The *getenv*( ) function shall search the environment of the calling process (see XBD Chapter 8, on page 173) for the environment variable *name* if it exists and return a pointer to the value of the environment variable. If the specified environment variable cannot be found, a null pointer shall be returned. The application shall ensure that it does not modify the string pointed to by the *getenv*( ) function.

CX The string pointed to may be overwritten by a subsequent call to *getenv*( ), *setenv*( ), *unsetenv*( ), XSI or *putenv*( ) but shall not be overwritten by a call to any other function in this volume of POSIX.1-200x.

CX If the application modifies *environ* or the pointers to which it points, the behavior of *getenv*( ) is undefined.

The *getenv*( ) function need not be thread-safe.

RETURN VALUE

Upon successful completion, *getenv*( ) shall return a pointer to a string containing the *value* for the specified *name*. If the specified *name* cannot be found in the environment of the calling process, a null pointer shall be returned.

ERRORS

No errors are defined.

EXAMPLES

Getting the Value of an Environment Variable

The following example gets the value of the *HOME* environment variable.

```
#include <stdlib.h>
...
const char *name = "HOME";
char *value;

value = getenv(name);
```

APPLICATION USAGE

None.

RATIONALE

The *clearenv*( ) function was considered but rejected. The *putenv*( ) function has now been included for alignment with the Single UNIX Specification.

The *getenv*( ) function is inherently not thread-safe because it returns a value pointing to static data.

Conforming applications are required not to modify *environ* directly, but to use only the functions described here to manipulate the process environment as an abstract object. Thus, the

implementation of the environment access functions has complete control over the data structure used to represent the environment (subject to the requirement that *environ* be maintained as a list of strings with embedded <equals-sign> characters for applications that wish to scan the environment). This constraint allows the implementation to properly manage the memory it allocates, either by using allocated storage for all variables (copying them on the first invocation of *setenv*( ) or *unsetenv*( )), or keeping track of which strings are currently in allocated space and which are not, via a separate table or some other means. This enables the implementation to free any allocated space used by strings (and perhaps the pointers to them) stored in *environ* when *unsetenv*( ) is called. A C runtime start-up procedure (that which invokes *main*( ) and perhaps initializes *environ*) can also initialize a flag indicating that none of the environment has yet been copied to allocated storage, or that the separate table has not yet been initialized.

In fact, for higher performance of *getenv*( ), the implementation could also maintain a separate copy of the environment in a data structure that could be searched much more quickly (such as an indexed hash table, or a binary tree), and update both it and the linear list at *environ* when *setenv*( ) or *unsetenv*( ) is invoked.

Performance of *getenv*( ) can be important for applications which have large numbers of environment variables. Typically, applications like this use the environment as a resource database of user-configurable parameters. The fact that these variables are in the user's shell environment usually means that any other program that uses environment variables (such as *ls*, which attempts to use *COLUMNS*), or really almost any utility (*LANG*, *LC_ALL*, and so on) is similarly slowed down by the linear search through the variables.

An implementation that maintains separate data structures, or even one that manages the memory it consumes, is not currently required as it was thought it would reduce consensus among implementors who do not want to change their historical implementations.

FUTURE DIRECTIONS

A future version may add one or more functions to access and modify the environment in a thread-safe manner.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

The following changes were made to align with the IEEE P1003.1a draft standard:

- References added to the new *setenv*( ) and *unsetenv*( ) functions.

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #062 is applied, clarifying that a call to *putenv*( ) may also cause the string to be overwritten.

Austin Group Interpretation 1003.1-2001 #148 is applied, adding the FUTURE DIRECTIONS.

33932 Austin Group Interpretation 1003.1-2001 #156 is applied.

33988 **CHANGE HISTORY**

33989 First released in Issue 1. Derived from Issue 1 of the SVID.

33990 **Issue 6**

33991 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

33992 The following new requirements on POSIX implementations derive from alignment with the
33993 Single UNIX Specification:

33994 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
33995 required for conforming implementations of previous POSIX specifications, it was not
33996 required for UNIX applications.

33997 **NAME**

33998 getgrent — get the group database entry

33999 **SYNOPSIS**

34000 XSI
```
#include <grp.h>

struct group *getgrent(void);
```

34002 **DESCRIPTION**

34003 Refer to *endgrent( )*.

34004 **NAME**

34005 getgrgid, getgrgid_r — get group database entry for a group ID

34006 **SYNOPSIS**

34007
```
#include <grp.h>
```

34008
```
struct group *getgrgid(gid_t gid);
```
34009
```
int getgrgid_r(gid_t gid, struct group *grp, char *buffer,
```
34010
```
    size_t bufsize, struct group **result);
```

34011 **DESCRIPTION**

34012 The *getgrgid*( ) function shall search the group database for an entry with a matching *gid*.

34013 The *getgrgid*( ) function need not be thread-safe.

34014 The *getgrgid_r*( ) function shall update the **group** structure pointed to by *grp* and store a pointer
34015 to that structure at the location pointed to by *result*. The structure shall contain an entry from
34016 the group database with a matching *gid*. Storage referenced by the group structure is allocated
34017 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to
34018 *sysconf*(_SC_GETGR_R_SIZE_MAX) returns either –1 without changing *errno* or an initial value
34019 suggested for the size of this buffer. A null pointer shall be returned at the location pointed to
34020 by *result* on error or if the requested entry is not found.

34021 **RETURN VALUE**

34022 Upon successful completion, *getgrgid*( ) shall return a pointer to a **struct group** with the structure
34023 defined in **<grp.h>** with a matching entry if one is found. The *getgrgid*( ) function shall return a
34024 null pointer if either the requested entry was not found, or an error occurred. On error, *errno*
34025 shall be set to indicate the error.

34026 The return value may point to a static area which is overwritten by a subsequent call to
34027 *getgrent*( ), *getgrgid*( ), or *getgrnam*( ).

34028 If successful, the *getgrgid_r*( ) function shall return zero; otherwise, an error number shall be
34029 returned to indicate the error.

34030 **ERRORS**

34031 The *getgrgid*( ) and *getgrgid_r*( ) functions may fail if:

34032 [EIO] An I/O error has occurred.

34033 [EINTR] A signal was caught during *getgrgid*( ).

34034 [EMFILE] All file descriptors available to the process are currently open.

34035 [ENFILE] The maximum allowable number of files is currently open in the system.

34036 The *getgrgid_r*( ) function may fail if:

34037 [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be
34038 referenced by the resulting **group** structure.

EXAMPLES

Note that *sysconf*(_SC_GETGR_R_SIZE_MAX) may return –1 if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with *getgrid_r*( ).

```
long int initlen = sysconf(_SC_GETGR_R_SIZE_MAX);
size_t len;
if (initlen == -1)
    /* Default initial length. */
    len = 1024;
else
    len = (size_t) initlen;
struct group result;
struct group *resultp;
char *buffer = malloc(len);
if (buffer == NULL)
    ...handle error...
int e;
while ((e = getgrgid_r(42, &result, buffer, len, &resultp)) == ERANGE)
    {
    size_t newlen = 2 * len;
    if (newlen < len)
        ...handle error...
    len = newlen;
    char *newbuffer = realloc(buffer, len);
    if (newbuffer == NULL)
        ...handle error...
    buffer = newbuffer;
    }
if (e != 0)
    ...handle error...
free (buffer);
```

Finding an Entry in the Group Database

The following example uses *getgrgid*( ) to search the group database for a group ID that was previously stored in a **stat** structure, then prints out the group name if it is found. If the group is not found, the program prints the numeric value of the group for the entry.

```
#include <sys/types.h>
#include <grp.h>
#include <stdio.h>
...
struct stat statbuf;
struct group *grp;
...
if ((grp = getgrgid(statbuf.st_gid)) != NULL)
    printf(" %-8.8s", grp->gr_name);
else
    printf(" %-8d", statbuf.st_gid);
...
```

APPLICATION USAGE

Applications wishing to check for error situations should set *errno* to 0 before calling *getgrgid*( ). If *errno* is set on return, an error occurred.

The *getgrgid_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return –1 from *sysconf*( ) indicating that there is no maximum for _SC_GETGR_R_SIZE_MAX.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD **<grp.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getgrgid_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getgrgid*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getgrgid_r*( ) function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION describing matching the *gid*.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-166 is applied.

The *getgrgid_r*( ) function is moved from the Thread-Safe Functions option to the Base.

A minor addition is made to the EXAMPLES section, reminding the application developer to free memory allocated as if by *malloc*( ).

NAME

getgrnam, getgrnam_r — search group database for a name

SYNOPSIS

```
#include <grp.h>

struct group *getgrnam(const char *name);
int getgrnam_r(const char *name, struct group *grp, char *buffer,
    size_t bufsize, struct group **result);
```

DESCRIPTION

The *getgrnam*( ) function shall search the group database for an entry with a matching *name*.

The *getgrnam*( ) function need not be thread-safe.

The *getgrnam_r*( ) function shall update the **group** structure pointed to by *grp* and store a pointer to that structure at the location pointed to by *result*. The structure shall contain an entry from the group database with a matching *name*. Storage referenced by the **group** structure is allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to *sysconf*(_SC_GETGR_R_SIZE_MAX) returns either –1 without changing *errno* or an initial value suggested for the size of this buffer. A null pointer is returned at the location pointed to by *result* on error or if the requested entry is not found.

RETURN VALUE

The *getgrnam*( ) function shall return a pointer to a **struct group** with the structure defined in **<grp.h>** with a matching entry if one is found. The *getgrnam*( ) function shall return a null pointer if either the requested entry was not found, or an error occurred. On error, *errno* shall be set to indicate the error.

The return value may point to a static area which is overwritten by a subsequent call to *getgrent*( ), *getgrgid*( ), or *getgrnam*( ).

The *getgrnam_r*( ) function shall return zero on success or if the requested entry was not found and no error has occurred. If any error has occurred, an error number shall be returned to indicate the error.

ERRORS

The *getgrnam*( ) and *getgrnam_r*( ) functions may fail if:

[EIO] An I/O error has occurred.

[EINTR] A signal was caught during *getgrnam*( ).

[EMFILE] All file descriptors available to the process are currently open.

[ENFILE] The maximum allowable number of files is currently open in the system.

The *getgrnam_r*( ) function may fail if:

[ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be referenced by the resulting **group** structure.

EXAMPLES

Note that *sysconf*(_SC_GETGR_R_SIZE_MAX) may return –1 if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with *getgrnam_r*( ).

```
long int initlen = sysconf(_SC_GETGR_R_SIZE_MAX);
size_t len;
if (initlen == -1)
    /* Default initial length. */
    len = 1024;
else
    len = (size_t) initlen;
struct group result;
struct group *resultp;
char *buffer = malloc(len);
if (buffer == NULL)
    ...handle error...
int e;
while ((e = getgrnam_r("somegroup", &result, buffer, len, &resultp))
        == ERANGE)
    {
    size_t newlen = 2 * len;
    if (newlen < len)
        ...handle error...
    len = newlen;
    char *newbuffer = realloc(buffer, len);
    if (newbuffer == NULL)
        ...handle error...
    buffer = newbuffer;
    }
if (e != 0)
    ...handle error...
free (buffer);
```

APPLICATION USAGE

Applications wishing to check for error situations should set *errno* to 0 before calling *getgrnam*( ). If *errno* is set on return, an error occurred.

The *getgrnam_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return –1 from *sysconf*( ) indicating that there is no maximum for _SC_GETGR_R_SIZE_MAX.

34244 free memory allocated as if by *malloc*( ).

NAME

getgroups — get supplementary group IDs

SYNOPSIS

```
#include <unistd.h>

int getgroups(int gidsetsize, gid_t grouplist[]);
```

DESCRIPTION

The *getgroups*( ) function shall fill in the array *grouplist* with the current supplementary group IDs of the calling process. It is implementation-defined whether *getgroups*( ) also returns the effective group ID in the *grouplist* array.

The *gidsetsize* argument specifies the number of elements in the array *grouplist*. The actual number of group IDs stored in the array shall be returned. The values of array entries with indices greater than or equal to the value returned are undefined.

If *gidsetsize* is 0, *getgroups*( ) shall return the number of group IDs that it would otherwise return without modifying the array pointed to by *grouplist*.

If the effective group ID of the process is returned with the supplementary group IDs, the value returned shall always be greater than or equal to one and less than or equal to the value of {NGROUPS_MAX}+1.

RETURN VALUE

Upon successful completion, the number of supplementary group IDs shall be returned. A return value of –1 indicates failure and *errno* shall be set to indicate the error.

ERRORS

The *getgroups*( ) function shall fail if:

[EINVAL] The *gidsetsize* argument is non-zero and less than the number of group IDs that would have been returned.

EXAMPLES

Getting the Supplementary Group IDs of the Calling Process

The following example places the current supplementary group IDs of the calling process into the *group* array.

```
#include <sys/types.h>
#include <unistd.h>
...
gid_t *group;
int nogroups;
long ngroups_max;

ngroups_max = sysconf(_SC_NGROUPS_MAX) + 1;
group = (gid_t *)malloc(ngroups_max *sizeof(gid_t));

ngroups = getgroups(ngroups_max, group);
```

APPLICATION USAGE

None.

