named by *path* is currently a mount point or has a STREAMS file attached to it.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG] The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix is not a directory, or the *path* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

[EPERM] The effective user ID of the process is not the owner of the file named by *path* and the process does not have appropriate privileges.

The *fattach*( ) function may fail if:

[EINVAL] The *fildes* argument does not refer to a STREAMS file.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[EXDEV] A link to a file on another file system was attempted.

EXAMPLES

Attaching a File Descriptor to a File

In the following example, *fd* refers to an open STREAMS file. The call to *fattach*( ) associates this STREAM with the file **/tmp/named-STREAM**, such that any future calls to open **/tmp/named-STREAM**, prior to breaking the attachment via a call to *fdetach*( ), will instead create a new file handle referring to the STREAMS file associated with *fd*.

```
#include <stropts.h>
...
    int fd;
    char *filename = "/tmp/named-STREAM";
    int ret;

    ret = fattach(fd, filename);
```

APPLICATION USAGE

The *fattach*( ) function behaves similarly to the traditional *mount*( ) function in the way a file is temporarily replaced by the root directory of the mounted file system. In the case of *fattach*( ), the replaced file need not be a directory and the replacing file is a STREAMS file.

RATIONALE

The file attributes of a file which has been the subject of an *fattach*( ) call are specifically set because of an artifact of the original implementation. The internal mechanism was the same as for the *mount*( ) function. Since *mount*( ) is typically only applied to directories, the effects when applied to a regular file are a little surprising, especially as regards the link count which rigidly remains one, even if there were several links originally and despite the fact that all original links refer to the STREAM as long as the *fattach*( ) remains in effect.

FUTURE DIRECTIONS

The *fattach*( ) function may be removed in a future version.

SEE ALSO

fdetach( ), *isastream*( )

XBD **<stropts.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The [EXDEV] error is added to the list of optional errors in the ERRORS section.

Issue 6

This function is marked as part of the XSI STREAMS Option Group.

The normative text is updated to avoid use of the term "must" for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *fattach*( ) function is marked obsolescent.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a + pathname exists but is not a directory or a symbolic link to a directory.

NAME

fchdir — change working directory

SYNOPSIS

```
#include <unistd.h>

int fchdir(int fildes);
```

DESCRIPTION

The *fchdir*( ) function shall be equivalent to *chdir*( ) except that the directory that is to be the new current working directory is specified by the file descriptor *fildes*.

A conforming application can obtain a file descriptor for a file of type directory using *open*( ), provided that the file status flags and access modes do not contain O_WRONLY or O_RDWR.

RETURN VALUE

Upon successful completion, *fchdir*( ) shall return 0. Otherwise, it shall return −1 and set *errno* to indicate the error. On failure the current working directory shall remain unchanged.

ERRORS

The *fchdir*( ) function shall fail if:

[EACCES] Search permission is denied for the directory referenced by *fildes*.

[EBADF] The *fildes* argument is not an open file descriptor.

[ENOTDIR] The open file descriptor *fildes* does not refer to a directory.

The *fchdir*( ) may fail if:

[EINTR] A signal was caught during the execution of *fchdir*( ).

[EIO] An I/O error occurred while reading from or writing to the file system.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

chdir( ), *dirfd*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 7

The *fchdir*( ) function is moved from the XSI option to the Base.

NAME

fchmod — change mode of a file

SYNOPSIS

```
#include <sys/stat.h>

int fchmod(int fildes, mode_t mode);
```

DESCRIPTION

The *fchmod*( ) function shall be equivalent to *chmod*( ) except that the file whose permissions are changed is specified by the file descriptor *fildes*.

SHM If *fildes* references a shared memory object, the *fchmod*( ) function need only affect the S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits.

TYM If *fildes* references a typed memory object, the behavior of *fchmod*( ) is unspecified.

If *fildes* refers to a socket, the behavior of *fchmod*( ) is unspecified.

OB XSR If *fildes* refers to a STREAM (which is *fattach*( )-ed into the file system name space) the call returns successfully, doing nothing.

RETURN VALUE

Upon successful completion, *fchmod*( ) shall return 0. Otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *fchmod*( ) function shall fail if:

[EBADF] The *fildes* argument is not an open file descriptor.

[EPERM] The effective user ID does not match the owner of the file and the process does not have appropriate privileges.

[EROFS] The file referred to by *fildes* resides on a read-only file system.

The *fchmod*( ) function may fail if:

XSI [EINTR] The *fchmod*( ) function was interrupted by a signal.

XSI [EINVAL] The value of the *mode* argument is invalid.

[EINVAL] The *fildes* argument refers to a pipe and the implementation disallows execution of *fchmod*( ) on a pipe.

EXAMPLES

Changing the Current Permissions for a File

The following example shows how to change the permissions for a file named **/home/cnd/mod1** so that the owner and group have read/write/execute permissions, but the world only has read/write permissions.

```
#include <sys/stat.h>
#include <fcntl.h>

mode_t mode;
int    fildes;
...
fildes = open("/home/cnd/mod1", O_RDWR);
fchmod(fildes, S_IRWXU | S_IRWXG | S_IROTH | S_IWOTH);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

XBD **<sys/stat.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE and aligned with *fchmod*( ) in the POSIX Realtime Extension. Specifically, the second paragraph of the DESCRIPTION is added and a second instance of [EINVAL] is defined in the list of optional errors.

Issue 6

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by stating that *fchmod*( ) behavior is unspecified for typed memory objects.

26712 **NAME**

26713 fchmodat — change mode of a file relative to directory file descriptor

26714 **SYNOPSIS**

26715 ```
#include <sys/stat.h>
```

26716 ```
int fchmodat(int fd, const char *path, mode_t mode, int flag);
```

26717 **DESCRIPTION**

26718 Refer to *chmod( )*.

NAME

fchown — change owner and group of a file

SYNOPSIS

```
#include <unistd.h>

int fchown(int fildes, uid_t owner, gid_t group);
```

DESCRIPTION

The *fchown*( ) function shall be equivalent to *chown*( ) except that the file whose owner and group are changed is specified by the file descriptor *fildes*.

RETURN VALUE

Upon successful completion, *fchown*( ) shall return 0. Otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *fchown*( ) function shall fail if:

[EBADF] The *fildes* argument is not an open file descriptor.

[EPERM] The effective user ID does not match the owner of the file or the process does not have appropriate privileges and _POSIX_CHOWN_RESTRICTED indicates that such privilege is required.

[EROFS] The file referred to by *fildes* resides on a read-only file system.

The *fchown*( ) function may fail if:

[EINVAL] The owner or group ID is not a value supported by the implementation. The *fildes* argument refers to a pipe or socket or an *fattach*( )-ed STREAM and the implementation disallows execution of *fchown*( ) on a pipe. OB XSR

[EIO] A physical I/O error has occurred.

[EINTR] The *fchown*( ) function was interrupted by a signal which was caught.

EXAMPLES

Changing the Current Owner of a File

The following example shows how to change the owner of a file named **/home/cnd/mod1** to "jones" and the group to "cnd".

The numeric value for the user ID is obtained by extracting the user ID from the user database entry associated with "jones". Similarly, the numeric value for the group ID is obtained by extracting the group ID from the group database entry associated with "cnd". This example assumes the calling program has appropriate privileges.

```
#include <sys/types.h>
#include <unistd.h>
#include <fcntl.h>
#include <pwd.h>
#include <grp.h>

struct passwd *pwd;
struct group  *grp;
int            fildes;
...
fildes = open("/home/cnd/mod1", O_RDWR);
pwd = getpwnam("jones");
```

```
        grp = getgrnam("cnd");
        fchown(fildes, pwd->pw_uid, grp->gr_gid);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that a call to *fchown( )* may not be allowed on a pipe.

The *fchown( )* function is defined as mandatory.

Issue 7

Functionality relating to XSI STREAMS is marked obsolescent.

fchownat( )

NAME

fchownat — change owner and group of a file relative to directory file descriptor

SYNOPSIS

```
#include <unistd.h>

int fchownat(int fd, const char *path, uid_t owner, gid_t group,
    int flag);
```

DESCRIPTION

Refer to *chown( )*.

NAME

fclose — close a stream

SYNOPSIS

```
#include <stdio.h>

int fclose(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fclose*( ) function shall cause the stream pointed to by *stream* to be flushed and the associated file to be closed. Any unwritten buffered data for the stream shall be written to the file; any unread buffered data shall be discarded. Whether or not the call succeeds, the stream shall be disassociated from the file and any buffer set by the *setbuf*( ) or *setvbuf*( ) function shall be disassociated from the stream. If the associated buffer was automatically allocated, it shall be deallocated.

CX If the file is not already at EOF, and the file is one capable of seeking, the file offset of the underlying open file description shall be adjusted so that the next operation on the open file description deals with the byte after the last one read from or written to the stream being closed.

The *fclose*( ) function shall mark for update the last data modification and last file status change timestamps of the underlying file, if the stream was writable, and if buffered data remains that has not yet been written to the file. The *fclose*( ) function shall perform the equivalent of a *close*( ) on the file descriptor that is associated with the stream pointed to by *stream*.

After the call to *fclose*( ), any use of *stream* results in undefined behavior.

RETURN VALUE

CX Upon successful completion, *fclose*( ) shall return 0; otherwise, it shall return EOF and set *errno* to indicate the error.

ERRORS

The *fclose*( ) function shall fail if:

CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the thread would be delayed in the write operation.

CX [EBADF] The file descriptor underlying stream is not valid.

CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

XSI [EFBIG] An attempt was made to write a file that exceeds the file size limit of the process.

CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the offset maximum associated with the corresponding stream.

CX [EINTR] The *fclose*( ) function was interrupted by a signal.

CX [EIO] The process is a member of a background process group attempting to write to its controlling terminal, TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.

CX [ENOMEM] The underlying stream was created by *open_memstream*( ) or *open_wmemstream*( ) and insufficient memory is available.

CX [ENOSPC] There was no free space remaining on the device containing the file or in the buffer used by the *fmemopen*( ) function.

CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by any process. A SIGPIPE signal shall also be sent to the thread.

The *fclose*( ) function may fail if:

CX [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EFBIG] error is added as part of the large file support extensions.
- The [ENXIO] optional error condition is added.

The DESCRIPTION is updated to note that the stream and any buffer are disassociated whether or not the call succeeds. This is for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/28 is applied, updating the [EAGAIN] error in the ERRORS section from "the process would be delayed" to "the thread would be delayed".

Issue 7

Austin Group Interpretation 1003.1-2001 #002 is applied, clarifying the interaction of file descriptors and streams.

The [ENOSPC] error condition is updated and the [ENOMEM] error is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

Changes are made related to support for finegrained timestamps.

NAME

fcntl — file control

SYNOPSIS

```
#include <fcntl.h>

int fcntl(int fildes, int cmd, ...);
```

DESCRIPTION

The *fcntl*( ) function shall perform the operations described below on open files. The *fildes* argument is a file descriptor.

The available values for *cmd* are defined in **<fcntl.h>** and are as follows:

F_DUPFD — Return a new file descriptor which shall be the lowest numbered available (that is, not already open) file descriptor greater than or equal to the third argument, *arg*, taken as an integer of type **int**. The new file descriptor shall refer to the same open file description as the original file descriptor, and shall share any locks. The FD_CLOEXEC flag associated with the new file descriptor shall be cleared to keep the file open across calls to one of the *exec* functions.

F_DUPFD_CLOEXEC — Like F_DUPFD, but the FD_CLOEXEC flag associated with the new file descriptor shall be set.

F_GETFD — Get the file descriptor flags defined in **<fcntl.h>** that are associated with the file descriptor *fildes*. File descriptor flags are associated with a single file descriptor and do not affect other file descriptors that refer to the same file.

F_SETFD — Set the file descriptor flags defined in **<fcntl.h>**, that are associated with *fildes*, to the third argument, *arg*, taken as type **int**. If the FD_CLOEXEC flag in the third argument is 0, the file descriptor shall remain open across the *exec* functions; otherwise, the file descriptor shall be closed upon successful execution of one of the *exec* functions.

F_GETFL — Get the file status flags and file access modes, defined in **<fcntl.h>**, for the file description associated with *fildes*. The file access modes can be extracted from the return value using the mask O_ACCMODE, which is defined in **<fcntl.h>**. File status flags and file access modes are associated with the file description and do not affect other file descriptors that refer to the same file with different open file descriptions. The flags returned may include non-standard file status flags which the application did not set, provided that these additional flags do not alter the behavior of a conforming application.

F_SETFL — Set the file status flags, defined in **<fcntl.h>**, for the file description associated with *fildes* from the corresponding bits in the third argument, *arg*, taken as type **int**. Bits corresponding to the file access mode and the file creation flags, as defined in **<fcntl.h>**, that are set in *arg* shall be ignored. If any bits in *arg* other than those mentioned here are changed by the application, the result is unspecified.

F_GETOWN — If *fildes* refers to a socket, get the process or process group ID specified to receive SIGURG signals when out-of-band data is available. Positive values indicate a process ID; negative values, other than –1, indicate a process group ID. If *fildes* does not refer to a socket, the results are

26920 unspecified.

26921 F_SETOWN If *fildes* refers to a socket, set the process or process group ID specified to
26922 receive SIGURG signals when out-of-band data is available, using the
26923 value of the third argument, *arg*, taken as type **int**. Positive values
26924 indicate a process ID; negative values, other than –1, indicate a process
26925 group ID. If *fildes* does not refer to a socket, the results are unspecified.

26926 The following values for *cmd* are available for advisory record locking. Record locking shall be
26927 supported for regular files, and may be supported for other files.

26928 F_GETLK Get the first lock which blocks the lock description pointed to by the third
26929 argument, *arg*, taken as a pointer to type **struct flock**, defined in
26930 **<fcntl.h>**. The information retrieved shall overwrite the information
26931 passed to *fcntl*( ) in the structure **flock**. If no lock is found that would
26932 prevent this lock from being created, then the structure shall be left
26933 unchanged except for the lock type which shall be set to F_UNLCK.

26934 F_SETLK Set or clear a file segment lock according to the lock description pointed
26935 to by the third argument, *arg*, taken as a pointer to type **struct flock**,
26936 defined in **<fcntl.h>**. F_SETLK can establish shared (or read) locks
26937 (F_RDLCK) or exclusive (or write) locks (F_WRLCK), as well as to
26938 remove either type of lock (F_UNLCK). F_RDLCK, F_WRLCK, and
26939 F_UNLCK are defined in **<fcntl.h>**. If a shared or exclusive lock cannot
26940 be set, *fcntl*( ) shall return immediately with a return value of –1.

26941 F_SETLKW This command shall be equivalent to F_SETLK except that if a shared or
26942 exclusive lock is blocked by other locks, the thread shall wait until the
26943 request can be satisfied. If a signal that is to be caught is received while
26944 *fcntl*( ) is waiting for a region, *fcntl*( ) shall be interrupted. Upon return
26945 from the signal handler, *fcntl*( ) shall return –1 with *errno* set to [EINTR],
26946 and the lock operation shall not be done.

26947 Additional implementation-defined values for *cmd* may be defined in **<fcntl.h>**. Their names
26948 shall start with F_.

26949 When a shared lock is set on a segment of a file, other processes shall be able to set shared locks
26950 on that segment or a portion of it. A shared lock prevents any other process from setting an
26951 exclusive lock on any portion of the protected area. A request for a shared lock shall fail if the
26952 file descriptor was not opened with read access.

26953 An exclusive lock shall prevent any other process from setting a shared lock or an exclusive lock
26954 on any portion of the protected area. A request for an exclusive lock shall fail if the file
26955 descriptor was not opened with write access.

26956 The structure **flock** describes the type (*l_type*), starting offset (*l_whence*), relative offset (*l_start*),
26957 size (*l_len*), and process ID (*l_pid*) of the segment of the file to be affected.

26958 The value of *l_whence* is SEEK_SET, SEEK_CUR, or SEEK_END, to indicate that the relative
26959 offset *l_start* bytes shall be measured from the start of the file, current position, or end of the file,
26960 respectively. The value of *l_len* is the number of consecutive bytes to be locked. The value of *l_len*
26961 may be negative (where the definition of **off_t** permits negative values of *l_len*). The *l_pid* field
26962 is only used with F_GETLK to return the process ID of the process holding a blocking lock. After
26963 a successful F_GETLK request, when a blocking lock is found, the values returned in the **flock**
26964 structure shall be as follows:

l_type Type of blocking lock found.

l_whence SEEK_SET.

l_start Start of the blocking lock.

l_len Length of the blocking lock.

l_pid Process ID of the process that holds the blocking lock.

If the command is F_SETLKW and the process must wait for another process to release a lock, then the range of bytes to be locked shall be determined before the *fcntl*( ) function blocks. If the file size or file descriptor seek offset change while *fcntl*( ) is blocked, this shall not affect the range of bytes locked.

If *l_len* is positive, the area affected shall start at *l_start* and end at *l_start*+*l_len*−1. If *l_len* is negative, the area affected shall start at *l_start*+*l_len* and end at *l_start*−1. Locks may start and extend beyond the current end of a file, but shall not extend before the beginning of the file. A lock shall be set to extend to the largest possible value of the file offset for that file by setting *l_len* to 0. If such a lock also has *l_start* set to 0 and *l_whence* is set to SEEK_SET, the whole file shall be locked.

There shall be at most one type of lock set for each byte in the file. Before a successful return from an F_SETLK or an F_SETLKW request when the calling process has previously existing locks on bytes in the region specified by the request, the previous lock type for each byte in the specified region shall be replaced by the new lock type. As specified above under the descriptions of shared locks and exclusive locks, an F_SETLK or an F_SETLKW request (respectively) shall fail or block when another process has existing locks on bytes in the specified region and the type of any of those locks conflicts with the type specified in the request.

All locks associated with a file for a given process shall be removed when a file descriptor for that file is closed by that process or the process holding that file descriptor terminates. Locks are not inherited by a child process.

A potential for deadlock occurs if a process controlling a locked region is put to sleep by attempting to lock the locked region of another process. If the system detects that sleeping until a locked region is unlocked would cause a deadlock, *fcntl*( ) shall fail with an [EDEADLK] error.

An unlock (F_UNLCK) request in which *l_len* is non-zero and the offset of the last byte of the requested segment is the maximum value for an object of type **off_t**, when the process has an existing lock in which *l_len* is 0 and which includes the last byte of the requested segment, shall be treated as a request to unlock from the start of the requested segment with an *l_len* equal to 0. Otherwise, an unlock (F_UNLCK) request shall attempt to unlock only the requested segment.

SHM When the file descriptor *fildes* refers to a shared memory object, the behavior of *fcntl*( ) shall be the same as for a regular file except the effect of the following values for the argument *cmd* shall be unspecified: F_SETFL, F_GETLK, F_SETLK, and F_SETLKW.

TYM If *fildes* refers to a typed memory object, the result of the *fcntl*( ) function is unspecified.

RETURN VALUE

Upon successful completion, the value returned shall depend on *cmd* as follows:

F_DUPFD A new file descriptor.

F_DUPFD_CLOEXEC
A new file descriptor.

27007 F_GETFD Value of flags defined in **<fcntl.h>**. The return value shall not be negative.

27008 F_SETFD Value other than –1.

27009 F_GETFL Value of file status flags and access modes. The return value is not negative.

27010 F_SETFL Value other than –1.

27011 F_GETLK Value other than –1.

27012 F_SETLK Value other than –1.

27013 F_SETLKW Value other than –1.

27014 F_GETOWN Value of the socket owner process or process group; this will not be –1.

27015 F_SETOWN Value other than –1.

27016 Otherwise, –1 shall be returned and *errno* set to indicate the error.

27017 **ERRORS**

27018 The *fcntl*( ) function shall fail if:

27019 [EACCES] or [EAGAIN]

27020 The *cmd* argument is F_SETLK; the type of lock (*l_type*) is a shared (F_RDLCK)
27021 or exclusive (F_WRLCK) lock and the segment of a file to be locked is already
27022 exclusive-locked by another process, or the type is an exclusive lock and some
27023 portion of the segment of a file to be locked is already shared-locked or
27024 exclusive-locked by another process.

27025 [EBADF] The *fildes* argument is not a valid open file descriptor, or the argument *cmd* is
27026 F_SETLK or F_SETLKW, the type of lock, *l_type*, is a shared lock (F_RDLCK),
27027 and *fildes* is not a valid file descriptor open for reading, or the type of lock,
27028 *l_type*, is an exclusive lock (F_WRLCK), and *fildes* is not a valid file descriptor
27029 open for writing.

27030 [EINTR] The *cmd* argument is F_SETLKW and the function was interrupted by a signal.

27031 [EINVAL] The *cmd* argument is invalid, or the *cmd* argument is F_DUPFD or
27032 F_DUPFD_CLOEXEC and *arg* is negative or greater than or equal to
27033 {OPEN_MAX}, or the *cmd* argument is F_GETLK, F_SETLK, or F_SETLKW
27034 and the data pointed to by *arg* is not valid, or *fildes* refers to a file that does not
27035 support locking.

27036 [EMFILE] The argument *cmd* is F_DUPFD or F_DUPFD_CLOEXEC and all file
27037 descriptors available to the process are currently open, or no file descriptors
27038 greater than or equal to *arg* are available.

27039 [ENOLCK] The argument *cmd* is F_SETLK or F_SETLKW and satisfying the lock or unlock
27040 request would result in the number of locked regions in the system exceeding
27041 a system-imposed limit.

27042 [EOVERFLOW] One of the values to be returned cannot be represented correctly.

27043 [EOVERFLOW] The *cmd* argument is F_GETLK, F_SETLK, or F_SETLKW and the smallest or,
27044 if *l_len* is non-zero, the largest offset of any byte in the requested segment
27045 cannot be represented correctly in an object of type **off_t**.

The *fcntl*( ) function may fail if:

[EDEADLK] The *cmd* argument is F_SETLKW, the lock is blocked by a lock from another process, and putting the calling process to sleep to wait for that lock to become free would cause a deadlock.

EXAMPLES

Locking and Unlocking a File

The following example demonstrates how to place a lock on bytes 100 to 109 of a file and then later remove it. F_SETLK is used to perform a non-blocking lock request so that the process does not have to wait if an incompatible lock is held by another process; instead the process can take some other action.

```
#include <stdlib.h>
#include <unistd.h>
#include <fcntl.h>
#include <errno.h>
#include <stdio.h>

int
main(int argc, char *argv[])
{
    int fd;
    struct flock fl;

    fd = open("testfile", O_RDWR);
    if (fd == -1)
        /* Handle error */;

    /* Make a non-blocking request to place a write lock
       on bytes 100-109 of testfile */

    fl.l_type = F_WRLCK;
    fl.l_whence = SEEK_SET;
    fl.l_start = 100;
    fl.l_len = 10;

    if (fcntl(fd, F_SETLK, &fl) == -1) {
        if (errno == EACCES || errno == EAGAIN) {
            printf("Already locked by another process\n");

            /* We can't get the lock at the moment */

        } else {
            /* Handle unexpected error */;
        }
    } else { /* Lock was granted... */

        /* Perform I/O on bytes 100 to 109 of file */

        /* Unlock the locked bytes */

        fl.l_type = F_UNLCK;
        fl.l_whence = SEEK_SET;
        fl.l_start = 100;
        fl.l_len = 10;
        if (fcntl(fd, F_SETLK, &fl) == -1)
```

```
                /* Handle error */;
        }
        exit(EXIT_SUCCESS);
    } /* main */
```

Setting the Close-on-Exec Flag

The following example demonstrates how to set the close-on-exec flag for the file descriptor *fd*.

```
#include <unistd.h>
#include <fcntl.h>
...
    int flags;

    flags = fcntl(fd, F_GETFD);
    if (flags == -1)
        /* Handle error */;
    flags |= FD_CLOEXEC;
    if (fcntl(fd, F_SETFD, flags) == -1)
        /* Handle error */;"
```

APPLICATION USAGE

The *arg* values to F_GETFD, F_SETFD, F_GETFL, and F_SETFL all represent flag values to allow for future growth. Applications using these functions should do a read-modify-write operation on them, rather than assuming that only the values defined by this volume of POSIX.1-200x are valid. It is a common error to forget this, particularly in the case of F_SETFD. Some implementations set additional file status flags to advise the application of default behavior, even though the application did not request these flags.

RATIONALE

The ellipsis in the SYNOPSIS is the syntax specified by the ISO C standard for a variable number of arguments. It is used because System V uses pointers for the implementation of file locking functions.

This volume of POSIX.1-200x permits concurrent read and write access to file data using the *fcntl*() function; this is a change from the 1984 /usr/group standard and early proposals. Without concurrency controls, this feature may not be fully utilized without occasional loss of data.

Data losses occur in several ways. One case occurs when several processes try to update the same record, without sequencing controls; several updates may occur in parallel and the last writer "wins". Another case is a bit-tree or other internal list-based database that is undergoing reorganization. Without exclusive use to the tree segment by the updating process, other reading processes chance getting lost in the database when the index blocks are split, condensed, inserted, or deleted. While *fcntl*() is useful for many applications, it is not intended to be overly general and does not handle the bit-tree example well.

This facility is only required for regular files because it is not appropriate for many devices such as terminals and network connections.

Since *fcntl*() works with "any file descriptor associated with that file, however it is obtained", the file descriptor may have been inherited through a *fork*() or *exec* operation and thus may affect a file that another process also has open.

The use of the open file description to identify what to lock requires extra calls and presents problems if several processes are sharing an open file description, but there are too many

implementations of the existing mechanism for this volume of POSIX.1-200x to use different specifications.

Another consequence of this model is that closing any file descriptor for a given file (whether or not it is the same open file description that created the lock) causes the locks on that file to be relinquished for that process. Equivalently, any close for any file/process pair relinquishes the locks owned on that file for that process. But note that while an open file description may be shared through *fork*( ), locks are not inherited through *fork*( ). Yet locks may be inherited through one of the *exec* functions.

The identification of a machine in a network environment is outside the scope of this volume of POSIX.1-200x. Thus, an *l_sysid* member, such as found in System V, is not included in the locking structure.

Changing of lock types can result in a previously locked region being split into smaller regions.

Mandatory locking was a major feature of the 1984 /usr/group standard.

For advisory file record locking to be effective, all processes that have access to a file must cooperate and use the advisory mechanism before doing I/O on the file. Enforcement-mode record locking is important when it cannot be assumed that all processes are cooperating. For example, if one user uses an editor to update a file at the same time that a second user executes another process that updates the same file and if only one of the two processes is using advisory locking, the processes are not cooperating. Enforcement-mode record locking would protect against accidental collisions.

Secondly, advisory record locking requires a process using locking to bracket each I/O operation with lock (or test) and unlock operations. With enforcement-mode file and record locking, a process can lock the file once and unlock when all I/O operations have been completed. Enforcement-mode record locking provides a base that can be enhanced; for example, with sharable locks. That is, the mechanism could be enhanced to allow a process to lock a file so other processes could read it, but none of them could write it.

Mandatory locks were omitted for several reasons:

1. Mandatory lock setting was done by multiplexing the set-group-ID bit in most implementations; this was confusing, at best.
2. The relationship to file truncation as supported in 4.2 BSD was not well specified.
3. Any publicly readable file could be locked by anyone. Many historical implementations keep the password database in a publicly readable file. A malicious user could thus prohibit logins. Another possibility would be to hold open a long-distance telephone line.
4. Some demand-paged historical implementations offer memory mapped files, and enforcement cannot be done on that type of file.

Since sleeping on a region is interrupted with any signal, *alarm*( ) may be used to provide a timeout facility in applications requiring it. This is useful in deadlock detection. Since implementation of full deadlock detection is not always feasible, the [EDEADLK] error was made optional.

FUTURE DIRECTIONS

None.

alarm( ), *close*( ), *exec*, *open*( ), *sigaction*( )

XBD **<fcntl.h>**, **<signal.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the DESCRIPTION, sentences describing behavior when *l_len* is negative are now mandated, and the description of unlock (F_UNLOCK) when *l_len* is non-negative is mandated.
- In the ERRORS section, the [EINVAL] error condition has the case mandated when the *cmd* is invalid, and two [EOVERFLOW] error conditions are added.

The F_GETOWN and F_SETOWN values are added for sockets.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that the extent of the bytes locked is determined prior to the blocking action.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *fcntl*( ) results are unspecified for typed memory objects.

The normative text is updated to avoid use of the term "must" for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/29 is applied, adding the example to the EXAMPLES section.

Issue 7

Austin Group Interpretation 1003.1-2001 #150 is applied, clarifying the file status flags returned when *cmd* is F_GETFL.

Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the FD_CLOEXEC flag atomically at *open*( ), and adding the F_DUPFD_CLOEXEC flag.

The optional **<unistd.h>** header is removed from this function, since **<fcntl.h>** now defines SEEK_SET, SEEK_CUR, and SEEK_END as part of the Base.

NAME

fdatasync — synchronize the data of a file (**REALTIME**)

SYNOPSIS

SIO
```
#include <unistd.h>

int fdatasync(int fildes);
```

DESCRIPTION

The *fdatasync*( ) function shall force all currently queued I/O operations associated with the file indicated by file descriptor *fildes* to the synchronized I/O completion state.

The functionality shall be equivalent to *fsync*( ) with the symbol _POSIX_SYNCHRONIZED_IO defined, with the exception that all I/O operations shall be completed as defined for synchronized I/O data integrity completion.

RETURN VALUE

If successful, the *fdatasync*( ) function shall return the value 0; otherwise, the function shall return the value –1 and set *errno* to indicate the error. If the *fdatasync*( ) function fails, outstanding I/O operations are not guaranteed to have been completed.

ERRORS

The *fdatasync*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid file descriptor open for writing.

[EINVAL] This implementation does not support synchronized I/O for this file.

In the event that any of the queued I/O operations fail, *fdatasync*( ) shall return the error conditions defined for *read*( ) and *write*( ).

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Synchronized Input and Output option.

The *fdatasync*( ) function is marked as part of the Synchronized Input and Output option.

27251 **NAME**

27252 fdetach — detach a name from a STREAMS-based file descriptor (**STREAMS**)

27253 **SYNOPSIS**

27254 OB XSR
```
#include <stropts.h>

int fdetach(const char *path);
```

27255

27256 **DESCRIPTION**

27257 The *fdetach*( ) function shall detach a STREAMS-based file from the file to which it was attached
27258 by a previous call to *fattach*( ). The *path* argument points to the pathname of the attached
27259 STREAMS file. The process shall have appropriate privileges or be the owner of the file. A
27260 successful call to *fdetach*( ) shall cause all pathnames that named the attached STREAMS file to
27261 again name the file to which the STREAMS file was attached. All subsequent operations on *path*
27262 shall operate on the underlying file and not on the STREAMS file.

27263 All open file descriptions established while the STREAMS file was attached to the file referenced
27264 by *path* shall still refer to the STREAMS file after the *fdetach*( ) has taken effect.

27265 If there are no open file descriptors or other references to the STREAMS file, then a successful
27266 call to *fdetach*( ) shall be equivalent to performing the last *close*( ) on the attached file.

27267 **RETURN VALUE**

27268 Upon successful completion, *fdetach*( ) shall return 0; otherwise, it shall return –1 and set *errno* to
27269 indicate the error.

27270 **ERRORS**

27271 The *fdetach*( ) function shall fail if:

27272 [EACCES] Search permission is denied on a component of the path prefix.

27273 [EINVAL] The *path* argument names a file that is not currently attached.

27274 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
27275 argument.

27276 [ENAMETOOLONG]
27277 The length of a component of a pathname is longer than {NAME_MAX}.

27278 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

27279 [ENOTDIR] A component of the path prefix is not a directory, or the *path* argument
27280 contains at least one non-<slash> character and ends with one or more trailing
27281 <slash> characters and the last pathname component names an existing file
27282 that is neither a directory nor a symbolic link to a directory.

27283 [EPERM] The effective user ID is not the owner of *path* and the process does not have
27284 appropriate privileges.

27285 The *fdetach*( ) function may fail if:

27286 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
27287 resolution of the *path* argument.

27288 [ENAMETOOLONG]
27289 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
27290 symbolic link produced an intermediate result with a length that exceeds
27291 {PATH_MAX}.

EXAMPLES

Detaching a File

The following example detaches the STREAMS-based file **/tmp/named-STREAM** from the file to which it was attached by a previous, successful call to *fattach*( ). Subsequent calls to open this file refer to the underlying file, not to the STREAMS file.

```
#include <stropts.h>
...
    char *filename = "/tmp/named-STREAM";
    int ret;

    ret = fdetach(filename);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *fdetach*( ) function may be removed in a future version.

SEE ALSO

fattach( )

XBD **<stropts.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *fdetach*( ) function is marked obsolescent.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory. +

NAME

fdim, fdimf, fdiml — compute positive difference between two floating-point numbers

SYNOPSIS

```
#include <math.h>

double fdim(double x, double y);
float fdimf(float x, float y);
long double fdiml(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall determine the positive difference between their arguments. If *x* is greater than *y*, *x*–*y* is returned. If *x* is less than or equal to *y*, +0 is returned.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the positive difference value.

If *x*–*y* is positive and overflows, a range error shall occur and *fdim*( ), *fdimf*( ), and *fdiml*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

XSI If *x*–*y* is positive and underflows, a range error may occur, and either (*x*–*y*) (if representable), or 0.0 (if supported), or an implementation-defined value shall be returned.

MX If *x* or *y* is NaN, a NaN shall be returned.

ERRORS

The *fdim*( ) function shall fail if:

Range Error — The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

The *fdim*( ) function may fail if:

Range Error — The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

27361 **EXAMPLES**

27362 None.

27363 **APPLICATION USAGE**

27364 On implementations supporting IEEE Std 754-1985, $x-y$ cannot underflow, and hence the 0.0
27365 return value is shaded as an extension for implementations supporting the XSI option rather
27366 than an MX extension.

27367 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
27368 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

27369 **RATIONALE**

27370 None.

27371 **FUTURE DIRECTIONS**

27372 None.

27373 **SEE ALSO**

27376 **CHANGE HISTORY**

27377 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

fdopen — associate a stream with a file descriptor

SYNOPSIS

CX
```
#include <stdio.h>

FILE *fdopen(int fildes, const char *mode);
```

DESCRIPTION

The *fdopen*( ) function shall associate a stream with a file descriptor.

The *mode* argument is a character string having one of the following values:

r or *rb*	Open a file for reading.
w or *wb*	Open a file for writing.
a or *ab*	Open a file for writing at end-of-file.
r+ or *rb+* or *r+b*	Open a file for update (reading and writing).
w+ or *wb+* or *w+b*	Open a file for update (reading and writing).
a+ or *ab+* or *a+b*	Open a file for update (reading and writing) at end-of-file.

The meaning of these flags is exactly as specified in *fopen*( ), except that modes beginning with *w* shall not cause truncation of the file.

Additional values for the *mode* argument may be supported by an implementation.

The application shall ensure that the mode of the stream as expressed by the *mode* argument is allowed by the file access mode of the open file description to which *fildes* refers. The file position indicator associated with the new stream is set to the position indicated by the file offset associated with the file descriptor.

The error and end-of-file indicators for the stream shall be cleared. The *fdopen*( ) function may cause the last data access timestamp of the underlying file to be marked for update.

SHM If *fildes* refers to a shared memory object, the result of the *fdopen*( ) function is unspecified.

TYM If *fildes* refers to a typed memory object, the result of the *fdopen*( ) function is unspecified.

The *fdopen*( ) function shall preserve the offset maximum previously set for the open file description corresponding to *fildes*.

RETURN VALUE

Upon successful completion, *fdopen*( ) shall return a pointer to a stream; otherwise, a null pointer shall be returned and *errno* set to indicate the error.

ERRORS

The *fdopen*( ) function shall fail if:

[EMFILE]	{STREAM_MAX} streams are currently open in the calling process.

The *fdopen*( ) function may fail if:

[EBADF]	The *fildes* argument is not a valid file descriptor.
[EINVAL]	The *mode* argument is not a valid mode.
[EMFILE]	{FOPEN_MAX} streams are currently open in the calling process.

[ENOMEM] Insufficient space to allocate a buffer.

EXAMPLES

None.

APPLICATION USAGE

File descriptors are obtained from calls like *open*( ), *dup*( ), *creat*( ), or *pipe*( ), which open files but do not return streams.

RATIONALE

The file descriptor may have been obtained from *open*( ), *creat*( ), *pipe*( ), *dup*( ), *fcntl*( ), or *socket*( ); inherited through *fork*( ), *posix_spawn*( ), or *exec*; or perhaps obtained by other means.

The meanings of the *mode* arguments of *fdopen*( ) and *fopen*( ) differ. With *fdopen*( ), open for write (*w* or *w*+) does not truncate, and append (*a* or *a*+) cannot create for writing. The *mode* argument formats that include *a b* are allowed for consistency with the ISO C standard function *fopen*( ). The *b* has no effect on the resulting stream. Although not explicitly required by this volume of POSIX.1-200x, a good implementation of append (*a*) mode would cause the O_APPEND flag to be set.

FUTURE DIRECTIONS

None.

XBD **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the use and setting of the *mode* argument are changed to include binary streams.
- In the DESCRIPTION, text is added for large file support to indicate setting of the offset maximum in the open file description.
- All errors identified in the ERRORS section are added.
- In the DESCRIPTION, text is added that the *fdopen*( ) function may cause *st_atime* to be updated.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that it is the responsibility of the application to ensure that the mode is compatible with the open file descriptor.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *fdopen*( ) results are unspecified for typed memory objects.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/30 is applied, making corrections to the RATIONALE.

Issue 7

SD5-XSH-ERN-149 is applied, adding the {STREAM_MAX} [EMFILE] error condition.

Changes are made related to support for finegrained timestamps.

NAME

fdopendir, opendir — open directory associated with file descriptor

SYNOPSIS

```
#include <dirent.h>

DIR *fdopendir(int fd);
DIR *opendir(const char *dirname);
```

DESCRIPTION

The *fdopendir*( ) function shall be equivalent to the *opendir*( ) function except that the directory is specified by a file descriptor rather than by a name. The file offset associated with the file descriptor at the time of the call determines which entries are returned.

Upon successful return from *fdopendir*( ), the file descriptor is under the control of the system, and if any attempt is made to close the file descriptor, or to modify the state of the associated description, other than by means of *closedir*( ), *readdir*( ), *readdir_r*( ), or *rewinddir*( ), the behavior is undefined. Upon calling *closedir*( ) the file descriptor shall be closed.

It is unspecified whether the FD_CLOEXEC flag will be set on the file descriptor by a successful call to *fdopendir*( ).

The *opendir*( ) function shall open a directory stream corresponding to the directory named by the *dirname* argument. The directory stream is positioned at the first entry. If the type **DIR** is implemented using a file descriptor, applications shall only be able to open up to a total of {OPEN_MAX} files and directories.

If the type **DIR** is implemented using a file descriptor, the descriptor shall be obtained as if the O_DIRECTORY flag was passed to *open*( ).

RETURN VALUE

Upon successful completion, these functions shall return a pointer to an object of type **DIR**. Otherwise, these functions shall return a null pointer and set *errno* to indicate the error.

ERRORS

The *fdopendir*( ) function shall fail if:

[EBADF] The *fd* argument is not a valid file descriptor open for reading.

[ENOTDIR] The descriptor *fd* is not associated with a directory.

The *opendir*( ) function shall fail if:

[EACCES] Search permission is denied for the component of the path prefix of *dirname* or read permission is denied for *dirname*.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *dirname* argument.

[ENAMETOOLONG] The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *dirname* does not name an existing directory or *dirname* is an empty string.

[ENOTDIR] A component of *dirname* is not a directory.

The *opendir*( ) function may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *dirname* argument.

[EMFILE] All file descriptors available to the process are currently open.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[ENFILE] Too many files are currently open in the system.

EXAMPLES

Open a Directory Stream

The following program fragment demonstrates how the *opendir*( ) function is used.