RATIONALE

The related function *setgroups*( ) is a privileged operation and therefore is not covered by this volume of POSIX.1-200x.

As implied by the definition of supplementary groups, the effective group ID may appear in the

array returned by *getgroups*( ) or it may be returned only by *getegid*( ). Duplication may exist, but the application needs to call *getegid*( ) to be sure of getting all of the information. Various implementation variations and administrative sequences cause the set of groups appearing in the result of *getgroups*( ) to vary in order and as to whether the effective group ID is included, even when the set of groups is the same (in the mathematical sense of "set"). (The history of a process and its parents could affect the details of the result.)

Application developers should note that {NGROUPS_MAX} is not necessarily a constant on all implementations.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- A return value of 0 is not permitted, because {NGROUPS_MAX} cannot be 0. This is a FIPS requirement.

The following changes were made to align with the IEEE P1003.1a draft standard:

- An explanation is added that the effective group ID may be included in the supplementary group list.

34318 **NAME**

34319 gethostent — network host database functions

34347 **CHANGE HISTORY**

34348 First released in Issue 4, Version 2.

34349 **Issue 5**

34350 Moved from X/OPEN UNIX extension to BASE.

34351 **NAME**

34352 gethostname — get name of current host

34353 **SYNOPSIS**

34354
```
#include <unistd.h>
```

34355
```
int gethostname(char *name, size_t namelen);
```

34356 **DESCRIPTION**

34357 The *gethostname*( ) function shall return the standard host name for the current machine. The
34358 *namelen* argument shall specify the size of the array pointed to by the *name* argument. The
34359 returned name shall be null-terminated, except that if *namelen* is an insufficient length to hold
34360 the host name, then the returned name shall be truncated and it is unspecified whether the
34361 returned name is null-terminated.

34362 Host names are limited to {HOST_NAME_MAX} bytes.

34363 **RETURN VALUE**

34364 Upon successful completion, 0 shall be returned; otherwise, –1 shall be returned.

34365 **ERRORS**

34366 No errors are defined.

34367 **EXAMPLES**

34368 None.

34369 **APPLICATION USAGE**

34370 None.

34371 **RATIONALE**

34372 None.

34377 XBD **<unistd.h>**

34378 **CHANGE HISTORY**

34379 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

34380 The Open Group Base Resolution bwg2001-008 is applied, changing the *namelen* parameter from
34381 **socklen_t** to **size_t**.

NAME

getitimer, setitimer — get and set value of interval timer

SYNOPSIS

OB XSI
```
#include <sys/time.h>

int getitimer(int which, struct itimerval *value);
int setitimer(int which, const struct itimerval *restrict value,
    struct itimerval *restrict ovalue);
```

DESCRIPTION

The *getitimer*( ) function shall store the current value of the timer specified by *which* into the structure pointed to by *value*. The *setitimer*( ) function shall set the timer specified by *which* to the value specified in the structure pointed to by *value*, and if *ovalue* is not a null pointer, store the previous value of the timer in the structure pointed to by *ovalue*.

A timer value is defined by the **itimerval** structure, specified in **<sys/time.h>**. If *it_value* is non-zero, it shall indicate the time to the next timer expiration. If *it_interval* is non-zero, it shall specify a value to be used in reloading *it_value* when the timer expires. Setting *it_value* to 0 shall disable a timer, regardless of the value of *it_interval*. Setting *it_interval* to 0 shall disable a timer after its next expiration (assuming *it_value* is non-zero).

Implementations may place limitations on the granularity of timer values. For each interval timer, if the requested timer value requires a finer granularity than the implementation supports, the actual timer value shall be rounded up to the next supported value.

An XSI-conforming implementation provides each process with at least three interval timers, which are indicated by the *which* argument:

ITIMER_PROF — Decrements both in process virtual time and when the system is running on behalf of the process. It is designed to be used by interpreters in statistically profiling the execution of interpreted programs. Each time the ITIMER_PROF timer expires, the SIGPROF signal is delivered.

ITIMER_REAL — Decrements in real time. A SIGALRM signal is delivered when this timer expires.

ITIMER_VIRTUAL — Decrements in process virtual time. It runs only when the process is executing. A SIGVTALRM signal is delivered when it expires.

The interaction between *setitimer*( ) and *alarm*( ) or *sleep*( ) is unspecified.

RETURN VALUE

Upon successful completion, *getitimer*( ) or *setitimer*( ) shall return 0; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *setitimer*( ) function shall fail if:

[EINVAL] — The *value* argument is not in canonical form. (In canonical form, the number of microseconds is a non-negative integer less than 1 000 000 and the number of seconds is a non-negative integer.)

The *getitimer*( ) and *setitimer*( ) functions may fail if:

[EINVAL] — The *which* argument is not recognized.

34423 **EXAMPLES**

34424 None.

34425 **APPLICATION USAGE**

34426 Applications should use the *timer_gettime*( ) and *timer_settime*( ) functions instead of the
34427 obsolescent *getitimer*( ) and *setitimer*( ) functions, respectively.

34428 **RATIONALE**

34429 None.

34430 **FUTURE DIRECTIONS**

34431 The *getitimer*( ) and *setitimer*( ) functions may be removed in a future version.

34432 **SEE ALSO**

34433 *alarm*( ), *exec*, *sleep*( ), *timer_getoverrun*( )

34435 **CHANGE HISTORY**

34436 First released in Issue 4, Version 2.

34437 **Issue 5**

34438 Moved from X/OPEN UNIX extension to BASE.

34439 **Issue 6**

34440 The **restrict** keyword is added to the *setitimer*( ) prototype for alignment with the
34441 ISO/IEC 9899: 1999 standard.

34442 **Issue 7**

34443 The *getitimer*( ) and *setitimer*( ) functions are marked obsolescent.

NAME

getline — read a delimited record from *stream*

SYNOPSIS

CX
```
#include <stdio.h>

ssize_t getline(char **restrict lineptr, size_t *restrict n,
    FILE *restrict stream);
```

DESCRIPTION

Refer to *getdelim( )*.

NAME

getlogin, getlogin_r — get login name

SYNOPSIS

```
#include <unistd.h>

char *getlogin(void);
int getlogin_r(char *name, size_t namesize);
```

DESCRIPTION

The *getlogin*( ) function shall return a pointer to a string containing the user name associated by the login activity with the controlling terminal of the current process. If *getlogin*( ) returns a non-null pointer, then that pointer points to the name that the user logged in under, even if there are several login names with the same user ID.

The *getlogin*( ) function need not be thread-safe.

The *getlogin_r*( ) function shall put the name associated by the login activity with the controlling terminal of the current process in the character array pointed to by *name*. The array is *namesize* characters long and should have space for the name and the terminating null character. The maximum size of the login name is {LOGIN_NAME_MAX}.

If *getlogin_r*( ) is successful, *name* points to the name the user used at login, even if there are several login names with the same user ID.

RETURN VALUE

Upon successful completion, *getlogin*( ) shall return a pointer to the login name or a null pointer if the user's login name cannot be found. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

The return value from *getlogin*( ) may point to static data whose content is overwritten by each call.

If successful, the *getlogin_r*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EMFILE] All file descriptors available to the process are currently open.

[ENFILE] The maximum allowable number of files is currently open in the system.

[ENXIO] The calling process has no controlling terminal.

The *getlogin_r*( ) function may fail if:

[ERANGE] The value of *namesize* is smaller than the length of the string to be returned including the terminating null character.

EXAMPLES

Getting the User Login Name

The following example calls the *getlogin*( ) function to obtain the name of the user associated with the calling process, and passes this information to the *getpwnam*( ) function to get the associated user database information.

```
#include <unistd.h>
#include <sys/types.h>
#include <pwd.h>
```

```
#include <stdio.h>
...
char *lgn;
struct passwd *pw;
...
if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
    fprintf(stderr, "Get of user information failed.\n"); exit(1);
    }
```

APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid*(*geteuid*()) shall return the name associated with the effective user ID of the process; *getlogin*() shall return the name associated with the current login activity; and *getpwuid*(*getuid*()) shall return the name associated with the real user ID of the process.

The *getlogin_r*() function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

The *getlogin*() function returns a pointer to the user's login name. The same user ID may be shared by several login names. If it is desired to get the user database entry that is used during login, the result of *getlogin*() should be used to provide the argument to the *getpwnam*() function. (This might be used to determine the user's login shell, particularly where a single user has multiple login shells with distinct login names, but the same user ID.)

The information provided by the *cuserid*() function, which was originally defined in the POSIX.1-1988 standard and subsequently removed, can be obtained by the following:

```
getpwuid(geteuid())
```

while the information provided by historical implementations of *cuserid*() can be obtained by:

```
getpwuid(getuid())
```

The thread-safe version of this function places the user name in a user-supplied buffer and returns a non-zero value if it fails. The non-thread-safe version may return the name in a static data area that may be overwritten by each call.

FUTURE DIRECTIONS

None.

SEE ALSO

getpwnam(), *getpwuid*(), *geteuid*(), *getuid*()

XBD **<limits.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getlogin_r*() function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getlogin*() function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getlogin_r*( ) function is marked as part of the Thread-Safe Functions option.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

The *getlogin_r*( ) function is moved from the Thread-Safe Functions option to the Base.

NAME

getmsg, getpmsg — receive next message from a STREAMS file (**STREAMS**)

SYNOPSIS

OB XSR

```
#include <stropts.h>

int getmsg(int fildes, struct strbuf *restrict ctlptr,
    struct strbuf *restrict dataptr, int *restrict flagsp);
int getpmsg(int fildes, struct strbuf *restrict ctlptr,
    struct strbuf *restrict dataptr, int *restrict bandp,
    int *restrict flagsp);
```

DESCRIPTION

The *getmsg*( ) function shall retrieve the contents of a message located at the head of the STREAM head read queue associated with a STREAMS file and place the contents into one or more buffers. The message contains either a data part, a control part, or both. The data and control parts of the message shall be placed into separate buffers, as described below. The semantics of each part are defined by the originator of the message.

The *getpmsg*( ) function shall be equivalent to *getmsg*( ), except that it provides finer control over the priority of the messages received. Except where noted, all requirements on *getmsg*( ) also pertain to *getpmsg*( ).

The *fildes* argument specifies a file descriptor referencing a STREAMS-based file.

The *ctlptr* and *dataptr* arguments each point to a **strbuf** structure, in which the *buf* member points to a buffer in which the data or control information is to be placed, and the *maxlen* member indicates the maximum number of bytes this buffer can hold. On return, the *len* member shall contain the number of bytes of data or control information actually received. The *len* member shall be set to 0 if there is a zero-length control or data part and *len* shall be set to –1 if no data or control information is present in the message.

When *getmsg*( ) is called, *flagsp* should point to an integer that indicates the type of message the process is able to receive. This is described further below.

The *ctlptr* argument is used to hold the control part of the message, and *dataptr* is used to hold the data part of the message. If *ctlptr* (or *dataptr*) is a null pointer or the *maxlen* member is –1, the control (or data) part of the message shall not be processed and shall be left on the STREAM head read queue, and if the *ctlptr* (or *dataptr*) is not a null pointer, *len* shall be set to –1. If the *maxlen* member is set to 0 and there is a zero-length control (or data) part, that zero-length part shall be removed from the read queue and *len* shall be set to 0. If the *maxlen* member is set to 0 and there are more than 0 bytes of control (or data) information, that information shall be left on the read queue and *len* shall be set to 0. If the *maxlen* member in *ctlptr* (or *dataptr*) is less than the control (or data) part of the message, *maxlen* bytes shall be retrieved. In this case, the remainder of the message shall be left on the STREAM head read queue and a non-zero return value shall be provided.

By default, *getmsg*( ) shall process the first available message on the STREAM head read queue. However, a process may choose to retrieve only high-priority messages by setting the integer pointed to by *flagsp* to RS_HIPRI. In this case, *getmsg*( ) shall only process the next message if it is a high-priority message. When the integer pointed to by *flagsp* is 0, any available message shall be retrieved. In this case, on return, the integer pointed to by *flagsp* shall be set to RS_HIPRI if a high-priority message was retrieved, or 0 otherwise.

For *getpmsg*( ), the flags are different. The *flagsp* argument points to a bitmask with the following mutually-exclusive flags defined: MSG_HIPRI, MSG_BAND, and MSG_ANY. Like *getmsg*( ),

getpmsg( ) shall process the first available message on the STREAM head read queue. A process may choose to retrieve only high-priority messages by setting the integer pointed to by *flagsp* to MSG_HIPRI and the integer pointed to by *bandp* to 0. In this case, *getpmsg*( ) shall only process the next message if it is a high-priority message. In a similar manner, a process may choose to retrieve a message from a particular priority band by setting the integer pointed to by *flagsp* to MSG_BAND and the integer pointed to by *bandp* to the priority band of interest. In this case, *getpmsg*( ) shall only process the next message if it is in a priority band equal to, or greater than, the integer pointed to by *bandp*, or if it is a high-priority message. If a process wants to get the first message off the queue, the integer pointed to by *flagsp* should be set to MSG_ANY and the integer pointed to by *bandp* should be set to 0. On return, if the message retrieved was a high-priority message, the integer pointed to by *flagsp* shall be set to MSG_HIPRI and the integer pointed to by *bandp* shall be set to 0. Otherwise, the integer pointed to by *flagsp* shall be set to MSG_BAND and the integer pointed to by *bandp* shall be set to the priority band of the message.

If O_NONBLOCK is not set, *getmsg*( ) and *getpmsg*( ) shall block until a message of the type specified by *flagsp* is available at the front of the STREAM head read queue. If O_NONBLOCK is set and a message of the specified type is not present at the front of the read queue, *getmsg*( ) and *getpmsg*( ) shall fail and set *errno* to [EAGAIN].

If a hangup occurs on the STREAM from which messages are retrieved, *getmsg*( ) and *getpmsg*( ) shall continue to operate normally, as described above, until the STREAM head read queue is empty. Thereafter, they shall return 0 in the *len* members of *ctlptr* and *dataptr*.

RETURN VALUE

Upon successful completion, *getmsg*( ) and *getpmsg*( ) shall return a non-negative value. A value of 0 indicates that a full message was read successfully. A return value of MORECTL indicates that more control information is waiting for retrieval. A return value of MOREDATA indicates that more data is waiting for retrieval. A return value of the bitwise-logical OR of MORECTL and MOREDATA indicates that both types of information remain. Subsequent *getmsg*( ) and *getpmsg*( ) calls shall retrieve the remainder of the message. However, if a message of higher priority has come in on the STREAM head read queue, the next call to *getmsg*( ) or *getpmsg*( ) shall retrieve that higher-priority message before retrieving the remainder of the previous message.

If the high priority control part of the message is consumed, the message shall be placed back on the queue as a normal message of band 0. Subsequent *getmsg*( ) and *getpmsg*( ) calls shall retrieve the remainder of the message. If, however, a priority message arrives or already exists on the STREAM head, the subsequent call to *getmsg*( ) or *getpmsg*( ) shall retrieve the higher-priority message before retrieving the remainder of the message that was put back.

Upon failure, *getmsg*( ) and *getpmsg*( ) shall return –1 and set *errno* to indicate the error.

ERRORS

The *getmsg*( ) and *getpmsg*( ) functions shall fail if:

[EAGAIN] The O_NONBLOCK flag is set and no messages are available.

[EBADF] The *fildes* argument is not a valid file descriptor open for reading.

[EBADMSG] The queued message to be read is not valid for *getmsg*( ) or *getpmsg*( ) or a pending file descriptor is at the STREAM head.

[EINTR] A signal was caught during *getmsg*( ) or *getpmsg*( ).

[EINVAL] An illegal value was specified by *flagsp*, or the STREAM or multiplexer referenced by *fildes* is linked (directly or indirectly) downstream from a multiplexer.

[ENOSTR] A STREAM is not associated with *fildes*.

In addition, *getmsg*( ) and *getpmsg*( ) shall fail if the STREAM head had processed an asynchronous error before the call. In this case, the value of *errno* does not reflect the result of *getmsg*( ) or *getpmsg*( ) but reflects the prior error.

EXAMPLES

Getting Any Message

In the following example, the value of *fd* is assumed to refer to an open STREAMS file. The call to *getmsg*( ) retrieves any available message on the associated STREAM-head read queue, returning control and data information to the buffers pointed to by *ctrlbuf* and *databuf*, respectively.

```
#include <stropts.h>
...
int fd;
char ctrlbuf[128];
char databuf[512];
struct strbuf ctrl;
struct strbuf data;
int flags = 0;
int ret;

ctrl.buf = ctrlbuf;
ctrl.maxlen = sizeof(ctrlbuf);

data.buf = databuf;
data.maxlen = sizeof(databuf);

ret = getmsg (fd, &ctrl, &data, &flags);
```

Getting the First Message off the Queue

In the following example, the call to *getpmsg*( ) retrieves the first available message on the associated STREAM-head read queue.

```
#include <stropts.h>
...

int fd;
char ctrlbuf[128];
char databuf[512];
struct strbuf ctrl;
struct strbuf data;
int band = 0;
int flags = MSG_ANY;
int ret;

ctrl.buf = ctrlbuf;
ctrl.maxlen = sizeof(ctrlbuf);

data.buf = databuf;
data.maxlen = sizeof(databuf);

ret = getpmsg (fd, &ctrl, &data, &band, &flags);
```

34683 **APPLICATION USAGE**
34684 None.

34685 **RATIONALE**
34686 None.

34687 **FUTURE DIRECTIONS**
34688 The *getmsg*( ) and *getpmsg*( ) functions may be removed in a future version.

34689 **SEE ALSO**
34690 Section 2.6 (on page 494), *poll*( ), *putmsg*( ), *read*( ), *write*( )

34691 XBD **<stropts.h>**

34692 **CHANGE HISTORY**
34693 First released in Issue 4, Version 2.

34694 **Issue 5**
34695 Moved from X/OPEN UNIX extension to BASE.

34696 A paragraph regarding "high-priority control parts of messages" is added to the RETURN
34697 VALUE section.

34698 **Issue 6**
34699 This function is marked as part of the XSI STREAMS Option Group.

34700 The **restrict** keyword is added to the *getmsg*( ) and *getpmsg*( ) prototypes for alignment with the
34701 ISO/IEC 9899: 1999 standard.

34702 **Issue 7**
34703 The *getmsg*( ) and *getpmsg*( ) functions are marked obsolescent.

34704 **NAME**

34705 getnameinfo — get name information

34706 **SYNOPSIS**

34707 ```
#include <sys/socket.h>
```
34708 ```
#include <netdb.h>
```

34709 ```
int getnameinfo(const struct sockaddr *restrict sa, socklen_t salen,
```
34710 ```
    char *restrict node, socklen_t nodelen, char *restrict service,
```
34711 ```
    socklen_t servicelen, int flags);
```

34712 **DESCRIPTION**

34713 The *getnameinfo*( ) function shall translate a socket address to a node name and service location,
34714 all of which are defined as in *freeaddrinfo*( ).

34715 The *sa* argument points to a socket address structure to be translated.

34716 IP6 If the socket address structure contains an IPv4-mapped IPv6 address or an IPv4-compatible
34717 IPv6 address, the implementation shall extract the embedded IPv4 address and lookup the node
34718 name for that IPv4 address.

34719 If the address is the IPv6 unspecified address ("::"), a lookup shall not be performed and the
34720 behavior shall be the same as when the node's name cannot be located.

34721 If the *node* argument is non-NULL and the *nodelen* argument is non-zero, then the *node* argument
34722 points to a buffer able to contain up to *nodelen* characters that receives the node name as a null-
34723 terminated string. If the *node* argument is NULL or the *nodelen* argument is zero, the node name
34724 shall not be returned. If the node's name cannot be located, the numeric form of the address
34725 contained in the socket address structure pointed to by the *sa* argument is returned instead of its
34726 name.

34727 If the *service* argument is non-NULL and the *servicelen* argument is non-zero, then the *service*
34728 argument points to a buffer able to contain up to *servicelen* bytes that receives the service name
34729 as a null-terminated string. If the *service* argument is NULL or the *servicelen* argument is zero,
34730 the service name shall not be returned. If the service's name cannot be located, the numeric form
34731 of the service address (for example, its port number) shall be returned instead of its name.

34732 The *flags* argument is a flag that changes the default actions of the function. By default the fully-
34733 qualified domain name (FQDN) for the host shall be returned, but:

34734 • If the flag bit NI_NOFQDN is set, only the node name portion of the FQDN shall be
34735 returned for local hosts.

34736 • If the flag bit NI_NUMERICHOST is set, the numeric form of the address contained in the
34737 socket address structure pointed to by the *sa* argument shall be returned instead of its
34738 name.

34739 • If the flag bit NI_NAMEREQD is set, an error shall be returned if the host's name cannot
34740 be located.

34741 • If the flag bit NI_NUMERICSERV is set, the numeric form of the service address shall be
34742 returned (for example, its port number) instead of its name.

34743 • If the flag bit NI_NUMERICSCOPE is set, the numeric form of the scope identifier shall be
34744 returned (for example, interface index) instead of its name. This flag shall be ignored if the
34745 *sa* argument is not an IPv6 address.

34746 • If the flag bit NI_DGRAM is set, this indicates that the service is a datagram service
34747 (SOCK_DGRAM). The default behavior shall assume that the service is a stream service
34748 (SOCK_STREAM).
```

34749 **Notes:**

34750 1. The two NI_NUMERICxxx flags are required to support the –**n** flag that many
34751 commands provide.

34752 2. The NI_DGRAM flag is required for the few AF_INET and AF_INET6 port numbers (for
34753 example, [512,514]) that represent different services for UDP and TCP.

34754 The *getnameinfo*( ) function shall be thread-safe.

34755 **RETURN VALUE**

34756 A zero return value for *getnameinfo*( ) indicates successful completion; a non-zero return value
34757 indicates failure. The possible values for the failures are listed in the ERRORS section.

34758 Upon successful completion, *getnameinfo*( ) shall return the *node* and *service* names, if requested,
34759 in the buffers provided. The returned names are always null-terminated strings.

34760 **ERRORS**

34761 The *getnameinfo*( ) function shall fail and return the corresponding value if:

34762 [EAI_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

34763 [EAI_BADFLAGS]
34764 The *flags* had an invalid value.

34765 [EAI_FAIL] A non-recoverable error occurred.

34766 [EAI_FAMILY] The address family was not recognized or the address length was invalid for
34767 the specified family.

34768 [EAI_MEMORY] There was a memory allocation failure.

34769 [EAI_NONAME] The name does not resolve for the supplied parameters.

34770 NI_NAMEREQD is set and the host's name cannot be located, or both
34771 *nodename* and *servname* were null.

34772 [EAI_OVERFLOW]
34773 An argument buffer overflowed. The buffer pointed to by the *node* argument
34774 or the *service* argument was too small.

34775 [EAI_SYSTEM] A system error occurred. The error code can be found in *errno*.

34776 **EXAMPLES**

34777 None.

34778 **APPLICATION USAGE**

34779 If the returned values are to be used as part of any further name resolution (for example, passed
34780 to *getaddrinfo*( )), applications should provide buffers large enough to store any result possible on
34781 the system.

34782 Given the IPv4-mapped IPv6 address `"::ffff:1.2.3.4"`, the implementation performs a
34783 lookup as if the socket address structure contains the IPv4 address `"1.2.3.4"`.

34784 The IPv6 unspecified address (`"::"`) and the IPv6 loopback address (`"::1"`) are not
34785 IPv4-compatible addresses.

34786 **RATIONALE**

34787 None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getnameinfo*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/23 is applied, making various changes in the SYNOPSIS and DESCRIPTION for alignment with IPv6.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/24 is applied, adding the [EAI_OVERFLOW] error to the ERRORS section.

Issue 7

SD5-XSH-ERN-127 is applied, clarifying the behavior if the address is the IPv6 unspecified address.

NAME

getnetbyaddr, getnetbyname, getnetent — network database functions

SYNOPSIS

```
#include <netdb.h>

struct netent *getnetbyaddr(uint32_t net, int type);
struct netent *getnetbyname(const char *name);
struct netent *getnetent(void);
```

DESCRIPTION

Refer to *endnetent( )*.

34813 **NAME**

34814 getopt, optarg, opterr, optind, optopt — command option parsing

34815 **SYNOPSIS**

34816 ```
#include <unistd.h>
```

34817 ```
int getopt(int argc, char * const argv[], const char *optstring);
```
34818 ```
extern char *optarg;
```
34819 ```
extern int opterr, optind, optopt;
```

34820 **DESCRIPTION**

34821 The *getopt*( ) function is a command-line parser that shall follow Utility Syntax Guidelines 3, 4, 5,
34822 6, 7, 9, and 10 in XBD Section 12.2 (on page 215).

34823 The parameters *argc* and *argv* are the argument count and argument array as passed to *main*( )
34824 (see *exec*( )). The argument *optstring* is a string of recognized option characters; if a character is
34825 followed by a <colon>, the option takes an argument. All option characters allowed by Utility
34826 Syntax Guideline 3 are allowed in *optstring*. The implementation may accept other characters as
34827 an extension.

34828 The variable *optind* is the index of the next element of the *argv*[ ] vector to be processed. It shall
34829 be initialized to 1 by the system, and *getopt*( ) shall update it when it finishes with each element
34830 of *argv*[ ]. When an element of *argv*[ ] contains multiple option characters, it is unspecified how
34831 *getopt*( ) determines which options have already been processed.

34832 The *getopt*( ) function shall return the next option character (if one is found) from *argv* that
34833 matches a character in *optstring*, if there is one that matches. If the option takes an argument,
34834 *getopt*( ) shall set the variable *optarg* to point to the option-argument as follows:

34835 1. If the option was the last character in the string pointed to by an element of *argv*, then
34836 *optarg* shall contain the next element of *argv*, and *optind* shall be incremented by 2. If the
34837 resulting value of *optind* is greater than *argc*, this indicates a missing option-argument,
34838 and *getopt*( ) shall return an error indication.

34839 2. Otherwise, *optarg* shall point to the string following the option character in that element
34840 of *argv*, and *optind* shall be incremented by 1.