```
#include <dirent.h>
...
    DIR *dir;
    struct dirent *dp;
...
    if ((dir = opendir (".")) == NULL) {
        perror ("Cannot open .");
        exit (1);
    }

    while ((dp = readdir (dir)) != NULL) {
...
```

Find And Open a File

The following program searches through a given directory looking for files whose name does not begin with a dot and whose size is larger than 1 MiB.

```
#include <stdio.h>
#include <dirent.h>
#include <fcntl.h>
#include <sys/stat.h>
#include <stdint.h>
#include <stdlib.h>
#include <unistd.h>

int
main(int argc, char *argv[])
{
    struct stat statbuf;
    DIR *d;
    struct dirent *dp;
    int dfd, ffd;

    if ((d = fdopendir((dfd = open("./tmp", O_RDONLY)))) == NULL) {
        fprintf(stderr, "Cannot open ./tmp directory\n");
        exit(1);
```

```
        }
        while ((dp = readdir(d)) != NULL) {
            if (dp->d_name[0] == '.')
                continue;
            /* there is a possible race condition here as the file
             * could be renamed between the readdir and the open */
            if ((ffd = openat(dfd, dp->d_name, O_RDONLY)) == -1) {
                perror(dp->d_name);
                continue;
            }
            if (fstat(ffd, &statbuf) == 0 && statbuf.st_size > (1024*1024)) {
                /* found it ... */
                printf("%s: %jdK\n", dp->d_name,
                    (intmax_t)(statbuf.st_size / 1024));
            }
            close(ffd);
        }
        closedir(d); // note this implicitly closes dfd
        return 0;
    }
```

APPLICATION USAGE

The *opendir*( ) function should be used in conjunction with *readdir*( ), *closedir*( ), and *rewinddir*( ) to examine the contents of the directory (see the EXAMPLES section in *readdir*( )). This method is recommended for portability.

RATIONALE

The purpose of the *fdopendir*( ) function is to enable opening files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *opendir*( ), resulting in unspecified behavior.

Based on historical implementations, the rules about file descriptors apply to directory streams as well. However, this volume of POSIX.1-200x does not mandate that the directory stream be implemented using file descriptors. The description of *closedir*( ) clarifies that if a file descriptor is used for the directory stream, it is mandatory that *closedir*( ) deallocate the file descriptor. When a file descriptor is used to implement the directory stream, it behaves as if the FD_CLOEXEC had been set for the file descriptor.

The directory entries for dot and dot-dot are optional. This volume of POSIX.1-200x does not provide a way to test *a priori* for their existence because an application that is portable must be written to look for (and usually ignore) those entries. Writing code that presumes that they are the first two entries does not always work, as many implementations permit them to be other than the first two entries, with a "normal" entry preceding them. There is negligible value in providing a way to determine what the implementation does because the code to deal with dot and dot-dot must be written in any case and because such a flag would add to the list of those flags (which has proven in itself to be objectionable) and might be abused.

Since the structure and buffer allocation, if any, for directory operations are defined by the implementation, this volume of POSIX.1-200x imposes no portability requirements for erroneous program constructs, erroneous data, or the use of unspecified values such as the use or referencing of a *dirp* value or a **dirent** structure value after a directory stream has been closed or after a *fork*( ) or one of the *exec* function calls.

FUTURE DIRECTIONS

None.

SEE ALSO

closedir( ), *dirfd*( ), *fstatat*( ), *open*( ), *readdir*( ), *rewinddir*( ), *symlink*( )

XBD **<dirent.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 2.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

The *fdopendir*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

An additional example is added.

NAME

feclearexcept — clear floating-point exception

SYNOPSIS

```
#include <fenv.h>

int feclearexcept(int excepts);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *feclearexcept*( ) function shall attempt to clear the supported floating-point exceptions represented by *excepts*.

RETURN VALUE

If the argument is zero or if all the specified exceptions were successfully cleared, *feclearexcept*( ) shall return zero. Otherwise, it shall return a non-zero value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

ISO/IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated.

27644 **NAME**

27645 fegetenv, fesetenv — get and set current floating-point environment

27646 **SYNOPSIS**

27647
```
#include <fenv.h>
```

27648
```
int fegetenv(fenv_t *envp);
```
27649
```
int fesetenv(const fenv_t *envp);
```

27650 **DESCRIPTION**

27651 CX The functionality described on this reference page is aligned with the ISO C standard. Any
27652 conflict between the requirements described here and the ISO C standard is unintentional. This
27653 volume of POSIX.1-200x defers to the ISO C standard.

27654 The *fegetenv*( ) function shall attempt to store the current floating-point environment in the object
27655 pointed to by *envp*.

27656 The *fesetenv*( ) function shall attempt to establish the floating-point environment represented by
27657 the object pointed to by *envp*. The argument *envp* shall point to an object set by a call to
27658 *fegetenv*( ) or *feholdexcept*( ), or equal a floating-point environment macro. The *fesetenv*( ) function
27659 does not raise floating-point exceptions, but only installs the state of the floating-point status
27660 flags represented through its argument.

27661 **RETURN VALUE**

27662 If the representation was successfully stored, *fegetenv*( ) shall return zero. Otherwise, it shall
27663 return a non-zero value. If the environment was successfully established, *fesetenv*( ) shall return
27664 zero. Otherwise, it shall return a non-zero value.

27665 **ERRORS**

27666 No errors are defined.

27667 **EXAMPLES**

27681 **NAME**

27682 fegetexceptflag, fesetexceptflag — get and set floating-point status flags

27683 **SYNOPSIS**

27684 ```
#include <fenv.h>
```

27685 ```
int fegetexceptflag(fexcept_t *flagp, int excepts);
```

27686 ```
int fesetexceptflag(const fexcept_t *flagp, int excepts);
```

27687 **DESCRIPTION**

27688 CX The functionality described on this reference page is aligned with the ISO C standard. Any
27689 conflict between the requirements described here and the ISO C standard is unintentional. This
27690 volume of POSIX.1-200x defers to the ISO C standard.

27691 The *fegetexceptflag*( ) function shall attempt to store an implementation-defined representation of
27692 the states of the floating-point status flags indicated by the argument *excepts* in the object
27693 pointed to by the argument *flagp*.

27694 The *fesetexceptflag*( ) function shall attempt to set the floating-point status flags indicated by the
27695 argument *excepts* to the states stored in the object pointed to by *flagp*. The value pointed to by
27696 *flagp* shall have been set by a previous call to *fegetexceptflag*( ) whose second argument
27697 represented at least those floating-point exceptions represented by the argument *excepts*. This
27698 function does not raise floating-point exceptions, but only sets the state of the flags.

27699 **RETURN VALUE**

27700 If the representation was successfully stored, *fegetexceptflag*( ) shall return zero. Otherwise, it
27701 shall return a non-zero value. If the *excepts* argument is zero or if all the specified exceptions
27702 were successfully set, *fesetexceptflag*( ) shall return zero. Otherwise, it shall return a non-zero
27703 value.

27704 **ERRORS**

27705 No errors are defined.

27706 **EXAMPLES**

27707 None.

```

NAME

fegetround, fesetround — get and set current rounding direction

SYNOPSIS

```
#include <fenv.h>

int fegetround(void);
int fesetround(int round);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fegetround*( ) function shall get the current rounding direction.

The *fesetround*( ) function shall establish the rounding direction represented by its argument *round*. If the argument is not equal to the value of a rounding direction macro, the rounding direction is not changed.

RETURN VALUE

The *fegetround*( ) function shall return the value of the rounding direction macro representing the current rounding direction or a negative value if there is no such rounding direction macro or the current rounding direction is not determinable.

The *fesetround*( ) function shall return a zero value if and only if the requested rounding direction was established.

ERRORS

No errors are defined.

EXAMPLES

The following example saves, sets, and restores the rounding direction, reporting an error and aborting if setting the rounding direction fails:

```
#include <fenv.h>
#include <assert.h>
void f(int round_dir)
{
    #pragma STDC FENV_ACCESS ON
    int save_round;
    int setround_ok;
    save_round = fegetround();
    setround_ok = fesetround(round_dir);
    assert(setround_ok == 0);
    /* ... */
    fesetround(save_round);
    /* ... */
}
```

APPLICATION USAGE

None.

RATIONALE

None.

27763 **FUTURE DIRECTIONS**

27764 None.

27765 **SEE ALSO**

27766 XBD **<fenv.h>**

27767 **CHANGE HISTORY**

27768 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

feholdexcept — save current floating-point environment

SYNOPSIS

```
#include <fenv.h>

int feholdexcept(fenv_t *envp);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *feholdexcept*( ) function shall save the current floating-point environment in the object pointed to by *envp*, clear the floating-point status flags, and then install a non-stop (continue on floating-point exceptions) mode, if available, for all floating-point exceptions.

RETURN VALUE

The *feholdexcept*( ) function shall return zero if and only if non-stop floating-point exception handling was successfully installed.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *feholdexcept*( ) function should be effective on typical IEC 60559: 1989 standard implementations which have the default non-stop mode and at least one other mode for trap handling or aborting. If the implementation provides only the non-stop mode, then installing the non-stop mode is trivial.

FUTURE DIRECTIONS

None.

NAME

feraiseexcept — raise floating-point exception

SYNOPSIS

```
#include <fenv.h>

int feraiseexcept(int excepts);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *feraiseexcept*( ) function shall attempt to raise the supported floating-point exceptions represented by the argument *excepts*. The order in which these floating-point exceptions are raised is unspecified. Whether the *feraiseexcept*( ) function additionally raises the inexact floating-point exception whenever it raises the overflow or underflow floating-point exception is implementation-defined.

RETURN VALUE

If the argument is zero or if all the specified exceptions were successfully raised, *feraiseexcept*( ) shall return zero. Otherwise, it shall return a non-zero value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The effect is intended to be similar to that of floating-point exceptions raised by arithmetic operations. Hence, enabled traps for floating-point exceptions raised by this function are taken.

RATIONALE

Raising overflow or underflow is allowed to also raise inexact because on some architectures the only practical way to raise an exception is to execute an instruction that has the exception as a side-effect. The function is not restricted to accept only valid coincident expressions for atomic operations, so the function can be used to raise exceptions accrued over several operations.

FUTURE DIRECTIONS

None.

NAME

ferror — test error indicator on a stream

SYNOPSIS

```
#include <stdio.h>

int ferror(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *ferror*( ) function shall test the error indicator for the stream pointed to by *stream*.

RETURN VALUE

The *ferror*( ) function shall return non-zero if and only if the error indicator is set for *stream*.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

fesetenv( )

27894 **NAME**

27895 fesetenv — set current floating-point environment

27896 **SYNOPSIS**

27897 ```
#include <fenv.h>
```

27898 ```
int fesetenv(const fenv_t *envp);
```

27899 **DESCRIPTION**

27900 Refer to *fegetenv( )*.

27901 **NAME**

27902 fesetexceptflag — set floating-point status flags

27903 **SYNOPSIS**

27904 `#include <fenv.h>`

27905 `int fesetexceptflag(const fexcept_t *flagp, int excepts);`

27906 **DESCRIPTION**

27907 Refer to *fegetexceptflag( )*.

fesetround( )

27908 **NAME**

27909 fesetround — set current rounding direction

27910 **SYNOPSIS**

27911 ```
#include <fenv.h>
```

27912 ```
int fesetround(int round);
```

27913 **DESCRIPTION**

27914 Refer to *fegetround( )*.

NAME

fetestexcept — test floating-point exception flags

SYNOPSIS

```
#include <fenv.h>

int fetestexcept(int excepts);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fetestexcept*( ) function shall determine which of a specified subset of the floating-point exception flags are currently set. The *excepts* argument specifies the floating-point status flags to be queried.

RETURN VALUE

The *fetestexcept*( ) function shall return the value of the bitwise-inclusive OR of the floating-point exception macros corresponding to the currently set floating-point exceptions included in *excepts*.

ERRORS

No errors are defined.

EXAMPLES

The following example calls function *f*( ) if an invalid exception is set, and then function *g*( ) if an overflow exception is set:

```
#include <fenv.h>
/* ... */
{
    #pragma STDC FENV_ACCESS ON
    int set_excepts;
    feclearexcept(FE_INVALID | FE_OVERFLOW);
    // maybe raise exceptions
    set_excepts = fetestexcept(FE_INVALID | FE_OVERFLOW);
    if (set_excepts & FE_INVALID) f();
    if (set_excepts & FE_OVERFLOW) g();
    /* ... */
}
```

APPLICATION USAGE

None.

27957 **CHANGE HISTORY**
27958 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

feupdateenv — update floating-point environment

SYNOPSIS

```
#include <fenv.h>

int feupdateenv(const fenv_t *envp);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *feupdateenv*( ) function shall attempt to save the currently raised floating-point exceptions in its automatic storage, attempt to install the floating-point environment represented by the object pointed to by *envp*, and then attempt to raise the saved floating-point exceptions. The argument *envp* shall point to an object set by a call to *feholdexcept*( ) or *fegetenv*( ), or equal a floating-point environment macro.

RETURN VALUE

The *feupdateenv*( ) function shall return a zero value if and only if all the required actions were successfully carried out.

ERRORS

No errors are defined.

EXAMPLES

The following example shows sample code to hide spurious underflow floating-point exceptions:

```
#include <fenv.h>
double f(double x)
{
    #pragma STDC FENV_ACCESS ON
    double result;
    fenv_t save_env;
    feholdexcept(&save_env);
    // compute result
    if (/* test spurious underflow */)
    feclearexcept(FE_UNDERFLOW);
    feupdateenv(&save_env);
    return result;
}
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

28006 **NAME**

28007 fexecve — execute a file

28008 **SYNOPSIS**

28009 `#include <unistd.h>`

28010 `int fexecve(int fd, char *const argv[], char *const envp[]);`

28011 **DESCRIPTION**

28012 Refer to *exec*.

NAME

fflush — flush a stream

SYNOPSIS

```
#include <stdio.h>

int fflush(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

If *stream* points to an output stream or an update stream in which the most recent operation was not input, *fflush*( ) shall cause any unwritten data for that stream to be written to the file, CX and the last data modification and last file status change timestamps of the underlying file shall be marked for update.

If *stream* is a null pointer, *fflush*( ) shall perform this flushing action on all streams for which the behavior is defined above.

CX For a stream open for reading, if the file is not already at EOF, and the file is one capable of seeking, the file offset of the underlying open file description shall be adjusted so that the next operation on the open file description deals with the byte after the last one read from or written to the stream being flushed.

RETURN VALUE

Upon successful completion, *fflush*( ) shall return 0; otherwise, it shall set the error indicator for the stream, return EOF, CX and set *errno* to indicate the error.

ERRORS

The *fflush*( ) function shall fail if:

CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the thread would be delayed in the write operation.

CX [EBADF] The file descriptor underlying *stream* is not valid.

CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

XSI [EFBIG] An attempt was made to write a file that exceeds the file size limit of the process.

CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the offset maximum associated with the corresponding stream.

CX [EINTR] The *fflush*( ) function was interrupted by a signal.

CX [EIO] The process is a member of a background process group attempting to write to its controlling terminal, TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.

CX [ENOMEM] The underlying stream was created by *open_memstream*( ) or *open_wmemstream*( ) and insufficient memory is available.

CX [ENOSPC] There was no free space remaining on the device containing the file or in the buffer used by the *fmemopen*( ) function.

28054 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by
28055 any process. A SIGPIPE signal shall also be sent to the thread.

28056 The *fflush*( ) function may fail if:

28057 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
28058 capabilities of the device.

28059 **EXAMPLES**

28060 **Sending Prompts to Standard Output**

28061 The following example uses *printf*( ) calls to print a series of prompts for information the user
28062 must enter from standard input. The *fflush*( ) calls force the output to standard output. The
28063 *fflush*( ) function is used because standard output is usually buffered and the prompt may not
28064 immediately be printed on the output or terminal. The *getline*( ) function calls read strings from
28065 standard input and place the results in variables, for use later in the program.

```
28066 char *user;
28067 char *oldpasswd;
28068 char *newpasswd;
28069 ssize_t llen;
28070 size_t blen;
28071 struct termios term;
28072 tcflag_t saveflag;

28073 printf("User name: ");
28074 fflush(stdout);
28075 blen = 0;
28076 llen = getline(&user, &blen, stdin);
28077 user[llen-1] = 0;
28078 tcgetattr(fileno(stdin), &term);
28079 saveflag = term.c_lflag;
28080 term.c_lflag &= ~ECHO;
28081 tcsetattr(fileno(stdin), TCSANOW, &term);
28082 printf("Old password: ");
28083 fflush(stdout);
28084 blen = 0;
28085 llen = getline(&oldpasswd, &blen, stdin);
28086 oldpasswd[llen-1] = 0;

28087 printf("\nNew password: ");
28088 fflush(stdout);
28089 blen = 0;
28090 llen = getline(&newpasswd, &blen, stdin);
28091 newpasswd[llen-1] = 0;
28092 term.c_lflag = saveflag;
28093 tcsetattr(fileno(stdin), TCSANOW, &term);
28094 free(user);
28095 free(oldpasswd);
28096 free(newpasswd);
```

APPLICATION USAGE

None.

RATIONALE

Data buffered by the system may make determining the validity of the position of the current file descriptor impractical. Thus, enforcing the repositioning of the file descriptor after *fflush*( ) on streams open for *read*( ) is not mandated by POSIX.1-200x.

FUTURE DIRECTIONS

None.

fmemopen( ), *getrlimit*( ), *open_memstream*( ), *ulimit*( )

XBD **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EFBIG] error is added as part of the large file support extensions.
- The [ENXIO] optional error condition is added.

The RETURN VALUE section is updated to note that the error indicator shall be set for the stream. This is for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/31 is applied, updating the [EAGAIN] error in the ERRORS section from "the process would be delayed" to "the thread would be delayed".

Issue 7

Austin Group Interpretation 1003.1-2001 #002 is applied, clarifying the interaction of file descriptors and streams.

The [ENOSPC] error condition is updated and the [ENOMEM] error is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

The EXAMPLES section is revised.

Changes are made related to support for finegrained timestamps.

28130 **NAME**

28131 ffs — find first set bit

28132 **SYNOPSIS**

28133 XSI
```
#include <strings.h>

int ffs(int i);
```
28134

28135 **DESCRIPTION**

28136 The *ffs*( ) function shall find the first bit set (beginning with the least significant bit) in *i*, and
28137 return the index of that bit. Bits are numbered starting at one (the least significant bit).

28138 **RETURN VALUE**

28139 The *ffs*( ) function shall return the index of the first bit set. If *i* is 0, then *ffs*( ) shall return 0.

28140 **ERRORS**

28141 No errors are defined.

28142 **EXAMPLES**

28143 None.

28144 **APPLICATION USAGE**

28145 None.

28146 **RATIONALE**

28147 None.

28148 **FUTURE DIRECTIONS**

28149 None.

28150 **SEE ALSO**

28152 **CHANGE HISTORY**

28153 First released in Issue 4, Version 2.

28154 **Issue 5**

28155 Moved from X/OPEN UNIX extension to BASE.

28156 **NAME**

28157 fgetc — get a byte from a stream

28158 **SYNOPSIS**

28159 ```
#include <stdio.h>
```

28160 ```
int fgetc(FILE *stream);
```

28161 **DESCRIPTION**

28162 CX The functionality described on this reference page is aligned with the ISO C standard. Any
28163 conflict between the requirements described here and the ISO C standard is unintentional. This
28164 volume of POSIX.1-200x defers to the ISO C standard.

28165 If the end-of-file indicator for the input stream pointed to by *stream* is not set and a next byte is
28166 present, the *fgetc*( ) function shall obtain the next byte as an **unsigned char** converted to an **int**,
28167 from the input stream pointed to by *stream*, and advance the associated file position indicator for
28168 the stream (if defined). Since *fgetc*( ) operates on bytes, reading a character consisting of multiple
28169 bytes (or "a multi-byte character") may require multiple calls to *fgetc*( ).

28170 CX The *fgetc*( ) function may mark the last data access timestamp of the file associated with *stream*
28171 for update. The last data access timestamp shall be marked for update by the first successful
28172 execution of *fgetc*( ), *fgets*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *getdelim*( ), *getline*( ), *gets*( ), or
28173 *scanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ).

28174 **RETURN VALUE**

28175 Upon successful completion, *fgetc*( ) shall return the next byte from the input stream pointed to
28176 by *stream*. If the end-of-file indicator for the stream is set, or if the stream is at end-of-file, the
28177 end-of-file indicator for the stream shall be set and *fgetc*( ) shall return EOF. If a read error occurs,
28178 CX the error indicator for the stream shall be set, *fgetc*( ) shall return EOF, and shall set *errno* to
28179 indicate the error.

28180 **ERRORS**

28181 The *fgetc*( ) function shall fail if data needs to be read and:

28182 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and
28183 the thread would be delayed in the *fgetc*( ) operation.

28184 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for
28185 reading.

28186 CX [EINTR] The read operation was terminated due to the receipt of a signal, and no data
28187 was transferred.

28188 CX [EIO] A physical I/O error has occurred, or the process is in a background process
28189 group attempting to read from its controlling terminal, and either the process
28190 is ignoring or blocking the SIGTTIN signal or the process group is orphaned.
28191 This error may also be generated for implementation-defined reasons.

28192 CX [EOVERFLOW] The file is a regular file and an attempt was made to read at or beyond the
28193 offset maximum associated with the corresponding stream.

28194 The *fgetc*( ) function may fail if:

28195 CX [ENOMEM] Insufficient storage space is available.

28196 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
28197 capabilities of the device.

EXAMPLES

None.

APPLICATION USAGE

If the integer value returned by *fgetc*( ) is stored into a variable of type **char** and then compared against the integer constant EOF, the comparison may never succeed, because sign-extension of a variable of type **char** on widening to integer is implementation-defined.

The *ferror*( ) or *feof*( ) functions must be used to distinguish between an error condition and an end-of-file condition.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

feof( ), *ferror*( ), *fgets*( ), *fread*( ), *fscanf*( ), *getchar*( ), *getc*( ), *gets*( ), *ungetc*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] and [EOVERFLOW] mandatory error conditions are added.
- The [ENOMEM] and [ENXIO] optional error conditions are added.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The DESCRIPTION is updated to clarify the behavior when the end-of-file indicator for the input stream is not set.
- The RETURN VALUE section is updated to note that the error indicator shall be set for the stream.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/32 is applied, updating the [EAGAIN] error in the ERRORS section from "the process would be delayed" to "the thread would be delayed".

Issue 7

Austin Group Interpretation 1003.1-2001 #051 is applied, updating the list of functions that mark the last data access timestamp for update.

NAME

fgetpos — get current file position information

SYNOPSIS

```
#include <stdio.h>

int fgetpos(FILE *restrict stream, fpos_t *restrict pos);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fgetpos*( ) function shall store the current values of the parse state (if any) and file position indicator for the stream pointed to by *stream* in the object pointed to by *pos*. The value stored contains unspecified information usable by *fsetpos*( ) for repositioning the stream to its position at the time of the call to *fgetpos*( ).

RETURN VALUE

Upon successful completion, *fgetpos*( ) shall return 0; otherwise, it shall return a non-zero value and set *errno* to indicate the error.

ERRORS

The *fgetpos*( ) function shall fail if:

CX [EOVERFLOW] The current value of the file position cannot be represented correctly in an object of type **fpos_t**.

The *fgetpos*( ) function may fail if:

CX [EBADF] The file descriptor underlying *stream* is not valid.

CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe, FIFO, or socket.

EXAMPLES

None.

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 4. Derived from the ISO C standard.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EBADF] and [ESPIPE] optional error conditions are added.

An additional [ESPIPE] error condition is added for sockets.

The prototype for *fgetpos*( ) is changed for alignment with the ISO/IEC 9899: 1999 standard.

NAME

fgets — get a string from a stream

SYNOPSIS

```
#include <stdio.h>

char *fgets(char *restrict s, int n, FILE *restrict stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fgets*( ) function shall read bytes from *stream* into the array pointed to by *s*, until *n*–1 bytes are read, or a <newline> is read and transferred to *s*, or an end-of-file condition is encountered. The string is then terminated with a null byte.

CX The *fgets*( ) function may mark the last data access timestamp of the file associated with *stream* for update. The last data access timestamp shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *getdelim*( ), *getline*( ), *gets*( ), or *scanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ).

RETURN VALUE

Upon successful completion, *fgets*( ) shall return *s*. If the stream is at end-of-file, the end-of-file indicator for the stream shall be set and *fgets*( ) shall return a null pointer. If a read error occurs, CX the error indicator for the stream shall be set, *fgets*( ) shall return a null pointer, and shall set *errno* to indicate the error.

ERRORS

Refer to *fgetc*( ).

EXAMPLES

Reading Input

The following example uses *fgets*( ) to read each line of input. {LINE_MAX}, which defines the maximum size of the input line, is defined in the **<limits.h>** header.

```
#include <stdio.h>
...
char line[LINE_MAX];
...
while (fgets(line, LINE_MAX, fp) != NULL) {
...
}
...
```

NAME

fgetwc — get a wide-character code from a stream

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

wint_t fgetwc(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fgetwc*( ) function shall obtain the next character (if present) from the input stream pointed to by *stream*, convert that to the corresponding wide-character code, and advance the associated file position indicator for the stream (if defined).

If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

CX The *fgetwc*( ) function may mark the last data access timestamp of the file associated with *stream* for update. The last data access timestamp shall be marked for update by the first successful execution of *fgetwc*( ), *fgetws*( ), *fwscanf*( ), *getwc*( ), *getwchar*( ), *vfwscanf*( ), *vwscanf*( ), or *wscanf*( ) using *stream* that returns data not supplied by a prior call to *ungetwc*( ).

RETURN VALUE

Upon successful completion, the *fgetwc*( ) function shall return the wide-character code of the character read from the input stream pointed to by *stream* converted to a type **wint_t**. If the end-of-file indicator for the stream is set, or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and *fgetwc*( ) shall return WEOF. If a read error occurs, the error indicator for the stream shall be set, *fgetwc*( ) shall return WEOF, CX and shall set *errno* to indicate the error. If an encoding error occurs, the error indicator for the stream shall be set, *fgetwc*( ) shall return WEOF, and shall set *errno* to indicate the error.

ERRORS

The *fgetwc*( ) function shall fail if data needs to be read and:

CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the thread would be delayed in the *fgetwc*( ) operation.

CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for reading.

[EILSEQ] The data obtained from the input stream does not form a valid character.

CX [EINTR] The read operation was terminated due to the receipt of a signal, and no data was transferred.

CX [EIO] A physical I/O error has occurred, or the process is in a background process group attempting to read from its controlling terminal, and either the process is ignoring or blocking the SIGTTIN signal or the process group is orphaned. This error may also be generated for implementation-defined reasons.

CX [EOVERFLOW] The file is a regular file and an attempt was made to read at or beyond the offset maximum associated with the corresponding stream.

The *fgetwc*( ) function may fail if:

CX [ENOMEM] Insufficient storage space is available.

CX [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.

EXAMPLES

NAME

fgetws — get a wide-character string from a stream

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

wchar_t *fgetws(wchar_t *restrict ws, int n,
    FILE *restrict stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fgetws*( ) function shall read characters from the *stream*, convert these to the corresponding wide-character codes, place them in the **wchar_t** array pointed to by *ws*, until *n*–1 characters are read, or a <newline> is read, converted, and transferred to *ws*, or an end-of-file condition is encountered. The wide-character string, *ws*, shall then be terminated with a null wide-character code.

If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

CX The *fgetws*( ) function may mark the last data access timestamp of the file associated with *stream* for update. The last data access timestamp shall be marked for update by the first successful execution of *fgetwc*( ), *fgetws*( ), *fwscanf*( ), *getwc*( ), *getwchar*( ), *vfwscanf*( ), *vwscanf*( ), or *wscanf*( ) using *stream* that returns data not supplied by a prior call to *ungetwc*( ).

RETURN VALUE

Upon successful completion, *fgetws*( ) shall return *ws*. If the end-of-file indicator for the stream is set, or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and *fgetws*( ) shall return a null pointer. If a read error occurs, the error indicator for the stream shall be set, *fgetws*( ) shall return a null pointer, CX and shall set *errno* to indicate the error.

ERRORS

Refer to *fgetwc*( ).

CHANGE HISTORY

First released in Issue 4. Derived from the MSE working draft.

28446 **Issue 5**

28447 The Optional Header (OH) marking is removed from **<stdio.h>**.

28448 **Issue 6**

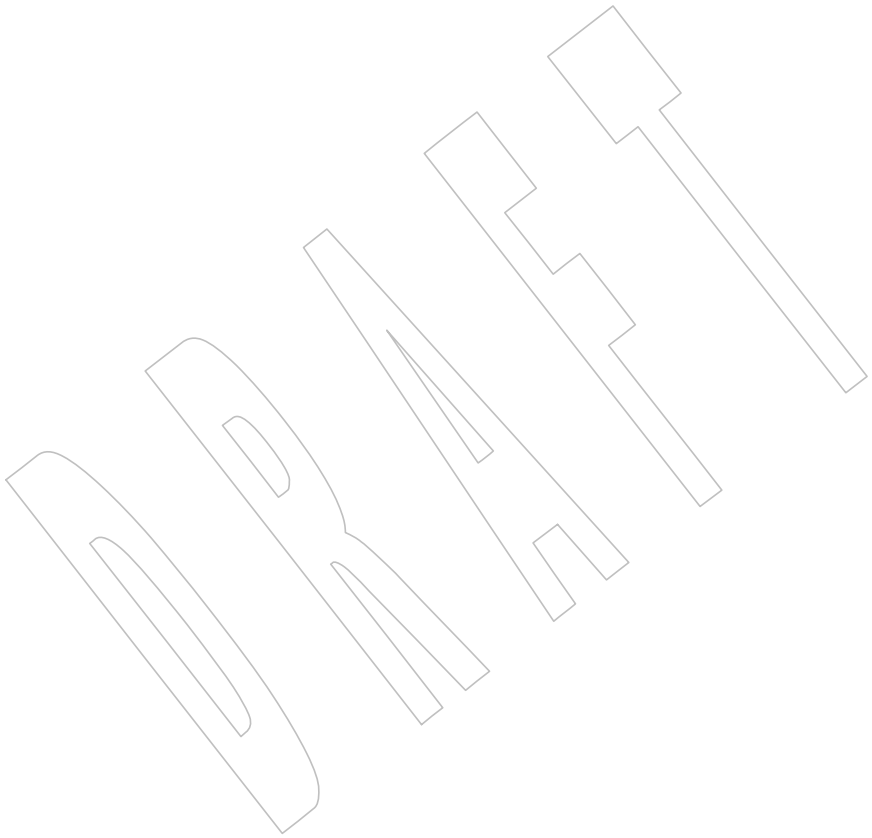
28449 Extensions beyond the ISO C standard are marked.

28450 The prototype for *fgetws*( ) is changed for alignment with the ISO/IEC 9899: 1999 standard.

28451 **Issue 7**

28452 Austin Group Interpretation 1003.1-2001 #051 is applied, clarifying the RETURN VALUE section.

28453 Changes are made related to support for finegrained timestamps.



28454 **NAME**

28455 fileno — map a stream pointer to a file descriptor

28456 **SYNOPSIS**

28457 CX
```
#include <stdio.h>

int fileno(FILE *stream);
```
28458

28459 **DESCRIPTION**

28460 The *fileno*( ) function shall return the integer file descriptor associated with the stream pointed to
28461 by *stream*.

28462 **RETURN VALUE**

28463 Upon successful completion, *fileno*( ) shall return the integer value of the file descriptor
28464 associated with *stream*. Otherwise, the value –1 shall be returned and *errno* set to indicate the
28465 error.

28466 **ERRORS**

28467 The *fileno*( ) function may fail if:

28468 [EBADF] The *stream* argument is not a valid stream, or the stream is not associated with
28469 a file.

28470 **EXAMPLES**

28471 None.

28472 **APPLICATION USAGE**

28473 None.

28474 **RATIONALE**

28475 Without some specification of which file descriptors are associated with these streams, it is
28476 impossible for an application to set up the streams for another application it starts with *fork*( )
28477 and *exec*. In particular, it would not be possible to write a portable version of the *sh* command
28478 interpreter (although there may be other constraints that would prevent that portability).

28479 **FUTURE DIRECTIONS**

28480 None.

28485 First released in Issue 1. Derived from Issue 1 of the SVID.

28486 **Issue 6**

28487 The following new requirements on POSIX implementations derive from alignment with the
28488 Single UNIX Specification:

28489 - The [EBADF] optional error condition is added.

28490 **Issue 7**

28491 SD5-XBD-ERN-99 is applied, changing the definition of the [EBADF] error.

NAME

flockfile, ftrylockfile, funlockfile — stdio locking functions

SYNOPSIS

CX
```
#include <stdio.h>

void flockfile(FILE *file);
int ftrylockfile(FILE *file);
void funlockfile(FILE *file);
```

DESCRIPTION

These functions shall provide for explicit application-level locking of stdio (**FILE** *) objects. These functions can be used by a thread to delineate a sequence of I/O statements that are executed as a unit.

The *flockfile*( ) function shall acquire for a thread ownership of a (**FILE** *) object.

The *ftrylockfile*( ) function shall acquire for a thread ownership of a (**FILE** *) object if the object is available; *ftrylockfile*( ) is a non-blocking version of *flockfile*( ).

The *funlockfile*( ) function shall relinquish the ownership granted to the thread. The behavior is undefined if a thread other than the current owner calls the *funlockfile*( ) function.

The functions shall behave as if there is a lock count associated with each (**FILE** *) object. This count is implicitly initialized to zero when the (**FILE** *) object is created. The (**FILE** *) object is unlocked when the count is zero. When the count is positive, a single thread owns the (**FILE** *) object. When the *flockfile*( ) function is called, if the count is zero or if the count is positive and the caller owns the (**FILE** *) object, the count shall be incremented. Otherwise, the calling thread shall be suspended, waiting for the count to return to zero. Each call to *funlockfile*( ) shall decrement the count. This allows matching calls to *flockfile*( ) (or successful calls to *ftrylockfile*( )) and *funlockfile*( ) to be nested.

All functions that reference (**FILE** *) objects shall behave as if they use *flockfile*( ) and *funlockfile*( ) internally to obtain ownership of these (**FILE** *) objects.

RETURN VALUE

None for *flockfile*( ) and *funlockfile*( ).

The *ftrylockfile*( ) function shall return zero for success and non-zero to indicate that the lock cannot be acquired.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Applications using these functions may be subject to priority inversion, as discussed in XBD Section 3.285 (on page 79).

RATIONALE

The *flockfile*( ) and *funlockfile*( ) functions provide an orthogonal mutual-exclusion lock for each **FILE**. The *ftrylockfile*( ) function provides a non-blocking attempt to acquire a file lock, analogous to *pthread_mutex_trylock*( ).

These locks behave as if they are the same as those used internally by *stdio* for thread-safety. This both provides thread-safety of these functions without requiring a second level of internal locking and allows functions in *stdio* to be implemented in terms of other *stdio* functions.

Application developers and implementors should be aware that there are potential deadlock problems on **FILE** objects. For example, the line-buffered flushing semantics of *stdio* (requested via {_IOLBF}) require that certain input operations sometimes cause the buffered contents of implementation-defined line-buffered output streams to be flushed. If two threads each hold the lock on the other's **FILE**, deadlock ensues. This type of deadlock can be avoided by acquiring **FILE** locks in a consistent order. In particular, the line-buffered output stream deadlock can typically be avoided by acquiring locks on input streams before locks on output streams if a thread would be acquiring both.

In summary, threads sharing *stdio* streams with other threads can use *flockfile*( ) and *funlockfile*( ) to cause sequences of I/O performed by a single thread to be kept bundled. The only case where the use of *flockfile*( ) and *funlockfile*( ) is required is to provide a scope protecting uses of the *_unlocked* functions/macros. This moves the cost/performance tradeoff to the optimal point.

FUTURE DIRECTIONS

None.

SEE ALSO

getc_unlocked( )

XBD Section 3.285 (on page 79), **<stdio.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

These functions are marked as part of the Thread-Safe Functions option.

Issue 7

The *flockfile*( ), *ftrylockfile*( ), and *funlockfile*( ) functions are moved from the Thread-Safe Functions option to the Base.

NAME

floor, floorf, floorl — floor function

SYNOPSIS

```
#include <math.h>

double floor(double x);
float floorf(float x);
long double floorl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the largest integral value not greater than *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the largest integral value not greater than *x*, expressed as a **double**, **float**, or **long double**, as appropriate for the return type of the function.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0 or ±Inf, *x* shall be returned.

XSI If the correct value would cause overflow, a range error shall occur and *floor*( ), *floorf*( ), and *floorl*( ) shall return the value of the macro –HUGE_VAL, –HUGE_VALF, and –HUGE_VALL, respectively.

ERRORS

These functions shall fail if:

XSI

Range Error	The result would cause an overflow.
	If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

The integral value returned by these functions might not be expressible as an **int** or **long**. The return value should be tested before assigning it to an integer type to avoid the undefined results of an integer overflow.

The *floor*( ) function can only overflow when the floating-point representation has DBL_MANT_DIG > DBL_MAX_EXP.

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

28602 **RATIONALE**

28619 marked.

NAME

fma, fmaf, fmal — floating-point multiply-add

SYNOPSIS

```
#include <math.h>

double fma(double x, double y, double z);
float fmaf(float x, float y, float z);
long double fmal(long double x, long double y, long double z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute $(x * y) + z$, rounded as one ternary operation: they shall compute the value (as if) to infinite precision and round once to the result format, according to the rounding mode characterized by the value of FLT_ROUNDS.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return $(x * y) + z$, rounded as one ternary operation.

MX If the result overflows or underflows, a range error may occur. On systems that support the IEC 60559 Floating-Point option, if the result overflows a range error shall occur.

If x or y are NaN, a NaN shall be returned.

If x multiplied by y is an exact infinity and z is also an infinity but with the opposite sign, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If one of x and y is infinite, the other is zero, and z is not a NaN, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If one of x and y is infinite, the other is zero, and z is a NaN, a NaN shall be returned and a domain error may occur.

If $x*y$ is not 0*Inf nor Inf*0 and z is a NaN, a NaN shall be returned.

ERRORS

These functions shall fail if:

MX **Domain Error** The value of $x*y+z$ is invalid, or the value $x*y$ is invalid and z is not a NaN.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

MX **Range Error** The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

MX

Domain Error — The value $x*y$ is invalid and z is a NaN.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

Range Error — The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

Range Error — The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

In many cases, clever use of floating (*fused*) multiply-add leads to much improved code; but its unexpected use by the compiler can undermine carefully written code. The FP_CONTRACT macro can be used to disallow use of floating multiply-add; and the *fma*( ) function guarantees its use where desired. Many current machines provide hardware floating multiply-add instructions; software implementation can be used for others.

FUTURE DIRECTIONS

None.

NAME

fmemopen — open a memory buffer stream

SYNOPSIS

CX
```
#include <stdio.h>

FILE *fmemopen(void *restrict buf, size_t size,
    const char *restrict mode);
```

DESCRIPTION

The *fmemopen*( ) function shall associate the buffer given by the *buf* and *size* arguments with a stream. The *buf* argument shall be either a null pointer or point to a buffer that is at least *size* bytes long.

The *mode* argument is a character string having one of the following values:

r or *rb*	Open the stream for reading.
w or *wb*	Open the stream for writing.
a or *ab*	Append; open the stream for writing at the first null byte.
r+ or *rb*+ or *r*+*b*	Open the stream for update (reading and writing).
w+ or *wb*+ or *w*+*b*	Open the stream for update (reading and writing). Truncate the buffer contents.
a+ or *ab*+ or *a*+*b*	Append; open the stream for update (reading and writing); the initial position is at the first null byte.

The character `'b'` shall have no effect.

If a null pointer is specified as the *buf* argument, *fmemopen*( ) shall allocate *size* bytes of memory as if by a call to *malloc*( ). This buffer shall be automatically freed when the stream is closed. Because this feature is only useful when the stream is opened for updating (because there is no way to get a pointer to the buffer) the *fmemopen*( ) call may fail if the *mode* argument does not include a `'+'`.

The stream maintains a current position in the buffer. This position is initially set to either the beginning of the buffer (for *r* and *w* modes) or to the first null byte in the buffer (for *a* modes). If no null byte is found in append mode, the initial position is set to one byte after the end of the buffer.

If *buf* is a null pointer, the initial position shall always be set to the beginning of the buffer.

The stream also maintains the size of the current buffer contents. For modes *r* and *r*+ the size is set to the value given by the *size* argument. For modes *w* and *w*+ the initial size is zero and for modes *a* and *a*+ the initial size is either the position of the first null byte in the buffer or the value of the *size* argument if no null byte is found.

A read operation on the stream cannot advance the current buffer position beyond the current buffer size. Reaching the buffer size in a read operation counts as "end-of-file". Null bytes in the buffer have no special meaning for reads. The read operation starts at the current buffer position of the stream.

A write operation starts either at the current position of the stream (if mode has not specified `'a'` as the first character) or at the current size of the stream (if mode had `'a'` as the first character). If the current position at the end of the write is larger than the current buffer size, the current buffer size is set to the current position. A write operation on the stream cannot advance the current buffer size beyond the size given in the *size* argument.

When a stream open for writing is flushed or closed, a null byte is written at the current position or at the end of the buffer, depending on the size of the contents. If a stream open for update is flushed or closed and the last write has advanced the current buffer size, a null byte is written at the end of the buffer if it fits.

An attempt to seek a memory buffer stream to a negative position or to a position larger than the buffer size given in the *size* argument shall fail.

RETURN VALUE

Upon successful completion, *fmemopen*( ) shall return a pointer to the object controlling the stream. Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

ERRORS

The *fmemopen*( ) function shall fail if:

[EINVAL] The *size* argument specifies a buffer size of zero.

The *fmemopen*( ) function may fail if:

[EINVAL] The value of the *mode* argument is not valid.

[EINVAL] The *buf* argument is a null pointer and the *mode* argument does not include a '+' character.

[ENOMEM] The *buf* argument is a null pointer and the allocation of a buffer of length *size* has failed.

[EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

EXAMPLES

```
#include <stdio.h>
#include <string.h>

static char buffer[] = "foobar";

int
main (void)
{
    int ch;
    FILE *stream;

    stream = fmemopen(buffer, strlen (buffer), "r");
    if (stream == NULL)
        /* handle error */;

    while ((ch = fgetc(stream)) != EOF)
        printf("Got %c\n", ch);

    fclose(stream);
    return (0);
}
```

This program produces the following output:

```
Got f
Got o
Got o
Got b
Got a
Got r
```

APPLICATION USAGE

None.

RATIONALE

This interface has been introduced to eliminate many of the errors encountered in the construction of strings, notably overflowing of strings. This interface prevents overflow.

NAME

fmod, fmodf, fmodl — floating-point remainder value function

SYNOPSIS

```
#include <math.h>

double fmod(double x, double y);
float fmodf(float x, float y);
long double fmodl(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall return the floating-point remainder of the division of *x* by *y*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

These functions shall return the value $x-i*y$, for some integer i such that, if y is non-zero, the result has the same sign as x and magnitude less than the magnitude of y.

If the correct value would cause underflow, and is not representable, a range error may occur, and MX either 0.0 (if supported), or an implementation-defined value shall be returned.

MX If *x* or *y* is NaN, a NaN shall be returned.

If *y* is zero, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If *x* is infinite, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If *x* is ±0 and *y* is not zero, ±0 shall be returned.

If *x* is not infinite and *y* is ±Inf, *x* shall be returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

ERRORS

These functions shall fail if:

MX Domain Error — The *x* argument is infinite or *y* is zero.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Range Error — The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The behavior for when the *y* argument is zero is now defined.

The *fmodf*( ) and *fmodl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

fmtmsg — display a message in the specified format on standard error and/or a system console

SYNOPSIS

XSI

```
#include <fmtmsg.h>

int fmtmsg(long classification, const char *label, int severity,
    const char *text, const char *action, const char *tag);
```

DESCRIPTION

The *fmtmsg*( ) function shall display messages in a specified format instead of the traditional *printf*( ) function.

Based on a message's classification component, *fmtmsg*( ) shall write a formatted message either to standard error, to the console, or to both.

A formatted message consists of up to five components as defined below. The component *classification* is not part of a message displayed to the user, but defines the source of the message and directs the display of the formatted message.

classification Contains the sum of identifying values constructed from the constants defined below. Any one identifier from a subclass may be used in combination with a single identifier from a different subclass. Two or more identifiers from the same subclass should not be used together, with the exception of identifiers from the display subclass. (Both display subclass identifiers may be used so that messages can be displayed to both standard error and the system console.)

Major Classifications

Identifies the source of the condition. Identifiers are: MM_HARD (hardware), MM_SOFT (software), and MM_FIRM (firmware).

Message Source Subclassifications

Identifies the type of software in which the problem is detected. Identifiers are: MM_APPL (application), MM_UTIL (utility), and MM_OPSYS (operating system).

Display Subclassifications

Indicates where the message is to be displayed. Identifiers are: MM_PRINT to display the message on the standard error stream, MM_CONSOLE to display the message on the system console. One or both identifiers may be used.

Status Subclassifications

Indicates whether the application can recover from the condition. Identifiers are: MM_RECOVER (recoverable) and MM_NRECOV (non-recoverable).

An additional identifier, MM_NULLMC, indicates that no classification component is supplied for the message.

label Identifies the source of the message. The format is two fields separated by a <colon>. The first field is up to 10 bytes, the second is up to 14 bytes.

severity Indicates the seriousness of the condition. Identifiers for the levels of *severity* are:

MM_HALT Indicates that the application has encountered a severe fault and is halting. Produces the string "HALT".

MM_ERROR Indicates that the application has detected a fault. Produces the string "ERROR".

MM_WARNING Indicates a condition that is out of the ordinary, that might be a problem, and should be watched. Produces the string "WARNING".

MM_INFO Provides information about a condition that is not in error. Produces the string "INFO".

MM_NOSEV Indicates that no severity level is supplied for the message.

text Describes the error condition that produced the message. The character string is not limited to a specific size. If the character string is empty, then the text produced is unspecified.

action Describes the first step to be taken in the error-recovery process. The *fmtmsg*( ) function precedes the action string with the prefix: "TO FIX:". The *action* string is not limited to a specific size.

tag An identifier that references on-line documentation for the message. Suggested usage is that *tag* includes the *label* and a unique identifying number. A sample *tag* is "XSI:cat:146".

The *MSGVERB* environment variable (for message verbosity) shall determine for *fmtmsg*( ) which message components it is to select when writing messages to standard error. The value of *MSGVERB* shall be a <colon>-separated list of optional keywords. Valid keywords are: *label*, *severity*, *text*, *action*, and *tag*. If *MSGVERB* contains a keyword for a component and the component's value is not the component's null value, *fmtmsg*( ) shall include that component in the message when writing the message to standard error. If *MSGVERB* does not include a keyword for a message component, that component shall not be included in the display of the message. The keywords may appear in any order. If *MSGVERB* is not defined, if its value is the null string, if its value is not of the correct format, or if it contains keywords other than the valid ones listed above, *fmtmsg*( ) shall select all components.

MSGVERB shall determine which components are selected for display to standard error. All message components shall be included in console messages.

RETURN VALUE

The *fmtmsg*( ) function shall return one of the following values:

MM_OK The function succeeded.

MM_NOTOK The function failed completely.

MM_NOMSG The function was unable to generate a message on standard error, but otherwise succeeded.

MM_NOCON The function was unable to generate a console message, but otherwise succeeded.

ERRORS

None.

EXAMPLES

1. The following example of *fmtmsg*( ):

```
fmtmsg(MM_PRINT, "XSI:cat", MM_ERROR, "illegal option",
"refer to cat in user's reference manual", "XSI:cat:001")
```

produces a complete message in the specified message format:

```
XSI:cat: ERROR: illegal option
TO FIX: refer to cat in user's reference manual XSI:cat:001
```

2. When the environment variable *MSGVERB* is set as follows:

```
MSGVERB=severity:text:action
```

and Example 1 is used, *fmtmsg*( ) produces:

```
ERROR: illegal option
TO FIX: refer to cat in user's reference manual
```

APPLICATION USAGE

One or more message components may be systematically omitted from messages generated by an application by using the null value of the argument for that component.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

NAME

fnmatch — match a filename or a pathname

SYNOPSIS

```
#include <fnmatch.h>

int fnmatch(const char *pattern, const char *string, int flags);
```

DESCRIPTION

The *fnmatch*( ) function shall match patterns as described in XCU Section 2.13.1 (on page 2332) and Section 2.13.2 (on page 2332). It checks the string specified by the *string* argument to see if it matches the pattern specified by the *pattern* argument.

The *flags* argument shall modify the interpretation of *pattern* and *string*. It is the bitwise-inclusive OR of zero or more of the flags defined in **<fnmatch.h>**. If the FNM_PATHNAME flag is set in *flags*, then a <slash> character (`'/'`) in *string* shall be explicitly matched by a <slash> in *pattern*; it shall not be matched by either the <asterisk> or <question-mark> special characters, nor by a bracket expression. If the FNM_PATHNAME flag is not set, the <slash> character shall be treated as an ordinary character.

If FNM_NOESCAPE is not set in *flags*, a <backslash> character in *pattern* followed by any other character shall match that second character in *string*. In particular, `"\\"` shall match a <backslash> in *string*. If FNM_NOESCAPE is set, a <backslash> character shall be treated as an ordinary character.

If FNM_PERIOD is set in *flags*, then a leading <period> (`'.'`) in *string* shall match a <period> in *pattern*; as described by rule 2 in XCU Section 2.13.3 (on page 2333) where the location of "leading" is indicated by the value of FNM_PATHNAME:

- If FNM_PATHNAME is set, a <period> is "leading" if it is the first character in *string* or if it immediately follows a <slash>.
- If FNM_PATHNAME is not set, a <period> is "leading" only if it is the first character of *string*.

If FNM_PERIOD is not set, then no special restrictions are placed on matching a period.

RETURN VALUE

If *string* matches the pattern specified by *pattern*, then *fnmatch*( ) shall return 0. If there is no match, *fnmatch*( ) shall return FNM_NOMATCH, which is defined in **<fnmatch.h>**. If an error occurs, *fnmatch*( ) shall return another non-zero value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *fnmatch*( ) function has two major uses. It could be used by an application or utility that needs to read a directory and apply a pattern against each entry. The *find* utility is an example of this. It can also be used by the *pax* utility to process its *pattern* operands, or by applications that need to match strings in a similar manner.

The name *fnmatch*( ) is intended to imply *filename* match, rather than *pathname* match. The default action of this function is to match filenames, rather than pathnames, since it gives no special significance to the <slash> character. With the FNM_PATHNAME flag, *fnmatch*( ) does match pathnames, but without tilde expansion, parameter expansion, or special treatment for a <period> at the beginning of a filename.

RATIONALE

This function replaced the REG_FILENAME flag of *regcomp*( ) in early proposals of this volume of POSIX.1-200x. It provides virtually the same functionality as the *regcomp*( ) and *regexec*( ) functions using the REG_FILENAME and REG_FSLASH flags (the REG_FSLASH flag was proposed for *regcomp*( ), and would have had the opposite effect from FNM_PATHNAME), but with a simpler function and less system overhead.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 5

Moved from POSIX2 C-language Binding to BASE.

NAME

fopen — open a stream

SYNOPSIS

```
#include <stdio.h>

FILE *fopen(const char *restrict filename, const char *restrict mode);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fopen*( ) function shall open the file whose pathname is the string pointed to by *filename*, and associates a stream with it.

The *mode* argument points to a string. If the string is one of the following, the file shall be opened in the indicated mode. Otherwise, the behavior is undefined.

r or *rb*	Open file for reading.
w or *wb*	Truncate to zero length or create file for writing.
a or *ab*	Append; open or create file for writing at end-of-file.
r+ or *rb+* or *r+b*	Open file for update (reading and writing).
w+ or *wb+* or *w+b*	Truncate to zero length or create file for update.
a+ or *ab+* or *a+b*	Append; open or create file for update, writing at end-of-file.

CX The character `'b'` shall have no effect, but is allowed for ISO C standard conformance. Opening a file with read mode (*r* as the first character in the *mode* argument) shall fail if the file does not exist or cannot be read.

Opening a file with append mode (*a* as the first character in the *mode* argument) shall cause all subsequent writes to the file to be forced to the then current end-of-file, regardless of intervening calls to *fseek*( ).

When a file is opened with update mode (`'+'` as the second or third character in the *mode* argument), both input and output may be performed on the associated stream. However, the application shall ensure that output is not directly followed by input without an intervening call to *fflush*( ) or to a file positioning function (*fseek*( ), *fsetpos*( ), or *rewind*( )), and input is not directly followed by output without an intervening call to a file positioning function, unless the input operation encounters end-of-file.

When opened, a stream is fully buffered if and only if it can be determined not to refer to an interactive device. The error and end-of-file indicators for the stream shall be cleared.

CX If *mode* is *w*, *wb*, *a*, *ab*, *w+*, *wb+*, *w+b*, *a+*, *ab+*, or *a+b*, and the file did not previously exist, upon successful completion, *fopen*( ) shall mark for update the last data access, last data modification, and last file status change timestamps of the file and the last file status change and last data modification timestamps of the parent directory.

If *mode* is *w*, *wb*, *a*, *ab*, *w+*, *wb+*, *w+b*, *a+*, *ab+*, or *a+b*, and the file did not previously exist, the *fopen*( ) function shall create a file as if it called the *creat*( ) function with a value appropriate for the *path* argument interpreted from *filename* and a value of S_IRUSR | S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH for the *mode* argument.

If *mode* is *w*, *wb*, *w+*, *wb+*, or *w+b*, and the file did previously exist, upon successful completion, *fopen*( ) shall mark for update the last data modification and last file status change timestamps of

the file.

XSI After a successful call to the *fopen*( ) function, the orientation of the stream shall be cleared, the encoding rule shall be cleared, and the associated **mbstate_t** object shall be set to describe an initial conversion state.

CX The file descriptor associated with the opened stream shall be allocated and opened as if by a call to *open*( ) with the following flags:

fopen() Mode	*open*() Flags
r or *rb*	O_RDONLY
w or *wb*	O_WRONLY | O_CREAT | O_TRUNC
a or *ab*	O_WRONLY | O_CREAT | O_APPEND
r+ or *rb+* or *r+b*	O_RDWR
w+ or *wb+* or *w+b*	O_RDWR | O_CREAT | O_TRUNC
a+ or *ab+* or *a+b*	O_RDWR | O_CREAT | O_APPEND

RETURN VALUE

Upon successful completion, *fopen*( ) shall return a pointer to the object controlling the stream. CX Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

ERRORS

The *fopen*( ) function shall fail if:

CX **[EACCES]** Search permission is denied on a component of the path prefix, or the file exists and the permissions specified by *mode* are denied, or the file does not exist and write permission is denied for the parent directory of the file to be created.

CX **[EINTR]** A signal was caught during *fopen*( ).

CX **[EISDIR]** The named file is a directory and *mode* requires write access.

CX **[ELOOP]** A loop exists in symbolic links encountered during resolution of the *path* argument.

CX **[EMFILE]** All file descriptors available to the process are currently open.

CX **[EMFILE]** {STREAM_MAX} streams are currently open in the calling process.

CX **[ENAMETOOLONG]**
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

CX **[ENFILE]** The maximum allowable number of files is currently open in the system.

CX **[ENOENT]** A component of *filename* does not name an existing file or *filename* is an empty string.

CX **[ENOSPC]** The directory or file system that would contain the new file cannot be expanded, the file does not exist, and the file was to be created.

CX **[ENOTDIR]** A component of the path prefix is not a directory, or the *filename* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

29193 CX [ENXIO] The named file is a character special or block special file, and the device
29194 associated with this special file does not exist.

29195 CX [EOVERFLOW] The named file is a regular file and the size of the file cannot be represented
29196 correctly in an object of type **off_t**.

29197 CX [EROFS] The named file resides on a read-only file system and *mode* requires write
29198 access.

29199 The *fopen*( ) function may fail if:

29200 CX [EINVAL] The value of the *mode* argument is not valid.

29201 CX [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
29202 resolution of the *path* argument.

29203 CX [EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

29204 CX [ENAMETOOLONG]
29205 The length of a component of a pathname is longer than {NAME_MAX}.

29206 CX [ENOMEM] Insufficient storage space is available.

29207 CX [ETXTBSY] The file is a pure procedure (shared text) file that is being executed and *mode*
29208 requires write access.

29209 **EXAMPLES**

29210 **Opening a File**

29211 The following example tries to open the file named **file** for reading. The *fopen*( ) function returns
29212 a file pointer that is used in subsequent *fgets*( ) and *fclose*( ) calls. If the program cannot open the
29213 file, it just ignores it.

```
29214 #include <stdio.h>
29215 ...
29216 FILE *fp;
29217 ...
29218 void rgrep(const char *file)
29219 {
29220 ...
29221     if ((fp = fopen(file, "r")) == NULL)
29222         return;
29223 ...
29224 }
```

29225 **APPLICATION USAGE**

29226 None.

29227 **RATIONALE**

29228 None.

29229 **FUTURE DIRECTIONS**

29234 **CHANGE HISTORY**

29235 First released in Issue 1. Derived from Issue 1 of the SVID.

29236 **Issue 5**

29237 Large File Summit extensions are added.

29238 **Issue 6**

29239 Extensions beyond the ISO C standard are marked.

29240 The following new requirements on POSIX implementations derive from alignment with the
29241 Single UNIX Specification:

29242 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open
29243 file description. This change is to support large files.

29244 • In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support
29245 large files.

29246 • The [ELOOP] mandatory error condition is added.

29247 • The [EINVAL], [EMFILE], [ENAMETOOLONG], [ENOMEM], and [ETXTBSY] optional
29248 error conditions are added.

29249 The normative text is updated to avoid use of the term "must" for application requirements.

29250 The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

29251 • The prototype for *fopen*( ) is updated.

29252 • The DESCRIPTION is updated to note that if the argument *mode* points to a string other
29253 than those listed, then the behavior is undefined.

29254 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
29255 [ELOOP] error condition is added.

29256 **Issue 7**

29257 Austin Group Interpretation 1003.1-2001 #025 is applied, clarifying the file creation mode.

29258 Austin Group Interpretation 1003.1-2001 #143 is applied.

29259 Austin Group Interpretation 1003.1-2001 #159 is applied, clarifying requirements for the flags set
29260 on the open file description.

29261 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

29262 SD5-XSH-ERN-149 is applied, changing the {STREAM_MAX} [EMFILE] error condition from a
29263 "may fail" to a "shall fail".

29264 Changes are made related to support for finegrained timestamps.

NAME

fork — create a new process

SYNOPSIS

```
#include <unistd.h>

pid_t fork(void);
```

DESCRIPTION

The *fork*( ) function shall create a new process. The new process (child process) shall be an exact copy of the calling process (parent process) except as detailed below:

- The child process shall have a unique process ID.
- The child process ID also shall not match any active process group ID.
- The child process shall have a different parent process ID, which shall be the process ID of the calling process.
- The child process shall have its own copy of the parent's file descriptors. Each of the child's file descriptors shall refer to the same open file description with the corresponding file descriptor of the parent.
- The child process shall have its own copy of the parent's open directory streams. Each open directory stream in the child process may share directory stream positioning with the corresponding directory stream of the parent.
- The child process shall have its own copy of the parent's message catalog descriptors.
- The child process values of *tms_utime*, *tms_stime*, *tms_cutime*, and *tms_cstime* shall be set to 0.
- The time left until an alarm clock signal shall be reset to zero, and the alarm, if any, shall be canceled; see *alarm*( ).
- XSI All *semadj* values shall be cleared.
- File locks set by the parent process shall not be inherited by the child process.
- The set of signals pending for the child process shall be initialized to the empty set.
- XSI Interval timers shall be reset in the child process.
- Any semaphores that are open in the parent process shall also be open in the child process.
- ML The child process shall not inherit any address space memory locks established by the parent process via calls to *mlockall*( ) or *mlock*( ).
- Memory mappings created in the parent shall be retained in the child process. MAP_PRIVATE mappings inherited from the parent shall also be MAP_PRIVATE mappings in the child, and any modifications to the data in these mappings made by the parent prior to calling *fork*( ) shall be visible to the child. Any modifications to the data in MAP_PRIVATE mappings made by the parent after *fork*( ) returns shall be visible only to the parent. Modifications to the data in MAP_PRIVATE mappings made by the child shall be visible only to the child.
- PS For the SCHED_FIFO and SCHED_RR scheduling policies, the child process shall inherit the policy and priority settings of the parent process during a *fork*( ) function. For other scheduling policies, the policy and priority settings on *fork*( ) are implementation-defined.

- Per-process timers created by the parent shall not be inherited by the child process.

MSG

- The child process shall have its own copy of the message queue descriptors of the parent. Each of the message descriptors of the child shall refer to the same open message queue description as the corresponding message descriptor of the parent.

- No asynchronous input or asynchronous output operations shall be inherited by the child process. Any use of asynchronous control blocks created by the parent produces undefined behavior.

- A process shall be created with a single thread. If a multi-threaded process calls *fork*( ), the new process shall contain a replica of the calling thread and its entire address space, possibly including the states of mutexes and other resources. Consequently, to avoid errors, the child process may only execute async-signal-safe operations until such time as one of the *exec* functions is called. Fork handlers may be established by means of the *pthread_atfork*( ) function in order to maintain application invariants across *fork*( ) calls.

  When the application calls *fork*( ) from a signal handler and any of the fork handlers registered by *pthread_atfork*( ) calls a function that is not async-signal-safe, the behavior is undefined.

OB TRC TRI

- If the Trace option and the Trace Inherit option are both supported:

  If the calling process was being traced in a trace stream that had its inheritance policy set to POSIX_TRACE_INHERITED, the child process shall be traced into that trace stream, and the child process shall inherit the parent's mapping of trace event names to trace event type identifiers. If the trace stream in which the calling process was being traced had its inheritance policy set to POSIX_TRACE_CLOSE_FOR_CHILD, the child process shall not be traced into that trace stream. The inheritance policy is set by a call to the *posix_trace_attr_setinherited*( ) function.

OB TRC

- If the Trace option is supported, but the Trace Inherit option is not supported:

  The child process shall not be traced into any of the trace streams of its parent process.

OB TRC

- If the Trace option is supported, the child process of a trace controller process shall not control the trace streams controlled by its parent process.

CPT

- The initial value of the CPU-time clock of the child process shall be set to zero.

TCT

- The initial value of the CPU-time clock of the single thread of the child process shall be set to zero.

All other process characteristics defined by POSIX.1-200x shall be the same in the parent and child processes. The inheritance of process characteristics not defined by POSIX.1-200x is unspecified by POSIX.1-200x.

After *fork*( ), both the parent and the child processes shall be capable of executing independently before either one terminates.

RETURN VALUE

Upon successful completion, *fork*( ) shall return 0 to the child process and shall return the process ID of the child process to the parent process. Both processes shall continue to execute from the *fork*( ) function. Otherwise, –1 shall be returned to the parent process, no child process shall be created, and *errno* shall be set to indicate the error.

29346 **ERRORS**

29347 The *fork*( ) function shall fail if:

29348 [EAGAIN] The system lacked the necessary resources to create another process, or the
29349 system-imposed limit on the total number of processes under execution
29350 system-wide or by a single user {CHILD_MAX} would be exceeded.

29351 The *fork*( ) function may fail if:

29352 [ENOMEM] Insufficient storage space is available.

29353 **EXAMPLES**

29354 None.

29355 **APPLICATION USAGE**

29356 None.

29357 **RATIONALE**

29358 Many historical implementations have timing windows where a signal sent to a process group
29359 (for example, an interactive SIGINT) just prior to or during execution of *fork*( ) is delivered to the
29360 parent following the *fork*( ) but not to the child because the *fork*( ) code clears the child's set of
29361 pending signals. This volume of POSIX.1-200x does not require, or even permit, this behavior.
29362 However, it is pragmatic to expect that problems of this nature may continue to exist in
29363 implementations that appear to conform to this volume of POSIX.1-200x and pass available
29364 verification suites. This behavior is only a consequence of the implementation failing to make
29365 the interval between signal generation and delivery totally invisible. From the application's
29366 perspective, a *fork*( ) call should appear atomic. A signal that is generated prior to the *fork*( )
29367 should be delivered prior to the *fork*( ). A signal sent to the process group after the *fork*( ) should
29368 be delivered to both parent and child. The implementation may actually initialize internal data
29369 structures corresponding to the child's set of pending signals to include signals sent to the
29370 process group during the *fork*( ). Since the *fork*( ) call can be considered as atomic from the
29371 application's perspective, the set would be initialized as empty and such signals would have
29372 arrived after the *fork*( ); see also **<signal.h>**.

29373 One approach that has been suggested to address the problem of signal inheritance across *fork*( )
29374 is to add an [EINTR] error, which would be returned when a signal is detected during the call.
29375 While this is preferable to losing signals, it was not considered an optimal solution. Although it
29376 is not recommended for this purpose, such an error would be an allowable extension for an
29377 implementation.

29378 The [ENOMEM] error value is reserved for those implementations that detect and distinguish
29379 such a condition. This condition occurs when an implementation detects that there is not enough
29380 memory to create the process. This is intended to be returned when [EAGAIN] is inappropriate
29381 because there can never be enough memory (either primary or secondary storage) to perform
29382 the operation. Since *fork*( ) duplicates an existing process, this must be a condition where there is
29383 sufficient memory for one such process, but not for two. Many historical implementations
29384 actually return [ENOMEM] due to temporary lack of memory, a case that is not generally
29385 distinct from [EAGAIN] from the perspective of a conforming application.

29386 Part of the reason for including the optional error [ENOMEM] is because the SVID specifies it
29387 and it should be reserved for the error condition specified there. The condition is not applicable
29388 on many implementations.

29389 IEEE Std 1003.1-1988 neglected to require concurrent execution of the parent and child of *fork*( ).
29390 A system that single-threads processes was clearly not intended and is considered an
29391 unacceptable "toy implementation" of this volume of POSIX.1-200x. The only objection
29392 anticipated to the phrase "executing independently" is testability, but this assertion should be

testable. Such tests require that both the parent and child can block on a detectable action of the other, such as a write to a pipe or a signal. An interactive exchange of such actions should be possible for the system to conform to the intent of this volume of POSIX.1-200x.

The [EAGAIN] error exists to warn applications that such a condition might occur. Whether it occurs or not is not in any practical sense under the control of the application because the condition is usually a consequence of the user's use of the system, not of the application's code. Thus, no application can or should rely upon its occurrence under any circumstances, nor should the exact semantics of what concept of "user" is used be of concern to the application developer. Validation writers should be cognizant of this limitation.

There are two reasons why POSIX programmers call *fork*( ). One reason is to create a new thread of control within the same program (which was originally only possible in POSIX by creating a new process); the other is to create a new process running a different program. In the latter case, the call to *fork*( ) is soon followed by a call to one of the *exec* functions.

The general problem with making *fork*( ) work in a multi-threaded world is what to do with all of the threads. There are two alternatives. One is to copy all of the threads into the new process. This causes the programmer or implementation to deal with threads that are suspended on system calls or that might be about to execute system calls that should not be executed in the new process. The other alternative is to copy only the thread that calls *fork*( ). This creates the difficulty that the state of process-local resources is usually held in process memory. If a thread that is not calling *fork*( ) holds a resource, that resource is never released in the child process because the thread whose job it is to release the resource does not exist in the child process.

When a programmer is writing a multi-threaded program, the first described use of *fork*( ), creating new threads in the same program, is provided by the *pthread_create*( ) function. The *fork*( ) function is thus used only to run new programs, and the effects of calling functions that require certain resources between the call to *fork*( ) and the call to an *exec* function are undefined.

The addition of the *forkall*( ) function to the standard was considered and rejected. The *forkall*( ) function lets all the threads in the parent be duplicated in the child. This essentially duplicates the state of the parent in the child. This allows threads in the child to continue processing and allows locks and the state to be preserved without explicit *pthread_atfork*( ) code. The calling process has to ensure that the threads processing state that is shared between the parent and child (that is, file descriptors or MAP_SHARED memory) behaves properly after *forkall*( ). For example, if a thread is reading a file descriptor in the parent when *forkall*( ) is called, then two threads (one in the parent and one in the child) are reading the file descriptor after the *forkall*( ). If this is not desired behavior, the parent process has to synchronize with such threads before calling *forkall*( ).

While the *fork*( ) function is async-signal-safe, there is no way for an implementation to determine whether the fork handlers established by *pthread_atfork*( ) are async-signal-safe. The fork handlers may attempt to execute portions of the implementation that are not async-signal-safe, such as those that are protected by mutexes, leading to a deadlock condition. It is therefore undefined for the fork handlers to execute functions that are not async-signal-safe when *fork*( ) is called from a signal handler.

When *forkall*( ) is called, threads, other than the calling thread, that are in functions that can return with an [EINTR] error may have those functions return [EINTR] if the implementation cannot ensure that the function behaves correctly in the parent and child. In particular, *pthread_cond_wait*( ) and *pthread_cond_timedwait*( ) need to return in order to ensure that the condition has not changed. These functions can be awakened by a spurious condition wakeup rather than returning [EINTR].

FUTURE DIRECTIONS

None.

XBD Section 4.11 (on page 110), **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is changed for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The effect of *fork*( ) on a pending alarm call in the child process is clarified.

The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/17 is applied, adding text to the DESCRIPTION and RATIONALE relating to fork handlers registered by the *pthread_atfork*( ) function and async-signal safety.

Issue 7

Austin Group Interpretation 1003.1-2001 #080 is applied, clarifying the status of asynchronous input and asynchronous output operations and asynchronous control lists in the DESCRIPTION.

Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, Timers, and Threads options is moved to the Base.

Functionality relating to message catalog descriptors is moved from the XSI option to the Base.

NAME

fpathconf, pathconf — get configurable pathname variables

SYNOPSIS

```
#include <unistd.h>

long fpathconf(int fildes, int name);
long pathconf(const char *path, int name);
```

DESCRIPTION

The *fpathconf*( ) and *pathconf*( ) functions shall determine the current value of a configurable limit or option (*variable*) that is associated with a file or directory.

For *pathconf*( ), the *path* argument points to the pathname of a file or directory.

For *fpathconf*( ), the *fildes* argument is an open file descriptor.

The *name* argument represents the variable to be queried relative to that file or directory. Implementations shall support all of the variables listed in the following table and may support others. The variables in the following table come from **<limits.h>** or **<unistd.h>** and the symbolic constants, defined in **<unistd.h>**, are the corresponding values used for *name*.

Variable	Value of *name*	Requirements
{FILESIZEBITS}	_PC_FILESIZEBITS	3,4
{LINK_MAX}	_PC_LINK_MAX	1
{MAX_CANON}	_PC_MAX_CANON	2
{MAX_INPUT}	_PC_MAX_INPUT	2
{NAME_MAX}	_PC_NAME_MAX	3,4
{PATH_MAX}	_PC_PATH_MAX	4,5
{PIPE_BUF}	_PC_PIPE_BUF	6
{POSIX2_SYMLINKS}	_PC_2_SYMLINKS	4
{POSIX_ALLOC_SIZE_MIN}	_PC_ALLOC_SIZE_MIN	10
{POSIX_REC_INCR_XFER_SIZE}	_PC_REC_INCR_XFER_SIZE	10
{POSIX_REC_MAX_XFER_SIZE}	_PC_REC_MAX_XFER_SIZE	10
{POSIX_REC_MIN_XFER_SIZE}	_PC_REC_MIN_XFER_SIZE	10
{POSIX_REC_XFER_ALIGN}	_PC_REC_XFER_ALIGN	10
{SYMLINK_MAX}	_PC_SYMLINK_MAX	4,9
_POSIX_CHOWN_RESTRICTED	_PC_CHOWN_RESTRICTED	7
_POSIX_NO_TRUNC	_PC_NO_TRUNC	3,4
_POSIX_VDISABLE	_PC_VDISABLE	2
_POSIX_ASYNC_IO	_PC_ASYNC_IO	8
_POSIX_PRIO_IO	_PC_PRIO_IO	8
_POSIX_SYNC_IO	_PC_SYNC_IO	8
_POSIX_TIMESTAMP_RESOLUTION	_PC_TIMESTAMP_RESOLUTION	1

Requirements

1. If *path* or *fildes* refers to a directory, the value returned shall apply to the directory itself.
2. If *path* or *fildes* does not refer to a terminal file, it is unspecified whether an implementation supports an association of the variable name with the specified file.
3. If *path* or *fildes* refers to a directory, the value returned shall apply to filenames within the directory.

4. If *path* or *fildes* does not refer to a directory, it is unspecified whether an implementation supports an association of the variable name with the specified file.
5. If *path* or *fildes* refers to a directory, the value returned shall be the maximum length of a relative pathname when the specified directory is the working directory.
6. If *path* refers to a FIFO, or *fildes* refers to a pipe or FIFO, the value returned shall apply to the referenced object. If *path* or *fildes* refers to a directory, the value returned shall apply to any FIFO that exists or can be created within the directory. If *path* or *fildes* refers to any other type of file, it is unspecified whether an implementation supports an association of the variable name with the specified file.
7. If *path* or *fildes* refers to a directory, the value returned shall apply to any files, other than directories, that exist or can be created within the directory.
8. If *path* or *fildes* refers to a directory, it is unspecified whether an implementation supports an association of the variable name with the specified file.
9. If *path* or *fildes* refers to a directory, the value returned shall be the maximum length of the string that a symbolic link in that directory can contain.
10. If *path* or *fildes* des does not refer to a regular file, it is unspecified whether an implementation supports an association of the variable name with the specified file. If an implementation supports such an association for other than a regular file, the value returned is unspecified.

RETURN VALUE

If *name* is an invalid value, both *pathconf*( ) and *fpathconf*( ) shall return –1 and set *errno* to indicate the error.

If the variable corresponding to *name* is described in **<limits.h>** as a maximum or minimum value and the variable has no limit for the path or file descriptor, both *pathconf*( ) and *fpathconf*( ) shall return –1 without changing *errno*. Note that indefinite limits do not imply infinite limits; see **<limits.h>**.

If the implementation needs to use *path* to determine the value of *name* and the implementation does not support the association of *name* with the file specified by *path*, or if the process did not have appropriate privileges to query the file specified by *path*, or *path* does not exist, *pathconf*( ) shall return –1 and set *errno* to indicate the error.

If the implementation needs to use *fildes* to determine the value of *name* and the implementation does not support the association of *name* with the file specified by *fildes*, or if *fildes* is an invalid file descriptor, *fpathconf*( ) shall return –1 and set *errno* to indicate the error.