34841 If, when *getopt*( ) is called:

34842 `argv[optind]` is a null pointer
34843 `*argv[optind]` is not the character –
34844 `argv[optind]` points to the string `"–"`

34845 *getopt*( ) shall return –1 without changing *optind*. If:

34846 `argv[optind]` points to the string `"––"`

34847 *getopt*( ) shall return –1 after incrementing *optind*.

34848 If *getopt*( ) encounters an option character that is not contained in *optstring*, it shall return the
34849 <question-mark> (`'?'`) character. If it detects a missing option-argument, it shall return the
34850 <colon> character (`':'`) if the first character of *optstring* was a <colon>, or a <question-mark>
34851 character (`'?'`) otherwise. In either case, *getopt*( ) shall set the variable *optopt* to the option
34852 character that caused the error. If the application has not set the variable *opterr* to 0 and the first
34853 character of *optstring* is not a <colon>, *getopt*( ) shall also print a diagnostic message to *stderr* in
34854 the format specified for the *getopts* utility.

34855 The *getopt*( ) function need not be thread-safe.

RETURN VALUE

The *getopt*( ) function shall return the next option character specified on the command line.

A <colon> (':') shall be returned if *getopt*( ) detects a missing argument and the first character of *optstring* was a <colon> (':').

A <question-mark> ('?') shall be returned if *getopt*( ) encounters an option character not in *optstring* or detects a missing argument and the first character of *optstring* was not a <colon> (':').

Otherwise, *getopt*( ) shall return –1 when all command line options are parsed.

ERRORS

No errors are defined.

EXAMPLES

Parsing Command Line Options

The following code fragment shows how you might process the arguments for a utility that can take the mutually-exclusive options *a* and *b* and the options *f* and *o*, both of which require arguments:

```
#include <unistd.h>

int
main(int argc, char *argv[ ])
{
    int c;
    int bflg, aflg, errflg;
    char *ifile;
    char *ofile;
    extern char *optarg;
    extern int optind, optopt;
    . . .
    while ((c = getopt(argc, argv, ":abf:o:")) != -1) {
        switch(c) {
        case 'a':
            if (bflg)
                errflg++;
            else
                aflg++;
            break;
        case 'b':
            if (aflg)
                errflg++;
            else {
                bflg++;
                bproc();
            }
            break;
        case 'f':
            ifile = optarg;
            break;
        case 'o':
            ofile = optarg;
```

```
                break;
                case ':':       /* -f or -o without operand */
                        fprintf(stderr,
                                "Option -%c requires an operand\n", optopt);
                        errflg++;
                        break;
            case '?':
                        fprintf(stderr,
                                "Unrecognized option: -%c\n", optopt);
                errflg++;
            }
        }
        if (errflg) {
            fprintf(stderr, "usage: . . . ");
            exit(2);
        }
        for ( ; optind < argc; optind++) {
            if (access(argv[optind], R_OK)) {
        . . .
    }
```

This code accepts any of the following as equivalent:

```
cmd –ao arg path path
cmd –a –o arg path path
cmd –o arg –a path path
cmd –a –o arg –– path path
cmd –a –oarg path path
cmd –aoarg path path
```

Checking Options and Arguments

The following example parses a set of command line options and prints messages to standard output for each option and argument that it encounters.

```
#include <unistd.h>
#include <stdio.h>
...
int c;
char *filename;
extern char *optarg;
extern int optind, optopt, opterr;
...
while ((c = getopt(argc, argv, ":abf:")) != -1) {
    switch(c) {
    case 'a':
        printf("a is set\n");
        break;
    case 'b':
        printf("b is set\n");
        break;
    case 'f':
        filename = optarg;
```

```
            printf("filename is %s\n", filename);
            break;
        case ':':
            printf("-%c without filename\n", optopt);
            break;
        case '?':
            printf("unknown arg %c\n", optopt);
            break;
        }
    }
```

Selecting Options from the Command Line

The following example selects the type of database routines the user wants to use based on the *Options* argument.

```
#include <unistd.h>
#include <string.h>
...
char *Options = "hdbtl";
...
int dbtype, i;
char c;
char *st;
...
dbtype = 0;
while ((c = getopt(argc, argv, Options)) != -1) {
    if ((st = strchr(Options, c)) != NULL) {
        dbtype = st - Options;
        break;
    }
}
```

APPLICATION USAGE

The *getopt*( ) function is only required to support option characters included in Utility Syntax Guideline 3. Many historical implementations of *getopt*( ) support other characters as options. This is an allowed extension, but applications that use extensions are not maximally portable. Note that support for multi-byte option characters is only possible when such characters can be represented as type **int**.

RATIONALE

The *optopt* variable represents historical practice and allows the application to obtain the identity of the invalid option.

The description has been written to make it clear that *getopt*( ), like the *getopts* utility, deals with option-arguments whether separated from the option by <blank> characters or not. Note that the requirements on *getopt*( ) and *getopts* are more stringent than the Utility Syntax Guidelines.

The *getopt*( ) function shall return –1, rather than EOF, so that **<stdio.h>** is not required.

The special significance of a <colon> as the first character of *optstring* makes *getopt*( ) consistent with the *getopts* utility. It allows an application to make a distinction between a missing argument and an incorrect option letter without having to examine the option letter. It is true that a missing argument can only be detected in one case, but that is a case that has to be considered.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A note indicating that the *getopt*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

IEEE PASC Interpretation 1003.2 #150 is applied.

Austin Group Interpretation 1003.1-2001 #156 is applied.

NAME

getpeername — get the name of the peer socket

SYNOPSIS

```
#include <sys/socket.h>

int getpeername(int socket, struct sockaddr *restrict address,
    socklen_t *restrict address_len);
```

DESCRIPTION

The *getpeername*( ) function shall retrieve the peer address of the specified socket, store this address in the **sockaddr** structure pointed to by the *address* argument, and store the length of this address in the object pointed to by the *address_len* argument.

If the actual length of the address is greater than the length of the supplied **sockaddr** structure, the stored address shall be truncated.

If the protocol permits connections by unbound clients, and the peer is not bound, then the value stored in the object pointed to by *address* is unspecified.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *getpeername*( ) function shall fail if:

[EBADF] The *socket* argument is not a valid file descriptor.

[EINVAL] The socket has been shut down.

[ENOTCONN] The socket is not connected or otherwise has not had the peer pre-specified.

[ENOTSOCK] The *socket* argument does not refer to a socket.

[EOPNOTSUPP] The operation is not supported for the socket protocol.

The *getpeername*( ) function may fail if:

[ENOBUFS] Insufficient resources were available in the system to complete the call.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getpeername*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

35051 **NAME**

35052 getpgid — get the process group ID for a process

35053 **SYNOPSIS**

35054 `#include <unistd.h>`

35055 `pid_t getpgid(pid_t pid);`

35056 **DESCRIPTION**

35057 The *getpgid*( ) function shall return the process group ID of the process whose process ID is equal
35058 to *pid*. If *pid* is equal to 0, *getpgid*( ) shall return the process group ID of the calling process.

35059 **RETURN VALUE**

35060 Upon successful completion, *getpgid*( ) shall return a process group ID. Otherwise, it shall return
35061 (**pid_t**)–1 and set *errno* to indicate the error.

35062 **ERRORS**

35063 The *getpgid*( ) function shall fail if:

35064 [EPERM] The process whose process ID is equal to *pid* is not in the same session as the
35065 calling process, and the implementation does not allow access to the process
35066 group ID of that process from the calling process.

35067 [ESRCH] There is no process with a process ID equal to *pid*.

35068 The *getpgid*( ) function may fail if:

35069 [EINVAL] The value of the *pid* argument is invalid.

35086 The *getpgid*( ) function is moved from the XSI option to the Base.

NAME

getpgrp — get the process group ID of the calling process

SYNOPSIS

```
#include <unistd.h>

pid_t getpgrp(void);
```

DESCRIPTION

The *getpgrp*( ) function shall return the process group ID of the calling process.

RETURN VALUE

The *getpgrp*( ) function shall always be successful and no return value is reserved to indicate an error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

4.3 BSD provides a *getpgrp*( ) function that returns the process group ID for a specified process. Although this function supports job control, all known job control shells always specify the calling process with this function. Thus, the simpler System V *getpgrp*( ) suffices, and the added complexity of the 4.3 BSD *getpgrp*( ) is provided by the XSI extension *getpgid*( ).

FUTURE DIRECTIONS

None.

NAME

getpriority, setpriority — get and set the nice value

SYNOPSIS

XSI
```
#include <sys/resource.h>

int getpriority(int which, id_t who);
int setpriority(int which, id_t who, int value);
```

DESCRIPTION

The *getpriority*( ) function shall obtain the nice value of a process, process group, or user. The *setpriority*( ) function shall set the nice value of a process, process group, or user to *value*+{NZERO}.

Target processes are specified by the values of the *which* and *who* arguments. The *which* argument may be one of the following values: PRIO_PROCESS, PRIO_PGRP, or PRIO_USER, indicating that the *who* argument is to be interpreted as a process ID, a process group ID, or an effective user ID, respectively. A 0 value for the *who* argument specifies the current process, process group, or user.

The nice value set with *setpriority*( ) shall be applied to the process. If the process is multi-threaded, the nice value shall affect all system scope threads in the process.

If more than one process is specified, *getpriority*( ) shall return value {NZERO} less than the lowest nice value pertaining to any of the specified processes, and *setpriority*( ) shall set the nice values of all of the specified processes to *value*+{NZERO}.

The default nice value is {NZERO}; lower nice values shall cause more favorable scheduling. While the range of valid nice values is [0,{NZERO}*2–1], implementations may enforce more restrictive limits. If *value*+{NZERO} is less than the system's lowest supported nice value, *setpriority*( ) shall set the nice value to the lowest supported value; if *value*+{NZERO} is greater than the system's highest supported nice value, *setpriority*( ) shall set the nice value to the highest supported value.

Only a process with appropriate privileges can lower its nice value.

PS | TPS
Any processes or threads using SCHED_FIFO or SCHED_RR shall be unaffected by a call to *setpriority*( ). This is not considered an error. A process which subsequently reverts to SCHED_OTHER need not have its priority affected by such a *setpriority*( ) call.

The effect of changing the nice value may vary depending on the process-scheduling algorithm in effect.

Since *getpriority*( ) can return the value –1 upon successful completion, it is necessary to set *errno* to 0 prior to a call to *getpriority*( ). If *getpriority*( ) returns the value –1, then *errno* can be checked to see if an error occurred or if the value is a legitimate nice value.

RETURN VALUE

Upon successful completion, *getpriority*( ) shall return an integer in the range –{NZERO} to {NZERO}–1. Otherwise, –1 shall be returned and *errno* set to indicate the error.

Upon successful completion, *setpriority*( ) shall return 0; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *getpriority*( ) and *setpriority*( ) functions shall fail if:

[ESRCH] No process could be located using the *which* and *who* argument values specified.

[EINVAL] The value of the *which* argument was not recognized, or the value of the *who* argument is not a valid process ID, process group ID, or user ID.

In addition, *setpriority*( ) may fail if:

[EPERM] A process was located, but neither the real nor effective user ID of the executing process match the effective user ID of the process whose nice value is being changed.

[EACCES] A request was made to change the nice value to a lower numeric value and the current process does not have appropriate privileges.

EXAMPLES

Using getpriority( )

The following example returns the current scheduling priority for the process ID returned by the call to *getpid*( ).

```
#include <sys/resource.h>
...
int which = PRIO_PROCESS;
id_t pid;
int ret;

pid = getpid();
ret = getpriority(which, pid);
```

Using setpriority( )

The following example sets the priority for the current process ID to –20.

```
#include <sys/resource.h>
...
int which = PRIO_PROCESS;
id_t pid;
int priority = -20;
int ret;

pid = getpid();
ret = setpriority(which, pid, priority);
```

APPLICATION USAGE

The *getpriority*( ) and *setpriority*( ) functions work with an offset nice value (nice value –{NZERO}). The nice value is in the range [0,2*{NZERO} –1], while the return value for *getpriority*( ) and the third parameter for *setpriority*( ) are in the range [–{NZERO},{NZERO} –1].

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The DESCRIPTION is reworded in terms of the nice value rather than *priority* to avoid confusion with functionality in the POSIX Realtime Extension.

35285 **NAME**

35286 getprotobyname, getprotobynumber, getprotent — network protocol database functions

35287 **SYNOPSIS**

35288 ```
#include <netdb.h>
```

35289 ```
struct protoent *getprotobyname(const char *name);
```
35290 ```
struct protoent *getprotobynumber(int proto);
```
35291 ```
struct protoent *getprotoent(void);
```

35292 **DESCRIPTION**

35293 Refer to *endprotoent( )*.

getpwent( )

NAME

getpwent — get user database entry

SYNOPSIS

XSI

```
#include <pwd.h>

struct passwd *getpwent(void);
```

DESCRIPTION

Refer to *endpwent( )*.

35301 **NAME**

35302 getpwnam, getpwnam_r — search user database for a name

35303 **SYNOPSIS**

35304
```
#include <pwd.h>
```

35305
```
struct passwd *getpwnam(const char *name);
```
35306
```
int getpwnam_r(const char *name, struct passwd *pwd, char *buffer,
```
35307
```
    size_t bufsize, struct passwd **result);
```

35308 **DESCRIPTION**

35309 The *getpwnam*( ) function shall search the user database for an entry with a matching *name*.

35310 The *getpwnam*( ) function need not be thread-safe.

35311 Applications wishing to check for error situations should set *errno* to 0 before calling
35312 *getpwnam*( ). If *getpwnam*( ) returns a null pointer and *errno* is non-zero, an error occurred.

35313 The *getpwnam_r*( ) function shall update the **passwd** structure pointed to by *pwd* and store a
35314 pointer to that structure at the location pointed to by *result*. The structure shall contain an entry
35315 from the user database with a matching *name*. Storage referenced by the structure is allocated
35316 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to
35317 *sysconf*(_SC_GETPW_R_SIZE_MAX) returns either –1 without changing *errno* or an initial value
35318 suggested for the size of this buffer. A null pointer shall be returned at the location pointed to
35319 by *result* on error or if the requested entry is not found.

35320 **RETURN VALUE**

35321 The *getpwnam*( ) function shall return a pointer to a **struct passwd** with the structure as defined
35322 in **<pwd.h>** with a matching entry if found. A null pointer shall be returned if the requested
35323 entry is not found, or an error occurs. On error, *errno* shall be set to indicate the error.

35324 The return value may point to a static area which is overwritten by a subsequent call to
35325 *getpwent*( ), *getpwnam*( ), or *getpwuid*( ).

35326 The *getpwnam_r*( ) function shall return zero on success or if the requested entry was not found
35327 and no error has occurred. If an error has occurred, an error number shall be returned to indicate
35328 the error.

35329 **ERRORS**

35330 These functions may fail if:

35331 [EIO] An I/O error has occurred.

35332 [EINTR] A signal was caught during *getpwnam*( ).

35333 [EMFILE] All file descriptors available to the process are currently open.

35334 [ENFILE] The maximum allowable number of files is currently open in the system.

35335 The *getpwnam_r*( ) function may fail if:

35336 [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be
35337 referenced by the resulting **passwd** structure.

EXAMPLES

Note that *sysconf* (_SC_GETPW_R_SIZE_MAX) may return –1 if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with *getpwnam_r*( ).

```
long int initlen = sysconf(_SC_GETPW_R_SIZE_MAX);
size_t len;
if (initlen == -1)
    /* Default initial length. */
    len = 1024;
else
    len = (size_t) initlen;
struct passwd result;
struct passwd *resultp;
char *buffer = malloc(len);
if (buffer == NULL)
    ...handle error...
int e;
while ((e = getpwnam_r("someuser", &result, buffer, len, &resultp))
        == ERANGE)
    {
    size_t newlen = 2 * len;
    if (newlen < len)
        ...handle error...
    len = newlen;
    char *newbuffer = realloc(buffer, len);
    if (newbuffer == NULL)
        ...handle error...
    buffer = newbuffer;
    }
if (e != 0)
    ...handle error...
free (buffer);
```

Getting an Entry for the Login Name

The following example uses the *getlogin*( ) function to return the name of the user who logged in; this information is passed to the *getpwnam*( ) function to get the user database entry for that user.

```
#include <sys/types.h>
#include <pwd.h>
#include <unistd.h>
#include <stdio.h>
#include <stdlib.h>
...
char *lgn;
struct passwd *pw;
...
if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
    fprintf(stderr, "Get of user information failed.\n"); exit(1);
}
...
```

APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid*(*geteuid*( )) returns the name associated with the effective user ID of the process; *getlogin*( ) returns the name associated with the current login activity; and *getpwuid*(*getuid*( )) returns the name associated with the real user ID of the process.

The *getpwnam_r*( ) function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return –1 from *sysconf*( ) indicating that there is no maximum for _SC_GETPW_R_SIZE_MAX.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getpwnam_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getpwnam*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getpwnam_r*( ) function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION describing matching the *name*.

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-166 is applied.

The *getpwnam_r*( ) function is moved from the Thread-Safe Functions option to the Base.

A minor addition is made to the EXAMPLES section, reminding the application developer to free memory allocated as if by *malloc*( ).

NAME

getpwuid, getpwuid_r — search user database for a user ID

SYNOPSIS

```
#include <pwd.h>

struct passwd *getpwuid(uid_t uid);
int getpwuid_r(uid_t uid, struct passwd *pwd, char *buffer,
    size_t bufsize, struct passwd **result);
```

DESCRIPTION

The *getpwuid*( ) function shall search the user database for an entry with a matching *uid*.

The *getpwuid*( ) function need not be thread-safe.

Applications wishing to check for error situations should set *errno* to 0 before calling *getpwuid*( ). If *getpwuid*( ) returns a null pointer and *errno* is set to non-zero, an error occurred.

The *getpwuid_r*( ) function shall update the **passwd** structure pointed to by *pwd* and store a pointer to that structure at the location pointed to by *result*. The structure shall contain an entry from the user database with a matching *uid*. Storage referenced by the structure is allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to *sysconf* (_SC_GETPW_R_SIZE_MAX) returns either –1 without changing *errno* or an initial value suggested for the size of this buffer. A null pointer shall be returned at the location pointed to by *result* on error or if the requested entry is not found.

RETURN VALUE

The *getpwuid*( ) function shall return a pointer to a **struct passwd** with the structure as defined in **<pwd.h>** with a matching entry if found. A null pointer shall be returned if the requested entry is not found, or an error occurs. On error, *errno* shall be set to indicate the error.

The return value may point to a static area which is overwritten by a subsequent call to *getpwent*( ), *getpwnam*( ), or *getpwuid*( ).

If successful, the *getpwuid_r*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EIO] An I/O error has occurred.

[EINTR] A signal was caught during *getpwuid*( ).

[EMFILE] All file descriptors available to the process are currently open.

[ENFILE] The maximum allowable number of files is currently open in the system.

The *getpwuid_r*( ) function may fail if:

[ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be referenced by the resulting **passwd** structure.

EXAMPLES

Note that *sysconf* (_SC_GETPW_R_SIZE_MAX) may return –1 if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with *getpwuid_r*( ).

```
long int initlen = sysconf(_SC_GETPW_R_SIZE_MAX);
size_t len;
if (initlen == -1)
    /* Default initial length. */
    len = 1024;
else
    len = (size_t) initlen;
struct passwd result;
struct passwd *resultp;
char *buffer = malloc(len);
if (buffer == NULL)
    ...handle error...
int e;
while ((e = getpwuid_r(42, &result, buffer, len, &resultp)) == ERANGE)
    {
    size_t newlen = 2 * len;
    if (newlen < len)
        ...handle error...
    len = newlen;
    char *newbuffer = realloc(buffer, len);
    if (newbuffer == NULL)
        ...handle error...
    buffer = newbuffer;
    }
if (e != 0)
    ...handle error...
free (buffer);
```

Getting an Entry for the Root User

The following example gets the user database entry for the user with user ID 0 (root).

```
#include <sys/types.h>
#include <pwd.h>
...
uid_t id = 0;
struct passwd *pwd;

pwd = getpwuid(id);
```

35509 **Finding the Name for the Effective User ID**

35510 The following example defines *pws* as a pointer to a structure of type **passwd**, which is used to
35511 store the structure pointer returned by the call to the *getpwuid*( ) function. The *geteuid*( ) function
35512 shall return the effective user ID of the calling process; this is used as the search criteria for the
35513 *getpwuid*( ) function. The call to *getpwuid*( ) shall return a pointer to the structure containing that
35514 user ID value.

```
35515 #include <unistd.h>
35516 #include <sys/types.h>
35517 #include <pwd.h>
35518 ...
35519 struct passwd *pws;
35520 pws = getpwuid(geteuid());
```

35521 **Finding an Entry in the User Database**

35522 The following example uses *getpwuid*( ) to search the user database for a user ID that was
35523 previously stored in a **stat** structure, then prints out the user name if it is found. If the user is not
35524 found, the program prints the numeric value of the user ID for the entry.

```
35525 #include <sys/types.h>
35526 #include <pwd.h>
35527 #include <stdio.h>
35528 ...
35529 struct stat statbuf;
35530 struct passwd *pwd;
35531 ...
35532 if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
35533     printf(" %-8.8s", pwd->pw_name);
35534 else
35535     printf(" %-8d", statbuf.st_uid);
```

35536 **APPLICATION USAGE**

35537 Three names associated with the current process can be determined: *getpwuid*(*geteuid*( )) returns
35538 the name associated with the effective user ID of the process; *getlogin*( ) returns the name
35539 associated with the current login activity; and *getpwuid*(*getuid*( )) returns the name associated
35540 with the real user ID of the process.

35541 The *getpwuid_r*( ) function is thread-safe and returns values in a user-supplied buffer instead of
35542 possibly using a static data area that may be overwritten by each call.

35543 Portable applications should take into account that it is usual for an implementation to return –1
35544 from *sysconf*( ) indicating that there is no maximum for _SC_GETPW_R_SIZE_MAX.

35545 **RATIONALE**

35546 None.

35547 **FUTURE DIRECTIONS**

35548 None.

35550 *getpwnam*( ), *geteuid*( ), *getuid*( ), *getlogin*( ), *sysconf*( )

35551 XBD **<pwd.h>**, **<sys/types.h>**

35552 **CHANGE HISTORY**

35553 First released in Issue 1. Derived from System V Release 2.0.

35554 **Issue 5**

35555 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
35556 VALUE section.

35557 The *getpwuid_r*( ) function is included for alignment with the POSIX Threads Extension.

35558 A note indicating that the *getpwuid*( ) function need not be reentrant is added to the
35559 DESCRIPTION.

35560 **Issue 6**

35561 The *getpwuid_r*( ) function is marked as part of the Thread-Safe Functions option.

35562 The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION
35563 describing matching the *uid*.

35564 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

35565 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

35566 The following new requirements on POSIX implementations derive from alignment with the
35567 Single UNIX Specification:

35568 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
35569 required for conforming implementations of previous POSIX specifications, it was not
35570 required for UNIX applications.

35571 • In the RETURN VALUE section, the requirement to set *errno* on error is added.

35572 • The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

35573 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
35574 its avoidance of possibly using a static data area.

35575 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the
35576 buffer from *bufsize* characters to bytes.

35577 **Issue 7**

35578 Austin Group Interpretation 1003.1-2001 #156 is applied.

35579 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

35580 SD5-XSH-ERN-166 is applied.

35581 The *getpwuid_r*( ) function is moved from the Thread-Safe Functions option to the Base.

35582 A minor addition is made to the EXAMPLES section, reminding the application developer to
35583 free memory allocated as if by *malloc*( ).

35584 **NAME**

35585 getrlimit, setrlimit — control maximum resource consumption

35586 **SYNOPSIS**

35587 XSI
```
#include <sys/resource.h>

int getrlimit(int resource, struct rlimit *rlp);
int setrlimit(int resource, const struct rlimit *rlp);
```

35590 **DESCRIPTION**

35591 The *getrlimit*( ) function shall get, and the *setrlimit*( ) function shall set, limits on the consumption
35592 of a variety of resources.

35593 Each call to either *getrlimit*( ) or *setrlimit*( ) identifies a specific resource to be operated upon as
35594 well as a resource limit. A resource limit is represented by an **rlimit** structure. The *rlim_cur*
35595 member specifies the current or soft limit and the *rlim_max* member specifies the maximum or
35596 hard limit. Soft limits may be changed by a process to any value that is less than or equal to the
35597 hard limit. A process may (irreversibly) lower its hard limit to any value that is greater than or
35598 equal to the soft limit. Only a process with appropriate privileges can raise a hard limit. Both
35599 hard and soft limits can be changed in a single call to *setrlimit*( ) subject to the constraints
35600 described above.

35601 The value RLIM_INFINITY, defined in **<sys/resource.h>**, shall be considered to be larger than
35602 any other limit value. If a call to *getrlimit*( ) returns RLIM_INFINITY for a resource, it means the
35603 implementation shall not enforce limits on that resource. Specifying RLIM_INFINITY as any
35604 resource limit value on a successful call to *setrlimit*( ) shall inhibit enforcement of that resource
35605 limit.

35606 The following resources are defined:

35607 RLIMIT_CORE — This is the maximum size of a **core** file, in bytes, that may be created by a
35608 process. A limit of 0 shall prevent the creation of a **core** file. If this limit is
35609 exceeded, the writing of a **core** file shall terminate at this size.

35610 RLIMIT_CPU — This is the maximum amount of CPU time, in seconds, used by a process.
35611 If this limit is exceeded, SIGXCPU shall be generated for the process. If
35612 the process is catching or ignoring SIGXCPU, or all threads belonging to
35613 that process are blocking SIGXCPU, the behavior is unspecified.

35614 RLIMIT_DATA — This is the maximum size of a data segment of the process, in bytes. If
35615 this limit is exceeded, the *malloc*( ) function shall fail with *errno* set to
35616 [ENOMEM].