Otherwise, *pathconf*( ) or *fpathconf*( ) shall return the current variable value for the file or directory without changing *errno*. The value returned shall not be more restrictive than the corresponding value available to the application when it was compiled with the implementation's **<limits.h>** or **<unistd.h>**.

If the variable corresponding to *name* is dependent on an unsupported option, the results are unspecified.

ERRORS

The *pathconf*( ) function shall fail if:

[EINVAL] The value of *name* is not valid.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[EOVERFLOW] The value of *name* is _PC_TIMESTAMP_RESOLUTION and the resolution is larger than {LONG_MAX}.

The *pathconf*( ) function may fail if:

[EACCES] Search permission is denied for a component of the path prefix.

[EINVAL] The implementation does not support an association of the variable *name* with the specified file.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix is not a directory, or the *path* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

The *fpathconf*( ) function shall fail if:

[EINVAL] The value of *name* is not valid.

[EOVERFLOW] The value of *name* is _PC_TIMESTAMP_RESOLUTION and the resolution is larger than {LONG_MAX}.

The *fpathconf*( ) function may fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

[EINVAL] The implementation does not support an association of the variable *name* with the specified file.

EXAMPLES

None.

APPLICATION USAGE

Application developers should check whether an option, such as _POSIX_ADVISORY_INFO, is supported prior to obtaining and using values for related variables such as {POSIX_ALLOC_SIZE_MIN}.

RATIONALE

The *pathconf*( ) function was proposed immediately after the *sysconf*( ) function when it was realized that some configurable values may differ across file system, directory, or device boundaries.

For example, {NAME_MAX} frequently changes between System V and BSD-based file systems; System V uses a maximum of 14, BSD 255. On an implementation that provides both types of file systems, an application would be forced to limit all pathname components to 14 bytes, as this

would be the value specified in **<limits.h>** on such a system.

Therefore, various useful values can be queried on any pathname or file descriptor, assuming that appropriate privileges are in place.

The value returned for the variable {PATH_MAX} indicates the longest relative pathname that could be given if the specified directory is the current working directory of the process. A process may not always be able to generate a name that long and use it if a subdirectory in the pathname crosses into a more restrictive file system. Note that implementations are allowed to accept pathnames longer than {PATH_MAX} bytes long, but are not allowed to return pathnames longer than this unless the user specifies a larger buffer using a function that provides a buffer size argument.

The value returned for the variable _POSIX_CHOWN_RESTRICTED also applies to directories that do not have file systems mounted on them. The value may change when crossing a mount point, so applications that need to know should check for each directory. (An even easier check is to try the *chown*( ) function and look for an error in case it happens.)

Unlike the values returned by *sysconf*( ), the pathname-oriented variables are potentially more volatile and are not guaranteed to remain constant throughout the lifetime of the process. For example, in between two calls to *pathconf*( ), the file system in question may have been unmounted and remounted with different characteristics.

Also note that most of the errors are optional. If one of the variables always has the same value on an implementation, the implementation need not look at *path* or *fildes* to return that value and is, therefore, not required to detect any of the errors except the meaning of [EINVAL] that indicates that the value of *name* is not valid for that variable.

If the value of any of the limits is unspecified (logically infinite), they will not be defined in **<limits.h>** and the *pathconf*( ) and *fpathconf*( ) functions return –1 without changing *errno*. This can be distinguished from the case of giving an unrecognized *name* argument because *errno* is set to [EINVAL] in this case.

Since –1 is a valid return value for the *pathconf*( ) and *fpathconf*( ) functions, applications should set *errno* to zero before calling them and check *errno* only if the return value is –1.

For the case of {SYMLINK_MAX}, since both *pathconf*( ) and *open*( ) follow symbolic links, there is no way that *path* or *fildes* could refer to a symbolic link.

It was the intention of IEEE Std 1003.1d-1999 that the following variables:

{POSIX_ALLOC_SIZE_MIN}
{POSIX_REC_INCR_XFER_SIZE}
{POSIX_REC_MAX_XFER_SIZE}
{POSIX_REC_MIN_XFER_SIZE}
{POSIX_REC_XFER_ALIGN}

only applied to regular files, but Note 10 also permits implementation of the advisory semantics on other file types unique to an implementation (for example, a character special device).

The [EOVERFLOW] error for _PC_TIMESTAMP_RESOLUTION cannot occur on POSIX-compliant file systems because POSIX requires a timestamp resolution no larger than one second. Even on 32-bit systems, this can be represented without overflow.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to include {FILESIZEBITS}.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The _PC_SYMLINK_MAX entry is added to the table in the DESCRIPTION.

The following *pathconf*( ) variables and their associated names are added for alignment with IEEE Std 1003.1d-1999:

{POSIX_ALLOC_SIZE_MIN}
{POSIX_REC_INCR_XFER_SIZE}
{POSIX_REC_MAX_XFER_SIZE}
{POSIX_REC_MIN_XFER_SIZE}
{POSIX_REC_XFER_ALIGN}

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/18 is applied, changing the fourth paragraph of the DESCRIPTION and removing shading and margin markers from the table. This change is needed since implementations are required to support all of these symbols.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/34 is applied, adding the table entry for POSIX2_SYMLINKS in the DESCRIPTION.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/35 is applied, updating the DESCRIPTION and RATIONALE sections to clarify behavior for the following variables:

{POSIX_ALLOC_SIZE_MIN}
{POSIX_REC_INCR_XFER_SIZE}
{POSIX_REC_MAX_XFER_SIZE}
{POSIX_REC_MIN_XFER_SIZE}
{POSIX_REC_XFER_ALIGN}

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/36 is applied, updating the RETURN VALUE and APPLICATION USAGE sections to state that the results are unspecified if a variable is dependent on an unsupported option, and advising application developers to check for

supported options prior to obtaining and using such values.

Issue 7

Austin Group Interpretations 1003.1-2001 #143 and #160 are applied.

Changes are made related to support for finegrained timestamps.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory. +

29685 **NAME**

29686 fpclassify — classify real floating type

29687 **SYNOPSIS**

29688
```
#include <math.h>
```

29689
```
int fpclassify(real-floating x);
```

29690 **DESCRIPTION**

29691 CX The functionality described on this reference page is aligned with the ISO C standard. Any
29692 conflict between the requirements described here and the ISO C standard is unintentional. This
29693 volume of POSIX.1-200x defers to the ISO C standard.

29694 The *fpclassify*( ) macro shall classify its argument value as NaN, infinite, normal, subnormal,
29695 zero, or into another implementation-defined category. First, an argument represented in a
29696 format wider than its semantic type is converted to its semantic type. Then classification is based
29697 on the type of the argument.

29698 **RETURN VALUE**

29699 The *fpclassify*( ) macro shall return the value of the number classification macro appropriate to
29700 the value of its argument.

29701 **ERRORS**

29702 No errors are defined.

29703 **EXAMPLES**

29704 None.

29705 **APPLICATION USAGE**

29706 None.

29707 **RATIONALE**

29714 **CHANGE HISTORY**

29715 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

dprintf, fprintf, printf, snprintf, sprintf — print formatted output

SYNOPSIS

```
#include <stdio.h>

int dprintf(int fildes, const char *restrict format, ...);
int fprintf(FILE *restrict stream, const char *restrict format, ...);
int printf(const char *restrict format, ...);
int snprintf(char *restrict s, size_t n,
    const char *restrict format, ...);
int sprintf(char *restrict s, const char *restrict format, ...);
```

DESCRIPTION

Excluding *dprintf*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fprintf*( ) function shall place output on the named output *stream*. The *printf*( ) function shall place output on the standard output stream *stdout*. The *sprintf*( ) function shall place output followed by the null byte, `'\0'`, in consecutive bytes starting at *s; it is the user's responsibility to ensure that enough space is available.

The *dprintf*( ) function shall be equivalent to the *fprintf*( ) function, except that *dprintf*( ) shall write output to the file associated with the file descriptor specified by the *fildes* argument rather than place output on a stream.

The *snprintf*( ) function shall be equivalent to *sprintf*( ), with the addition of the *n* argument which states the size of the buffer referred to by *s*. If *n* is zero, nothing shall be written and *s* may be a null pointer. Otherwise, output bytes beyond the *n*-1st shall be discarded instead of being written to the array, and a null byte is written at the end of the bytes actually written into the array.

If copying takes place between objects that overlap as a result of a call to *sprintf*( ) or *snprintf*( ), the results are undefined.

Each of these functions converts, formats, and prints its arguments under control of the *format*. The *format* is a character string, beginning and ending in its initial shift state, if any. The *format* is composed of zero or more directives: *ordinary characters*, which are simply copied to the output stream, and *conversion specifications*, each of which shall result in the fetching of zero or more arguments. The results are undefined if there are insufficient arguments for the *format*. If the *format* is exhausted while arguments remain, the excess arguments shall be evaluated but are otherwise ignored.

Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than to the next unused argument. In this case, the conversion specifier character % (see below) is replaced by the sequence "%*n*$", where *n* is a decimal integer in the range [1,{NL_ARGMAX}], giving the position of the argument in the argument list. This feature provides for the definition of format strings that select arguments in an order appropriate to specific languages (see the EXAMPLES section).

The *format* can contain either numbered argument conversion specifications (that is, "%*n*$" and "**m*$"), or unnumbered argument conversion specifications (that is, % and *), but not both. The only exception to this is that %% can be mixed with the "%*n*$" form. The results of mixing numbered and unnumbered argument specifications in a *format* string are undefined. When numbered argument specifications are used, specifying the *N*th argument requires that all the leading arguments, from the first to the (*N*–*1*)th, are specified in the format string.

29763 In format strings containing the "%*n*$" form of conversion specification, numbered arguments
29764 in the argument list can be referenced from the format string as many times as required.

29765 In format strings containing the % form of conversion specification, each conversion specification
29766 uses the first unused argument in the argument list.

29767 CX All forms of the *fprintf*() functions allow for the insertion of a language-dependent radix
29768 character in the output string. The radix character is defined in the process' locale (category
29769 *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the
29770 radix character shall default to a <period> ('.').

29771 CX Each conversion specification is introduced by the '%' character or by the character sequence
29772 "%*n*$", after which the following appear in sequence:

29773 • Zero or more *flags* (in any order), which modify the meaning of the conversion
29774 specification.

29775 • An optional minimum *field width*. If the converted value has fewer bytes than the field
29776 width, it shall be padded with <space> characters by default on the left; it shall be padded
29777 on the right if the left-adjustment flag ('–'), described below, is given to the field width.
29778 The field width takes the form of an <asterisk> ('*'), described below, or a decimal
29779 integer.

29780 • An optional *precision* that gives the minimum number of digits to appear for the d, i, o, u,
29781 x, and X conversion specifiers; the number of digits to appear after the radix character for
29782 the a, A, e, E, f, and F conversion specifiers; the maximum number of significant digits for
29783 the g and G conversion specifiers; or the maximum number of bytes to be printed from a
29784 XSI string in the s and S conversion specifiers. The precision takes the form of a <period>
29785 ('.') followed either by an <asterisk> ('*'), described below, or an optional decimal digit
29786 string, where a null digit string is treated as zero. If a precision appears with any other
29787 conversion specifier, the behavior is undefined.

29788 • An optional length modifier that specifies the size of the argument.

29789 • A *conversion specifier* character that indicates the type of conversion to be applied.

29790 A field width, or precision, or both, may be indicated by an <asterisk> ('*'). In this case an
29791 argument of type **int** supplies the field width or precision. Applications shall ensure that
29792 arguments specifying field width, or precision, or both appear in that order before the argument,
29793 if any, to be converted. A negative field width is taken as a '–' flag followed by a positive field
29794 CX width. A negative precision is taken as if the precision were omitted. In *format* strings
29795 containing the "%*n*$" form of a conversion specification, a field width or precision may be
29796 indicated by the sequence "**m*$", where *m* is a decimal integer in the range [1,{NL_ARGMAX}]
29797 giving the position in the argument list (after the *format* argument) of an integer argument
29798 containing the field width or precision, for example:

29799
```
printf("%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);
```

29800 The flag characters and their meanings are:

29801 CX ' (The <apostrophe>.) The integer portion of the result of a decimal conversion (%i, %d, +
29802 %u, %f, %F, %g, or %G) shall be formatted with thousands' grouping characters. For
29803 other conversions the behavior is undefined. The non-monetary grouping character is
29804 used.

29805 – The result of the conversion shall be left-justified within the field. The conversion is
29806 right-justified if this flag is not specified.

29807 + The result of a signed conversion shall always begin with a sign (`'+'` or `'-'`). The
29808 conversion shall begin with a sign only when a negative value is converted if this flag is
29809 not specified.

29810 <space> If the first character of a signed conversion is not a sign or if a signed conversion results
29811 in no characters, a <space> shall be prefixed to the result. This means that if the
29812 <space> and `'+'` flags both appear, the <space> flag shall be ignored.

29813 # Specifies that the value is to be converted to an alternative form. For `o` conversion, it
29814 increases the precision (if necessary) to force the first digit of the result to be zero. For `x`
29815 or `X` conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For `a`, `A`,
29816 `e`, `E`, `f`, `F`, `g`, and `G` conversion specifiers, the result shall always contain a radix
29817 character, even if no digits follow the radix character. Without this flag, a radix
29818 character appears in the result of these conversions only if a digit follows it. For `g` and `G`
29819 conversion specifiers, trailing zeros shall *not* be removed from the result as they
29820 normally are. For other conversion specifiers, the behavior is undefined.

29821 0 For `d`, `i`, `o`, `u`, `x`, `X`, `a`, `A`, `e`, `E`, `f`, `F`, `g`, and `G` conversion specifiers, leading zeros
29822 (following any indication of sign or base) are used to pad to the field width rather than
29823 performing space padding, except when converting an infinity or NaN. If the `'0'` and
29824 `'-'` flags both appear, the `'0'` flag is ignored. For `d`, `i`, `o`, `u`, `x`, and `X` conversion
29825 CX specifiers, if a precision is specified, the `'0'` flag shall be ignored. If the `'0'` and
29826 <apostrophe> flags both appear, the grouping characters are inserted before zero
29827 padding. For other conversions, the behavior is undefined.

29828 The length modifiers and their meanings are:

29829 hh Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **signed char**
29830 or **unsigned char** argument (the argument will have been promoted according to the
29831 integer promotions, but its value shall be converted to **signed char** or **unsigned char**
29832 before printing); or that a following `n` conversion specifier applies to a pointer to a
29833 **signed char** argument.

29834 h Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **short** or
29835 **unsigned short** argument (the argument will have been promoted according to the
29836 integer promotions, but its value shall be converted to **short** or **unsigned short** before
29837 printing); or that a following `n` conversion specifier applies to a pointer to a **short**
29838 argument.

29839 l (ell) Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **long** or
29840 **unsigned long** argument; that a following `n` conversion specifier applies to a pointer to
29841 a **long** argument; that a following `c` conversion specifier applies to a **wint_t** argument;
29842 that a following `s` conversion specifier applies to a pointer to a **wchar_t** argument; or
29843 has no effect on a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier.

29844 ll (ell-ell)
29845 Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **long long**
29846 or **unsigned long long** argument; or that a following `n` conversion specifier applies to a
29847 pointer to a **long long** argument.

29848 j Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to an **intmax_t**
29849 or **uintmax_t** argument; or that a following `n` conversion specifier applies to a pointer
29850 to an **intmax_t** argument.

29851 z Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **size_t** or the
29852 corresponding signed integer type argument; or that a following `n` conversion specifier
29853 applies to a pointer to a signed integer type corresponding to a **size_t** argument.

29854 `t` Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **ptrdiff_t** or
29855 the corresponding **unsigned** type argument; or that a following `n` conversion specifier
29856 applies to a pointer to a **ptrdiff_t** argument.

29857 `L` Specifies that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier applies to a **long**
29858 **double** argument.

29859 If a length modifier appears with any conversion specifier other than as specified above, the
29860 behavior is undefined.

29861 The conversion specifiers and their meanings are:

29862 `d,i` The **int** argument shall be converted to a signed decimal in the style "`[−]`*dddd*". The
29863 precision specifies the minimum number of digits to appear; if the value being
29864 converted can be represented in fewer digits, it shall be expanded with leading zeros.
29865 The default precision is 1. The result of converting zero with an explicit precision of
29866 zero shall be no characters.

29867 `o` The **unsigned** argument shall be converted to unsigned octal format in the style
29868 "*dddd*". The precision specifies the minimum number of digits to appear; if the value
29869 being converted can be represented in fewer digits, it shall be expanded with leading
29870 zeros. The default precision is 1. The result of converting zero with an explicit precision
29871 of zero shall be no characters.

29872 `u` The **unsigned** argument shall be converted to unsigned decimal format in the style
29873 "*dddd*". The precision specifies the minimum number of digits to appear; if the value
29874 being converted can be represented in fewer digits, it shall be expanded with leading
29875 zeros. The default precision is 1. The result of converting zero with an explicit precision
29876 of zero shall be no characters.

29877 `x` The **unsigned** argument shall be converted to unsigned hexadecimal format in the style
29878 "*dddd*"; the letters "`abcdef`" are used. The precision specifies the minimum number
29879 of digits to appear; if the value being converted can be represented in fewer digits, it
29880 shall be expanded with leading zeros. The default precision is 1. The result of
29881 converting zero with an explicit precision of zero shall be no characters.

29882 `X` Equivalent to the `x` conversion specifier, except that letters "`ABCDEF`" are used instead
29883 of "`abcdef`".

29884 `f,F` The **double** argument shall be converted to decimal notation in the style
29885 "`[−]`*ddd*`.`*ddd*", where the number of digits after the radix character is equal to the
29886 precision specification. If the precision is missing, it shall be taken as 6; if the precision
29887 is explicitly zero and no '`#`' flag is present, no radix character shall appear. If a radix
29888 character appears, at least one digit appears before it. The low-order digit shall be
29889 rounded in an implementation-defined manner.

29890 A **double** argument representing an infinity shall be converted in one of the styles
29891 "`[−]inf`" or "`[−]infinity`"; which style is implementation-defined. A **double**
29892 argument representing a NaN shall be converted in one of the styles "`[−]nan(`*n-*
29893 *char-sequence*`)`" or "`[−]nan`"; which style, and the meaning of any *n-char-sequence*,
29894 is implementation-defined. The `F` conversion specifier produces "`INF`", "`INFINITY`",
29895 or "`NAN`" instead of "`inf`", "`infinity`", or "`nan`", respectively.

29896 `e,E` The **double** argument shall be converted in the style "`[−]`*d*`.`*ddd*`e±`*dd*", where there is
29897 one digit before the radix character (which is non-zero if the argument is non-zero) and
29898 the number of digits after it is equal to the precision; if the precision is missing, it shall
29899 be taken as 6; if the precision is zero and no '`#`' flag is present, no radix character shall

appear. The low-order digit shall be rounded in an implementation-defined manner. The E conversion specifier shall produce a number with 'E' instead of 'e' introducing the exponent. The exponent shall always contain at least two digits. If the value is zero, the exponent shall be zero.

A **double** argument representing an infinity or NaN shall be converted in the style of an f or F conversion specifier.

g, G The **double** argument representing a floating-point number shall be converted in the style f or e (or in the style F or E in the case of a G conversion specifier), depending on the value converted and the precision. Let P equal the precision if non-zero, 6 if the precision is omitted, or 1 if the precision is zero. Then, if a conversion with style E would have an exponent of *X*:

— If P>*X*≥–4, the conversion shall be with style f (or F) and precision P–(*X*+1).

— Otherwise, the conversion shall be with style e (or E) and precision P–1.

Finally, unless the '#' flag is used, any trailing zeros shall be removed from the fractional portion of the result and the decimal-point character shall be removed if there is no fractional portion remaining.

A **double** argument representing an infinity or NaN shall be converted in the style of an f or F conversion specifier.

a, A A **double** argument representing a floating-point number shall be converted in the style "[–]0x*h*.*hhhh*p±*d*", where there is one hexadecimal digit (which shall be non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point character and the number of hexadecimal digits after it is equal to the precision; if the precision is missing and FLT_RADIX is a power of 2, then the precision shall be sufficient for an exact representation of the value; if the precision is missing and FLT_RADIX is not a power of 2, then the precision shall be sufficient to distinguish values of type **double**, except that trailing zeros may be omitted; if the precision is zero and the '#' flag is not specified, no decimal-point character shall appear. The letters "abcdef" shall be used for a conversion and the letters "ABCDEF" for A conversion. The A conversion specifier produces a number with 'X' and 'P' instead of 'x' and 'p'. The exponent shall always contain at least one digit, and only as many more digits as necessary to represent the decimal exponent of 2. If the value is zero, the exponent shall be zero.

A **double** argument representing an infinity or NaN shall be converted in the style of an f or F conversion specifier.

c The **int** argument shall be converted to an **unsigned char**, and the resulting byte shall be written.

If an l (ell) qualifier is present, the **wint_t** argument shall be converted as if by an ls conversion specification with no precision and an argument that points to a two-element array of type **wchar_t**, the first element of which contains the **wint_t** argument to the ls conversion specification and the second element contains a null wide character.

s The argument shall be a pointer to an array of **char**. Bytes from the array shall be written up to (but not including) any terminating null byte. If the precision is specified, no more than that many bytes shall be written. If the precision is not specified or is greater than the size of the array, the application shall ensure that the array contains a null byte.

29946 If an `l` (ell) qualifier is present, the argument shall be a pointer to an array of type
29947 **wchar_t**. Wide characters from the array shall be converted to characters (each as if by
29948 a call to the *wcrtomb*( ) function, with the conversion state described by an **mbstate_t**
29949 object initialized to zero before the first wide character is converted) up to and
29950 including a terminating null wide character. The resulting characters shall be written
29951 up to (but not including) the terminating null character (byte). If no precision is
29952 specified, the application shall ensure that the array contains a null wide character. If a
29953 precision is specified, no more than that many characters (bytes) shall be written
29954 (including shift sequences, if any), and the array shall contain a null wide character if,
29955 to equal the character sequence length given by the precision, the function would need
29956 to access a wide character one past the end of the array. In no case shall a partial
29957 character be written.

29958 `p` The argument shall be a pointer to **void**. The value of the pointer is converted to a
29959 sequence of printable characters, in an implementation-defined manner.

29960 `n` The argument shall be a pointer to an integer into which is written the number of bytes
29961 written to the output so far by this call to one of the *fprintf*( ) functions. No argument is
29962 converted.

29963 XSI `C` Equivalent to `lc`.

29964 XSI `S` Equivalent to `ls`.

29965 `%` Print a `'%'` character; no argument is converted. The complete conversion specification
29966 shall be %%.

29967 If a conversion specification does not match one of the above forms, the behavior is undefined. If
29968 any argument is not the correct type for the corresponding conversion specification, the
29969 behavior is undefined.

29970 In no case shall a nonexistent or small field width cause truncation of a field; if the result of a
29971 conversion is wider than the field width, the field shall be expanded to contain the conversion
29972 result. Characters generated by *fprintf*( ) and *printf*( ) are printed as if *fputc*( ) had been called.

29973 For the `a` and `A` conversion specifiers, if FLT_RADIX is a power of 2, the value shall be correctly
29974 rounded to a hexadecimal floating number with the given precision.

29975 For `a` and `A` conversions, if FLT_RADIX is not a power of 2 and the result is not exactly
29976 representable in the given precision, the result should be one of the two adjacent numbers in
29977 hexadecimal floating style with the given precision, with the extra stipulation that the error
29978 should have a correct sign for the current rounding direction.

29979 For the `e`, `E`, `f`, `F`, `g`, and `G` conversion specifiers, if the number of significant decimal digits is at
29980 most DECIMAL_DIG, then the result should be correctly rounded. If the number of significant
29981 decimal digits is more than DECIMAL_DIG but the source value is exactly representable with
29982 DECIMAL_DIG digits, then the result should be an exact representation with trailing zeros.
29983 Otherwise, the source value is bounded by two adjacent decimal strings $L < U$, both having
29984 DECIMAL_DIG significant digits; the value of the resultant decimal string D should satisfy $L <= D <= U$, with the extra stipulation that the error should have a correct sign for the current
29986 rounding direction.

29987 CX The last data modification and last file status change timestamps of the file shall be marked for
29988 update:

29989 1. Between the call to a successful execution of *fprintf*( ) or *printf*( ) and the next successful
29990 completion of a call to *fflush*( ) or *fclose*( ) on the same stream or a call to *exit*( ) or *abort*( )

29991 2. Upon successful completion of a call to *dprintf*( )

29992 **RETURN VALUE**

29993 CX Upon successful completion, the *dprintf*( ), *fprintf*( ), and *printf*( ) functions shall return the
29994 number of bytes transmitted.

29995 Upon successful completion, the *sprintf*( ) function shall return the number of bytes written to *s*,
29996 excluding the terminating null byte.

29997 Upon successful completion, the *snprintf*( ) function shall return the number of bytes that would
29998 be written to *s* had *n* been sufficiently large excluding the terminating null byte.

29999 CX If an output error was encountered, these functions shall return a negative value and set *errno* to
30000 indicate the error.

30001 If the value of *n* is zero on a call to *snprintf*( ), nothing shall be written, the number of bytes that
30002 would have been written had *n* been sufficiently large excluding the terminating null shall be
30003 returned, and *s* may be a null pointer.

30004 **ERRORS**

30005 CX For the conditions under which *dprintf*( ), *fprintf*( ), and *printf*( ) fail and may fail, refer to *fputc*( )
30006 or *fputwc*( ).

30007 In addition, all forms of *fprintf*( ) shall fail if:

30008 CX [EILSEQ] A wide-character code that does not correspond to a valid character has been
30009 detected.

30010 In addition, all forms of *fprintf*( ) may fail if:

30011 CX [EINVAL] There are insufficient arguments.

30012 The *dprintf*( ) function may fail if:

30013 [EBADF] The *fildes* argument is not a valid file descriptor.

30014 CX The *dprintf*( ), *fprintf*( ), and *printf*( ) functions may fail if:

30015 CX [ENOMEM] Insufficient storage space is available.

30016 The *snprintf*( ) function shall fail if:

30017 CX [EOVERFLOW] The value of *n* is greater than {INT_MAX} or the number of bytes needed to
30018 hold the output excluding the terminating null is greater than {INT_MAX}.

30019 **EXAMPLES**

30020 **Printing Language-Independent Date and Time**

30021 The following statement can be used to print date and time using a language-independent
30022 format:

30023 ```
printf(format, weekday, month, day, hour, min);
```

30024 For American usage, *format* could be a pointer to the following string:

30025 ```
"%s, %s %d, %d:%.2d\n"
```

30026 This example would produce the following message:

30027 ```
Sunday, July 3, 10:02
```

30028 For German usage, *format* could be a pointer to the following string:
```

```
"%1$s, %3$d. %2$s, %4$d:%5$.2d\n"
```

This definition of *format* would produce the following message:

```
Sonntag, 3. Juli, 10:02
```

Printing File Information

The following example prints information about the type, permissions, and number of links of a specific file in a directory.

The first two calls to *printf*( ) use data decoded from a previous *stat*( ) call. The user-defined *strperm*( ) function shall return a string similar to the one at the beginning of the output for the following command:

```
ls –l
```

The next call to *printf*( ) outputs the owner's name if it is found using *getpwuid*( ); the *getpwuid*( ) function shall return a **passwd** structure from which the name of the user is extracted. If the user name is not found, the program instead prints out the numeric value of the user ID.

The next call prints out the group name if it is found using *getgrgid*( ); *getgrgid*( ) is very similar to *getpwuid*( ) except that it shall return group information based on the group number. Once again, if the group is not found, the program prints the numeric value of the group for the entry.

The final call to *printf*( ) prints the size of the file.

```
#include <stdio.h>
#include <sys/types.h>
#include <pwd.h>
#include <grp.h>

char *strperm (mode_t);
...
struct stat statbuf;
struct passwd *pwd;
struct group *grp;
...
printf("%10.10s", strperm (statbuf.st_mode));
printf("%4d", statbuf.st_nlink);

if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
    printf(" %–8.8s", pwd->pw_name);
else
    printf(" %–8ld", (long) statbuf.st_uid);

if ((grp = getgrgid(statbuf.st_gid)) != NULL)
    printf(" %–8.8s", grp->gr_name);
else
    printf(" %–8ld", (long) statbuf.st_gid);

printf("%9jd", (intmax_t) statbuf.st_size);
...
```

30068 **Printing a Localized Date String**

30069 The following example gets a localized date string. The *nl_langinfo*( ) function shall return the
30070 localized date string, which specifies the order and layout of the date. The *strftime*( ) function
30071 takes this information and, using the **tm** structure for values, places the date and time
30072 information into *datestring*. The *printf*( ) function then outputs *datestring* and the name of the
30073 entry.

```
30074 #include <stdio.h>
30075 #include <time.h>
30076 #include <langinfo.h>
30077 ...
30078 struct dirent *dp;
30079 struct tm *tm;
30080 char datestring[256];
30081 ...
30082 strftime(datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
30083 printf(" %s %s\n", datestring, dp->d_name);
30084 ...
```

30085 **Printing Error Information**

30086 The following example uses *fprintf*( ) to write error information to standard error.

30087 In the first group of calls, the program tries to open the password lock file named **LOCKFILE**. If
30088 the file already exists, this is an error, as indicated by the O_EXCL flag on the *open*( ) function. If
30089 the call fails, the program assumes that someone else is updating the password file, and the
30090 program exits.

30091 The next group of calls saves a new password file as the current password file by creating a link
30092 between **LOCKFILE** and the new password file **PASSWDFILE**.

```
30093 #include <sys/types.h>
30094 #include <sys/stat.h>
30095 #include <fcntl.h>
30096 #include <stdio.h>
30097 #include <stdlib.h>
30098 #include <unistd.h>
30099 #include <string.h>
30100 #include <errno.h>
30101 #define LOCKFILE "/etc/ptmp"
30102 #define PASSWDFILE "/etc/passwd"
30103 ...
30104 int pfd;
30105 ...
30106 if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
30107     S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
30108 {
30109     fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
30110     exit(1);
30111 }
30112 ...
30113 if (link(LOCKFILE,PASSWDFILE) == -1) {
```

```
        fprintf(stderr, "Link error: %s\n", strerror(errno));
        exit(1);
    }
    ...
```

Printing Usage Information

The following example checks to make sure the program has the necessary arguments, and uses *fprintf*( ) to print usage information if the expected number of arguments is not present.

```
#include <stdio.h>
#include <stdlib.h>
...
char *Options = "hdbtl";
...
if (argc < 2) {
    fprintf(stderr, "Usage: %s -%s <file\n", argv[0], Options); exit(1);
}
...
```

Formatting a Decimal String

The following example prints a key and data pair on *stdout*. Note use of the <asterisk> (`'*'`) in the format string; this ensures the correct number of decimal places for the element based on the number of elements requested.

```
#include <stdio.h>
...
long i;
char *keystr;
int elementlen, len;
...
while (len < elementlen) {
...
    printf("%s Element%0*ld\n", keystr, elementlen, i);
...
}
```

Creating a Filename

The following example creates a filename using information from a previous *getpwnam*() function that returned the HOME directory of the user.

```
#include <stdio.h>
#include <sys/types.h>
#include <unistd.h>
...
char filename[PATH_MAX+1];
struct passwd *pw;
...
sprintf(filename, "%s/%d.out", pw->pw_dir, getpid());
...
```

Reporting an Event

The following example loops until an event has timed out. The *pause*( ) function waits forever unless it receives a signal. The *fprintf*( ) statement should never occur due to the possible return values of *pause*( ).

```
#include <stdio.h>
#include <unistd.h>
#include <string.h>
#include <errno.h>
...
while (!event_complete) {
...
    if (pause() != –1 || errno != EINTR)
        fprintf(stderr, "pause: unknown error: %s\n", strerror(errno));
}
...
```

Printing Monetary Information

The following example uses *strfmon*( ) to convert a number and store it as a formatted monetary string named *convbuf*. If the first number is printed, the program prints the format and the description; otherwise, it just prints the number.

```
#include <monetary.h>
#include <stdio.h>
...
struct tblfmt {
    char *format;
    char *description;
};

struct tblfmt table[] = {
    { "%n", "default formatting" },
    { "%11n", "right align within an 11 character field" },
    { "%#5n", "aligned columns for values up to 99999" },
    { "%=*#5n", "specify a fill character" },
    { "%=0#5n", "fill characters do not use grouping" },
    { "%^#5n", "disable the grouping separator" },
    { "%^#5.0n", "round off to whole units" },
    { "%^#5.4n", "increase the precision" },
    { "%(#5n", "use an alternative pos/neg style" },
    { "%!(#5n", "disable the currency symbol" },
};
...
float input[3];
int i, j;
char convbuf[100];
...
strfmon(convbuf, sizeof(convbuf), table[i].format, input[j]);

if (j == 0) {
    printf("%s%s%s\n", table[i].format,
        convbuf, table[i].description);
```

```
    }
    else {
        printf("%s\n", convbuf);
    }
    ...
```

Printing Wide Characters

The following example prints a series of wide characters. Suppose that `"L‘@‘"` expands to three bytes:

```
wchar_t wz [3] = L"@@";       // Zero-terminated
wchar_t wn [3] = L"@@@";      // Unterminated

fprintf (stdout,"%ls", wz);   // Outputs 6 bytes
fprintf (stdout,"%ls", wn);   // Undefined because wn has no terminator
fprintf (stdout,"%4ls", wz);  // Outputs 3 bytes
fprintf (stdout,"%4ls", wn);  // Outputs 3 bytes; no terminator needed
fprintf (stdout,"%9ls", wz);  // Outputs 6 bytes
fprintf (stdout,"%9ls", wn);  // Outputs 9 bytes; no terminator needed
fprintf (stdout,"%10ls", wz); // Outputs 6 bytes
fprintf (stdout,"%10ls", wn); // Undefined because wn has no terminator
```

In the last line of the example, after processing three characters, nine bytes have been output. The fourth character must then be examined to determine whether it converts to one byte or more. If it converts to more than one byte, the output is only nine bytes. Since there is no fourth character in the array, the behavior is undefined.

APPLICATION USAGE

If the application calling *fprintf*( ) has any objects of type **wint_t** or **wchar_t**, it must also include the **<wchar.h>** header to have these objects defined.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Chapter 7 (on page 135), **<stdio.h>**, **<wchar.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the `l` (ell) qualifier can now be used with `c` and `s` conversion specifiers.

The *snprintf*( ) function is new in Issue 5.

Issue 6

Extensions beyond the ISO C standard are marked.

The normative text is updated to avoid use of the term “must” for application requirements.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The prototypes for *fprintf*( ), *printf*( ), *snprintf*( ), and *sprintf*( ) are updated, and the XSI shading is removed from *snprintf*( ).
- The description of *snprintf*( ) is aligned with the ISO C standard. Note that this supersedes the *snprintf*( ) description in The Open Group Base Resolution bwg98-006, which changed the behavior from Issue 5.
- The DESCRIPTION is updated.

The DESCRIPTION is updated to use the terms "conversion specifier" and "conversion specification" consistently.

ISO/IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated.

An example of printing wide characters is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #161 is applied, updating the DESCRIPTION of the 0 flag.

Austin Group Interpretation 1003.1-2001 #170 is applied.

ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #68 (SD5-XSH-ERN-70) is applied, revising the description of `g` and `G`.

SD5-XSH-ERN-174 is applied.

The *dprintf*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

Functionality relating to the `%n$` form of conversion specification and the <apostrophe> flag is moved from the XSI option to the Base.

Changes are made related to support for finegrained timestamps.

30268 **NAME**

30269 fputc — put a byte on a stream

30270 **SYNOPSIS**

30271 ```
#include <stdio.h>
```

30272 ```
int fputc(int c, FILE *stream);
```

30273 **DESCRIPTION**

30274 CX The functionality described on this reference page is aligned with the ISO C standard. Any
30275 conflict between the requirements described here and the ISO C standard is unintentional. This
30276 volume of POSIX.1-200x defers to the ISO C standard.

30277 The *fputc*( ) function shall write the byte specified by *c* (converted to an **unsigned char**) to the
30278 output stream pointed to by *stream*, at the position indicated by the associated file-position
30279 indicator for the stream (if defined), and shall advance the indicator appropriately. If the file
30280 cannot support positioning requests, or if the stream was opened with append mode, the byte
30281 shall be appended to the output stream.

30282 CX The last data modification and last file status change timestamps of the file shall be marked for
30283 update between the successful execution of *fputc*( ) and the next successful completion of a call
30284 to *fflush*( ) or *fclose*( ) on the same stream or a call to *exit*( ) or *abort*( ).

30285 **RETURN VALUE**

30286 Upon successful completion, *fputc*( ) shall return the value it has written. Otherwise, it shall
30287 CX return EOF, the error indicator for the stream shall be set, and *errno* shall be set to indicate the
30288 error.

30289 **ERRORS**

30290 The *fputc*( ) function shall fail if either the *stream* is unbuffered or the *stream*'s buffer needs to be
30291 flushed, and:

30292 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and
30293 the thread would be delayed in the write operation.

30294 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for
30295 writing.

30296 CX [EFBIG] An attempt was made to write to a file that exceeds the maximum file size.

30297 XSI [EFBIG] An attempt was made to write to a file that exceeds the file size limit of the
30298 process.

30299 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the
30300 offset maximum.

30301 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data
30302 was transferred.

30303 CX [EIO] A physical I/O error has occurred, or the process is a member of a background
30304 process group attempting to write to its controlling terminal, TOSTOP is set,
30305 the process is neither ignoring nor blocking SIGTTOU, and the process group
30306 of the process is orphaned. This error may also be returned under
30307 implementation-defined conditions.

30308 CX [ENOSPC] There was no free space remaining on the device containing the file.

30309 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by
30310 any process. A SIGPIPE signal shall also be sent to the thread.

The *fputc*( ) function may fail if:

CX [ENOMEM] Insufficient storage space is available.

CX [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] and [EFBIG] mandatory error conditions are added.
- The [ENOMEM] and [ENXIO] optional error conditions are added.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/37 is applied, updating the [EAGAIN] error in the ERRORS section from "the process would be delayed" to "the thread would be delayed".

Issue 7

Changes are made related to support for finegrained timestamps.