35617 RLIMIT_FSIZE — This is the maximum size of a file, in bytes, that may be created by a
35618 process. If a write or truncate operation would cause this limit to be
35619 exceeded, SIGXFSZ shall be generated for the thread. If the thread is
35620 blocking, or the process is catching or ignoring SIGXFSZ, continued
35621 attempts to increase the size of a file from end-of-file to beyond the limit
35622 shall fail with *errno* set to [EFBIG].

35623 RLIMIT_NOFILE — This is a number one greater than the maximum value that the system
35624 may assign to a newly-created descriptor. If this limit is exceeded,
35625 functions that allocate a file descriptor shall fail with *errno* set to
35626 [EMFILE]. This limit constrains the number of file descriptors that a
35627 process may allocate.

RLIMIT_STACK This is the maximum size of the initial thread's stack, in bytes. The implementation does not automatically grow the stack beyond this limit. If this limit is exceeded, SIGSEGV shall be generated for the thread. If the thread is blocking SIGSEGV, or the process is ignoring or catching SIGSEGV and has not made arrangements to use an alternate stack, the disposition of SIGSEGV shall be set to SIG_DFL before it is generated.

RLIMIT_AS This is the maximum size of total available memory of the process, in bytes. If this limit is exceeded, the *malloc*( ) and *mmap*( ) functions shall fail with *errno* set to [ENOMEM]. In addition, the automatic stack growth fails with the effects outlined above.

When using the *getrlimit*( ) function, if a resource limit can be represented correctly in an object of type **rlim_t**, then its representation is returned; otherwise, if the value of the resource limit is equal to that of the corresponding saved hard limit, the value returned shall be RLIM_SAVED_MAX; otherwise, the value returned shall be RLIM_SAVED_CUR.

When using the *setrlimit*( ) function, if the requested new limit is RLIM_INFINITY, the new limit shall be "no limit"; otherwise, if the requested new limit is RLIM_SAVED_MAX, the new limit shall be the corresponding saved hard limit; otherwise, if the requested new limit is RLIM_SAVED_CUR, the new limit shall be the corresponding saved soft limit; otherwise, the new limit shall be the requested value. In addition, if the corresponding saved limit can be represented correctly in an object of type **rlim_t** then it shall be overwritten with the new limit.

The result of setting a limit to RLIM_SAVED_MAX or RLIM_SAVED_CUR is unspecified unless a previous call to *getrlimit*( ) returned that value as the soft or hard limit for the corresponding resource limit.

The determination of whether a limit can be correctly represented in an object of type **rlim_t** is implementation-defined. For example, some implementations permit a limit whose value is greater than RLIM_INFINITY and others do not.

The *exec* family of functions shall cause resource limits to be saved.

RETURN VALUE

Upon successful completion, *getrlimit*( ) and *setrlimit*( ) shall return 0. Otherwise, these functions shall return –1 and set *errno* to indicate the error.

ERRORS

The *getrlimit*( ) and *setrlimit*( ) functions shall fail if:

[EINVAL] An invalid *resource* was specified; or in a *setrlimit*( ) call, the new *rlim_cur* exceeds the new *rlim_max*.

[EPERM] The limit specified to *setrlimit*( ) would have raised the maximum limit value, and the calling process does not have appropriate privileges.

The *setrlimit*( ) function may fail if:

[EINVAL] The limit specified cannot be lowered because current usage is already higher than the limit.

EXAMPLES

None.

APPLICATION USAGE

If a process attempts to set the hard limit or soft limit for RLIMIT_NOFILE to less than the value of {_POSIX_OPEN_MAX} from **<limits.h>**, unexpected behavior may occur.

If a process attempts to set the hard limit or soft limit for RLIMIT_NOFILE to less than the highest currently open file descriptor +1, unexpected behavior may occur.

RATIONALE

It should be noted that RLIMIT_STACK applies "at least" to the stack of the initial thread in the process, and not to the sum of all the stacks in the process, as that would be very limiting unless the value is so big as to provide no value at all with a single thread.

FUTURE DIRECTIONS

None.

XBD **<stropts.h>**, **<sys/resource.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

An APPLICATION USAGE section is added.

Large File Summit extensions are added.

Issue 6

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/25 is applied, changing wording for RLIMIT_NOFILE in the DESCRIPTION related to functions that allocate a file descriptor failing with [EMFILE]. Text is added to the APPLICATION USAGE section noting the consequences of a process attempting to set the hard or soft limit for RLIMIT_NOFILE less than the highest currently open file descriptor +1.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/46 is applied, updating the definition of RLIMIT_STACK in the DESCRIPTION from "the maximum size of a process stack" to "the maximum size of the initial thread's stack". Text is added to the RATIONALE section.

NAME

getrusage — get information about resource utilization

SYNOPSIS

XSI
```
#include <sys/resource.h>

int getrusage(int who, struct rusage *r_usage);
```

DESCRIPTION

The *getrusage*( ) function shall provide measures of the resources used by the current process or its terminated and waited-for child processes. If the value of the *who* argument is RUSAGE_SELF, information shall be returned about resources used by the current process. If the value of the *who* argument is RUSAGE_CHILDREN, information shall be returned about resources used by the terminated and waited-for children of the current process. If the child is never waited for (for example, if the parent has SA_NOCLDWAIT set or sets SIGCHLD to SIG_IGN), the resource information for the child process is discarded and not included in the resource information provided by *getrusage*( ).

The *r_usage* argument is a pointer to an object of type **struct rusage** in which the returned information is stored.

RETURN VALUE

Upon successful completion, *getrusage*( ) shall return 0; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *getrusage*( ) function shall fail if:

[EINVAL] The value of the *who* argument is not valid.

EXAMPLES

Using getrusage( )

The following example returns information about the resources used by the current process.

```
#include <sys/resource.h>
...
int who = RUSAGE_SELF;
struct rusage usage;
int ret;

ret = getrusage(who, &usage);
```

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

35742 **NAME**

35743 gets — get a string from a *stdin* stream

35744 **SYNOPSIS**

35745 OB
```
#include <stdio.h>
```
35746
```
char *gets(char *s);
```

35747 **DESCRIPTION**

35748 CX The functionality described on this reference page is aligned with the ISO C standard. Any
35749 conflict between the requirements described here and the ISO C standard is unintentional. This
35750 volume of POSIX.1-200x defers to the ISO C standard.

35751 The *gets*( ) function shall read bytes from the standard input stream, *stdin*, into the array pointed
35752 to by *s*, until a <newline> is read or an end-of-file condition is encountered. Any <newline> shall
35753 be discarded and a null byte shall be placed immediately after the last byte read into the array.

35754 CX The *gets*( ) function may mark the last data access timestamp of the file associated with *stream* for
35755 update. The last data access timestamp shall be marked for update by the first successful
35756 execution of *fgetc*( ), *fgets*( ), *fread*( ), *fscanf*( ), *getc*( ), *getchar*( ), *getdelim*( ), *getline*( ), *gets*( ), or
35757 *scanf*( ) using *stream* that returns data not supplied by a prior call to *ungetc*( ).

35758 **RETURN VALUE**

35759 Upon successful completion, *gets*( ) shall return *s*. If the end-of-file indicator for the stream is set,
35760 or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and *gets*( )
35761 shall return a null pointer. If a read error occurs, the error indicator for the stream shall be set,
35762 CX *gets*( ) shall return a null pointer, and set *errno* to indicate the error.

35763 **ERRORS**

35764 Refer to *fgetc*( ).

35765 **EXAMPLES**

35766 None.

35767 **APPLICATION USAGE**

35768 Reading a line that overflows the array pointed to by *s* results in undefined behavior. The use of
35769 *fgets*( ) is recommended.

35770 Since the user cannot specify the length of the buffer passed to *gets*( ), use of this function is
35771 discouraged. The length of the string read is unlimited. It is possible to overflow this buffer in
35772 such a way as to cause applications to fail, or possible system security violations.

35773 Applications should use the *fgets*( ) function instead of the obsolescent *gets*( ) function.

35774 **RATIONALE**

35775 The standard developers decided to mark the *gets*( ) function as obsolescent even though it is in
35776 the ISO C standard due to the possibility of buffer overflow.

35777 **FUTURE DIRECTIONS**

35778 The *gets*( ) function may be removed in a future version.

35779 **SEE ALSO**

35780 *feof*( ), *ferror*( ), *fgets*( )

35781 XBD **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

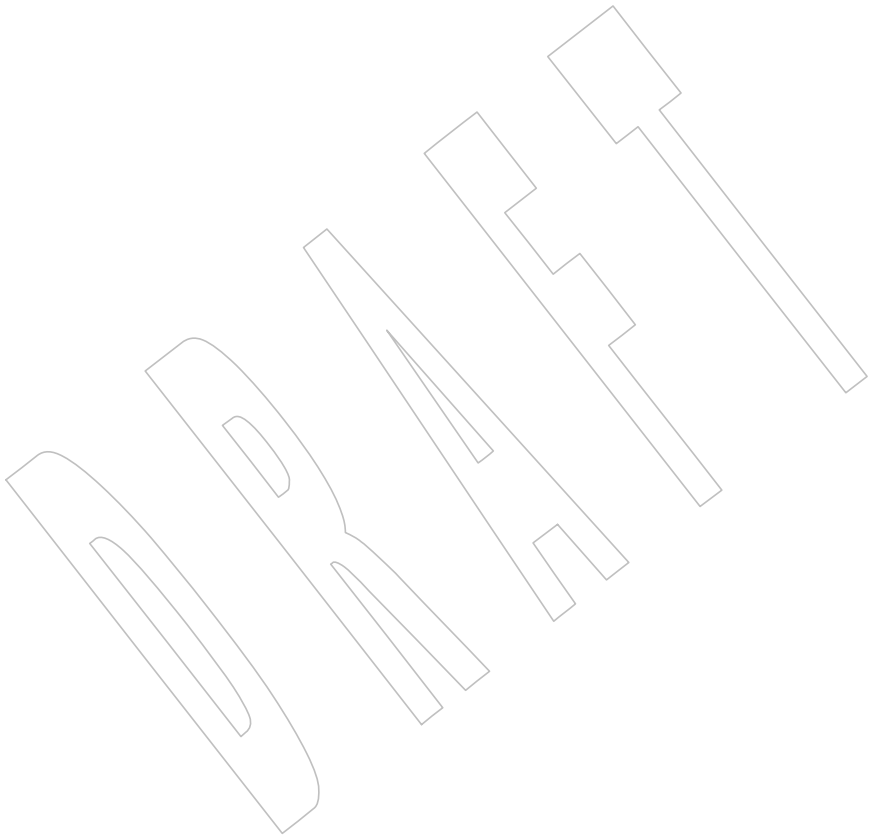
Extensions beyond the ISO C standard are marked.

Issue 7

Austin Group Interpretation 1003.1-2001 #051 is applied, clarifying the RETURN VALUE section.

The *gets*( ) function is marked obsolescent.

Changes are made related to support for finegrained timestamps.



getservbyname( )

35790 **NAME**

35791 getservbyname, getservbyport, getservent — network services database functions

35792 **SYNOPSIS**

35793 ```
#include <netdb.h>
```

35794 ```
struct servent *getservbyname(const char *name, const char *proto);
```
35795 ```
struct servent *getservbyport(int port, const char *proto);
```
35796 ```
struct servent *getservent(void);
```

35797 **DESCRIPTION**

35798 Refer to *endservent( )*.

35799 **NAME**

35800 getsid — get the process group ID of a session leader

35801 **SYNOPSIS**

35802
```
#include <unistd.h>
```

35803
```
pid_t getsid(pid_t pid);
```

35804 **DESCRIPTION**

35805 The *getsid*( ) function shall obtain the process group ID of the process that is the session leader of
35806 the process specified by *pid*. If *pid* is (**pid_t**)0, it specifies the calling process.

35807 **RETURN VALUE**

35808 Upon successful completion, *getsid*( ) shall return the process group ID of the session leader of
35809 the specified process. Otherwise, it shall return (**pid_t**)–1 and set *errno* to indicate the error.

35810 **ERRORS**

35811 The *getsid*( ) function shall fail if:

35812 [EPERM] The process specified by *pid* is not in the same session as the calling process,
35813 and the implementation does not allow access to the process group ID of the
35814 session leader of that process from the calling process.

35815 [ESRCH] There is no process with a process ID equal to *pid*.

35816 **EXAMPLES**

35817 None.

35818 **APPLICATION USAGE**

35819 None.

35820 **RATIONALE**

35821 None.

35822 **FUTURE DIRECTIONS**

35823 None.

35827 **CHANGE HISTORY**

35828 First released in Issue 4, Version 2.

35829 **Issue 5**

35830 Moved from X/OPEN UNIX extension to BASE.

35831 **Issue 7**

35832 The *getsid*( ) function is moved from the XSI option to the Base.

35833 **NAME**

35834 getsockname — get the socket name

35835 **SYNOPSIS**

35836
```
#include <sys/socket.h>
```

35837
```
int getsockname(int socket, struct sockaddr *restrict address,
```
35838
```
    socklen_t *restrict address_len);
```

35839 **DESCRIPTION**

35840 The *getsockname*( ) function shall retrieve the locally-bound name of the specified socket, store
35841 this address in the **sockaddr** structure pointed to by the *address* argument, and store the length of
35842 this address in the object pointed to by the *address_len* argument.

35843 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,
35844 the stored address shall be truncated.

35845 If the socket has not been bound to a local name, the value stored in the object pointed to by
35846 *address* is unspecified.

35847 **RETURN VALUE**

35848 Upon successful completion, 0 shall be returned, the *address* argument shall point to the address
35849 of the socket, and the *address_len* argument shall point to the length of the address. Otherwise, –1
35850 shall be returned and *errno* set to indicate the error.

35851 **ERRORS**

35852 The *getsockname*( ) function shall fail if:

35853 [EBADF] The *socket* argument is not a valid file descriptor.

35854 [ENOTSOCK] The *socket* argument does not refer to a socket.

35855 [EOPNOTSUPP] The operation is not supported for this socket's protocol.

35856 The *getsockname*( ) function may fail if:

35857 [EINVAL] The socket has been shut down.

35858 [ENOBUFS] Insufficient resources were available in the system to complete the function.

35859 **EXAMPLES**

35860 None.

35861 **APPLICATION USAGE**

35862 None.

35863 **RATIONALE**

35864 None.

35865 **FUTURE DIRECTIONS**

35866 None.

35867 **SEE ALSO**

35868 *accept*( ), *bind*( ), *getpeername*( ), *socket*( )

35869 XBD **<sys/socket.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getsockname*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

35874 **NAME**

35875 getsockopt — get the socket options

35876 **SYNOPSIS**

35877
```
#include <sys/socket.h>
```

35878
```
int getsockopt(int socket, int level, int option_name,
```
35879
```
    void *restrict option_value, socklen_t *restrict option_len);
```

35880 **DESCRIPTION**

35881 The *getsockopt*( ) function manipulates options associated with a socket.

35882 The *getsockopt*( ) function shall retrieve the value for the option specified by the *option_name*
35883 argument for the socket specified by the *socket* argument. If the size of the option value is greater
35884 than *option_len*, the value stored in the object pointed to by the *option_value* argument shall be
35885 silently truncated. Otherwise, the object pointed to by the *option_len* argument shall be modified
35886 to indicate the actual length of the value.

35887 The *level* argument specifies the protocol level at which the option resides. To retrieve options at
35888 the socket level, specify the *level* argument as SOL_SOCKET. To retrieve options at other levels,
35889 supply the appropriate level identifier for the protocol controlling the option. For example, to
35890 indicate that an option is interpreted by the TCP (Transmission Control Protocol), set *level* to
35891 IPPROTO_TCP as defined in the **<netinet/in.h>** header.

35892 The socket in use may require the process to have appropriate privileges to use the *getsockopt*( )
35893 function.

35894 The *option_name* argument specifies a single option to be retrieved. It can be one of the socket-
35895 level options defined in **<sys/socket.h>** and described in Section 2.10.16 (on page 522).

35896 **RETURN VALUE**

35897 Upon successful completion, *getsockopt*( ) shall return 0; otherwise, –1 shall be returned and *errno*
35898 set to indicate the error.

35899 **ERRORS**

35900 The *getsockopt*( ) function shall fail if:

35901 [EBADF] The *socket* argument is not a valid file descriptor.

35902 [EINVAL] The specified option is invalid at the specified socket level.

35903 [ENOPROTOOPT]
35904 The option is not supported by the protocol.

35905 [ENOTSOCK] The *socket* argument does not refer to a socket.

35906 The *getsockopt*( ) function may fail if:

35907 [EACCES] The calling process does not have appropriate privileges.

35908 [EINVAL] The socket has been shut down.

35909 [ENOBUFS] Insufficient resources are available in the system to complete the function.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getsockopt*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/47 is applied, updating the description of SO_LINGER in the DESCRIPTION so that it blocks the calling thread rather than the process.

Issue 7

Austin Group Interpretation 1003.1-2001 #158 is applied, removing text relating to socket options that is now in Section 2.10.16 (on page 522).

NAME

getsubopt — parse suboption arguments from a string

SYNOPSIS

```
#include <stdlib.h>

int getsubopt(char **optionp, char * const *keylistp, char **valuep);
```

DESCRIPTION

The *getsubopt*( ) function shall parse suboption arguments in a flag argument. Such options often result from the use of *getopt*( ).

The *getsubopt*( ) argument *optionp* is a pointer to a pointer to the option argument string. The suboption arguments shall be separated by <comma> characters and each may consist of either a single token, or a token-value pair separated by an <equals-sign>.

The *keylistp* argument shall be a pointer to a vector of strings. The end of the vector is identified by a null pointer. Each entry in the vector is one of the possible tokens that might be found in **optionp*. Since <comma> characters delimit suboption arguments in *optionp*, they should not appear in any of the strings pointed to by *keylistp*. Similarly, because an <equals-sign> separates a token from its value, the application should not include an <equals-sign> in any of the strings pointed to by *keylistp*.

The *valuep* argument is the address of a value string pointer.

If a <comma> appears in *optionp*, it shall be interpreted as a suboption separator. After <comma> characters have been processed, if there are one or more <equals-sign> characters in a suboption string, the first <equals-sign> in any suboption string shall be interpreted as a separator between a token and a value. Subsequent <equals-sign> characters in a suboption string shall be interpreted as part of the value.

If the string at **optionp* contains only one suboption argument (equivalently, no <comma> characters), *getsubopt*( ) shall update **optionp* to point to the null character at the end of the string. Otherwise, it shall isolate the suboption argument by replacing the <comma> separator with a null character, and shall update **optionp* to point to the start of the next suboption argument. If the suboption argument has an associated value (equivalently, contains an <equals-sign>), *getsubopt*( ) shall update **valuep* to point to the value's first character. Otherwise, it shall set **valuep* to a null pointer. The calling application may use this information to determine whether the presence or absence of a value for the suboption is an error.

Additionally, when *getsubopt*( ) fails to match the suboption argument with a token in the *keylistp* array, the calling application should decide if this is an error, or if the unrecognized option should be processed in another way.

RETURN VALUE

The *getsubopt*( ) function shall return the index of the matched token string, or –1 if no token strings were matched.

ERRORS

No errors are defined.

EXAMPLES

```
#include <stdio.h>
#include <stdlib.h>

int do_all;
const char *type;
int read_size;
int write_size;
int read_only;

enum
{
    RO_OPTION = 0,
    RW_OPTION,
    READ_SIZE_OPTION,
    WRITE_SIZE_OPTION
};

const char *mount_opts[] =
{
    [RO_OPTION] = "ro",
    [RW_OPTION] = "rw",
    [READ_SIZE_OPTION] = "rsize",
    [WRITE_SIZE_OPTION] = "wsize",
    NULL
};

int
main(int argc, char *argv[])
{
    char *subopts, *value;
    int opt;

    while ((opt = getopt(argc, argv, "at:o:")) != -1)
        switch(opt)
            {
            case 'a':
                do_all = 1;
                break;
            case 't':
                type = optarg;
                break;
            case 'o':
                subopts = optarg;
                while (*subopts != '\0')
                    switch(getsubopt(&subopts, mount_opts, &value))
                {
                case RO_OPTION:
                    read_only = 1;
                    break;
                case RW_OPTION:
                    read_only = 0;
                    break;
                case READ_SIZE_OPTION:
```

```
                        if (value == NULL)
                            abort();
                        read_size = atoi(value);
                        break;
                    case WRITE_SIZE_OPTION:
                        if (value == NULL)
                            abort();
                        write_size = atoi(value);
                        break;
                    default:
                        /* Unknown suboption. */
                        printf("Unknown suboption ‘%s’\n", value);
                        break;
                    }
                break;
            default:
                abort();
            }

        /* Do the real work. */

        return 0;
    }
```

Parsing Suboptions

The following example uses the *getsubopt*( ) function to parse a *value* argument in the *optarg* external variable returned by a call to *getopt*( ).

```
#include <stdlib.h>
...
char *tokens[] = {"HOME", "PATH", "LOGNAME", (char *) NULL };
char *value;
int opt, index;

while ((opt = getopt(argc, argv, "e:")) != -1) {
    switch(opt)  {
    case ’e’ :
        while ((index = getsubopt(&optarg, tokens, &value)) != -1) {
            switch(index) {
...
        }
        break;
...
    }
}
...
```

NAME

gettimeofday — get the date and time

SYNOPSIS

OB XSI
```
#include <sys/time.h>

int gettimeofday(struct timeval *restrict tp, void *restrict tzp);
```

DESCRIPTION

The *gettimeofday*( ) function shall obtain the current time, expressed as seconds and microseconds since the Epoch, and store it in the **timeval** structure pointed to by *tp*. The resolution of the system clock is unspecified.

If *tzp* is not a null pointer, the behavior is unspecified.

RETURN VALUE

The *gettimeofday*( ) function shall return 0 and no value shall be reserved to indicate an error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Applications should use the *clock_gettime*( ) function instead of the obsolescent *gettimeofday*( ) function.

RATIONALE

None.

FUTURE DIRECTIONS

The *gettimeofday*( ) function may be removed in a future version.

SEE ALSO

clock_getres( ), *ctime*( )

XBD **<sys/time.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The DESCRIPTION is updated to refer to "seconds since the Epoch" rather than "seconds since 00:00:00 UTC (Coordinated Universal Time), January 1 1970" for consistency with other *time* functions.

The **restrict** keyword is added to the *gettimeofday*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

The *gettimeofday*( ) function is marked obsolescent.

NAME

getuid — get a real user ID

SYNOPSIS

```
#include <unistd.h>

uid_t getuid(void);
```

DESCRIPTION

The *getuid*( ) function shall return the real user ID of the calling process.

RETURN VALUE

The *getuid*( ) function shall always be successful and no return value is reserved to indicate the error.

ERRORS

No errors are defined.

EXAMPLES

Setting the Effective User ID to the Real User ID

The following example sets the effective user ID and the real user ID of the current process to the real user ID of the caller.

```
#include <unistd.h>
#include <sys/types.h>
...
setreuid(getuid(), getuid());
...
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

getutxent( )

NAME

getutxent, getutxid, getutxline — get user accounting database entries

SYNOPSIS

XSI

```
#include <utmpx.h>

struct utmpx *getutxent(void);
struct utmpx *getutxid(const struct utmpx *id);
struct utmpx *getutxline(const struct utmpx *line);
```

DESCRIPTION

Refer to *endutxent( )*.

NAME

getwc — get a wide character from a stream

SYNOPSIS

```
#include <stdio.h>
#include <wchar.h>

wint_t getwc(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *getwc*( ) function shall be equivalent to *fgetwc*( ), except that if it is implemented as a macro it may evaluate *stream* more than once, so the argument should never be an expression with side-effects.

RETURN VALUE

Refer to *fgetwc*( ).

ERRORS

Refer to *fgetwc*( ).

EXAMPLES

None.

APPLICATION USAGE

Since it may be implemented as a macro, *getwc*( ) may treat incorrectly a *stream* argument with side-effects. In particular, *getwc*(*f*++) does not necessarily work as expected. Therefore, use of this function is not recommended; *fgetwc*( ) should be used instead.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

fgetwc( )

CHANGE HISTORY

First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working draft.

Issue 5

The Optional Header (OH) marking is removed from **<stdio.h>**.

NAME

getwchar — get a wide character from a *stdin* stream

SYNOPSIS

```
#include <wchar.h>

wint_t getwchar(void);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *getwchar*( ) function shall be equivalent to *getwc*(*stdin*).

RETURN VALUE

Refer to *fgetwc*( ).

ERRORS

Refer to *fgetwc*( ).

EXAMPLES

None.

APPLICATION USAGE

If the **wint_t** value returned by *getwchar*( ) is stored into a variable of type **wchar_t** and then compared against the **wint_t** macro WEOF, the result may be incorrect. Only the **wint_t** type is guaranteed to be able to represent any wide character and WEOF.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

glob, globfree — generate pathnames matching a pattern

SYNOPSIS