30341 **NAME**

30342 fputs — put a string on a stream

30343 **SYNOPSIS**

30344
```
#include <stdio.h>
```

30345
```
int fputs(const char *restrict s, FILE *restrict stream);
```

30346 **DESCRIPTION**

30347 CX The functionality described on this reference page is aligned with the ISO C standard. Any
30348 conflict between the requirements described here and the ISO C standard is unintentional. This
30349 volume of POSIX.1-200x defers to the ISO C standard.

30350 The *fputs*( ) function shall write the null-terminated string pointed to by *s* to the stream pointed
30351 to by *stream*. The terminating null byte shall not be written.

30352 CX The last data modification and last file status change timestamps of the file shall be marked for
30353 update between the successful execution of *fputs*( ) and the next successful completion of a call
30354 to *fflush*( ) or *fclose*( ) on the same stream or a call to *exit*( ) or *abort*( ).

30355 **RETURN VALUE**

30356 Upon successful completion, *fputs*( ) shall return a non-negative number. Otherwise, it shall
30357 CX return EOF, set an error indicator for the stream, and set *errno* to indicate the error.

30358 **ERRORS**

30359 Refer to *fputc*( ).

30360 **EXAMPLES**

30361 **Printing to Standard Output**

30362 The following example gets the current time, converts it to a string using *localtime*( ) and
30363 *asctime*( ), and prints it to standard output using *fputs*( ). It then prints the number of minutes to
30364 an event for which it is waiting.

30365
```
#include <time.h>
```
30366
```
#include <stdio.h>
```
30367
```
...
```
30368
```
time_t now;
```
30369
```
int minutes_to_event;
```
30370
```
...
```
30371
```
time(&now);
```
30372
```
printf("The time is ");
```
30373
```
fputs(asctime(localtime(&now)), stdout);
```
30374
```
printf("There are still %d minutes to the event.\n",
```
30375
```
    minutes_to_event);
```
30376
```
...
```

30377 **APPLICATION USAGE**

30378 The *puts*( ) function appends a <newline> while *fputs*( ) does not.

30379 **RATIONALE**

30380 None.

30381 **FUTURE DIRECTIONS**

30382 None.

30383 **SEE ALSO**

30385 XBD **<stdio.h>**

30386 **CHANGE HISTORY**

30387 First released in Issue 1. Derived from Issue 1 of the SVID.

30388 **Issue 6**

30389 Extensions beyond the ISO C standard are marked.

30390 The *fputs*( ) prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.

30391 **Issue 7**

30392 Changes are made related to support for finegrained timestamps.

30393 **NAME**

30394 fputwc — put a wide-character code on a stream

30395 **SYNOPSIS**

30396 ```
#include <stdio.h>
```

30397 ```
#include <wchar.h>
```

30398 ```
wint_t fputwc(wchar_t wc, FILE *stream);
```

30399 **DESCRIPTION**

30400 CX The functionality described on this reference page is aligned with the ISO C standard. Any
30401 conflict between the requirements described here and the ISO C standard is unintentional. This
30402 volume of POSIX.1-200x defers to the ISO C standard.

30403 The *fputwc*( ) function shall write the character corresponding to the wide-character code *wc* to
30404 the output stream pointed to by *stream*, at the position indicated by the associated file-position
30405 indicator for the stream (if defined), and advances the indicator appropriately. If the file cannot
30406 support positioning requests, or if the stream was opened with append mode, the character is
30407 appended to the output stream. If an error occurs while writing the character, the shift state of
30408 the output file is left in an undefined state.

30409 CX The last data modification and last file status change timestamps of the file shall be marked for
30410 update between the successful execution of *fputwc*( ) and the next successful completion of a call
30411 to *fflush*( ) or *fclose*( ) on the same stream or a call to *exit*( ) or *abort*( ).

30412 **RETURN VALUE**

30413 Upon successful completion, *fputwc*( ) shall return *wc*. Otherwise, it shall return WEOF, the error
30414 CX indicator for the stream shall be set, and *errno* shall be set to indicate the error.

30415 **ERRORS**

30416 The *fputwc*( ) function shall fail if either the stream is unbuffered or data in the *stream*'s buffer
30417 needs to be written, and:

30418 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and
30419 the thread would be delayed in the write operation.

30420 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for
30421 writing.

30422 CX [EFBIG] An attempt was made to write to a file that exceeds the maximum file size or
30423 the file size limit of the process.

30424 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the
30425 offset maximum associated with the corresponding stream.

30426 [EILSEQ] The wide-character code *wc* does not correspond to a valid character.

30427 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data
30428 was transferred.

30429 CX [EIO] A physical I/O error has occurred, or the process is a member of a background
30430 process group attempting to write to its controlling terminal, TOSTOP is set,
30431 the process is neither ignoring nor blocking SIGTTOU, and the process group
30432 of the process is orphaned. This error may also be returned under
30433 implementation-defined conditions.

30434 CX [ENOSPC] There was no free space remaining on the device containing the file.

 
```

CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by any process. A SIGPIPE signal shall also be sent to the thread.

The *fputwc*( ) function may fail if:

CX [ENOMEM] Insufficient storage space is available.

CX [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.

CHANGE HISTORY

First released in Issue 4. Derived from the MSE working draft.

Issue 5

Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc* is changed from **wint_t** to **wchar_t**.

The Optional Header (OH) marking is removed from **<stdio.h>**.

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EFBIG] and [EIO] mandatory error conditions are added.
- The [ENOMEM] and [ENXIO] optional error conditions are added.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/38 is applied, updating the [EAGAIN] error in the ERRORS section from "the process would be delayed" to "the thread would be delayed".

Issue 7

Changes are made related to support for finegrained timestamps.

30470 **NAME**

30471 fputws — put a wide-character string on a stream

30472 **SYNOPSIS**

30473 ```
#include <stdio.h>
```

30474 ```
#include <wchar.h>
```

30475 ```
int fputws(const wchar_t *restrict ws, FILE *restrict stream);
```

30476 **DESCRIPTION**

30477 CX The functionality described on this reference page is aligned with the ISO C standard. Any
30478 conflict between the requirements described here and the ISO C standard is unintentional. This
30479 volume of POSIX.1-200x defers to the ISO C standard.

30480 The *fputws*( ) function shall write a character string corresponding to the (null-terminated) wide-
30481 character string pointed to by *ws* to the stream pointed to by *stream*. No character corresponding
30482 to the terminating null wide-character code shall be written.

30483 CX The last data modification and last file status change timestamps of the file shall be marked for
30484 update between the successful execution of *fputws*( ) and the next successful completion of a call
30485 to *fflush*( ) or *fclose*( ) on the same stream or a call to *exit*( ) or *abort*( ).

30486 **RETURN VALUE**

30487 Upon successful completion, *fputws*( ) shall return a non-negative number. Otherwise, it shall
30488 CX return –1, set an error indicator for the stream, and set *errno* to indicate the error.

30489 **ERRORS**

30490 Refer to *fputwc*( ).

30491 **EXAMPLES**

30492 None.

30493 **APPLICATION USAGE**

30494 The *fputws*( ) function does not append a <newline>.

30495 **RATIONALE**

30496 None.

30497 **FUTURE DIRECTIONS**

30498 None.

30506 **Issue 6**

30507 Extensions beyond the ISO C standard are marked.

30508 The *fputws*( ) prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.

30509 **Issue 7**

30510 Changes are made related to support for finegrained timestamps.
```

NAME

fread — binary input

SYNOPSIS

```
#include <stdio.h>

size_t fread(void *restrict ptr, size_t size, size_t nitems,
    FILE *restrict stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fread*( ) function shall read into the array pointed to by *ptr* up to *nitems* elements whose size is specified by *size* in bytes, from the stream pointed to by *stream*. For each object, *size* calls shall be made to the *fgetc*( ) function and the results stored, in the order read, in an array of **unsigned char** exactly overlaying the object. The file position indicator for the stream (if defined) shall be advanced by the number of bytes successfully read. If an error occurs, the resulting value of the file position indicator for the stream is unspecified. If a partial element is read, its value is unspecified.

CX The *fread*( ) function may mark the last data access timestamp of the file associated with *stream* for update. The last data access timestamp shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *getdelim*( ), *getline*( ), *gets*( ), or *scanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ).

RETURN VALUE

Upon successful completion, *fread*( ) shall return the number of elements successfully read which is less than *nitems* only if a read error or end-of-file is encountered. If *size* or *nitems* is 0, *fread*( ) shall return 0 and the contents of the array and the state of the stream remain unchanged.

CX Otherwise, if a read error occurs, the error indicator for the stream shall be set, and *errno* shall be set to indicate the error.

ERRORS

Refer to *fgetc*( ).

EXAMPLES

Reading from a Stream

The following example reads a single element from the *fp* stream into the array pointed to by *buf*.

```
#include <stdio.h>
...
size_t bytes_read;
char buf[100];
FILE *fp;
...
bytes_read = fread(buf, sizeof(buf), 1, fp);
...
```

APPLICATION USAGE

The *ferror*( ) or *feof*( ) functions must be used to distinguish between an error condition and an end-of-file condition.

Because of possible differences in element length and byte ordering, files written using *fwrite*( )

30556 are application-dependent, and possibly cannot be read using *fread*( ) by a different application
30557 or by the same application on a different processor.

30558 **RATIONALE**

30559 None.

30560 **FUTURE DIRECTIONS**

30561 None.

30562 **SEE ALSO**

30563 *feof*( ), *ferror*( ), *fgetc*( ), *fopen*( ), *fscanf*( ), *getc*( ), *gets*( )

30564 XBD **<stdio.h>**

30565 **CHANGE HISTORY**

30566 First released in Issue 1. Derived from Issue 1 of the SVID.

30567 **Issue 6**

30568 Extensions beyond the ISO C standard are marked.

30569 The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

30570 • The *fread*( ) prototype is updated.

30571 • The DESCRIPTION is updated to describe how the bytes from a call to *fgetc*( ) are stored.

30572 **Issue 7**

30573 Changes are made related to support for finegrained timestamps.

30574 **NAME**

30575 free — free allocated memory

30576 **SYNOPSIS**

30577
```
#include <stdlib.h>
```

30578
```
void free(void *ptr);
```

30579 **DESCRIPTION**

30580 CX The functionality described on this reference page is aligned with the ISO C standard. Any
30581 conflict between the requirements described here and the ISO C standard is unintentional. This
30582 volume of POSIX.1-200x defers to the ISO C standard.

30583 The *free*( ) function shall cause the space pointed to by *ptr* to be deallocated; that is, made
30584 available for further allocation. If *ptr* is a null pointer, no action shall occur. Otherwise, if the
30585 argument does not match a pointer earlier returned by a function in POSIX.1-200x that allocates
30586 memory as if by *malloc*( ), or if the space has been deallocated by a call to *free*( ) or *realloc*( ), the
30587 behavior is undefined.

30588 Any use of a pointer that refers to freed space results in undefined behavior.

30589 **RETURN VALUE**

30590 The *free*( ) function shall not return a value.

30591 **ERRORS**

30592 No errors are defined.

30593 **EXAMPLES**

30594 None.

30595 **APPLICATION USAGE**

30596 There is now no requirement for the implementation to support the inclusion of **<malloc.h>**.

30597 **RATIONALE**

30598 None.

30599 **FUTURE DIRECTIONS**

30600 None.

30601 **SEE ALSO**

30602 *calloc*( ), *malloc*( ), *posix_memalign*( ), *realloc*( )

30603 XBD **<stdlib.h>**

30604 **CHANGE HISTORY**

30605 First released in Issue 1. Derived from Issue 1 of the SVID.

30606 **Issue 6**

30607 Reference to the *valloc*( ) function is removed.

30608 **Issue 7**

30609 The DESCRIPTION is updated to clarify that if the pointer returned is not by a function that
30610 allocates memory as if by *malloc*( ), then the behavior is undefined.

NAME

freeaddrinfo, getaddrinfo — get address information

SYNOPSIS

```
#include <sys/socket.h>
#include <netdb.h>

void freeaddrinfo(struct addrinfo *ai);
int getaddrinfo(const char *restrict nodename,
    const char *restrict servname,
    const struct addrinfo *restrict hints,
    struct addrinfo **restrict res);
```

DESCRIPTION

The *freeaddrinfo*( ) function shall free one or more **addrinfo** structures returned by *getaddrinfo*( ), along with any additional storage associated with those structures. If the *ai_next* field of the structure is not null, the entire list of structures shall be freed. The *freeaddrinfo*( ) function shall support the freeing of arbitrary sublists of an **addrinfo** list originally returned by *getaddrinfo*( ).

The *getaddrinfo*( ) function shall translate the name of a service location (for example, a host name) and/or a service name and shall return a set of socket addresses and associated information to be used in creating a socket with which to address the specified service.

Note: In many cases it is implemented by the Domain Name System, as documented in RFC 1034, RFC 1035, and RFC 1886.

The *freeaddrinfo*( ) and *getaddrinfo*( ) functions shall be thread-safe.

The *nodename* and *servname* arguments are either null pointers or pointers to null-terminated strings. One or both of these two arguments shall be supplied by the application as a non-null pointer.

The format of a valid name depends on the address family or families. If a specific family is not given and the name could be interpreted as valid within multiple supported families, the implementation shall attempt to resolve the name in all supported families and, in absence of errors, one or more results shall be returned.

If the *nodename* argument is not null, it can be a descriptive name or can be an address string. If IP6 the specified address family is AF_INET, AF_INET6, or AF_UNSPEC, valid descriptive names include host names. If the specified address family is AF_INET or AF_UNSPEC, address strings using Internet standard dot notation as specified in *inet_addr*( ) are valid.

IP6 If the specified address family is AF_INET6 or AF_UNSPEC, standard IPv6 text forms described in *inet_ntop*( ) are valid.

If *nodename* is not null, the requested service location is named by *nodename*; otherwise, the requested service location is local to the caller.

If *servname* is null, the call shall return network-level addresses for the specified *nodename*. If *servname* is not null, it is a null-terminated character string identifying the requested service. This can be either a descriptive name or a numeric representation suitable for use with the IP6 address family or families. If the specified address family is AF_INET, AF_INET6, or AF_UNSPEC, the service can be specified as a string specifying a decimal port number.

If the *hints* argument is not null, it refers to a structure containing input values that directs the operation by providing options and by limiting the returned information to a specific socket type, address family, and/or protocol, as described below. In this *hints* structure every member other than *ai_flags*, *ai_family*, *ai_socktype*, and *ai_protocol* shall be set to zero or a null pointer. A value of AF_UNSPEC for *ai_family* means that the caller shall accept any address family. A value

of zero for *ai_socktype* means that the caller shall accept any socket type. A value of zero for *ai_protocol* means that the caller shall accept any protocol. If *hints* is a null pointer, the behavior shall be as if it referred to a structure containing the value zero for the *ai_flags*, *ai_socktype*, and *ai_protocol* fields, and AF_UNSPEC for the *ai_family* field.

The *ai_flags* field to which the *hints* parameter points shall be set to zero or be the bitwise-inclusive OR of one or more of the values AI_PASSIVE, AI_CANONNAME, AI_NUMERICHOST, AI_NUMERICSERV, AI_V4MAPPED, AI_ALL, and AI_ADDRCONFIG.

If the AI_PASSIVE flag is specified, the returned address information shall be suitable for use in binding a socket for accepting incoming connections for the specified service. In this case, if the *nodename* argument is null, then the IP address portion of the socket address structure shall be set to INADDR_ANY for an IPv4 address or IN6ADDR_ANY_INIT for an IPv6 address. If the AI_PASSIVE flag is not specified, the returned address information shall be suitable for a call to *connect*( ) (for a connection-mode protocol) or for a call to *connect*( ), *sendto*( ), or *sendmsg*( ) (for a connectionless protocol). In this case, if the *nodename* argument is null, then the IP address portion of the socket address structure shall be set to the loopback address. The AI_PASSIVE flag shall be ignored if the *nodename* argument is not null.

If the AI_CANONNAME flag is specified and the *nodename* argument is not null, the function shall attempt to determine the canonical name corresponding to *nodename* (for example, if *nodename* is an alias or shorthand notation for a complete name).

Note: Since different implementations use different conceptual models, the terms "canonical name" and "alias" cannot be precisely defined for the general case. However, Domain Name System implementations are expected to interpret them as they are used in RFC 1034.

A numeric host address string is not a "name", and thus does not have a "canonical name" form; no address to host name translation is performed. See below for handling of the case where a canonical name cannot be obtained.

If the AI_NUMERICHOST flag is specified, then a non-null *nodename* string supplied shall be a numeric host address string. Otherwise, an [EAI_NONAME] error is returned. This flag shall prevent any type of name resolution service (for example, the DNS) from being invoked.

If the AI_NUMERICSERV flag is specified, then a non-null *servname* string supplied shall be a numeric port string. Otherwise, an [EAI_NONAME] error shall be returned. This flag shall prevent any type of name resolution service (for example, NIS+) from being invoked.

IP6 If the AI_V4MAPPED flag is specified along with an *ai_family* of AF_INET6, then *getaddrinfo*( ) shall return IPv4-mapped IPv6 addresses on finding no matching IPv6 addresses (*ai_addrlen* shall be 16). The AI_V4MAPPED flag shall be ignored unless *ai_family* equals AF_INET6. If the AI_ALL flag is used with the AI_V4MAPPED flag, then *getaddrinfo*( ) shall return all matching IPv6 and IPv4 addresses. The AI_ALL flag without the AI_V4MAPPED flag is ignored.

If the AI_ADDRCONFIG flag is specified, IPv4 addresses shall be returned only if an IPv4 IP6 address is configured on the local system, and IPv6 addresses shall be returned only if an IPv6 address is configured on the local system.

The *ai_socktype* field to which argument *hints* points specifies the socket type for the service, as defined in *socket*( ). If a specific socket type is not given (for example, a value of zero) and the service name could be interpreted as valid with multiple supported socket types, the implementation shall attempt to resolve the service name for all supported socket types and, in the absence of errors, all possible results shall be returned. A non-zero socket type value shall limit the returned information to values with the specified socket type.

If the *ai_family* field to which *hints* points has the value AF_UNSPEC, addresses shall be returned for use with any address family that can be used with the specified *nodename* and/or

30704 *servname*. Otherwise, addresses shall be returned for use only with the specified address family.
30705 If *ai_family* is not AF_UNSPEC and *ai_protocol* is not zero, then addresses shall be returned for
30706 use only with the specified address family and protocol; the value of *ai_protocol* shall be
30707 interpreted as in a call to the *socket*( ) function with the corresponding values of *ai_family* and
30708 *ai_protocol*.

30709 **RETURN VALUE**

30710 A zero return value for *getaddrinfo*( ) indicates successful completion; a non-zero return value
30711 indicates failure. The possible values for the failures are listed in the ERRORS section.

30712 Upon successful return of *getaddrinfo*( ), the location to which *res* points shall refer to a linked list
30713 of **addrinfo** structures, each of which shall specify a socket address and information for use in
30714 creating a socket with which to use that socket address. The list shall include at least one
30715 **addrinfo** structure. The *ai_next* field of each structure contains a pointer to the next structure on
30716 the list, or a null pointer if it is the last structure on the list. Each structure on the list shall
30717 include values for use with a call to the *socket*( ) function, and a socket address for use with the
30718 *connect*( ) function or, if the AI_PASSIVE flag was specified, for use with the *bind*( ) function. The
30719 fields *ai_family*, *ai_socktype*, and *ai_protocol* shall be usable as the arguments to the *socket*( )
30720 function to create a socket suitable for use with the returned address. The fields *ai_addr* and
30721 *ai_addrlen* are usable as the arguments to the *connect*( ) or *bind*( ) functions with such a socket,
30722 according to the AI_PASSIVE flag.

30723 If *nodename* is not null, and if requested by the AI_CANONNAME flag, the *ai_canonname* field of
30724 the first returned **addrinfo** structure shall point to a null-terminated string containing the
30725 canonical name corresponding to the input *nodename*; if the canonical name is not available, then
30726 *ai_canonname* shall refer to the *nodename* argument or a string with the same contents. The
30727 contents of the *ai_flags* field of the returned structures are undefined.

30728 All fields in socket address structures returned by *getaddrinfo*( ) that are not filled in through an
30729 explicit argument (for example, *sin6_flowinfo*) shall be set to zero.

30730 **Note:** This makes it easier to compare socket address structures.

30731 **ERRORS**

30732 The *getaddrinfo*( ) function shall fail and return the corresponding error value if:

30733 [EAI_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

30734 [EAI_BADFLAGS]
30735 The *flags* parameter had an invalid value.

30736 [EAI_FAIL] A non-recoverable error occurred when attempting to resolve the name.

30737 [EAI_FAMILY] The address family was not recognized.

30738 [EAI_MEMORY] There was a memory allocation failure when trying to allocate storage for the
30739 return value.

30740 [EAI_NONAME] The name does not resolve for the supplied parameters.

30741 Neither *nodename* nor *servname* were supplied. At least one of these shall be
30742 supplied.

30743 [EAI_SERVICE] The service passed was not recognized for the specified socket type.

30744 [EAI_SOCKTYPE]
30745 The intended socket type was not recognized.

[EAI_SYSTEM] A system error occurred; the error code can be found in *errno*.

EXAMPLES

The following (incomplete) program demonstrates the use of *getaddrinfo*( ) to obtain the socket address structure(s) for the service named in the program's command-line argument. The program then loops through each of the address structures attempting to create and bind a socket to the address, until it performs a successful *bind*( ).

```
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <string.h>
#include <sys/socket.h>
#include <netdb.h>

int
main(int argc, char *argv[])
{
    struct addrinfo *result, *rp;
    int sfd, s;

    if (argc != 2) {
        fprintf(stderr, "Usage: %s port\n", argv[0]);
        exit(EXIT_FAILURE);
    }

    struct addrinfo hints = {};
    hints.ai_family = AF_UNSPEC;
    hints.ai_socktype = SOCK_DGRAM;
    hints.ai_flags = AI_PASSIVE;
    hints.ai_protocol = 0;

    s = getaddrinfo(NULL, argv[1], &hints, &result);
    if (s != 0) {
        fprintf(stderr, "getaddrinfo: %s\n", gai_strerror(s));
        exit(EXIT_FAILURE);
    }

    /* getaddrinfo() returns a list of address structures.
       Try each address until a successful bind().
       If socket(2) (or bind(2)) fails, close the socket
       and try the next address. */

    for (rp = result; rp != NULL; rp = rp->ai_next) {
        sfd = socket(rp->ai_family, rp->ai_socktype,
            rp->ai_protocol);
        if (sfd == -1)
            continue;

        if (bind(sfd, rp->ai_addr, rp->ai_addrlen) == 0)
            break;           /* Success */

        close(sfd);
    }

    if (rp == NULL) {        /* No address succeeded */
        fprintf(stderr, "Could not bind\n");
```

```
            exit(EXIT_FAILURE);
        }
        freeaddrinfo(result);     /* No longer needed */
                /* ... use socket bound to sfd ... */
    }
```

APPLICATION USAGE

If the caller handles only TCP and not UDP, for example, then the *ai_protocol* member of the *hints* structure should be set to IPPROTO_TCP when *getaddrinfo*( ) is called.

If the caller handles only IPv4 and not IPv6, then the *ai_family* member of the *hints* structure should be set to AF_INET when *getaddrinfo*( ) is called.

The term "canonical name" is misleading; it is taken from the Domain Name System (RFC 2181). It should be noted that the canonical name is a result of alias processing, and not necessarily a unique attribute of a host, address, or set of addresses. See RFC 2181 for more discussion of this in the Domain Name System context.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getaddrinfo*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/19 is applied, adding three notes to the DESCRIPTION and adding text to the APPLICATION USAGE related to the term "canonical name". A reference to RFC 2181 is also added to the Informative References.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/20 is applied, making changes for alignment with IPv6. These include the following:

- Adding AI_V4MAPPED, AI_ALL, and AI_ADDRCONFIG to the allowed values for the *ai_flags* field
- Adding a description of AI_ADDRCONFIG
- Adding a description of the consequences of ignoring the AI_PASSIVE flag.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/39 is applied, changing "corresponding value" to "corresponding error value" in the ERRORS section.

Issue 7

Austin Group Interpretation 1003.1-2001 #013 is applied.

Austin Group Interpretation 1003.1-2001 #146 is applied, updating the DESCRIPTION.

An example is added.

NAME

freelocale — free resources allocated for a locale object

SYNOPSIS

CX
```
#include <locale.h>

void freelocale(locale_t locobj);
```

DESCRIPTION

The *freelocale*( ) function shall cause the resources allocated for a locale object returned by a call to the *newlocale*( ) or *duplocale*( ) functions to be released.

Any use of a locale object that has been freed results in undefined behavior.

RETURN VALUE

None.

ERRORS

None.

EXAMPLES

Freeing Up a Locale Object

The following example shows a code fragment to free a locale object created by *newlocale*( ):

```
#include <locale.h>
...

/* Every locale object allocated with newlocale() should be
 * freed using freelocale():
 */

locale_t loc;

/* Get the locale. */

loc = newlocale (LC_CTYPE_MASK | LC_TIME_MASK, "locname", NULL);

/* ... Use the locale object ... */
...

/* Free the locale object resources. */
freelocale (loc);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

freopen — open a stream

SYNOPSIS

```
#include <stdio.h>

FILE *freopen(const char *restrict filename, const char *restrict mode,
    FILE *restrict stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *freopen*( ) function shall first attempt to flush the stream associated with *stream* as if by a call to *fflush*(*stream*). Failure to flush the stream successfully shall be ignored. If *filename* is not a null pointer, *freopen*( ) shall close any file descriptor associated with *stream*. Failure to close the file descriptor successfully shall be ignored. The error and end-of-file indicators for the stream shall be cleared.

The *freopen*( ) function shall open the file whose pathname is the string pointed to by *filename* and associate the stream pointed to by *stream* with it. The *mode* argument shall be used just as in *fopen*( ).

The original stream shall be closed regardless of whether the subsequent open succeeds.

If *filename* is a null pointer, the *freopen*( ) function shall attempt to change the mode of the stream to that specified by *mode*, as if the name of the file currently associated with the stream had been used. In this case, the file descriptor associated with the stream need not be closed if the call to *freopen*( ) succeeds. It is implementation-defined which changes of mode are permitted (if any), and under what circumstances.

XSI After a successful call to the *freopen*( ) function, the orientation of the stream shall be cleared, the encoding rule shall be cleared, and the associated **mbstate_t** object shall be set to describe an initial conversion state.

CX If *filename* is not a null pointer, or if *filename* is a null pointer and the specified mode change necessitates the file descriptor associated with the stream to be closed and reopened, the file descriptor associated with the reopened stream shall be allocated and opened as if by a call to *open*( ) with the following flags:

freopen() Mode	*open*() Flags
r or *rb*	O_RDONLY
w or *wb*	O_WRONLY | O_CREAT | O_TRUNC
a or *ab*	O_WRONLY | O_CREAT | O_APPEND
r+ or *rb+* or *r+b*	O_RDWR
w+ or *wb+* or *w+b*	O_RDWR | O_CREAT | O_TRUNC
a+ or *ab+* or *a+b*	O_RDWR | O_CREAT | O_APPEND

RETURN VALUE

Upon successful completion, *freopen*( ) shall return the value of *stream*. Otherwise, a null pointer shall be returned, CX and *errno* shall be set to indicate the error.

30912 **ERRORS**

30913 The *freopen*( ) function shall fail if:

30914 CX [EACCES] Search permission is denied on a component of the path prefix, or the file
30915 exists and the permissions specified by *mode* are denied, or the file does not
30916 exist and write permission is denied for the parent directory of the file to be
30917 created.

30918 CX [EBADF] The file descriptor underlying the stream is not a valid file descriptor when
30919 *filename* is a null pointer.

30920 CX [EINTR] A signal was caught during *freopen*( ).

30921 CX [EISDIR] The named file is a directory and *mode* requires write access.

30922 CX [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
30923 argument.

30924 CX [EMFILE] All file descriptors available to the process are currently open.

30925 CX [ENAMETOOLONG]
30926 The length of a component of a pathname is longer than {NAME_MAX}.

30927 CX [ENFILE] The maximum allowable number of files is currently open in the system.

30928 CX [ENOENT] A component of *filename* does not name an existing file or *filename* is an empty
30929 string.

30930 CX [ENOSPC] The directory or file system that would contain the new file cannot be
30931 expanded, the file does not exist, and it was to be created.

30932 CX [ENOTDIR] A component of the path prefix is not a directory, or the *filename* argument
30933 contains at least one non-<slash> character and ends with one or more trailing
30934 <slash> characters and the last pathname component names an existing file
30935 that is neither a directory nor a symbolic link to a directory.

30936 CX [ENXIO] The named file is a character special or block special file, and the device
30937 associated with this special file does not exist.

30938 CX [EOVERFLOW] The named file is a regular file and the size of the file cannot be represented
30939 correctly in an object of type **off_t**.

30940 CX [EROFS] The named file resides on a read-only file system and *mode* requires write
30941 access.

30942 The *freopen*( ) function may fail if:

30943 CX [EBADF] The mode with which the file descriptor underlying the stream was opened
30944 does not support the requested mode when *filename* is a null pointer.

30945 CX [EINVAL] The value of the *mode* argument is not valid.

30946 CX [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
30947 resolution of the *path* argument.

30948 CX [ENAMETOOLONG]
30949 The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a
30950 symbolic link produced an intermediate result with a length that exceeds
30951 {PATH_MAX}.

30952 CX [ENOMEM] Insufficient storage space is available.

30953 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
30954 capabilities of the device.

30955 CX [ETXTBSY] The file is a pure procedure (shared text) file that is being executed and *mode*
30956 requires write access.

30957 **EXAMPLES**

30958 **Directing Standard Output to a File**

30959 The following example logs all standard output to the **/tmp/logfile** file.

```
30960 #include <stdio.h>
30961 ...
30962 FILE *fp;
30963 ...
30964 fp = freopen ("/tmp/logfile", "a+", stdout);
30965 ...
```

30966 **APPLICATION USAGE**

30967 The *freopen*( ) function is typically used to attach the pre-opened *streams* associated with *stdin*,
30968 *stdout*, and *stderr* to other files.

30969 Since implementations are not required to support any stream mode changes when the *filename*
30970 argument is NULL, portable applications cannot rely on the use of *freopen*( ) to change the stream
30971 mode, and use of this feature is discouraged. The feature was originally added to the ISO C
30972 standard in order to facilitate changing *stdin* and *stdout* to binary mode. Since a `'b'` character in
30973 the mode has no effect on POSIX systems, this use of the feature is unnecessary in POSIX
30974 applications. However, even though the `'b'` is ignored, a successful call to *freopen*(NULL, "*wb*",
30975 *stdout*) does have an effect. In particular, for regular files it truncates the file and sets the file-
30976 position indicator for the stream to the start of the file. It is possible that these side-effects are an
30977 unintended consequence of the way the feature is specified in the ISO/IEC 9899: 1999 standard,
30978 but unless or until the ISO C standard is changed, applications which successfully call
30979 *freopen*(NULL, "*wb*", *stdout*) will behave in unexpected ways on conforming systems in situations
30980 such as:

```
30981 { appl file1; appl file2; } > file3
```

30982 which will result in **file3** containing only the output from the second invocation of *appl*.

30983 **RATIONALE**

30984 None.

30985 **FUTURE DIRECTIONS**

30986 None.

30989 XBD **<stdio.h>**

30990 **CHANGE HISTORY**

30991 First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate that the orientation of the stream is cleared and the conversion state of the stream is set to an initial conversion state by a successful call to the *freopen*( ) function.

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support large files.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [EINVAL], [ENOMEM], [ENXIO], and [ETXTBSY] optional error conditions are added.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The *freopen*( ) prototype is updated.
- The DESCRIPTION is updated.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

The DESCRIPTION is updated regarding failure to close, changing the "file" to "file descriptor".

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/40 is applied, adding the following sentence to the DESCRIPTION: "In this case, the file descriptor associated with the stream need not be closed if the call to *freopen*( ) succeeds.".

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/41 is applied, adding an mandatory [EBADF] error, and an optional [EBADF] error to the ERRORS section.

Issue 7

Austin Group Interpretation 1003.1-2001 #043 is applied, clarifying that the *freopen*( ) function allocates a file descriptor as per *open*( ).

Austin Group Interpretation 1003.1-2001 #143 is applied.

Austin Group Interpretation 1003.1-2001 #159 is applied, clarifying requirements for the flags set on the open file description.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-150 and SD5-XSH-ERN-219 are applied.

NAME

frexp, frexpf, frexpl — extract mantissa and exponent from a double precision number

SYNOPSIS

```
#include <math.h>

double frexp(double num, int *exp);
float frexpf(float num, int *exp);
long double frexpl(long double num, int *exp);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall break a floating-point number *num* into a normalized fraction and an integral power of 2. The integer exponent shall be stored in the **int** object pointed to by *exp*.

RETURN VALUE

For finite arguments, these functions shall return the value *x*, such that *x* has a magnitude in the interval [½,1) or 0, and *num* equals *x* times 2 raised to the power **exp*.

MX If *num* is NaN, a NaN shall be returned, and the value of **exp* is unspecified.

If *num* is ±0, ±0 shall be returned, and the value of **exp* shall be 0.

If *num* is ±Inf, *num* shall be returned, and the value of **exp* is unspecified.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *frexpf*( ) and *frexpl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

fscanf, scanf, sscanf — convert formatted input

SYNOPSIS

```
#include <stdio.h>

int fscanf(FILE *restrict stream, const char *restrict format, ...);
int scanf(const char *restrict format, ...);
int sscanf(const char *restrict s, const char *restrict format, ...);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fscanf*( ) function shall read from the named input *stream*. The *scanf*( ) function shall read from the standard input stream *stdin*. The *sscanf*( ) function shall read from the string *s*. Each function reads bytes, interprets them according to a format, and stores the results in its arguments. Each expects, as arguments, a control string *format* described below, and a set of *pointer* arguments indicating where the converted input should be stored. The result is undefined if there are insufficient arguments for the format. If the format is exhausted while arguments remain, the excess arguments shall be evaluated but otherwise ignored.

CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than to the next unused argument. In this case, the conversion specifier character % (see below) is replaced by the sequence "%*n*$", where *n* is a decimal integer in the range [1,{NL_ARGMAX}]. This feature provides for the definition of format strings that select arguments in an order appropriate to specific languages. In format strings containing the "%*n*$" form of conversion specifications, it is unspecified whether numbered arguments in the argument list can be referenced from the format string more than once.

The *format* can contain either form of a conversion specification—that is, % or "%*n*$"—but the two forms cannot be mixed within a single *format* string. The only exception to this is that %% or %* can be mixed with the "%*n*$" form. When numbered argument specifications are used, specifying the *N*th argument requires that all the leading arguments, from the first to the (*N*−1)th, are pointers.

The *fscanf*( ) function in all its forms shall allow detection of a language-dependent radix character in the input string. The radix character is defined in the locale of the process (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a <period> ('.').

The format is a character string, beginning and ending in its initial shift state, if any, composed of zero or more directives. Each directive is composed of one of the following: one or more white-space characters (<space>, <tab>, <newline>, <vertical-tab>, or <form-feed>); an ordinary character (neither '%' nor a white-space character); or a conversion specification. Each
CX conversion specification is introduced by the character '%' or the character sequence "%*n*$", after which the following appear in sequence:

- An optional assignment-suppressing character '*'.
- An optional non-zero decimal integer that specifies the maximum field width.
- CX An optional assignment-allocation character 'm'.
- An option length modifier that specifies the size of the receiving object.

- A *conversion specifier* character that specifies the type of conversion to be applied. The valid conversion specifiers are described below.

The *fscanf*( ) functions shall execute each directive of the format in turn. If a directive fails, as detailed below, the function shall return. Failures are described as input failures (due to the unavailability of input bytes) or matching failures (due to inappropriate input).

A directive composed of one or more white-space characters shall be executed by reading input until no more valid input can be read, or up to the first byte which is not a white-space character, which remains unread.

A directive that is an ordinary character shall be executed as follows: the next byte shall be read from the input and compared with the byte that comprises the directive; if the comparison shows that they are not equivalent, the directive shall fail, and the differing and subsequent bytes shall remain unread. Similarly, if end-of-file, an encoding error, or a read error prevents a character from being read, the directive shall fail.

A directive that is a conversion specification defines a set of matching input sequences, as described below for each conversion character. A conversion specification shall be executed in the following steps.

Input white-space characters (as specified by *isspace*( )) shall be skipped, unless the conversion specification includes a `[`, `c`, `C`, or `n` conversion specifier.

An item shall be read from the input, unless the conversion specification includes an `n` conversion specifier. An input item shall be defined as the longest sequence of input bytes (up to any specified maximum field width, which may be measured in characters or bytes dependent on the conversion specifier) which is an initial subsequence of a matching sequence. The first byte, if any, after the input item shall remain unread. If the length of the input item is 0, the execution of the conversion specification shall fail; this condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented input from the stream, in which case it is an input failure.

Except in the case of a `%` conversion specifier, the input item (or, in the case of a `%n` conversion specification, the count of input bytes) shall be converted to a type appropriate to the conversion character. If the input item is not a matching sequence, the execution of the conversion specification fails; this condition is a matching failure. Unless assignment suppression was indicated by a `'*'`, the result of the conversion shall be placed in the object pointed to by the first argument following the *format* argument that has not already received a conversion result if CX the conversion specification is introduced by `%`, or in the *n*th argument if introduced by the character sequence `"%`*n*`$"`. If this object does not have an appropriate type, or if the result of the conversion cannot be represented in the space provided, the behavior is undefined.

CX The `%c`, `%s`, and `%[` conversion specifiers shall accept an optional assignment-allocation character `'m'`, which shall cause a memory buffer to be allocated to hold the string converted including a terminating null character. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer variable that will receive a pointer to the allocated buffer. The system shall allocate a buffer as if *malloc*( ) had been called. The application shall be responsible for freeing the memory after usage. If there is insufficient memory to allocate a buffer, the function shall set *errno* to [ENOMEM] and a conversion error shall result. If the function returns EOF, any memory successfully allocated for parameters using assignment-allocation character `'m'` by this call shall be freed before the function returns.

The length modifiers and their meanings are:

`hh` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **signed char** or **unsigned char**.

`h` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **short** or **unsigned short**.

`l` (ell) Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **long** or **unsigned long**; that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier applies to an argument with type pointer to **double**; or that a following `c`, `s`, or `[` conversion specifier applies to an argument with type pointer to **wchar_t**. If the `'m'` assignment-allocation character is specified, the conversion applies to an argument with the type pointer to a pointer to **wchar_t**.

CX

`ll` (ell-ell) Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **long long** or **unsigned long long**.

`j` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **intmax_t** or **uintmax_t**.

`z` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **size_t** or the corresponding signed integer type.

`t` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **ptrdiff_t** or the corresponding **unsigned** type.

`L` Specifies that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier applies to an argument with type pointer to **long double**.

If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.

The following conversion specifiers are valid:

`d` Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of *strtol*( ) with the value 10 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **int**.

`i` Matches an optionally signed integer, whose format is the same as expected for the subject sequence of *strtol*( ) with 0 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **int**.

`o` Matches an optionally signed octal integer, whose format is the same as expected for the subject sequence of *strtoul*( ) with the value 8 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

`u` Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of *strtoul*( ) with the value 10 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

`x` Matches an optionally signed hexadecimal integer, whose format is the same as expected for the subject sequence of *strtoul*( ) with the value 16 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding

31203 argument is a pointer to **unsigned**.

31204 a, e, f, g
31205 Matches an optionally signed floating-point number, infinity, or NaN, whose format is
31206 the same as expected for the subject sequence of *strtod*( ). In the absence of a size
31207 modifier, the application shall ensure that the corresponding argument is a pointer to
31208 **float**.

31209 If the *fprintf*( ) family of functions generates character string representations for infinity
31210 and NaN (a symbolic entity encoded in floating-point format) to support
31211 IEEE Std 754-1985, the *fscanf*( ) family of functions shall recognize them as input.

31212 s Matches a sequence of bytes that are not white-space characters. If the 'm' assignment-
31213 allocation character is not specified, the application shall ensure that the corresponding
31214 argument is a pointer to the initial byte of an array of **char**, **signed char**, or **unsigned**
31215 **char** large enough to accept the sequence and a terminating null character code, which
31216 CX shall be added automatically. Otherwise, the application shall ensure that the
31217 corresponding argument is a pointer to a pointer to a **char**.

31218 If an l (ell) qualifier is present, the input is a sequence of characters that begins in the
31219 initial shift state. Each character shall be converted to a wide character as if by a call to
31220 the *mbrtowc*( ) function, with the conversion state described by an **mbstate_t** object
31221 initialized to zero before the first character is converted. If the 'm' assignment-
31222 allocation character is not specified, the application shall ensure that the corresponding
31223 argument is a pointer to an array of **wchar_t** large enough to accept the sequence and
31224 CX the terminating null wide character, which shall be added automatically. Otherwise,
31225 the application shall ensure that the corresponding argument is a pointer to a pointer to
31226 a **wchar_t**.

31227 [Matches a non-empty sequence of bytes from a set of expected bytes (the *scanset*). The
31228 normal skip over white-space characters shall be suppressed in this case. If the 'm'
31229 assignment-allocation character is not specified, the application shall ensure that the
31230 corresponding argument is a pointer to the initial byte of an array of **char**, **signed char**,
31231 or **unsigned char** large enough to accept the sequence and a terminating null byte,
31232 CX which shall be added automatically. Otherwise, the application shall ensure that the
31233 corresponding argument is a pointer to a pointer to a **char**.

31234 If an l (ell) qualifier is present, the input is a sequence of characters that begins in the
31235 initial shift state. Each character in the sequence shall be converted to a wide character
31236 as if by a call to the *mbrtowc*( ) function, with the conversion state described by an
31237 **mbstate_t** object initialized to zero before the first character is converted. If the 'm'
31238 assignment-allocation character is not specified, the application shall ensure that the
31239 corresponding argument is a pointer to an array of **wchar_t** large enough to accept the
31240 CX sequence and the terminating null wide character, which shall be added automatically.
31241 Otherwise, the application shall ensure that the corresponding argument is a pointer to
31242 a pointer to a **wchar_t**.

31243 The conversion specification includes all subsequent bytes in the *format* string up to
31244 and including the matching <right-square-bracket> (']'). The bytes between the
31245 square brackets (the *scanlist*) comprise the scanset, unless the byte after the <left-
31246 square-bracket> is a <circumflex> ('^'), in which case the scanset contains all bytes
31247 that do not appear in the scanlist between the <circumflex> and the <right-square-
31248 bracket>. If the conversion specification begins with "[]" or "[^]", the <right-
31249 square-bracket> is included in the scanlist and the next <right-square-bracket> is the
31250 matching <right-square-bracket> that ends the conversion specification; otherwise, the

first <right-square-bracket> is the one that ends the conversion specification. If a '–' is in the scanlist and is not the first character, nor the second where the first character is a '^', nor the last character, the behavior is implementation-defined.

c — Matches a sequence of bytes of the number specified by the field width (1 if no field width is present in the conversion specification). No null byte is added. The normal skip over white-space characters shall be suppressed in this case. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to the initial byte of an array of **char**, **signed char**, or **unsigned char** large enough to accept the sequence. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a **char**.

If an l (ell) qualifier is present, the input shall be a sequence of characters that begins in the initial shift state. Each character in the sequence is converted to a wide character as if by a call to the *mbrtowc*() function, with the conversion state described by an **mbstate_t** object initialized to zero before the first character is converted. No null wide character is added. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to an array of **wchar_t** large enough to accept the resulting sequence of wide characters. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a **wchar_t**.

p — Matches an implementation-defined set of sequences, which shall be the same as the set of sequences that is produced by the %p conversion specification of the corresponding *fprintf*() functions. The application shall ensure that the corresponding argument is a pointer to a pointer to **void**. The interpretation of the input item is implementation-defined. If the input item is a value converted earlier during the same program execution, the pointer that results shall compare equal to that value; otherwise, the behavior of the %p conversion specification is undefined.

n — No input is consumed. The application shall ensure that the corresponding argument is a pointer to the integer into which shall be written the number of bytes read from the input so far by this call to the *fscanf*() functions. Execution of a %n conversion specification shall not increment the assignment count returned at the completion of execution of the function. No argument shall be converted, but one shall be consumed. If the conversion specification includes an assignment-suppressing character or a field width, the behavior is undefined.

XSI C — Equivalent to lc.

XSI S — Equivalent to ls.

% — Matches a single '%' character; no conversion or assignment occurs. The complete conversion specification shall be %%.

If a conversion specification is invalid, the behavior is undefined.

The conversion specifiers A, E, F, G, and X are also valid and shall be equivalent to a, e, f, g, and x, respectively.

If end-of-file is encountered during input, conversion shall be terminated. If end-of-file occurs before any bytes matching the current conversion specification (except for %n) have been read (other than leading white-space characters, where permitted), execution of the current conversion specification shall terminate with an input failure. Otherwise, unless execution of the current conversion specification is terminated with a matching failure, execution of the following conversion specification (if any) shall be terminated with an input failure.

Reaching the end of the string in *sscanf*( ) shall be equivalent to encountering end-of-file for *fscanf*( ).

If conversion terminates on a conflicting input, the offending input is left unread in the input. Any trailing white space (including <newline> characters) shall be left unread unless matched by a conversion specification. The success of literal matches and suppressed assignments is only directly determinable via the `%n` conversion specification.

CX The *fscanf*( ) and *scanf*( ) functions may mark the last data access timestamp of the file associated with *stream* for update. The last data access timestamp shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ), *fread*( ), *getc*( ), *getchar*( ), *getdelim*( ), *getline*( ), *gets*( ), *fscanf*( ), or *scanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ).

RETURN VALUE

Upon successful completion, these functions shall return the number of successfully matched and assigned input items; this number can be zero in the event of an early matching failure. If the input ends before the first matching failure or conversion, EOF shall be returned. If any CX error occurs, EOF shall be returned, and *errno* shall be set to indicate the error. If a read error occurs, the error indicator for the stream shall be set.

ERRORS

For the conditions under which the *fscanf*( ) functions fail and may fail, refer to *fgetc*( ) or *fgetwc*( ).

In addition, the *fscanf*( ) function shall fail if:

CX [EILSEQ] Input byte sequence does not form a valid character.

[ENOMEM] Insufficient storage space is available.

In addition, the *fscanf*( ) function may fail if:

CX [EINVAL] There are insufficient arguments.

EXAMPLES

The call:

```
int i, n; float x; char name[50];
n = scanf("%d%f%s", &i, &x, name);
```

with the input line:

```
25 54.32E-1 Hamster
```

assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string `"Hamster"`.

The call:

```
int i; float x; char name[50];
(void) scanf("%2d%f%*d %[0123456789]", &i, &x, name);
```

with input:

```
56789 0123 56a72
```

assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string `"56\0"` in *name*. The next call to *getchar*( ) shall return the character `'a'`.

Reading Data into an Array

The following call uses *fscanf*( ) to read three floating-point numbers from standard input into the *input* array.

```
float input[3]; fscanf (stdin, "%f %f %f", input, input+1, input+2);
```

APPLICATION USAGE

If the application calling *fscanf*( ) has any objects of type **wint_t** or **wchar_t**, it must also include the **<wchar.h>** header to have these objects defined.

For functions that allocate memory as if by *malloc*( ), the application should release such memory when it is no longer required by a call to *free*( ). For *fscanf*( ), this is memory allocated via use of the `'m'` assignment-allocation character.

RATIONALE

This function is aligned with the ISO/IEC 9899: 1999 standard, and in doing so a few "obvious" things were not included. Specifically, the set of characters allowed in a scanset is limited to single-byte characters. In other similar places, multi-byte characters have been permitted, but for alignment with the ISO/IEC 9899: 1999 standard, it has not been done here. Applications needing this could use the corresponding wide-character functions to achieve the desired results.

FUTURE DIRECTIONS

None.

XBD Chapter 7 (on page 135), **<langinfo.h>**, **<stdio.h>**, **<wchar.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Aligned with ISO/IEC 9899: 1990/Amendment 1: 1995 (E). Specifically, the `l` (ell) qualifier is now defined for the `c`, `s`, and `[` conversion specifiers.

The DESCRIPTION is updated to indicate that if infinity and NaN can be generated by the *fprintf*( ) family of functions, then they are recognized by the *fscanf*( ) family.

Issue 6

The Open Group Corrigenda U021/7 and U028/10 are applied. These correct several occurrences of "characters" in the text which have been replaced with the term "bytes".

The normative text is updated to avoid use of the term "must" for application requirements.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The prototypes for *fscanf*( ), *scanf*( ), and *sscanf*( ) are updated.
- The DESCRIPTION is updated.
- The `hh`, `ll`, `j`, `t`, and `z` length modifiers are added.
- The `a`, `A`, and `F` conversion characters are added.

The DESCRIPTION is updated to use the terms "conversion specifier" and "conversion specification" consistently.

Issue 7

Austin Group Interpretation 1003.1-2001 #170 is applied.

SD5-XSH-ERN-9 is applied, correcting *fscanf*( ) to *scanf*( ) in the DESCRIPTION.

SD5-XSH-ERN-132 is applied, adding the assignment-allocation character `'m'`.

Functionality relating to the `%n$` form of conversion specification is moved from the XSI option to the Base.

Changes are made related to support for finegrained timestamps.

The APPLICATION USAGE section is updated to clarify that memory is allocated as if by *malloc*( ).

NAME

fseek, fseeko — reposition a file-position indicator in a stream

SYNOPSIS

```
#include <stdio.h>

int fseek(FILE *stream, long offset, int whence);
CX int fseeko(FILE *stream, off_t offset, int whence);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fseek*( ) function shall set the file-position indicator for the stream pointed to by *stream*. If a read or write error occurs, the error indicator for the stream shall be set and *fseek*( ) fails.

The new position, measured in bytes from the beginning of the file, shall be obtained by adding *offset* to the position specified by *whence*. The specified point is the beginning of the file for SEEK_SET, the current value of the file-position indicator for SEEK_CUR, or end-of-file for SEEK_END.

If the stream is to be used with wide-character input/output functions, the application shall ensure that *offset* is either 0 or a value returned by an earlier call to *ftell*( ) on the same stream and *whence* is SEEK_SET.

A successful call to *fseek*( ) shall clear the end-of-file indicator for the stream and undo any effects of *ungetc*( ) and *ungetwc*( ) on the same stream. After an *fseek*( ) call, the next operation on an update stream may be either input or output.

CX If the most recent operation, other than *ftell*( ), on a given stream is *fflush*( ), the file offset in the underlying open file description shall be adjusted to reflect the location specified by *fseek*( ).

The *fseek*( ) function shall allow the file-position indicator to be set beyond the end of existing data in the file. If data is later written at this point, subsequent reads of data in the gap shall return bytes with the value 0 until data is actually written into the gap.

The behavior of *fseek*( ) on devices which are incapable of seeking is implementation-defined. The value of the file offset associated with such a device is undefined.

If the stream is writable and buffered data had not been written to the underlying file, *fseek*( ) shall cause the unwritten data to be written to the file and shall mark the last data modification and last file status change timestamps of the file for update.

In a locale with state-dependent encoding, whether *fseek*( ) restores the stream's shift state is implementation-defined.

The *fseeko*( ) function shall be equivalent to the *fseek*( ) function except that the *offset* argument is of type **off_t**.

RETURN VALUE

CX The *fseek*( ) and *fseeko*( ) functions shall return 0 if they succeed.

CX Otherwise, they shall return –1 and set *errno* to indicate the error.

ERRORS

CX The *fseek*( ) and *fseeko*( ) functions shall fail if, either the *stream* is unbuffered or the *stream*'s buffer needed to be flushed, and the call to *fseek*( ) or *fseeko*( ) causes an underlying *lseek*( ) or *write*( ) to be invoked, and:

CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor and the thread would be delayed in the write operation.

CX [EBADF] The file descriptor underlying the stream file is not open for writing or the stream's buffer needed to be flushed and the file is not open.

CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

XSI [EFBIG] An attempt was made to write a file that exceeds the file size limit of the process.

CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the offset maximum associated with the corresponding stream.

CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data was transferred.

CX [EINVAL] The *whence* argument is invalid. The resulting file-position indicator would be set to a negative value.

CX [EIO] A physical I/O error has occurred, or the process is a member of a background process group attempting to perform a *write*( ) to its controlling terminal, TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.

CX [ENOSPC] There was no free space remaining on the device containing the file.

CX [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.

CX [EOVERFLOW] For *fseek*( ), the resulting file offset would be a value which cannot be represented correctly in an object of type **long**.

CX [EOVERFLOW] For *fseeko*( ), the resulting file offset would be a value which cannot be represented correctly in an object of type **off_t**.

CX [EPIPE] An attempt was made to write to a pipe or FIFO that is not open for reading by any process; a SIGPIPE signal shall also be sent to the thread.

CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe or FIFO.

XBD **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The *fseeko*( ) function is added.
- The [EFBIG], [EOVERFLOW], and [ENXIO] mandatory error conditions are added.

The following change is incorporated for alignment with the FIPS requirements:

- The [EINTR] error is no longer an indication that the implementation does not report partial transfers.

The normative text is updated to avoid use of the term "must" for application requirements.

The DESCRIPTION is updated to explicitly state that *fseek*( ) sets the file-position indicator, and then on error the error indicator is set and *fseek*( ) fails. This is for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/42 is applied, updating the [EAGAIN] error in the ERRORS section from "the process would be delayed" to "the thread would be delayed".

Issue 7

Changes are made related to support for finegrained timestamps.

NAME

fsetpos — set current file position

SYNOPSIS

```
#include <stdio.h>

int fsetpos(FILE *stream, const fpos_t *pos);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fsetpos*( ) function shall set the file position and state indicators for the stream pointed to by *stream* according to the value of the object pointed to by *pos*, which the application shall ensure is a value obtained from an earlier call to *fgetpos*( ) on the same stream. If a read or write error occurs, the error indicator for the stream shall be set and *fsetpos*( ) fails.

A successful call to the *fsetpos*( ) function shall clear the end-of-file indicator for the stream and undo any effects of *ungetc*( ) on the same stream. After an *fsetpos*( ) call, the next operation on an update stream may be either input or output.

CX The behavior of *fsetpos*( ) on devices which are incapable of seeking is implementation-defined. The value of the file offset associated with such a device is undefined.

RETURN VALUE

The *fsetpos*( ) function shall return 0 if it succeeds; otherwise, it shall return a non-zero value and set *errno* to indicate the error.

ERRORS

CX The *fsetpos*( ) function shall fail if, either the *stream* is unbuffered or the *stream*'s buffer needed to be flushed, and the call to *fsetpos*( ) causes an underlying *lseek*( ) or *write*( ) to be invoked, and:

CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor and the thread would be delayed in the write operation.

CX [EBADF] The file descriptor underlying the stream file is not open for writing or the stream's buffer needed to be flushed and the file is not open.

CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

XSI [EFBIG] An attempt was made to write a file that exceeds the file size limit of the process.

CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the offset maximum associated with the corresponding stream.

CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data was transferred.

CX [EIO] A physical I/O error has occurred, or the process is a member of a background process group attempting to perform a *write*( ) to its controlling terminal, TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.

CX [ENOSPC] There was no free space remaining on the device containing the file.

CX [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.

CX [EPIPE] An attempt was made to write to a pipe or FIFO that is not open for reading by any process; a SIGPIPE signal shall also be sent to the thread.

CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe or FIFO.

CHANGE HISTORY

First released in Issue 4. Derived from the ISO C standard.

Issue 6

Extensions beyond the ISO C standard are marked.

An additional [ESPIPE] error condition is added for sockets.

The normative text is updated to avoid use of the term "must" for application requirements.

The DESCRIPTION is updated to clarify that the error indicator is set for the stream on a read or write error. This is for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/21 is applied, deleting an erroneous [EINVAL] error case from the ERRORS section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/43 is applied, updating the [EAGAIN] error in the ERRORS section from "the process would be delayed" to "the thread would be delayed".

Issue 7

SD5-XSH-ERN-220 is applied.

NAME

fstat — get file status

SYNOPSIS

```
#include <sys/stat.h>

int fstat(int fildes, struct stat *buf);
```

DESCRIPTION

The *fstat*( ) function shall obtain information about an open file associated with the file descriptor *fildes*, and shall write it to the area pointed to by *buf*.

SHM If *fildes* references a shared memory object, the implementation shall update in the **stat** structure pointed to by the *buf* argument the *st_uid*, *st_gid*, *st_size*, and *st_mode* fields, and only the S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits need be valid. The implementation may update other fields and flags.

TYM If *fildes* references a typed memory object, the implementation shall update in the **stat** structure pointed to by the *buf* argument the *st_uid*, *st_gid*, *st_size*, and *st_mode* fields, and only the S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits need be valid. The implementation may update other fields and flags.

The *buf* argument is a pointer to a **stat** structure, as defined in **<sys/stat.h>**, into which information is placed concerning the file.

For all other file types defined in this volume of POSIX.1-200x, the structure members *st_mode*, *st_ino*, *st_dev*, *st_uid*, *st_gid*, *st_atim*, *st_ctim*, and *st_mtim* shall have meaningful values and the value of the *st_nlink* member shall be set to the number of links to the file.

An implementation that provides additional or alternative file access control mechanisms may, under implementation-defined conditions, cause *fstat*( ) to fail.

The *fstat*( ) function shall update any time-related fields (as described in XBD Section 4.8, on page 109), before writing into the **stat** structure.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *fstat*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

[EIO] An I/O error occurred while reading from the file system.

[EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file serial number cannot be represented correctly in the structure pointed to by *buf*.

The *fstat*( ) function may fail if:

[EOVERFLOW] One of the values is too large to store into the structure pointed to by the *buf* argument.

EXAMPLES

Obtaining File Status Information

The following example shows how to obtain file status information for a file named **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure. The **/home/cnd/mod1** file is opened with read/write privileges and is passed to the open file descriptor *fildes*.

```
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>

struct stat buffer;
int         status;
...
fildes = open("/home/cnd/mod1", O_RDWR);
status = fstat(fildes, &buffer);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

SEE ALSO

fstatat( )

XBD Section 4.8 (on page 109), **<sys/stat.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EIO] mandatory error condition is added.
- The [EOVERFLOW] mandatory error condition is added. This change is to support large files.
- The [EOVERFLOW] optional error condition is added.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that shared memory object semantics apply to typed memory objects.

Issue 7

XSH-SD5-ERN-161 is applied, updating the DESCRIPTION to clarify to which file types *st_nlink* applies.

Changes are made related to support for finegrained timestamps.

NAME

fstatat, lstat, stat — get file status

SYNOPSIS

```
#include <sys/stat.h>

int fstatat(int fd, const char *restrict path,
    struct stat *restrict buf, int flag);
int lstat(const char *restrict path, struct stat *restrict buf);
int stat(const char *restrict path, struct stat *restrict buf);
```

DESCRIPTION

The *stat*( ) function shall obtain information about the named file and write it to the area pointed to by the *buf* argument. The *path* argument points to a pathname naming a file. Read, write, or execute permission of the named file is not required. An implementation that provides additional or alternate file access control mechanisms may, under implementation-defined conditions, cause *stat*( ) to fail. In particular, the system may deny the existence of the file specified by *path*.

If the named file is a symbolic link, the *stat*( ) function shall continue pathname resolution using the contents of the symbolic link, and shall return information pertaining to the resulting file if the file exists.

The *buf* argument is a pointer to a **stat** structure, as defined in the **<sys/stat.h>** header, into which information is placed concerning the file.

The *stat*( ) function shall update any time-related fields (as described in XBD Section 4.8, on page 109), before writing into the **stat** structure.

SHM If the named file is a shared memory object, the implementation shall update in the **stat** structure pointed to by the *buf* argument the *st_uid*, *st_gid*, *st_size*, and *st_mode* fields, and only the S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits need be valid. The implementation may update other fields and flags.

TYM If the named file is a typed memory object, the implementation shall update in the **stat** structure pointed to by the *buf* argument the *st_uid*, *st_gid*, *st_size*, and *st_mode* fields, and only the S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits need be valid. The implementation may update other fields and flags.

For all other file types defined in this volume of POSIX.1-200x, the structure members *st_mode*, *st_ino*, *st_dev*, *st_uid*, *st_gid*, *st_atim*, *st_ctim*, and *st_mtim* shall have meaningful values and the value of the member *st_nlink* shall be set to the number of links to the file.

The *lstat*( ) function shall be equivalent to *stat*( ), except when *path* refers to a symbolic link. In that case *lstat*( ) shall return information about the link, while *stat*( ) shall return information about the file the link references.

For symbolic links, the *st_mode* member shall contain meaningful information when used with the file type macros. The file mode bits in *st_mode* are unspecified. The structure members *st_ino*, *st_dev*, *st_uid*, *st_gid*, *st_atim*, *st_ctim*, and *st_mtim* shall have meaningful values and the value of the *st_nlink* member shall be set to the number of (hard) links to the symbolic link. The value of the *st_size* member shall be set to the length of the pathname contained in the symbolic link not including any terminating null byte.

The *fstatat*( ) function shall be equivalent to the *stat*( ) or *lstat*( ) function, depending on the value of *flag* (see below), except in the case where *path* specifies a relative path. In this case the status shall be retrieved from a file relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without O_SEARCH, the

function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function shall not perform the check.

Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in **<fcntl.h>**:

AT_SYMLINK_NOFOLLOW
If *path* names a symbolic link, the status of the symbolic link is returned.

If *fstatat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working directory is used and the behavior shall be identical to a call to *stat*( ) or *lstat*( ) respectively, depending on whether or not the AT_SYMLINK_NOFOLLOW bit is set in *flag*.

RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return −1 and set *errno* to indicate the error.

ERRORS

These functions shall fail if:

[EACCES] Search permission is denied for a component of the path prefix.

[EIO] An error occurred while reading from the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix is not a directory, or the *path* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

[EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file serial number cannot be represented correctly in the structure pointed to by *buf*.

The *fstatat*( ) function shall fail if:

[EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

These functions may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[EOVERFLOW] A value to be stored would overflow one of the members of the **stat** structure.

The *fstatat*( ) function may fail if:

[EINVAL] The value of the *flag* argument is not valid.

[ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a file descriptor associated with a directory.

EXAMPLES

Obtaining File Status Information

The following example shows how to obtain file status information for a file named **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure.

```
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>

struct stat buffer;
int         status;
...
status = stat("/home/cnd/mod1", &buffer);
```

Getting Directory Information

The following example fragment gets status information for each entry in a directory. The call to the *stat*( ) function stores file information in the **stat** structure pointed to by *statbuf*. The lines that follow the *stat*( ) call format the fields in the **stat** structure for presentation to the user of the program.

```
#include <sys/types.h>
#include <sys/stat.h>
#include <dirent.h>
#include <pwd.h>
#include <grp.h>
#include <time.h>
#include <locale.h>
#include <langinfo.h>
#include <stdio.h>
#include <stdint.h>

struct dirent  *dp;
struct stat     statbuf;
struct passwd  *pwd;
struct group   *grp;
struct tm      *tm;
char            datestring[256];
...
/* Loop through directory entries. */
while ((dp = readdir(dir)) != NULL) {

    /* Get entry's information. */
    if (stat(dp->d_name, &statbuf) == -1)
        continue;
```

```
        /* Print out type, permissions, and number of links. */
        printf("%10.10s", sperm (statbuf.st_mode));
        printf("%4d", statbuf.st_nlink);

        /* Print out owner's name if it is found using getpwuid(). */
        if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
            printf(" %-8.8s", pwd->pw_name);
        else
            printf(" %-8d", statbuf.st_uid);

        /* Print out group name if it is found using getgrgid(). */
        if ((grp = getgrgid(statbuf.st_gid)) != NULL)
            printf(" %-8.8s", grp->gr_name);
        else
            printf(" %-8d", statbuf.st_gid);

        /* Print size of file. */
        printf(" %9jd", (intmax_t)statbuf.st_size);

        tm = localtime(&statbuf.st_mtime);

        /* Get localized date string. */
        strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);

        printf(" %s %s\n", datestring, dp->d_name);
    }
```

Obtaining Symbolic Link Status Information

The following example shows how to obtain status information for a symbolic link named **/modules/pass1**. The structure variable *buffer* is defined for the **stat** structure. If the *path* argument specified the filename for the file pointed to by the symbolic link (**/home/cnd/mod1**), the results of calling the function would be the same as those returned by a call to the *stat*( ) function.

```
#include <sys/stat.h>

struct stat buffer;
int status;
...
status = lstat("/modules/pass1", &buffer);
```

APPLICATION USAGE

None.

RATIONALE

The intent of the paragraph describing "additional or alternate file access control mechanisms" is to allow a secure implementation where a process with a label that does not dominate the file's label cannot perform a *stat*( ) function. This is not related to read permission; a process with a label that dominates the file's label does not need read permission. An implementation that supports write-up operations could fail *fstat*( ) function calls even though it has a valid file descriptor open for writing.

The *lstat*( ) function is not required to update the time-related fields if the named file is not a symbolic link. While the *st_uid*, *st_gid*, *st_atim*, *st_mtim*, and *st_ctim* members of the **stat** structure may apply to a symbolic link, they are not required to do so. No functions in POSIX.1-200x are required to maintain any of these time fields.

The purpose of the *fstatat*( ) function is to obtain the status of files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *stat*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *fstatat*( ) function it can be guaranteed that the file for which status is returned is located relative to the desired directory.

FUTURE DIRECTIONS

None.

XBD Section 4.8 (on page 109), **<fcntl.h>**, **<sys/stat.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EIO] mandatory error condition is added.
- The [ELOOP] mandatory error condition is added.
- The [EOVERFLOW] mandatory error condition is added. This change is to support large files.
- The [ENAMETOOLONG] and the second [EOVERFLOW] optional error conditions are added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Details are added regarding the treatment of symbolic links.
- The [ELOOP] optional error condition is added.

The normative text is updated to avoid use of the term "must" for application requirements.

The **restrict** keyword is added to the *stat*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

XSH-SD5-ERN-161 is applied, updating the DESCRIPTION to clarify to which file types *st_nlink* applies.

The *fstatat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

The *lstat*( ) function is now required to return meaningful data for symbolic links in all **stat**

structure fields, except for the permission bits of *st_mode*.

Changes are made to allow a directory to be opened for searching.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory. +

NAME

fstatvfs, statvfs — get file system information

SYNOPSIS

```
#include <sys/statvfs.h>

int fstatvfs(int fildes, struct statvfs *buf);
int statvfs(const char *restrict path, struct statvfs *restrict buf);
```

DESCRIPTION

The *fstatvfs*( ) function shall obtain information about the file system containing the file referenced by *fildes*.

The *statvfs*( ) function shall obtain information about the file system containing the file named by *path*.

For both functions, the *buf* argument is a pointer to a **statvfs** structure that shall be filled. Read, write, or execute permission of the named file is not required.

The following flags can be returned in the *f_flag* member:

ST_RDONLY Read-only file system.

ST_NOSUID Setuid/setgid bits ignored by *exec*.

It is unspecified whether all members of the **statvfs** structure have meaningful values on all file systems.

RETURN VALUE

Upon successful completion, *statvfs*( ) shall return 0. Otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *fstatvfs*( ) and *statvfs*( ) functions shall fail if:

[EIO] An I/O error occurred while reading the file system.

[EINTR] A signal was caught during execution of the function.

[EOVERFLOW] One of the values to be returned cannot be represented correctly in the structure pointed to by *buf*.

The *fstatvfs*( ) function shall fail if:

[EBADF] The *fildes* argument is not an open file descriptor.

The *statvfs*( ) function shall fail if:

[EACCES] Search permission is denied on a component of the path prefix.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG] The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix is not a directory, or the *path* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

The *statvfs*( ) function may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

EXAMPLES

Obtaining File System Information Using fstatvfs( )

The following example shows how to obtain file system information for the file system upon which the file named **/home/cnd/mod1** resides, using the *fstatvfs*( ) function. The **/home/cnd/mod1** file is opened with read/write privileges and the open file descriptor is passed to the *fstatvfs*( ) function.

```
#include <sys/statvfs.h>
#include <fcntl.h>

struct statvfs buffer;
int            status;
...
fildes = open("/home/cnd/mod1", O_RDWR);
status  = fstatvfs(fildes, &buffer);
```

Obtaining File System Information Using statvfs( )

The following example shows how to obtain file system information for the file system upon which the file named **/home/cnd/mod1** resides, using the *statvfs*( ) function.

```
#include <sys/statvfs.h>

struct statvfs buffer;
int            status;
...
status = statvfs("/home/cnd/mod1", &buffer);
```

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Large File Summit extensions are added.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

The **restrict** keyword is added to the *statvfs*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

SD5-XSH-ERN-68 is applied, correcting the EXAMPLES section.

The *fstatvfs*( ) and *statvfs*( ) functions are moved from the XSI option to the Base.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory. +

NAME

fsync — synchronize changes to a file

SYNOPSIS

FSC
```
#include <unistd.h>

int fsync(int fildes);
```

DESCRIPTION

The *fsync*( ) function shall request that all data for the open file descriptor named by *fildes* is to be transferred to the storage device associated with the file described by *fildes*. The nature of the transfer is implementation-defined. The *fsync*( ) function shall not return until the system has completed that action or until an error is detected.

SIO If _POSIX_SYNCHRONIZED_IO is defined, the *fsync*( ) function shall force all currently queued I/O operations associated with the file indicated by file descriptor *fildes* to the synchronized I/O completion state. All I/O operations shall be completed as defined for synchronized I/O file integrity completion.

RETURN VALUE

Upon successful completion, *fsync*( ) shall return 0. Otherwise, –1 shall be returned and *errno* set to indicate the error. If the *fsync*( ) function fails, outstanding I/O operations are not guaranteed to have been completed.

ERRORS

The *fsync*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid descriptor.

[EINTR] The *fsync*( ) function was interrupted by a signal.

[EINVAL] The *fildes* argument does not refer to a file on which this operation is possible.

[EIO] An I/O error occurred while reading from or writing to the file system.

In the event that any of the queued I/O operations fail, *fsync*( ) shall return the error conditions defined for *read*( ) and *write*( ).

EXAMPLES

None.

APPLICATION USAGE

The *fsync*( ) function should be used by programs which require modifications to a file to be completed before continuing; for example, a program which contains a simple transaction facility might use it to ensure that all modifications to a file or files caused by a transaction are recorded.

RATIONALE

The *fsync*( ) function is intended to force a physical write of data from the buffer cache, and to assure that after a system crash or other failure that all data up to the time of the *fsync*( ) call is recorded on the disk. Since the concepts of "buffer cache", "system crash", "physical write", and "non-volatile storage" are not defined here, the wording has to be more abstract.

If _POSIX_SYNCHRONIZED_IO is not defined, the wording relies heavily on the conformance document to tell the user what can be expected from the system. It is explicitly intended that a null implementation is permitted. This could be valid in the case where the system cannot assure non-volatile storage under any circumstances or when the system is highly fault-tolerant and the functionality is not required. In the middle ground between these extremes, *fsync*( ) might or might not actually cause data to be written where it is safe from a power failure. The

conformance document should identify at least that one configuration exists (and how to obtain that configuration) where this can be assured for at least some files that the user can select to use for critical data. It is not intended that an exhaustive list is required, but rather sufficient information is provided so that if critical data needs to be saved, the user can determine how the system is to be configured to allow the data to be written to non-volatile storage.

It is reasonable to assert that the key aspects of *fsync*( ) are unreasonable to test in a test suite. That does not make the function any less valuable, just more difficult to test. A formal conformance test should probably force a system crash (power shutdown) during the test for this condition, but it needs to be done in such a way that automated testing does not require this to be done except when a formal record of the results is being made. It would also not be unreasonable to omit testing for *fsync*( ), allowing it to be treated as a quality-of-implementation issue.

FUTURE DIRECTIONS

None.

SEE ALSO

sync( )

XBD **<unistd.h>**

CHANGE HISTORY

First released in Issue 3.

Issue 5

Aligned with *fsync*( ) in the POSIX Realtime Extension. Specifically, the DESCRIPTION and RETURN VALUE sections are much expanded, and the ERRORS section is updated to indicate that *fsync*( ) can return the error conditions defined for *read*( ) and *write*( ).

Issue 6

This function is marked as part of the File Synchronization option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EINVAL] and [EIO] mandatory error conditions are added.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/44 is applied, applying an editorial rewording of the DESCRIPTION. No change in meaning is intended.

NAME

ftell, ftello — return a file offset in a stream

SYNOPSIS

```
#include <stdio.h>

long ftell(FILE *stream);
CX off_t ftello(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *ftell*( ) function shall obtain the current value of the file-position indicator for the stream pointed to by *stream*.

CX The *ftello*( ) function shall be equivalent to *ftell*( ), except that the return value is of type **off_t**.

RETURN VALUE

CX Upon successful completion, *ftell*( ) and *ftello*( ) shall return the current value of the file-position indicator for the stream measured in bytes from the beginning of the file.

CX Otherwise, *ftell*( ) and *ftello*( ) shall return –1, cast to **long** and **off_t** respectively, and set *errno* to indicate the error.

ERRORS

CX The *ftell*( ) and *ftello*( ) functions shall fail if:

CX [EBADF] The file descriptor underlying *stream* is not an open file descriptor.

CX [EOVERFLOW] For *ftell*( ), the current file offset cannot be represented correctly in an object of type **long**.

CX [EOVERFLOW] For *ftello*( ), the current file offset cannot be represented correctly in an object of type **off_t**.

CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe or FIFO.

The *ftell*( ) function may fail if:

CX [ESPIPE] The file descriptor underlying *stream* is associated with a socket.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The *ftello*( ) function is added.
- The [EOVERFLOW] error conditions are added.

An additional [ESPIPE] error condition is added for sockets.

NAME

ftok — generate an IPC key

SYNOPSIS

XSI

```
#include <sys/ipc.h>

key_t ftok(const char *path, int id);
```

DESCRIPTION

The *ftok*( ) function shall return a key based on *path* and *id* that is usable in subsequent calls to *msgget*( ), *semget*( ), and *shmget*( ). The application shall ensure that the *path* argument is the pathname of an existing file that the process is able to *stat*( ).

The *ftok*( ) function shall return the same key value for all paths that name the same file, when called with the same *id* value, and return different key values when called with different *id* values or with paths that name different files existing on the same file system at the same time. It is unspecified whether *ftok*( ) shall return the same key value when called again after the file named by *path* is removed and recreated with the same name.

Only the low-order 8-bits of *id* are significant. The behavior of *ftok*( ) is unspecified if these bits are 0.

RETURN VALUE

Upon successful completion, *ftok*( ) shall return a key. Otherwise, *ftok*( ) shall return (**key_t**)–1 and set *errno* to indicate the error.

ERRORS

The *ftok*( ) function shall fail if:

[EACCES] Search permission is denied for a component of the path prefix.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix is not a directory, or the *path* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

The *ftok*( ) function may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

EXAMPLES

Getting an IPC Key

The following example gets a unique key that can be used by the IPC functions *semget*( ), *msgget*( ), and *shmget*( ). The key returned by *ftok*( ) for this example is based on the ID value *S* and the pathname **/tmp**.

```
#include <sys/ipc.h>
...
key_t key;
char *path = "/tmp";
int id = 'S';

key = ftok(path, id);
```

Saving an IPC Key

The following example gets a unique key based on the pathname **/tmp** and the ID value *a*. It also assigns the value of the resulting key to the *semkey* variable so that it will be available to a later call to *semget*( ), *msgget*( ), or *shmget*( ).

```
#include <sys/ipc.h>
...
key_t semkey;

if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
    perror("IPC error: ftok"); exit(1);
}
```

APPLICATION USAGE

For maximum portability, *id* should be a single-byte character.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

ftruncate — truncate a file to a specified length

SYNOPSIS

```
#include <unistd.h>

int ftruncate(int fildes, off_t length);
```

DESCRIPTION

If *fildes* is not a valid file descriptor open for writing, the *ftruncate*( ) function shall fail.

If *fildes* refers to a regular file, the *ftruncate*( ) function shall cause the size of the file to be truncated to *length*. If the size of the file previously exceeded *length*, the extra data shall no longer be available to reads on the file. If the file previously was smaller than this size, *ftruncate*( ) shall increase the size of the file. If the file size is increased, the extended area shall appear as if it were zero-filled. The value of the seek pointer shall not be modified by a call to *ftruncate*( ).

Upon successful completion, if *fildes* refers to a regular file, *ftruncate*( ) shall mark for update the last data modification and last file status change timestamps of the file and the S_ISUID and S_ISGID bits of the file mode may be cleared. If the *ftruncate*( ) function is unsuccessful, the file is unaffected.

XSI If the request would cause the file size to exceed the soft file size limit for the process, the request shall fail and the implementation shall generate the SIGXFSZ signal for the thread.

If *fildes* refers to a directory, *ftruncate*( ) shall fail.

If *fildes* refers to any other file type, except a shared memory object, the result is unspecified.

SHM If *fildes* refers to a shared memory object, *ftruncate*( ) shall set the size of the shared memory object to *length*.

SHM If the effect of *ftruncate*( ) is to decrease the size of a memory mapped file or a shared memory object and whole pages beyond the new end were previously mapped, then the whole pages beyond the new end shall be discarded.

References to discarded pages shall result in the generation of a SIGBUS signal.

If the effect of *ftruncate*( ) is to increase the size of a memory object, it is unspecified whether the contents of any mapped pages between the old end-of-file and the new are flushed to the underlying object.

RETURN VALUE

Upon successful completion, *ftruncate*( ) shall return 0; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *ftruncate*( ) function shall fail if:

[EINTR] A signal was caught during execution.

[EINVAL] The *length* argument was less than 0.

[EFBIG] or [EINVAL]
The *length* argument was greater than the maximum file size.

[EFBIG] The file is a regular file and *length* is greater than the offset maximum established in the open file description associated with *fildes*.

[EIO] An I/O error occurred while reading from or writing to a file system.

[EBADF] or [EINVAL]
The *fildes* argument is not a file descriptor open for writing.

XBD **<unistd.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE and aligned with *ftruncate*( ) in the POSIX Realtime Extension. Specifically, the DESCRIPTION is extensively reworded and [EROFS] is added to the list of mandatory errors that can be returned by *ftruncate*( ).

Large File Summit extensions are added.

Issue 6

The *truncate*( ) function is split out into a separate reference page.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is changed to indicate that if the file size is changed, and if the file is a regular file, the S_ISUID and S_ISGID bits in the file mode may be cleared.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The DESCRIPTION text is updated.

XSI-conformant systems are required to increase the size of the file if the file was previously smaller than the size requested.

Issue 7

Austin Group Interpretation 1003.1-2001 #056 is applied, revising the ERRORS section (although the [EINVAL] "may fail" error was subsequently removed during review of the XSI option).

Functionality relating to the Memory Protection and Memory Mapped Files options is moved to the Base.

The DESCRIPTION is updated so that a call to *ftruncate*( ) when the file is smaller than the size requested will increase the size of the file. Previously, non-XSI-conforming implementations were allowed to increase the size of the file or fail.

Changes are made related to support for finegrained timestamps.

NAME

ftrylockfile — stdio locking functions

SYNOPSIS

CX
```
#include <stdio.h>

int ftrylockfile(FILE *file);
```

DESCRIPTION

Refer to *flockfile( )*.

NAME

ftw — traverse (walk) a file tree

SYNOPSIS

OB XSI

```
#include <ftw.h>

int ftw(const char *path, int (*fn)(const char *,
    const struct stat *ptr, int flag), int ndirs);
```

DESCRIPTION

The *ftw*( ) function shall recursively descend the directory hierarchy rooted in *path*. For each object in the hierarchy, *ftw*( ) shall call the function pointed to by *fn*, passing it a pointer to a null-terminated character string containing the name of the object, a pointer to a **stat** structure containing information about the object, filled in as if *stat*( ) or *lstat*( ) had been called to retrieve the information. Possible values of the integer, defined in the **<ftw.h>** header, are:

FTW_D For a directory.

FTW_DNR For a directory that cannot be read.

FTW_F For a file.

FTW_SL For a symbolic link (but see also FTW_NS below).

FTW_NS For an object other than a symbolic link on which *stat*( ) could not successfully be executed. If the object is a symbolic link and *stat*( ) failed, it is unspecified whether *ftw*( ) passes FTW_SL or FTW_NS to the user-supplied function.

If the integer is FTW_DNR, descendants of that directory shall not be processed. If the integer is FTW_NS, the **stat** structure contains undefined values. An example of an object that would cause FTW_NS to be passed to the function pointed to by *fn* would be a file in a directory with read but without execute (search) permission.

The *ftw*( ) function shall visit a directory before visiting any of its descendants.

The *ftw*( ) function shall use at most one file descriptor for each level in the tree.

The argument *ndirs* should be in the range [1,{OPEN_MAX}].

The tree traversal shall continue until either the tree is exhausted, an invocation of *fn* returns a non-zero value, or some error, other than [EACCES], is detected within *ftw*( ).

The *ndirs* argument shall specify the maximum number of directory streams or file descriptors or both available for use by *ftw*( ) while traversing the tree. When *ftw*( ) returns it shall close any directory streams and file descriptors it uses not counting any opened by the application-supplied *fn* function.

The results are unspecified if the application-supplied *fn* function does not preserve the current working directory.

The *ftw*( ) function need not be thread-safe.

RETURN VALUE

If the tree is exhausted, *ftw*( ) shall return 0. If the function pointed to by *fn* returns a non-zero value, *ftw*( ) shall stop its tree traversal and return whatever value was returned by the function pointed to by *fn*. If *ftw*( ) detects an error, it shall return –1 and set *errno* to indicate the error.

If *ftw*( ) encounters an error other than [EACCES] (see FTW_DNR and FTW_NS above), it shall return –1 and set *errno* to indicate the error. The external variable *errno* may contain any error value that is possible when a directory is opened or when one of the *stat* functions is executed on

a directory or file.

ERRORS

The *ftw*( ) function shall fail if:

[EACCES] Search permission is denied for any component of *path* or read permission is denied for *path*.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG] The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of *path* is not a directory.

[EOVERFLOW] A field in the **stat** structure cannot be represented correctly in the current programming environment for one or more files found in the file hierarchy.

The *ftw*( ) function may fail if:

[EINVAL] The value of the *ndirs* argument is invalid.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG] The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

In addition, if the function pointed to by *fn* encounters system errors, *errno* may be set accordingly.

EXAMPLES

Walking a Directory Structure

The following example walks the current directory structure, calling the *fn* function for every directory entry, using at most 10 file descriptors:

```
#include <ftw.h>
...
if (ftw(".", fn, 10) != 0) {
    perror("ftw"); exit(2);
}
```

APPLICATION USAGE

The *ftw*( ) function may allocate dynamic storage during its operation. If *ftw*( ) is forcibly terminated, such as by *longjmp*( ) or *siglongjmp*( ) being executed by the function pointed to by *fn* or an interrupt routine, *ftw*( ) does not have a chance to free that storage, so it remains permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has occurred, and arrange to have the function pointed to by *fn* return a non-zero value at its next invocation.

Applications should use the *nftw*( ) function instead of the obsolescent *ftw*( ) function.

RATIONALE

None.

FUTURE DIRECTIONS

The *ftw*( ) function may be removed in a future version.

SEE ALSO

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

UX codings in the DESCRIPTION, RETURN VALUE, and ERRORS sections are changed to EX.

Issue 6

The ERRORS section is updated as follows:

- The wording of the mandatory [ELOOP] error condition is updated.
- A second optional [ELOOP] error condition is added.
- The [EOVERFLOW] mandatory error condition is added.

A note is added to the DESCRIPTION indicating that this function need not be reentrant, and that the results are unspecified if the application-supplied *fn* function does not preserve the current working directory.

Issue 7

Austin Group Interpretations 1003.1-2001 #143 and #156 are applied.

SD5-XBD-ERN-61 is applied.

The *ftw*( ) function ia marked obsolescent.

32357 **NAME**

32358 funlockfile — stdio locking functions

32359 **SYNOPSIS**

32360 CX
```
#include <stdio.h>

void funlockfile(FILE *file);
```

32362 **DESCRIPTION**

32363 Refer to *flockfile( )*.

NAME

futimens, utimensat, utimes — set file access and modification times

SYNOPSIS

```
#include <sys/stat.h>

int futimens(int fd, const struct timespec times[2]);
int utimensat(int fd, const char *path, const struct timespec times[2],
    int flag);
```

XSI

```
#include <sys/time.h>

int utimes(const char *path, const struct timeval times[2]);
```

DESCRIPTION

The *futimens*( ) and *utimensat*( ) functions shall set the access and modification times of a file to the values of the *times* argument. The *futimens*( ) function changes the times of the file associated with the file descriptor *fd*. The *utimensat*( ) function changes the times of the file pointed to by the *path* argument, relative to the directory associated with the file descriptor *fd*. Both functions allow time specifications accurate to the nanosecond.

For *futimens*( ) and *utimensat*( ), the *times* argument is an array of two **timespec** structures. The first array member represents the date and time of last access, and the second member represents the date and time of last modification. The times in the **timespec** structure are measured in seconds and nanoseconds since the Epoch. The file's relevant timestamp shall be set to the greatest value supported by the file system that is not greater than the specified time.

If the *tv_nsec* field of a **timespec** structure has the special value UTIME_NOW, the file's relevant timestamp shall be set to the greatest value supported by the file system that is not greater than the current time. If the *tv_nsec* field has the special value UTIME_OMIT, the file's relevant timestamp shall not be changed. In either case, the *tv_sec* field shall be ignored.

If the *times* argument is a null pointer, both the access and modification timestamps shall be set to the greatest value supported by the file system that is not greater than the current time. If *utimensat*( ) is passed a relative path in the *path* argument, the file to be used shall be relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function shall not perform the check.

If *utimensat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working directory shall be used.

Only a process with the effective user ID equal to the user ID of the file, or with write access to the file, or with appropriate privileges may use *futimens*( ) or *utimensat*( ) with a null pointer as + the *times* argument or with both *tv_nsec* fields set to the special value UTIME_NOW. Only a process with the effective user ID equal to the user ID of the file or with appropriate privileges may use *futimens*( ) or *utimensat*( ) with a non-null *times* argument that does not have both + *tv_nsec* fields set to UTIME_NOW and does not have both *tv_nsec* fields set to UTIME_OMIT. If both *tv_nsec* fields are set to UTIME_OMIT, no ownership or permissions check shall be performed for the file, but other error conditions may still be detected (including [EACCES] errors related to the path prefix).

Values for the *flag* argument of *utimensat*( ) are constructed by a bitwise-inclusive OR of flags from the following list, defined in **<fcntl.h>**:

AT_SYMLINK_NOFOLLOW
If *path* names a symbolic link, then the access and modification times of the symbolic link are changed.

Upon completion, *futimens*( ) and *utimensat*( ) shall mark the last file status change timestamp for update.

The *utimes*( ) function shall be equivalent to the *utimensat*( ) function with the special value AT_FDCWD as the *fd* argument and the *flag* argument set to zero, except that the *times* argument is a **timeval** structure rather than a **timespec** structure, and accuracy is only to the microsecond, not nanosecond, and rounding towards the nearest second may occur.

RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return −1 and set *errno* to indicate the error. If −1 is returned, the file times shall not be affected.

ERRORS

These functions shall fail if:

[EACCES] The *times* argument is a null pointer, or both *tv_nsec* values are UTIME_NOW, and the effective user ID of the process does not match the owner of the file and write access is denied.

[EINVAL] Either of the *times* argument structures specified a *tv_nsec* value that was neither UTIME_NOW nor UTIME_OMIT, and was a value less than zero or greater than or equal to 1 000 million.

[EINVAL] A new file timestamp would be a value whose *tv_sec* component is not a value supported by the file system.

[EPERM] The *times* argument is not a null pointer, does not have both *tv_nsec* fields set to UTIME_NOW, does not have both *tv_nsec* fields set to UTIME_OMIT, the calling process' effective user ID has write access to the file but does not match the owner of the file, and the calling process does not have appropriate privileges.

[EROFS] The file system containing the file is read-only.

The *futimens*( ) function shall fail if:

[EBADF] The *fd* argument is not a valid file descriptor.

The *utimensat*( ) function shall fail if:

[EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

The *utimensat*( ) and *utimes*( ) functions shall fail if:

[EACCES] Search permission is denied by a component of the path prefix.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix is not a directory, or the *path* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

The *utimensat*( ) and *utimes*( ) functions may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

The *utimensat*( ) function may fail if:

[ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a file descriptor associated with a directory.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The purpose of the *utimensat*( ) function is to set the access and modification time of files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *utimes*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *utimensat*( ) function it can be guaranteed that the changed file is located relative to the desired directory.

The standard developers considered including a special case for the permissions required by *utimensat*( ) when one *tv_nsec* field is UTIME_NOW and the other is UTIME_OMIT. One possibility would be to include this case in with the cases where *times* is a null pointer or both fields are UTIME_NOW, where the call is allowed if the process has write permission for the file. However, associating write permission with an update to just the last data access timestamp (which is normally updated by *read*( )) did not seem appropriate. The other possibility would be to specify that this one case is allowed if the process has read permission, but this was felt to be too great a departure from the *utime*( ) and *utimes*( ) functions on which *utimensat*( ) is based. If an application needs to set the last data access timestamp to the current time for a file on which it has read permission but is not the owner, it can do so by opening the file, reading one or more bytes (or reading a directory entry, if the file is a directory), and then closing it.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

This function is marked LEGACY.

The normative text is updated to avoid use of the term "must" for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The LEGACY marking is removed.

The *utimensat*( ) function (renamed from *futimesat*( )) is added from The Open Group Technical Standard, 2006, Extended API Set Part 2, and changed to allow modifying a symbolic link by adding a *flag* argument.

The *futimens*( ) function is added.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory. +

NAME

fwide — set stream orientation

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

int fwide(FILE *stream, int mode);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fwide*( ) function shall determine the orientation of the stream pointed to by *stream*. If *mode* is greater than zero, the function first attempts to make the stream wide-oriented. If *mode* is less than zero, the function first attempts to make the stream byte-oriented. Otherwise, *mode* is zero and the function does not alter the orientation of the stream.

If the orientation of the stream has already been determined, *fwide*( ) shall not change it.

CX Since no return value is reserved to indicate an error, an application wishing to check for error situations should set *errno* to 0, then call *fwide*( ), then check *errno*, and if it is non-zero, assume an error has occurred.

RETURN VALUE

The *fwide*( ) function shall return a value greater than zero if, after the call, the stream has wide-orientation, a value less than zero if the stream has byte-orientation, or zero if the stream has no orientation.

ERRORS

The *fwide*( ) function may fail if:

CX [EBADF] The *stream* argument is not a valid stream.

EXAMPLES

None.

APPLICATION USAGE

A call to *fwide*( ) with *mode* set to zero can be used to determine the current orientation of a stream.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).

Issue 6

Extensions beyond the ISO C standard are marked.

NAME

fwprintf, swprintf, wprintf — print formatted wide-character output

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

int fwprintf(FILE *restrict stream, const wchar_t *restrict format, ...);
int swprintf(wchar_t *restrict ws, size_t n,
    const wchar_t *restrict format, ...);
int wprintf(const wchar_t *restrict format, ...);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fwprintf*( ) function shall place output on the named output *stream*. The *wprintf*( ) function shall place output on the standard output stream *stdout*. The *swprintf*( ) function shall place output followed by the null wide character in consecutive wide characters starting at **ws*; no more than *n* wide characters shall be written, including a terminating null wide character, which is always added (unless *n* is zero).

Each of these functions shall convert, format, and print its arguments under control of the *format* wide-character string. The *format* is composed of zero or more directives: *ordinary wide-characters*, which are simply copied to the output stream, and *conversion specifications*, each of which results in the fetching of zero or more arguments. The results are undefined if there are insufficient arguments for the *format*. If the *format* is exhausted while arguments remain, the excess arguments are evaluated but are otherwise ignored.

CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than to the next unused argument. In this case, the conversion specifier wide character % (see below) is replaced by the sequence "%n$", where *n* is a decimal integer in the range [1,{NL_ARGMAX}], giving the position of the argument in the argument list. This feature provides for the definition of *format* wide-character strings that select arguments in an order appropriate to specific languages (see the EXAMPLES section).

The *format* can contain either numbered argument specifications (that is, "%*n*$" and "**m*$"), or unnumbered argument conversion specifications (that is, % and *), but not both. The only exception to this is that %% can be mixed with the "%*n*$" form. The results of mixing numbered and unnumbered argument specifications in a *format* wide-character string are undefined. When numbered argument specifications are used, specifying the *N*th argument requires that all the leading arguments, from the first to the (*N*–1)th, are specified in the *format* wide-character string.

In *format* wide-character strings containing the "%*n*$" form of conversion specification, numbered arguments in the argument list can be referenced from the *format* wide-character string as many times as required.

In *format* wide-character strings containing the % form of conversion specification, each argument in the argument list shall be used exactly once.

CX All forms of the *fwprintf*( ) function allow for the insertion of a locale-dependent radix character in the output string, output as a wide-character value. The radix character is defined in the locale of the process (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a <period> ('.').

CX Each conversion specification is introduced by the '%' wide character or by the wide-character sequence "%*n*$", after which the following appear in sequence:

- Zero or more *flags* (in any order), which modify the meaning of the conversion specification.
- An optional minimum *field width*. If the converted value has fewer wide characters than the field width, it shall be padded with <space> characters by default on the left; it shall be padded on the right, if the left-adjustment flag ('−'), described below, is given to the field width. The field width takes the form of an <asterisk> ('*'), described below, or a decimal integer.
- An optional *precision* that gives the minimum number of digits to appear for the d, i, o, u, x, and X conversion specifiers; the number of digits to appear after the radix character for the a, A, e, E, f, and F conversion specifiers; the maximum number of significant digits for the g and G conversion specifiers; or the maximum number of wide characters to be printed from a string in the s conversion specifiers. The precision takes the form of a <period> ('.') followed either by an <asterisk> ('*'), described below, or an optional decimal digit string, where a null digit string is treated as 0. If a precision appears with any other conversion wide character, the behavior is undefined.
- An optional length modifier that specifies the size of the argument.
- A *conversion specifier* wide character that indicates the type of conversion to be applied.

A field width, or precision, or both, may be indicated by an <asterisk> ('*'). In this case an argument of type **int** supplies the field width or precision. Applications shall ensure that arguments specifying field width, or precision, or both appear in that order before the argument, if any, to be converted. A negative field width is taken as a '−' flag followed by a positive field
CX width. A negative precision is taken as if the precision were omitted. In *format* wide-character strings containing the "%*n*$" form of a conversion specification, a field width or precision may be indicated by the sequence "**m*$", where *m* is a decimal integer in the range [1,{NL_ARGMAX}] giving the position in the argument list (after the *format* argument) of an integer argument containing the field width or precision, for example:

```
wprintf(L"%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);
```

The flag wide characters and their meanings are:

CX ' (The <apostrophe>.) The integer portion of the result of a decimal conversion (%i, %d, %u, %f, %F, %g, or %G) shall be formatted with thousands' grouping wide characters. For other conversions, the behavior is undefined. The numeric grouping wide character is used. +

− The result of the conversion shall be left-justified within the field. The conversion shall be right-justified if this flag is not specified.

\+ The result of a signed conversion shall always begin with a sign ('+' or '−'). The conversion shall begin with a sign only when a negative value is converted if this flag is not specified.

<space> If the first wide character of a signed conversion is not a sign, or if a signed conversion results in no wide characters, a <space> shall be prefixed to the result. This means that if the <space> and '+' flags both appear, the <space> flag shall be ignored.

\# Specifies that the value is to be converted to an alternative form. For o conversion, it increases the precision (if necessary) to force the first digit of the result to be 0. For x or X conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For a, A, e,

32642 E, f, F, g, and G conversion specifiers, the result shall always contain a radix character,
32643 even if no digits follow it. Without this flag, a radix character appears in the result of
32644 these conversions only if a digit follows it. For g and G conversion specifiers, trailing
32645 zeros shall *not* be removed from the result as they normally are. For other conversion
32646 specifiers, the behavior is undefined.

32647 0 For d, i, o, u, x, X, a, A, e, E, f, F, g, and G conversion specifiers, leading zeros
32648 (following any indication of sign or base) are used to pad to the field width rather than
32649 performing space padding, except when converting an infinity or NaN. If the '0' and
32650 '-' flags both appear, the '0' flag shall be ignored. For d, i, o, u, x, and X conversion
32651 CX specifiers, if a precision is specified, the '0' flag shall be ignored. If the '0' and
32652 <apostrophe> flags both appear, the grouping wide characters are inserted before zero
32653 padding. For other conversions, the behavior is undefined.

32654 The length modifiers and their meanings are:

32655 hh Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **signed char**
32656 or **unsigned char** argument (the argument will have been promoted according to the
32657 integer promotions, but its value shall be converted to **signed char** or **unsigned char**
32658 before printing); or that a following n conversion specifier applies to a pointer to a
32659 **signed char** argument.

32660 h Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **short** or
32661 **unsigned short** argument (the argument will have been promoted according to the
32662 integer promotions, but its value shall be converted to **short** or **unsigned short** before
32663 printing); or that a following n conversion specifier applies to a pointer to a **short**
32664 argument.

32665 l (ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long** or
32666 **unsigned long** argument; that a following n conversion specifier applies to a pointer to
32667 a **long** argument; that a following c conversion specifier applies to a **wint_t** argument;
32668 that a following s conversion specifier applies to a pointer to a **wchar_t** argument; or
32669 has no effect on a following a, A, e, E, f, F, g, or G conversion specifier.

32670 ll (ell-ell)
32671 Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long long**
32672 or **unsigned long long** argument; or that a following n conversion specifier applies to a
32673 pointer to a **long long** argument.

32674 j Specifies that a following d, i, o, u, x, or X conversion specifier applies to an **intmax_t**
32675 or **uintmax_t** argument; or that a following n conversion specifier applies to a pointer
32676 to an **intmax_t** argument.

32677 z Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **size_t** or the
32678 corresponding signed integer type argument; or that a following n conversion specifier
32679 applies to a pointer to a signed integer type corresponding to a **size_t** argument.

32680 t Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **ptrdiff_t** or
32681 the corresponding **unsigned** type argument; or that a following n conversion specifier
32682 applies to a pointer to a **ptrdiff_t** argument.

32683 L Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to a **long**
32684 **double** argument.

If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.

The conversion specifiers and their meanings are:

`d`, `i` The **int** argument shall be converted to a signed decimal in the style "`[−]`*dddd*". The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.

`o` The **unsigned** argument shall be converted to unsigned octal format in the style "`dddd`". The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.

`u` The **unsigned** argument shall be converted to unsigned decimal format in the style "`dddd`". The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.

`x` The **unsigned** argument shall be converted to unsigned hexadecimal format in the style "`dddd`"; the letters "`abcdef`" are used. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.

`X` Equivalent to the `x` conversion specifier, except that letters "`ABCDEF`" are used instead of "`abcdef`".

`f`, `F` The **double** argument shall be converted to decimal notation in the style "`[−]`*ddd.ddd*", where the number of digits after the radix character shall be equal to the precision specification. If the precision is missing, it shall be taken as 6; if the precision is explicitly zero and no '`#`' flag is present, no radix character shall appear. If a radix character appears, at least one digit shall appear before it. The value shall be rounded in an implementation-defined manner to the appropriate number of digits.

A **double** argument representing an infinity shall be converted in one of the styles "`[−]inf`" or "`[−]infinity`"; which style is implementation-defined. A **double** argument representing a NaN shall be converted in one of the styles "`[−]nan`" or "`[−]nan(`*n-char-sequence*`)`"; which style, and the meaning of any *n-char-sequence*, is implementation-defined. The `F` conversion specifier produces "`INF`", "`INFINITY`", or "`NAN`" instead of "`inf`", "`infinity`", or "`nan`", respectively.

`e`, `E` The **double** argument shall be converted in the style "`[−]`*d.ddd*`e±dd`", where there shall be one digit before the radix character (which is non-zero if the argument is non-zero) and the number of digits after it shall be equal to the precision; if the precision is missing, it shall be taken as 6; if the precision is zero and no '`#`' flag is present, no radix character shall appear. The value shall be rounded in an implementation-defined manner to the appropriate number of digits. The `E` conversion wide character shall produce a number with '`E`' instead of '`e`' introducing the exponent. The exponent shall always contain at least two digits. If the value is zero, the exponent shall be zero.

A **double** argument representing an infinity or NaN shall be converted in the style of an `f` or `F` conversion specifier.

32732 g, G The **double** argument representing a floating-point number shall be converted in the
32733 style f or e (or in the style F or E in the case of a G conversion specifier), depending on
32734 the value converted and the precision. Let P equal the precision if non-zero, 6 if the
32735 precision is omitted, or 1 if the precision is zero. Then, if a conversion with style E
32736 would have an exponent of *X*:

32737 — If P>*X*≥–4, the conversion shall be with style f (or F) and precision P–(*X*+1).

32738 — Otherwise, the conversion shall be with style e (or E) and precision P–1.

32739 Finally, unless the '#' flag is used, any trailing zeros shall be removed from the
32740 fractional portion of the result and the decimal-point character shall be removed if there
32741 is no fractional portion remaining.

32742 A **double** argument representing an infinity or NaN shall be converted in the style of
32743 an f or F conversion specifier.

32744 a, A A **double** argument representing a floating-point number shall be converted in the
32745 style "[−]0x*h*.*hhhh*p±*d*", where there shall be one hexadecimal digit (which is non-
32746 zero if the argument is a normalized floating-point number and is otherwise
32747 unspecified) before the decimal-point wide character and the number of hexadecimal
32748 digits after it shall be equal to the precision; if the precision is missing and FLT_RADIX
32749 is a power of 2, then the precision shall be sufficient for an exact representation of the
32750 value; if the precision is missing and FLT_RADIX is not a power of 2, then the precision
32751 shall be sufficient to distinguish values of type **double**, except that trailing zeros may
32752 be omitted; if the precision is zero and the '#' flag is not specified, no decimal-point
32753 wide character shall appear. The letters "abcdef" are used for a conversion and the
32754 letters "ABCDEF" for A conversion. The A conversion specifier produces a number with
32755 'X' and 'P' instead of 'x' and 'p'. The exponent shall always contain at least one
32756 digit, and only as many more digits as necessary to represent the decimal exponent of
32757 2. If the value is zero, the exponent shall be zero.

32758 A **double** argument representing an infinity or NaN shall be converted in the style of
32759 an f or F conversion specifier.

32760 c If no l (ell) qualifier is present, the **int** argument shall be converted to a wide character
32761 as if by calling the *btowc*( ) function and the resulting wide character shall be written.
32762 Otherwise, the **wint_t** argument shall be converted to **wchar_t**, and written.

32763 s If no l (ell) qualifier is present, the application shall ensure that the argument is a
32764 pointer to a character array containing a character sequence beginning in the initial
32765 shift state. Characters from the array shall be converted as if by repeated calls to the
32766 *mbrtowc*( ) function, with the conversion state described by an **mbstate_t** object
32767 initialized to zero before the first character is converted, and written up to (but not
32768 including) the terminating null wide character. If the precision is specified, no more
32769 than that many wide characters shall be written. If the precision is not specified, or is
32770 greater than the size of the array, the application shall ensure that the array contains a
32771 null wide character.

32772 If an l (ell) qualifier is present, the application shall ensure that the argument is a
32773 pointer to an array of type **wchar_t**. Wide characters from the array shall be written up
32774 to (but not including) a terminating null wide character. If no precision is specified, or
32775 is greater than the size of the array, the application shall ensure that the array contains a
32776 null wide character. If a precision is specified, no more than that many wide characters
32777 shall be written.

32778 p The application shall ensure that the argument is a pointer to **void**. The value of the
32779 pointer shall be converted to a sequence of printable wide characters in an
32780 implementation-defined manner.

32781 n The application shall ensure that the argument is a pointer to an integer into which is
32782 written the number of wide characters written to the output so far by this call to one of
32783 the *fwprintf*( ) functions. No argument shall be converted, but one shall be consumed. If
32784 the conversion specification includes any flags, a field width, or a precision, the
32785 behavior is undefined.

32786 XSI C Equivalent to lc.

32787 XSI S Equivalent to ls.

32788 % Output a '%' wide character; no argument shall be converted. The entire conversion
32789 specification shall be %%.

32790 If a conversion specification does not match one of the above forms, the behavior is undefined.

32791 In no case does a nonexistent or small field width cause truncation of a field; if the result of a
32792 conversion is wider than the field width, the field shall be expanded to contain the conversion
32793 result. Characters generated by *fwprintf*( ) and *wprintf*( ) shall be printed as if *fputwc*( ) had been
32794 called.

32795 For a and A conversions, if FLT_RADIX is not a power of 2 and the result is not exactly
32796 representable in the given precision, the result should be one of the two adjacent numbers in
32797 hexadecimal floating style with the given precision, with the extra stipulation that the error
32798 should have a correct sign for the current rounding direction.

32799 For e, E, f, F, g, and G conversion specifiers, if the number of significant decimal digits is at
32800 most DECIMAL_DIG, then the result should be correctly rounded. If the number of significant
32801 decimal digits is more than DECIMAL_DIG but the source value is exactly representable with
32802 DECIMAL_DIG digits, then the result should be an exact representation with trailing zeros.
32803 Otherwise, the source value is bounded by two adjacent decimal strings $L < U$, both having
32804 DECIMAL_DIG significant digits; the value of the resultant decimal string D should satisfy $L <= D <= U$, with the extra stipulation that the error should have a correct sign for the current
32805
32806 rounding direction.

32807 CX The last data modification and last file status change timestamps of the file shall be marked for
32808 update between the call to a successful execution of *fwprintf*( ) or *wprintf*( ) and the next
32809 successful completion of a call to *fflush*( ) or *fclose*( ) on the same stream, or a call to *exit*( ) or
32810 *abort*( ).

32811 **RETURN VALUE**

32812 Upon successful completion, these functions shall return the number of wide characters
32813 transmitted, excluding the terminating null wide character in the case of *swprintf*( ), or a negative
32814 CX value if an output error was encountered, and set *errno* to indicate the error.

32815 If *n* or more wide characters were requested to be written, *swprintf*( ) shall return a negative
32816 CX value, and set *errno* to indicate the error.

32817 **ERRORS**

32818 For the conditions under which *fwprintf*( ) and *wprintf*( ) fail and may fail, refer to *fputwc*( ).

32819 In addition, all forms of *fwprintf*( ) shall fail if:

32820 CX [EILSEQ] A wide-character code that does not correspond to a valid character has been
32821 detected.

In addition, all forms of *fwprintf*( ) may fail if:

CX [EINVAL] There are insufficient arguments.

In addition, *fwprintf*( ) and *wprintf*( ) may fail if:

CX [ENOMEM] Insufficient storage space is available.

The *swprintf*( ) shall fail if:

CX [EOVERFLOW] The value of *n* is greater than {INT_MAX} or the number of bytes needed to hold the output excluding the terminating null is greater than {INT_MAX}.

EXAMPLES

To print the language-independent date and time format, the following statement could be used:

```
wprintf(format, weekday, month, day, hour, min);
```

For American usage, *format* could be a pointer to the wide-character string:

```
L"%s, %s %d, %d:%.2d\n"
```

producing the message:

```
Sunday, July 3, 10:02
```

whereas for German usage, *format* could be a pointer to the wide-character string:

```
L"%1$s, %3$d. %2$s, %4$d:%5$.2d\n"
```

producing the message:

```
Sonntag, 3. Juli, 10:02
```

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).

Issue 6

The Open Group Corrigendum U040/1 is applied to the RETURN VALUE section, describing the case if *n* or more wide characters are requested to be written using *swprintf*( ).

The normative text is updated to avoid use of the term "must" for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototypes for *fwprintf*( ), *swprintf*( ), and *wprintf*( ) are updated.
- The DESCRIPTION is updated.

- The `hh`, `ll`, `j`, `t`, and `z` length modifiers are added.
- The `a`, `A`, and `F` conversion characters are added.
- XSI shading is removed from the description of character string representations of infinity and NaN floating-point values.

The DESCRIPTION is updated to use the terms "conversion specifier" and "conversion specification" consistently.

ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

Issue 7

Austin Group Interpretation 1003.1-2001 #161 is applied, updating the DESCRIPTION of the 0 flag.

Austin Group Interpretation 1003.1-2001 #170 is applied.

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #68 (SD5-XSH-ERN-70) is applied, revising the description of `g` and `G`.

Functionality relating to the `"%n$"` form of conversion specification and the <apostrophe> flag is moved from the XSI option to the Base.

The [EOVERFLOW] error is added for *swprintf( )*.

Changes are made related to support for finegrained timestamps.

NAME

fwrite — binary output

SYNOPSIS

```
#include <stdio.h>

size_t fwrite(const void *restrict ptr, size_t size, size_t nitems,
    FILE *restrict stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fwrite*( ) function shall write, from the array pointed to by *ptr*, up to *nitems* elements whose size is specified by *size*, to the stream pointed to by *stream*. For each object, *size* calls shall be made to the *fputc*( ) function, taking the values (in order) from an array of **unsigned char** exactly overlaying the object. The file-position indicator for the stream (if defined) shall be advanced by the number of bytes successfully written. If an error occurs, the resulting value of the file-position indicator for the stream is unspecified.

CX The last data modification and last file status change timestamps of the file shall be marked for update between the successful execution of *fwrite*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same stream, or a call to *exit*( ) or *abort*( ).

RETURN VALUE

The *fwrite*( ) function shall return the number of elements successfully written, which may be less than *nitems* if a write error is encountered. If *size* or *nitems* is 0, *fwrite*( ) shall return 0 and the state of the stream remains unchanged. Otherwise, if a write error occurs, the error indicator for the stream shall be set, CX and *errno* shall be set to indicate the error.

ERRORS

Refer to *fputc*( ).

EXAMPLES

None.

APPLICATION USAGE

Because of possible differences in element length and byte ordering, files written using *fwrite*( ) are application-dependent, and possibly cannot be read using *fread*( ) by a different application or by the same application on a different processor.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The *fwrite*( ) prototype is updated.
- The DESCRIPTION is updated to clarify how the data is written out using *fputc*( ).

Issue 7

Changes are made related to support for finegrained timestamps.

NAME

fwscanf, swscanf, wscanf — convert formatted wide-character input

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

int fwscanf(FILE *restrict stream, const wchar_t *restrict format, ...);
int swscanf(const wchar_t *restrict ws,
    const wchar_t *restrict format, ...);
int wscanf(const wchar_t *restrict format, ...);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *fwscanf*( ) function shall read from the named input *stream*. The *wscanf*( ) function shall read from the standard input stream *stdin*. The *swscanf*( ) function shall read from the wide-character string *ws*. Each function reads wide characters, interprets them according to a format, and stores the results in its arguments. Each expects, as arguments, a control wide-character string *format* described below, and a set of *pointer* arguments indicating where the converted input should be stored. The result is undefined if there are insufficient arguments for the format. If the *format* is exhausted while arguments remain, the excess arguments are evaluated but are otherwise ignored.

CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than to the next unused argument. In this case, the conversion specifier wide character % (see below) is replaced by the sequence "%*n*$", where *n* is a decimal integer in the range [1,{NL_ARGMAX}]. This feature provides for the definition of *format* wide-character strings that select arguments in an order appropriate to specific languages. In *format* wide-character strings containing the "%*n*$" form of conversion specifications, it is unspecified whether numbered arguments in the argument list can be referenced from the *format* wide-character string more than once.

The *format* can contain either form of a conversion specification—that is, % or "%*n*$"— but the two forms cannot normally be mixed within a single *format* wide-character string. The only exception to this is that %% or %* can be mixed with the "%*n*$" form. When numbered argument specifications are used, specifying the *N*th argument requires that all the leading arguments, from the first to the (*N*−1)th, are pointers.

The *fwscanf*( ) function in all its forms allows for detection of a language-dependent radix character in the input string, encoded as a wide-character value. The radix character is defined in the locale of the process (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a <period> ('.').

The *format* is a wide-character string composed of zero or more directives. Each directive is composed of one of the following: one or more white-space wide characters (<space>, <tab>, <newline>, <vertical-tab>, or <form-feed>); an ordinary wide character (neither '%' nor a white-space character); or a conversion specification.

CX Each conversion specification is introduced by the '%' or by the character sequence "%*n*$", after which the following appear in sequence:

- An optional assignment-suppressing character '*'.

- An optional non-zero decimal integer that specifies the maximum field width.
- CX An optional assignment-allocation character `'m'`.
- An optional length modifier that specifies the size of the receiving object.
- A conversion specifier wide character that specifies the type of conversion to be applied. The valid conversion specifiers are described below.

The *fwscanf*( ) functions shall execute each directive of the format in turn. If a directive fails, as detailed below, the function shall return. Failures are described as input failures (due to the unavailability of input bytes) or matching failures (due to inappropriate input).

A directive composed of one or more white-space wide characters is executed by reading input until no more valid input can be read, or up to the first wide character which is not a white-space wide character, which remains unread.

A directive that is an ordinary wide character shall be executed as follows. The next wide character is read from the input and compared with the wide character that comprises the directive; if the comparison shows that they are not equivalent, the directive shall fail, and the differing and subsequent wide characters remain unread. Similarly, if end-of-file, an encoding error, or a read error prevents a wide character from being read, the directive shall fail.

A directive that is a conversion specification defines a set of matching input sequences, as described below for each conversion wide character. A conversion specification is executed in the following steps.

Input white-space wide characters (as specified by *iswspace*( )) shall be skipped, unless the conversion specification includes a `[`, `c`, or `n` conversion specifier.

An item shall be read from the input, unless the conversion specification includes an `n` conversion specifier wide character. An input item is defined as the longest sequence of input wide characters, not exceeding any specified field width, which is an initial subsequence of a matching sequence. The first wide character, if any, after the input item shall remain unread. If the length of the input item is zero, the execution of the conversion specification shall fail; this condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented input from the stream, in which case it is an input failure.

Except in the case of a `%` conversion specifier, the input item (or, in the case of a `%n` conversion specification, the count of input wide characters) shall be converted to a type appropriate to the conversion wide character. If the input item is not a matching sequence, the execution of the conversion specification shall fail; this condition is a matching failure. Unless assignment suppression was indicated by a `'*'`, the result of the conversion shall be placed in the object pointed to by the first argument following the *format* argument that has not already received a conversion result if the conversion specification is introduced by `%`, CX or in the *n*th argument if introduced by the wide-character sequence `"%`*n*`$"`. If this object does not have an appropriate type, or if the result of the conversion cannot be represented in the space provided, the behavior is undefined.

CX The `%c`, `%s`, and `%[` conversion specifiers shall accept an optional assignment-allocation character `'m'`, which shall cause a memory buffer to be allocated to hold the wide-character string converted including a terminating null wide character. In such a case, the argument corresponding to the conversion specifier should be a reference to a pointer value that will receive a pointer to the allocated buffer. The system shall allocate a buffer as if *malloc*( ) had been called. The application shall be responsible for freeing the memory after usage. If there is insufficient memory to allocate a buffer, the function shall set *errno* to [ENOMEM] and a conversion error shall result. If the function returns EOF, any memory successfully allocated for

parameters using assignment-allocation character `'m'` by this call shall be freed before the function returns.

The length modifiers and their meanings are:

`hh` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **signed char** or **unsigned char**.

`h` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **short** or **unsigned short**.

`l` (ell) Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **long** or **unsigned long**; that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier applies to an argument with type pointer to **double**; or that a following `c`, `s`, or `[` conversion specifier applies to an argument with type pointer to **wchar_t**. If the `'m'` assignment-allocation character is specified, the conversion applies to an argument with the type pointer to a pointer to **wchar_t**.

CX

`ll` (ell-ell)
Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **long long** or **unsigned long long**.

`j` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **intmax_t** or **uintmax_t**.

`z` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **size_t** or the corresponding signed integer type.

`t` Specifies that a following `d`, `i`, `o`, `u`, `x`, `X`, or `n` conversion specifier applies to an argument with type pointer to **ptrdiff_t** or the corresponding **unsigned** type.

`L` Specifies that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier applies to an argument with type pointer to **long double**.

If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.

The following conversion specifier wide characters are valid:

`d` Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of *wcstol*( ) with the value 10 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **int**.

`i` Matches an optionally signed integer, whose format is the same as expected for the subject sequence of *wcstol*( ) with 0 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **int**.

`o` Matches an optionally signed octal integer, whose format is the same as expected for the subject sequence of *wcstoul*( ) with the value 8 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

`u` Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of *wcstoul*( ) with the value 10 for the *base* argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to **unsigned**.

33058 x Matches an optionally signed hexadecimal integer, whose format is the same as
33059 expected for the subject sequence of *wcstoul*( ) with the value 16 for the *base* argument.
33060 In the absence of a size modifier, the application shall ensure that the corresponding
33061 argument is a pointer to **unsigned**.

33062 a, e, f, g
33063 Matches an optionally signed floating-point number, infinity, or NaN whose format is
33064 the same as expected for the subject sequence of *wcstod*( ). In the absence of a size
33065 modifier, the application shall ensure that the corresponding argument is a pointer to
33066 **float**.

33067 If the *fwprintf*( ) family of functions generates character string representations for
33068 infinity and NaN (a symbolic entity encoded in floating-point format) to support
33069 IEEE Std 754-1985, the *fwscanf*( ) family of functions shall recognize them as input.

33070 s Matches a sequence of non-white-space wide characters. If no l (ell) qualifier is present,
33071 characters from the input field shall be converted as if by repeated calls to the
33072 *wcrtomb*( ) function, with the conversion state described by an **mbstate_t** object
33073 initialized to zero before the first wide character is converted. If the 'm' assignment-
33074 allocation character is not specified, the application shall ensure that the corresponding
33075 argument is a pointer to a character array large enough to accept the sequence and the
33076 CX terminating null character, which shall be added automatically. Otherwise, the
33077 application shall ensure that the corresponding argument is a pointer to a pointer to a
33078 **wchar_t**.

33079 If the l (ell) qualifier is present and the 'm' assignment-allocation character is not
33080 specified, the application shall ensure that the corresponding argument is a pointer to
33081 an array of **wchar_t** large enough to accept the sequence and the terminating null wide
33082 CX character, which shall be added automatically. If the l (ell) qualifier is present and the
33083 'm' assignment-allocation character is present, the application shall ensure that the
33084 corresponding argument is a pointer to a pointer to a **wchar_t**.

33085 [Matches a non-empty sequence of wide characters from a set of expected wide
33086 characters (the *scanset*). If no l (ell) qualifier is present, wide characters from the input
33087 field shall be converted as if by repeated calls to the *wcrtomb*( ) function, with the
33088 conversion state described by an **mbstate_t** object initialized to zero before the first
33089 wide character is converted. If the 'm' assignment-allocation character is not specified,
33090 the application shall ensure that the corresponding argument is a pointer to a character
33091 array large enough to accept the sequence and the terminating null character, which
33092 CX shall be added automatically. Otherwise, the application shall ensure that the
33093 corresponding argument is a pointer to a pointer to a **wchar_t**.

33094 If an l (ell) qualifier is present and the 'm' assignment-allocation character is not
33095 specified, the application shall ensure that the corresponding argument is a pointer to
33096 an array of **wchar_t** large enough to accept the sequence and the terminating null wide
33097 CX character. If an l (ell) qualifier is present and the 'm' assignment-allocation character
33098 is specified, the application shall ensure that the corresponding argument is a pointer to
33099 a pointer to a **wchar_t**.

33100 The conversion specification includes all subsequent wide characters in the *format*
33101 string up to and including the matching <right-square-bracket> (']'). The wide
33102 characters between the square brackets (the *scanlist*) comprise the scanset, unless the
33103 wide character after the <left-square-bracket> is a <circumflex> ('^'), in which case
33104 the scanset contains all wide characters that do not appear in the scanlist between the
33105 <circumflex> and the <right-square-bracket>. If the conversion specification begins

with "[]" or "[^]", the <right-square-bracket> is included in the scanlist and the next <right-square-bracket> is the matching <right-square-bracket> that ends the conversion specification; otherwise, the first <right-square-bracket> is the one that ends the conversion specification. If a '−' is in the scanlist and is not the first wide character, nor the second where the first wide character is a '^', nor the last wide character, the behavior is implementation-defined.

c Matches a sequence of wide characters of exactly the number specified by the field width (1 if no field width is present in the conversion specification).

If no l (ell) length modifier is present, characters from the input field shall be converted as if by repeated calls to the *wcrtomb*( ) function, with the conversion state described by an **mbstate_t** object initialized to zero before the first wide character is converted. No null character is added. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to the initial CX element of a character array large enough to accept the sequence. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a **char**.

No null wide character is added. If an l (ell) length modifier is present and the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument shall be a pointer to the initial element of an array of **wchar_t** CX large enough to accept the sequence. If an l (ell) qualifier is present and the 'm' assignment-allocation character is specified, the application shall ensure that the corresponding argument is a pointer to a pointer to a **wchar_t**.

p Matches an implementation-defined set of sequences, which shall be the same as the set of sequences that is produced by the %p conversion specification of the corresponding *fwprintf*( ) functions. The application shall ensure that the corresponding argument is a pointer to a pointer to **void**. The interpretation of the input item is implementation-defined. If the input item is a value converted earlier during the same program execution, the pointer that results shall compare equal to that value; otherwise, the behavior of the %p conversion is undefined.

n No input is consumed. The application shall ensure that the corresponding argument is a pointer to the integer into which is to be written the number of wide characters read from the input so far by this call to the *fwscanf*( ) functions. Execution of a %n conversion specification shall not increment the assignment count returned at the completion of execution of the function. No argument shall be converted, but one shall be consumed. If the conversion specification includes an assignment-suppressing wide character or a field width, the behavior is undefined.

XSI C Equivalent to lc.

XSI S Equivalent to ls.

% Matches a single '%' wide character; no conversion or assignment shall occur. The complete conversion specification shall be %%.

If a conversion specification is invalid, the behavior is undefined.

The conversion specifiers A, E, F, G, and X are also valid and shall be equivalent to, respectively, a, e, f, g, and x.

If end-of-file is encountered during input, conversion is terminated. If end-of-file occurs before any wide characters matching the current conversion specification (except for %n) have been read (other than leading white-space, where permitted), execution of the current conversion

specification shall terminate with an input failure. Otherwise, unless execution of the current conversion specification is terminated with a matching failure, execution of the following conversion specification (if any) shall be terminated with an input failure.

Reaching the end of the string in *swscanf*( ) shall be equivalent to encountering end-of-file for *fwscanf*( ).

If conversion terminates on a conflicting input, the offending input shall be left unread in the input. Any trailing white space (including <newline>) shall be left unread unless matched by a conversion specification. The success of literal matches and suppressed assignments is only directly determinable via the %n conversion specification.

CX The *fwscanf*( ) and *wscanf*( ) functions may mark the last data access timestamp of the file associated with *stream* for update. The last data access timestamp shall be marked for update by the first successful execution of *fgetwc*( ), *fgetws*( ), *fwscanf*( ), *getwc*( ), *getwchar*( ), *vfwscanf*( ), *vwscanf*( ), or *wscanf*( ) using *stream* that returns data not supplied by a prior call to *ungetwc*( ).

RETURN VALUE

Upon successful completion, these functions shall return the number of successfully matched and assigned input items; this number can be zero in the event of an early matching failure. If the input ends before the first matching failure or conversion, EOF shall be returned. If any CX error occurs, EOF shall be returned, and *errno* shall be set to indicate the error. If a read error occurs, the error indicator for the stream shall be set.

ERRORS

For the conditions under which the *fwscanf*( ) functions shall fail and may fail, refer to *fgetwc*( ).

In addition, the *fwscanf*( ) function shall fail if:

CX [EILSEQ] Input byte sequence does not form a valid character.

[ENOMEM] Insufficient storage space is available.

In addition, the *fwscanf*( ) function may fail if:

CX [EINVAL] There are insufficient arguments.

EXAMPLES

The call:

```
int i, n; float x; char name[50];
n = wscanf(L"%d%f%s", &i, &x, name);
```

with the input line:

```
25 54.32E-1 Hamster
```

assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string "Hamster".

The call:

```
int i; float x; char name[50];
(void) wscanf(L"%2d%f%*d %[0123456789]", &i, &x, name);
```

with input:

```
56789 0123 56a72
```

assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string "56\0" in *name*. The next call to *getchar*( ) shall return the character 'a'.

APPLICATION USAGE

In format strings containing the `'%'` form of conversion specifications, each argument in the argument list is used exactly once.

For functions that allocate memory as if by *malloc*( ), the application should release such memory when it is no longer required by a call to *free*( ). For *fwscanf*( ), this is memory allocated via use of the `'m'` assignment-allocation character.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Chapter 7 (on page 135), **<stdio.h>**, **<wchar.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The prototypes for *fwscanf*( ) and *swscanf*( ) are updated.
- The DESCRIPTION is updated.
- The `hh`, `ll`, `j`, `t`, and `z` length modifiers are added.
- The `a`, `A`, and `F` conversion characters are added.

The DESCRIPTION is updated to use the terms "conversion specifier" and "conversion specification" consistently.

Issue 7

Austin Group Interpretation 1003.1-2001 #170 is applied.

SD5-XSH-ERN-132 is applied, adding the assignment-allocation character `'m'`.

Functionality relating to the `"%n$"` form of conversion specification is moved from the XSI option to the Base.

Changes are made related to support for finegrained timestamps.

The APPLICATION USAGE section is updated to clarify that memory is allocated as if by *malloc*( ).

33226 **NAME**

33227 gai_strerror — address and name information error description

33228 **SYNOPSIS**

33229 `#include <netdb.h>`

33230 `const char *gai_strerror(int ecode);`

33231 **DESCRIPTION**

33232 The *gai_strerror*( ) function shall return a text string describing an error value for the *getaddrinfo*( )
33233 and *getnameinfo*( ) functions listed in the **<netdb.h>** header.

33234 When the *ecode* argument is one of the following values listed in the **<netdb.h>** header:

33235 [EAI_AGAIN] [EAI_NONAME]
33236 [EAI_BADFLAGS] [EAI_OVERFLOW]
33237 [EAI_FAIL] [EAI_SERVICE]
33238 [EAI_FAMILY] [EAI_SOCKTYPE]
33239 [EAI_MEMORY] [EAI_SYSTEM]

33240 the function return value shall point to a string describing the error. If the argument is not one
33241 of those values, the function shall return a pointer to a string whose contents indicate an
33242 unknown error.

33243 **RETURN VALUE**

33244 Upon successful completion, *gai_strerror*( ) shall return a pointer to an implementation-defined
33245 string.

33246 **ERRORS**

33247 No errors are defined.

33248 **EXAMPLES**

33249 None.

33259 **CHANGE HISTORY**

33260 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

33261 The Open Group Base Resolution bwg2001-009 is applied, which changes the return type from
33262 **char** * to **const char** *. This is for coordination with the IPnG Working Group.

33263 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/22 is applied, adding the
33264 [EAI_OVERFLOW] error code.

33265 **NAME**

33266 getaddrinfo — get address information

33267 **SYNOPSIS**

33268 ```
#include <sys/socket.h>
```

33269 ```
#include <netdb.h>
```

33270 ```
int getaddrinfo(const char *restrict nodename,
```

33271 ```
    const char *restrict servname,
```

33272 ```
    const struct addrinfo *restrict hints,
```

33273 ```
    struct addrinfo **restrict res);
```

33274 **DESCRIPTION**

33275 Refer to *freeaddrinfo( )*.

33276 **NAME**

33277 getc — get a byte from a stream

33278 **SYNOPSIS**

33279 `#include <stdio.h>`

33280 `int getc(FILE *stream);`

33281 **DESCRIPTION**

33282 CX The functionality described on this reference page is aligned with the ISO C standard. Any
33283 conflict between the requirements described here and the ISO C standard is unintentional. This
33284 volume of POSIX.1-200x defers to the ISO C standard.

33285 The *getc*( ) function shall be equivalent to *fgetc*( ), except that if it is implemented as a macro it
33286 may evaluate *stream* more than once, so the argument should never be an expression with side-
33287 effects.

33288 **RETURN VALUE**

33289 Refer to *fgetc*( ).

33290 **ERRORS**

33291 Refer to *fgetc*( ).

33292 **EXAMPLES**

33293 None.

33294 **APPLICATION USAGE**

33295 If the integer value returned by *getc*( ) is stored into a variable of type **char** and then compared
33296 against the integer constant EOF, the comparison may never succeed, because sign-extension of
33297 a variable of type **char** on widening to integer is implementation-defined.

33298 Since it may be implemented as a macro, *getc*( ) may treat incorrectly a *stream* argument with
33299 side-effects. In particular, *getc*(*f*++) does not necessarily work as expected. Therefore, use of this
33300 function should be preceded by `"#undef getc"` in such situations; *fgetc*( ) could also be used.

33301 **RATIONALE**

33302 None.

33303 **FUTURE DIRECTIONS**

33304 None.

33305 **SEE ALSO**

33306 *fgetc*( )

33307 XBD **<stdio.h>**

33308 **CHANGE HISTORY**

33309 First released in Issue 1. Derived from Issue 1 of the SVID.

NAME

getc_unlocked, getchar_unlocked, putc_unlocked, putchar_unlocked — stdio with explicit client locking

SYNOPSIS

CX
```
#include <stdio.h>

int getc_unlocked(FILE *stream);
int getchar_unlocked(void);
int putc_unlocked(int c, FILE *stream);
int putchar_unlocked(int c);
```

DESCRIPTION

Versions of the functions *getc*( ), *getchar*( ), *putc*( ), and *putchar*( ) respectively named *getc_unlocked*( ), *getchar_unlocked*( ), *putc_unlocked*( ), and *putchar_unlocked*( ) shall be provided which are functionally equivalent to the original versions, with the exception that they are not required to be implemented in a thread-safe manner. They may only safely be used within a scope protected by *flockfile*( ) (or *ftrylockfile*( )) and *funlockfile*( ). These functions may safely be used in a multi-threaded program if and only if they are called while the invoking thread owns the (**FILE** *) object, as is the case after a successful call to the *flockfile*( ) or *ftrylockfile*( ) functions.

RETURN VALUE

See *getc*( ), *getchar*( ), *putc*( ), and *putchar*( ).

ERRORS

See *getc*( ), *getchar*( ), *putc*( ), and *putchar*( ).

EXAMPLES

None.

APPLICATION USAGE

Since they may be implemented as macros, *getc_unlocked*( ) and *putc_unlocked*( ) may treat incorrectly a *stream* argument with side-effects. In particular, *getc_unlocked*(*f++) and *putc_unlocked*(*f++) do not necessarily work as expected. Therefore, use of these functions in such situations should be preceded by the following statement as appropriate:

```
#undef getc_unlocked
#undef putc_unlocked
```

RATIONALE

Some I/O functions are typically implemented as macros for performance reasons (for example, *putc*( ) and *getc*( )). For safety, they need to be synchronized, but it is often too expensive to synchronize on every character. Nevertheless, it was felt that the safety concerns were more important; consequently, the *getc*( ), *getchar*( ), *putc*( ), and *putchar*( ) functions are required to be thread-safe. However, unlocked versions are also provided with names that clearly indicate the unsafe nature of their operation but can be used to exploit their higher performance. These unlocked versions can be safely used only within explicitly locked program regions, using exported locking primitives. In particular, a sequence such as:

```
flockfile(fileptr);
putc_unlocked('1', fileptr);
putc_unlocked('\n', fileptr);
fprintf(fileptr, "Line 2\n");
funlockfile(fileptr);
```

is permissible, and results in the text sequence:

```
1
Line 2
```

being printed without being interspersed with output from other threads.

It would be wrong to have the standard names such as *getc*( ), *putc*( ), and so on, map to the "faster, but unsafe" rather than the "slower, but safe" versions. In either case, you would still want to inspect all uses of *getc*( ), *putc*( ), and so on, by hand when converting existing code. Choosing the safe bindings as the default, at least, results in correct code and maintains the "atomicity at the function" invariant. To do otherwise would introduce gratuitous synchronization errors into converted code. Other routines that modify the *stdio* (**FILE** *) structures or buffers are also safely synchronized.

Note that there is no need for functions of the form *getc_locked*( ), *putc_locked*( ), and so on, since this is the functionality of *getc*( ), *putc*( ), *et al*. It would be inappropriate to use a feature test macro to switch a macro definition of *getc*( ) between *getc_locked*( ) and *getc_unlocked*( ), since the ISO C standard requires an actual function to exist, a function whose behavior could not be changed by the feature test macro. Also, providing both the *xxx_locked*( ) and *xxx_unlocked*( ) forms leads to the confusion of whether the suffix describes the behavior of the function or the circumstances under which it should be used.

Three additional routines, *flockfile*( ), *ftrylockfile*( ), and *funlockfile*( ) (which may be macros), are provided to allow the user to delineate a sequence of I/O statements that are executed synchronously.

The *ungetc*( ) function is infrequently called relative to the other functions/macros so no unlocked variation is needed.

FUTURE DIRECTIONS

None.

getchar_unlocked( )

33421 **NAME**

33422 getchar_unlocked — stdio with explicit client locking

33423 **SYNOPSIS**

33424 CX
```
#include <stdio.h>

int getchar_unlocked(void);
```

33426 **DESCRIPTION**

33427 Refer to *getc_unlocked( )*.

NAME

getcwd — get the pathname of the current working directory

SYNOPSIS

```
#include <unistd.h>

char *getcwd(char *buf, size_t size);
```

DESCRIPTION

The *getcwd*( ) function shall place an absolute pathname of the current working directory in the array pointed to by *buf*, and return *buf*. The pathname shall contain no components that are dot or dot-dot, or are symbolic links.

If there are multiple pathnames that *getcwd*( ) could place in the array pointed to by *buf*, one beginning with a single <slash> character and one or more beginning with two <slash> characters, then *getcwd*( ) shall place the pathname beginning with a single <slash> character in the array. The pathname shall not contain any unnecessary <slash> characters after the leading one or two <slash> characters.

The *size* argument is the size in bytes of the character array pointed to by the *buf* argument. If *buf* is a null pointer, the behavior of *getcwd*( ) is unspecified.

RETURN VALUE

Upon successful completion, *getcwd*( ) shall return the *buf* argument. Otherwise, *getcwd*( ) shall return a null pointer and set *errno* to indicate the error. The contents of the array pointed to by *buf* are then undefined.

ERRORS

The *getcwd*( ) function shall fail if:

[EINVAL] The *size* argument is 0.

[ERANGE] The *size* argument is greater than 0, but is smaller than the length of the string +1.

The *getcwd*( ) function may fail if:

[EACCES] Search permission was denied for the current directory, or read or search permission was denied for a directory above the current directory in the file hierarchy.

[ENOMEM] Insufficient storage space is available.

EXAMPLES

The following example uses {PATH_MAX} as the initial buffer size (unless it is indeterminate or very large), and calls *getcwd()*( ) with progressively larger buffers until it does not give an [ERANGE] error.

```
#include <stdlib.h>
#include <errno.h>
#include <unistd.h>

...

long path_max;
size_t size;
char *buf;
char *ptr;

path_max = pathconf(".", _PC_PATH_MAX);
if (path_max == -1)
```

```
        size = 1024;
    else if (path_max > 10240)
        size = 10240;
    else
        size = path_max;

    for (buf = ptr = NULL; ptr == NULL; size *= 2)
    {
        if ((buf = realloc(buf, size)) == NULL)
        {
            ... handle error ...
        }

        ptr = getcwd(buf, size);
        if (ptr == NULL && errno != ERANGE)
        {
            ... handle error ...
        }
    }
    free (buf);
```

APPLICATION USAGE

If the pathname obtained from *getcwd*( ) is longer than {PATH_MAX} bytes, it could produce an [ENAMETOOLONG] error if passed to *chdir*( ). Therefore, in order to return to that directory it may be necessary to break the pathname into sections shorter than {PATH_MAX} bytes and call *chdir*( ) on each section in turn (the first section being an absolute pathname and subsequent sections being relative pathnames). A simpler way to handle saving and restoring the working directory when it may be deeper than {PATH_MAX} bytes in the file hierarchy is to use a file descriptor and *fchdir*( ), rather than *getcwd*( ) and *chdir*( ). However, the two methods do have some differences. The *fchdir*( ) approach causes the program to restore a working directory even if it has been renamed in the meantime, whereas the *chdir*( ) approach restores to a directory with the same name as the original, even if the directories were renamed in the meantime. Since the *fchdir*( ) approach does not access parent directories, it can succeed when *getcwd*( ) would fail due to permissions problems. In applications conforming to earlier versions of this standard, it was not possible to use the *fchdir*( ) approach when the working directory is searchable but not readable, as the only way to open a directory was with O_RDONLY, whereas the *getcwd*( ) approach can succeed in this case.

RATIONALE

Having *getcwd*( ) take no arguments and instead use the *malloc*( ) function to produce space for the returned argument was considered. The advantage is that *getcwd*( ) knows how big the working directory pathname is and can allocate an appropriate amount of space. But the programmer would have to use the *free*( ) function to free the resulting object, or each use of *getcwd*( ) would further reduce the available memory. Finally, *getcwd*( ) is taken from the SVID where it has the two arguments used in this volume of POSIX.1-200x.

The older function *getwd*( ) was rejected for use in this context because it had only a buffer argument and no *size* argument, and thus had no way to prevent overwriting the buffer, except to depend on the programmer to provide a large enough buffer.

On some implementations, if *buf* is a null pointer, *getcwd*( ) may obtain *size* bytes of memory using *malloc*( ). In this case, the pointer returned by *getcwd*( ) may be used as the argument in a subsequent call to *free*( ). Invoking *getcwd*( ) with *buf* as a null pointer is not recommended in conforming applications.

Earlier implementations of *getcwd*( ) sometimes generated pathnames like `"../../../subdirname"` internally, using them to explore the path of ancestor directories back to the root. If one of these internal pathnames exceeded {PATH_MAX} in length, the implementation could fail with *errno* set to [ENAMETOOLONG]. This is no longer allowed.

If a program is operating in a directory where some (grand)parent directory does not permit reading, *getcwd*( ) may fail, as in most implementations it must read the directory to determine the name of the file. This can occur if search, but not read, permission is granted in an intermediate directory, or if the program is placed in that directory by some more privileged process (for example, login). Including the [EACCES] error condition makes the reporting of the error consistent and warns the application developer that *getcwd*( ) can fail for reasons beyond the control of the application developer or user. Some implementations can avoid this occurrence (for example, by implementing *getcwd*( ) using *pwd*, where *pwd* is a set-user-root process), thus the error was made optional. Since this volume of POSIX.1-200x permits the addition of other errors, this would be a common addition and yet one that applications could not be expected to deal with without this addition.

FUTURE DIRECTIONS

None.

SEE ALSO

malloc( )

XBD **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ENOMEM] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #140 is applied, changing the text for consistency with the *pwd* utility, adding text to address the case where the current directory is deeper in the file hierarchy than {PATH_MAX} bytes, and adding the requirements relating to pathnames beginning with two <slash> characters.

NAME

getdate — convert user format date and time

SYNOPSIS

XSI
```
#include <time.h>

struct tm *getdate(const char *string);
```

DESCRIPTION

The *getdate*( ) function shall convert a string representation of a date or time into a broken-down time.

The external variable or macro *getdate_err*, which has type **int**, is used by *getdate*( ) to return error values. It is unspecified whether *getdate_err* is a macro or an identifier declared with external linkage, and whether or not it is a modifiable lvalue. If a macro definition is suppressed in order to access an actual object, or a program defines an identifier with the name *getdate_err*, the behavior is undefined.

Templates are used to parse and interpret the input string. The templates are contained in a text file identified by the environment variable *DATEMSK*. The *DATEMSK* variable should be set to indicate the full pathname of the file that contains the templates. The first line in the template that matches the input specification is used for interpretation and conversion into the internal time format.

The following conversion specifications shall be supported:

`%%` Equivalent to `%`.

`%a` Abbreviated weekday name.

`%A` Full weekday name.

`%b` Abbreviated month name.

`%B` Full month name.

`%c` Locale's appropriate date and time representation.

`%C` Century number [00,99]; leading zeros are permitted but not required.

`%d` Day of month [01,31]; the leading 0 is optional.

`%D` Date as `%m/%d/%y`.

`%e` Equivalent to `%d`.

`%h` Abbreviated month name.

`%H` Hour [00,23].

`%I` Hour [01,12].

`%m` Month number [01,12].

`%M` Minute [00,59].

`%n` Equivalent to <newline>.

`%p` Locale's equivalent of either AM or PM.

`%r` The locale's appropriate representation of time in AM and PM notation. In the POSIX locale, this shall be equivalent to `%I:%M:%S %p`.

33589 %R Time as %H:%M.

33590 %S Seconds [00,60]. The range goes to 60 (rather than stopping at 59) to allow positive leap
33591 seconds to be expressed. Since leap seconds cannot be predicted by any algorithm, leap
33592 second data must come from some external source.

33593 %t Equivalent to <tab>.

33594 %T Time as %H:%M:%S.

33595 %w Weekday number (Sunday = [0,6]).

33596 %x Locale's appropriate date representation.

33597 %X Locale's appropriate time representation.

33598 %y Year within century. When a century is not otherwise specified, values in the range
33599 [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall
33600 refer to years 2000 to 2068 inclusive.

33601 **Note:** It is expected that in a future version of this standard the default century inferred
33602 from a 2-digit year will change. (This would apply to all commands accepting a
33603 2-digit year as input.)

33604 %Y Year as "ccyy" (for example, 2001).

33605 %Z Timezone name or no characters if no timezone exists. If the timezone supplied by %Z is
33606 not the timezone that *getdate*( ) expects, an invalid input specification error shall result.
33607 The *getdate*( ) function calculates an expected timezone based on information supplied
33608 to the function (such as the hour, day, and month).

33609 The match between the template and input specification performed by *getdate*( ) shall be case-
33610 insensitive.

33611 The month and weekday names can consist of any combination of upper and lowercase letters.
33612 The process can request that the input date or time specification be in a specific language by
33613 setting the *LC_TIME* category (see *setlocale*( )).

33614 Leading zeros are not necessary for the descriptors that allow leading zeros. However, at most
33615 two digits are allowed for those descriptors, including leading zeros. Extra white space in either
33616 the template file or in *string* shall be ignored.

33617 The results are undefined if the conversion specifications %c, %x, and %X include unsupported
33618 conversion specifications.

33619 The following rules apply for converting the input specification into the internal format:

33620 • If %Z is being scanned, then *getdate*( ) shall initialize the broken-down time to be the current
33621 time in the scanned timezone. Otherwise, it shall initialize the broken-down time based on
33622 the current local time as if *localtime*( ) had been called.

33623 • If only the weekday is given, the day chosen shall be the day, starting with today and
33624 moving into the future, which first matches the named day.

33625 • If only the month (and no year) is given, the month chosen shall be the month, starting
33626 with the current month and moving into the future, which first matches the named month.
33627 The first day of the month shall be assumed if no day is given.

33628 • If no hour, minute, and second are given, the current hour, minute, and second shall be
33629 assumed.

- If no date is given, the hour chosen shall be the hour, starting with the current hour and moving into the future, which first matches the named hour.

If a conversion specification in the DATEMSK file does not correspond to one of the conversion specifications above, the behavior is unspecified.

The *getdate*( ) function need not be thread-safe.

RETURN VALUE

Upon successful completion, *getdate*( ) shall return a pointer to a **struct tm**. Otherwise, it shall return a null pointer and set *getdate_err* to indicate the error.

ERRORS

The *getdate*( ) function shall fail in the following cases, setting *getdate_err* to the value shown in the list below. Any changes to *errno* are unspecified.

1. The *DATEMSK* environment variable is null or undefined.
2. The template file cannot be opened for reading.
3. Failed to get file status information.
4. The template file is not a regular file.
5. An I/O error is encountered while reading the template file.
6. Memory allocation failed (not enough memory available).
7. There is no line in the template that matches the input.
8. Invalid input specification. For example, February 31; or a time is specified that cannot be represented in a **time_t** (representing the time in seconds since the Epoch).

EXAMPLES

1. The following example shows the possible contents of a template:

```
%m
%A %B %d, %Y, %H:%M:%S
%A
%B
%m/%d/%y %I %p
%d,%m,%Y %H:%M
at %A the %dst of %B in %Y
run job at %I %p,%B %dnd
%A den %d. %B %Y %H.%M Uhr
```

2. The following are examples of valid input specifications for the template in Example 1:

```
getdate("10/1/87 4 PM");
getdate("Friday");
getdate("Friday September 18, 1987, 10:30:30");
getdate("24,9,1986 10:30");
getdate("at monday the 1st of december in 1986");
getdate("run job at 3 PM, december 2nd");
```

If the *LC_TIME* category is set to a German locale that includes *freitag* as a weekday name and *oktober* as a month name, the following would be valid:

```
getdate("freitag den 10. oktober 1986 10.30 Uhr");
```

3. The following example shows how local date and time specification can be defined in the template:

Invocation	Line in Template
`getdate("11/27/86")`	`%m/%d/%y`
`getdate("27.11.86")`	`%d.%m.%y`
`getdate("86-11-27")`	`%y-%m-%d`
`getdate("Friday 12:00:00")`	`%A %H:%M:%S`

4. The following examples help to illustrate the above rules assuming that the current date is Mon Sep 22 12:19:47 EDT 1986 and the *LC_TIME* category is set to the default C locale:

Input	Line in Template	Date
`Mon`	`%a`	Mon Sep 22 12:19:47 EDT 1986
`Sun`	`%a`	Sun Sep 28 12:19:47 EDT 1986
`Fri`	`%a`	Fri Sep 26 12:19:47 EDT 1986
`September`	`%B`	Mon Sep 1 12:19:47 EDT 1986
`January`	`%B`	Thu Jan 1 12:19:47 EST 1987
`December`	`%B`	Mon Dec 1 12:19:47 EST 1986
`Sep Mon`	`%b %a`	Mon Sep 1 12:19:47 EDT 1986
`Jan Fri`	`%b %a`	Fri Jan 2 12:19:47 EST 1987
`Dec Mon`	`%b %a`	Mon Dec 1 12:19:47 EST 1986
`Jan Wed 1989`	`%b %a %Y`	Wed Jan 4 12:19:47 EST 1989
`Fri 9`	`%a %H`	Fri Sep 26 09:00:00 EDT 1986
`Feb 10:30`	`%b %H:%S`	Sun Feb 1 10:00:30 EST 1987
`10:30`	`%H:%M`	Tue Sep 23 10:30:00 EDT 1986
`13:30`	`%H:%M`	Mon Sep 22 13:30:00 EDT 1986

APPLICATION USAGE

Although historical versions of *getdate*( ) did not require that **<time.h>** declare the external variable *getdate_err*, this volume of POSIX.1-200x does require it. The standard developers encourage applications to remove declarations of *getdate_err* and instead incorporate the declaration by including **<time.h>**.

Applications should use `%Y` (4-digit years) in preference to `%y` (2-digit years).

RATIONALE

In standard locales, the conversion specifications `%c`, `%x`, and `%X` do not include unsupported conversion specifiers and so the text regarding results being undefined is not a problem in that case.

FUTURE DIRECTIONS

None.

XBD **<time.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The last paragraph of the DESCRIPTION is added.

The %C conversion specification is added, and the exact meaning of the %y conversion specification is clarified in the DESCRIPTION.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

The %R conversion specification is changed to follow historical practice.

Issue 6

The DESCRIPTION is updated to refer to "seconds since the Epoch" rather than "seconds since 00:00:00 UTC (Coordinated Universal Time), January 1 1970" for consistency with other *time* functions.

The description of %S is updated so that the valid range is [00,60] rather than [00,61].

The DESCRIPTION is updated to refer to conversion specifications instead of field descriptors for consistency with other functions.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

The description of the *getdate_err* value is expanded.

NAME

getdelim, getline — read a delimited record from *stream*

SYNOPSIS

CX
```
#include <stdio.h>

ssize_t getdelim(char **restrict lineptr, size_t *restrict n,
    int delimiter, FILE *restrict stream);
ssize_t getline(char **restrict lineptr, size_t *restrict n,
    FILE *restrict stream);
```

DESCRIPTION

The *getdelim*( ) function shall read from *stream* until it encounters a character matching the *delimiter* character. The *delimiter* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** of equal value that terminates the read process. If the *delimiter* argument has any other value, the behavior is undefined.

The application shall ensure that **lineptr* is a valid argument that could be passed to the *free*( ) function. If **n* is non-zero, the application shall ensure that **lineptr* either points to an object of size at least **n* bytes, or is a null pointer.

The size of the object pointed to by **lineptr* shall be increased to fit the incoming line, if it isn't already large enough, including room for the delimiter and a terminating NUL. The characters read, including any delimiter, shall be stored in the string pointed to by the *lineptr* argument, and a terminating NUL added when the delimiter or end of file is encountered.

The *getline*( ) function shall be equivalent to the *getdelim*( ) function with the *delimiter* character equal to the <newline> character.

The *getdelim*( ) and *getline*( ) functions may mark the last data access timestamp of the file associated with *stream* for update. The last data access timestamp shall be marked for update by the first successful execution of *fgetc*( ), *fgets*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *getdelim*( ), *getline*( ), *gets*( ), or *scanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ).

RETURN VALUE

Upon successful completion, the *getline*( ) and *getdelim*( ) functions shall return the number of characters written into the buffer, including the delimiter character if one was encountered before EOF, but excluding the terminating NUL character. If no characters were read, and the end-of-file indicator for the stream is set, or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and the function shall return –1. If an error occurs, the error indicator for the stream shall be set, and the function shall return –1 and set *errno* to indicate the error.

ERRORS

For the conditions under which the *getdelim*( ) and *getline*( ) functions shall fail and may fail, refer to *fgetc*( ).

In addition, these functions shall fail if:

[EINVAL] *lineptr* or *n* is a null pointer.

[ENOMEM] Insufficient memory is available.

These functions may fail if:

[EOVERFLOW] More than {SSIZE_MAX} characters were read without encountering the *delimiter* character.

EXAMPLES

```
#include <stdio.h>
#include <stdlib.h>

int main(void)
{
    FILE *fp;
    char *line = NULL;
    size_t len = 0;
    ssize_t read;
    fp = fopen("/etc/motd", "r");
    if (fp == NULL)
        exit(1);
    while ((read = getline(&line, &len, fp)) != -1) {
        printf("Retrieved line of length %zu :\n", read);
        printf("%s", line);
    }
    if (ferror(fp)) {
        /* handle error */
    }
    free(line);
    fclose(fp);
    return 0;
}
```

APPLICATION USAGE

Setting **lineptr* to a null pointer and **n* to zero are allowed and a recommended way to start parsing a file.

The *ferror*( ) or *feof*( ) functions should be used to distinguish between an error condition and an end-of-file condition.

Although a NUL terminator is always supplied after the line, note that *strlen*(**lineptr*) will be smaller than the return value if the line contains embedded NUL characters.

RATIONALE

These functions are widely used to solve the problem that the *fgets*( ) function has with long lines. The functions automatically enlarge the target buffers if needed. These are especially useful since they reduce code needed for applications.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 7.

33812 **NAME**

33813 getegid — get the effective group ID

33814 **SYNOPSIS**

33815
```
#include <unistd.h>
```

33816
```
gid_t getegid(void);
```

33817 **DESCRIPTION**

33818 The *getegid*( ) function shall return the effective group ID of the calling process.

33819 **RETURN VALUE**

33820 The *getegid*( ) function shall always be successful and no return value is reserved to indicate an
33821 error.

33822 **ERRORS**

33823 No errors are defined.

33824 **EXAMPLES**

33825 None.

33826 **APPLICATION USAGE**

33827 None.

33828 **RATIONALE**

33834 XBD **<sys/types.h>**, **<unistd.h>**

33835 **CHANGE HISTORY**

33836 First released in Issue 1. Derived from Issue 1 of the SVID.

33837 **Issue 6**

33838 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

33839 The following new requirements on POSIX implementations derive from alignment with the
33840 Single UNIX Specification:

33841 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
33842 required for conforming implementations of previous POSIX specifications, it was not
33843 required for UNIX applications.

NAME

getenv — get value of an environment variable

SYNOPSIS

```
#include <stdlib.h>

char *getenv(const char *name);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.