```
#include <glob.h>

int glob(const char *restrict pattern, int flags,
    int(*errfunc)(const char *epath, int eerrno),
    glob_t *restrict pglob);
void globfree(glob_t *pglob);
```

DESCRIPTION

The *glob*( ) function is a pathname generator that shall implement the rules defined in XCU Section 2.13 (on page 2332), with optional support for rule 3 in XCU Section 2.13.3 (on page 2333).

The structure type **glob_t** is defined in **<glob.h>** and includes at least the following members:

Member Type	Member Name	Description
size_t	*gl_pathc*	Count of paths matched by *pattern*.
**char ** **	*gl_pathv*	Pointer to a list of matched pathnames.
size_t	*gl_offs*	Slots to reserve at the beginning of *gl_pathv*.

The argument *pattern* is a pointer to a pathname pattern to be expanded. The *glob*( ) function shall match all accessible pathnames against this pattern and develop a list of all pathnames that match. In order to have access to a pathname, *glob*( ) requires search permission on every component of a path except the last, and read permission on each directory of any filename component of *pattern* that contains any of the following special characters: `'*'`, `'?'`, and `'['`.

The *glob*( ) function shall store the number of matched pathnames into *pglob->gl_pathc* and a pointer to a list of pointers to pathnames into *pglob->gl_pathv*. The pathnames shall be in sort order as defined by the current setting of the *LC_COLLATE* category; see XBD Section 7.3.2 (on page 146). The first pointer after the last pathname shall be a null pointer. If the pattern does not match any pathnames, the returned number of matched paths is set to 0, and the contents of *pglob->gl_pathv* are implementation-defined.

It is the caller's responsibility to create the structure pointed to by *pglob*. The *glob*( ) function shall allocate other space as needed, including the memory pointed to by *gl_pathv*. The *globfree*( ) function shall free any space associated with *pglob* from a previous call to *glob*( ).

The *flags* argument is used to control the behavior of *glob*( ). The value of *flags* is a bitwise-inclusive OR of zero or more of the following constants, which are defined in **<glob.h>**:

GLOB_APPEND — Append pathnames generated to the ones from a previous call to *glob*( ).

GLOB_DOOFFS — Make use of *pglob->gl_offs*. If this flag is set, *pglob->gl_offs* is used to specify how many null pointers to add to the beginning of *pglob->gl_pathv*. In other words, *pglob->gl_pathv* shall point to *pglob->gl_offs* null pointers, followed by *pglob->gl_pathc* pathname pointers, followed by a null pointer.

GLOB_ERR — Cause *glob*( ) to return when it encounters a directory that it cannot open or read. Ordinarily, *glob*( ) continues to find matches.

GLOB_MARK — Each pathname that is a directory that matches *pattern* shall have a <slash> appended.

GLOB_NOCHECK Supports rule 3 in XCU Section 2.13.3 (on page 2333). If *pattern* does not match any pathname, then *glob*( ) shall return a list consisting of only *pattern*, and the number of matched pathnames is 1.

GLOB_NOESCAPE Disable backslash escaping.

GLOB_NOSORT Ordinarily, *glob*( ) sorts the matching pathnames according to the current setting of the *LC_COLLATE* category; see XBD Section 7.3.2 (on page 146). When this flag is used, the order of pathnames returned is unspecified.

The GLOB_APPEND flag can be used to append a new set of pathnames to those found in a previous call to *glob*( ). The following rules apply to applications when two or more calls to *glob*( ) are made with the same value of *pglob* and without intervening calls to *globfree*( ):

1. The first such call shall not set GLOB_APPEND. All subsequent calls shall set it.
2. All the calls shall set GLOB_DOOFFS, or all shall not set it.
3. After the second call, *pglob*−>*gl_pathv* points to a list containing the following:
   a. Zero or more null pointers, as specified by GLOB_DOOFFS and *pglob*−>*gl_offs*.
   b. Pointers to the pathnames that were in the *pglob*−>*gl_pathv* list before the call, in the same order as before.
   c. Pointers to the new pathnames generated by the second call, in the specified order.
4. The count returned in *pglob*−>*gl_pathc* shall be the total number of pathnames from the two calls.
5. The application can change any of the fields after a call to *glob*( ). If it does, the application shall reset them to the original value before a subsequent call, using the same *pglob* value, to *globfree*( ) or *glob*( ) with the GLOB_APPEND flag.

If, during the search, a directory is encountered that cannot be opened or read and *errfunc* is not a null pointer, *glob*( ) calls (**errfunc*( )) with two arguments:

1. The *epath* argument is a pointer to the path that failed.
2. The *eerrno* argument is the value of *errno* from the failure, as set by *opendir*( ), *readdir*( ), or *stat*( ). (Other values may be used to report other errors not explicitly documented for those functions.)

If (**errfunc*( )) is called and returns non-zero, or if the GLOB_ERR flag is set in *flags*, *glob*( ) shall stop the scan and return GLOB_ABORTED after setting *gl_pathc* and *gl_pathv* in *pglob* to reflect the paths already scanned. If GLOB_ERR is not set and either *errfunc* is a null pointer or (**errfunc*( )) returns 0, the error shall be ignored.

The *glob*( ) function shall not fail because of large files.

RETURN VALUE

Upon successful completion, *glob*( ) shall return 0. The argument *pglob*−>*gl_pathc* shall return the number of matched pathnames and the argument *pglob*−>*gl_pathv* shall contain a pointer to a null-terminated list of matched and sorted pathnames. However, if *pglob*−>*gl_pathc* is 0, the content of *pglob*−>*gl_pathv* is undefined.

The *globfree*( ) function shall not return a value.

If *glob*( ) terminates due to an error, it shall return one of the non-zero constants defined in **<glob.h>**. The arguments *pglob*−>*gl_pathc* and *pglob*−>*gl_pathv* are still set as defined above.

ERRORS

The *glob*( ) function shall fail and return the corresponding value if:

GLOB_ABORTED — The scan was stopped because GLOB_ERR was set or (**errfunc*( )) returned non-zero.

GLOB_NOMATCH — The pattern does not match any existing pathname, and GLOB_NOCHECK was not set in flags.

GLOB_NOSPACE — An attempt to allocate memory failed.

EXAMPLES

One use of the GLOB_DOOFFS flag is by applications that build an argument list for use with *execv*( ), *execve*( ), or *execvp*( ). Suppose, for example, that an application wants to do the equivalent of:

```
ls -l *.c
```

but for some reason:

```
system("ls -l *.c")
```

is not acceptable. The application could obtain approximately the same result using the sequence:

```
globbuf.gl_offs = 2;
glob("*.c", GLOB_DOOFFS, NULL, &globbuf);
globbuf.gl_pathv[0] = "ls";
globbuf.gl_pathv[1] = "-l";
execvp("ls", &globbuf.gl_pathv[0]);
```

Using the same example:

```
ls -l *.c *.h
```

could be approximately simulated using GLOB_APPEND as follows:

```
globbuf.gl_offs = 2;
glob("*.c", GLOB_DOOFFS, NULL, &globbuf);
glob("*.h", GLOB_DOOFFS|GLOB_APPEND, NULL, &globbuf);
...
```

APPLICATION USAGE

This function is not provided for the purpose of enabling utilities to perform pathname expansion on their arguments, as this operation is performed by the shell, and utilities are explicitly not expected to redo this. Instead, it is provided for applications that need to do pathname expansion on strings obtained from other sources, such as a pattern typed by a user or read from a file.

If a utility needs to see if a pathname matches a given pattern, it can use *fnmatch*( ).

Note that *gl_pathc* and *gl_pathv* have meaning even if *glob*( ) fails. This allows *glob*( ) to report partial results in the event of an error. However, if *gl_pathc* is 0, *gl_pathv* is unspecified even if *glob*( ) did not return an error.

The GLOB_NOCHECK option could be used when an application wants to expand a pathname if wildcards are specified, but wants to treat the pattern as just a string otherwise. The *sh* utility might use this for option-arguments, for example.

The new pathnames generated by a subsequent call with GLOB_APPEND are not sorted together with the previous pathnames. This mirrors the way that the shell handles pathname

expansion when multiple expansions are done on a command line.

Applications that need tilde and parameter expansion should use *wordexp*( ).

RATIONALE

It was claimed that the GLOB_DOOFFS flag is unnecessary because it could be simulated using:

```
new = (char **)malloc((n + pglob->gl_pathc + 1)
       * sizeof(char *));
(void) memcpy(new+n, pglob->gl_pathv,
       pglob->gl_pathc * sizeof(char *));
(void) memset(new, 0, n * sizeof(char *));
free(pglob->gl_pathv);
pglob->gl_pathv = new;
```

However, this assumes that the memory pointed to by *gl_pathv* is a block that was separately created using *malloc*( ). This is not necessarily the case. An application should make no assumptions about how the memory referenced by fields in *pglob* was allocated. It might have been obtained from *malloc*( ) in a large chunk and then carved up within *glob*( ), or it might have been created using a different memory allocator. It is not the intent of the standard developers to specify or imply how the memory used by *glob*( ) is managed.

The GLOB_APPEND flag would be used when an application wants to expand several different patterns into a single list.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 5

Moved from POSIX2 C-language Binding to BASE.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

The **restrict** keyword is added to the *glob*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

NAME

gmtime, gmtime_r — convert a time value to a broken-down UTC time

SYNOPSIS

```
#include <time.h>

struct tm *gmtime(const time_t *timer);
CX struct tm *gmtime_r(const time_t *restrict timer,
        struct tm *restrict result);
```

DESCRIPTION

CX For *gmtime*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *gmtime*( ) function shall convert the time in seconds since the Epoch pointed to by *timer* into a broken-down time, expressed as Coordinated Universal Time (UTC).

CX The relationship between a time in seconds since the Epoch used as an argument to *gmtime*( ) and the **tm** structure (defined in the **<time.h>** header) is that the result shall be as specified in the expression given in the definition of seconds since the Epoch (see XBD Section 4.15, on page 113), where the names in the structure and in the expression correspond.

The same relationship shall apply for *gmtime_r*( ).

The *gmtime*( ) function need not be thread-safe.

The *asctime*( ), *ctime*( ), *gmtime*( ), and *localtime*( ) functions shall return values in one of two static objects: a broken-down time structure and an array of type **char**. Execution of any of the functions may overwrite the information returned in either of these objects by any of the other functions.

The *gmtime_r*( ) function shall convert the time in seconds since the Epoch pointed to by *timer* into a broken-down time expressed as Coordinated Universal Time (UTC). The broken-down time is stored in the structure referred to by *result*. The *gmtime_r*( ) function shall also return the address of the same structure.

RETURN VALUE

Upon successful completion, the *gmtime*( ) function shall return a pointer to a **struct tm**. If an CX error is detected, *gmtime*( ) shall return a null pointer and set *errno* to indicate the error.

Upon successful completion, *gmtime_r*( ) shall return the address of the structure pointed to by the argument *result*. If an error is detected, *gmtime_r*( ) shall return a null pointer and set *errno* to indicate the error.

ERRORS

CX The *gmtime*( ) and *gmtime_r*( ) functions shall fail if:

CX [EOVERFLOW] The result cannot be represented.

EXAMPLES

None.

APPLICATION USAGE

The *gmtime_r*( ) function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A note indicating that the *gmtime*( ) function need not be reentrant is added to the DESCRIPTION.

The *gmtime_r*( ) function is included for alignment with the POSIX Threads Extension.

Issue 6

The *gmtime_r*( ) function is marked as part of the Thread-Safe Functions option.

Extensions beyond the ISO C standard are marked.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The **restrict** keyword is added to the *gmtime_r*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/27 is applied, adding the [EOVERFLOW] error.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/48 is applied, updating the error handling for *gmtime_r*( ).

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

The *gmtime_r*( ) function is moved from the Thread-Safe Functions option to the Base.

NAME

grantpt — grant access to the slave pseudo-terminal device

SYNOPSIS

XSI
```
#include <stdlib.h>

int grantpt(int fildes);
```

DESCRIPTION

The *grantpt*( ) function shall change the mode and ownership of the slave pseudo-terminal device associated with its master pseudo-terminal counterpart. The *fildes* argument is a file descriptor that refers to a master pseudo-terminal device. The user ID of the slave shall be set to the real UID of the calling process and the group ID shall be set to an unspecified group ID. The permission mode of the slave pseudo-terminal shall be set to readable and writable by the owner, and writable by the group.

The behavior of the *grantpt*( ) function is unspecified if the application has installed a signal handler to catch SIGCHLD signals.

RETURN VALUE

Upon successful completion, *grantpt*( ) shall return 0; otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *grantpt*( ) function may fail if:

[EBADF] The *fildes* argument is not a valid open file descriptor.

[EINVAL] The *fildes* argument is not associated with a master pseudo-terminal device.

[EACCES] The corresponding slave pseudo-terminal device could not be accessed.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

NAME

hcreate, hdestroy, hsearch — manage hash search table

SYNOPSIS

XSI
```
#include <search.h>

int hcreate(size_t nel);
void hdestroy(void);
ENTRY *hsearch(ENTRY item, ACTION action);
```

DESCRIPTION

The *hcreate*( ), *hdestroy*( ), and *hsearch*( ) functions shall manage hash search tables.

The *hcreate*( ) function shall allocate sufficient space for the table, and the application shall ensure it is called before *hsearch*( ) is used. The *nel* argument is an estimate of the maximum number of entries that the table shall contain. This number may be adjusted upward by the algorithm in order to obtain certain mathematically favorable circumstances.

The *hdestroy*( ) function shall dispose of the search table, and may be followed by another call to *hcreate*( ). After the call to *hdestroy*( ), the data can no longer be considered accessible.

The *hsearch*( ) function is a hash-table search routine. It shall return a pointer into a hash table indicating the location at which an entry can be found. The *item* argument is a structure of type **ENTRY** (defined in the **<search.h>** header) containing two pointers: *item.key* points to the comparison key (a **char** *), and *item.data* (a **void** *) points to any other data to be associated with that key. The comparison function used by *hsearch*( ) is *strcmp*( ). The *action* argument is a member of an enumeration type **ACTION** indicating the disposition of the entry if it cannot be found in the table. ENTER indicates that the item should be inserted in the table at an appropriate point. FIND indicates that no entry should be made. Unsuccessful resolution is indicated by the return of a null pointer.

These functions need not be thread-safe.

RETURN VALUE

The *hcreate*( ) function shall return 0 if it cannot allocate sufficient space for the table; otherwise, it shall return non-zero.

The *hdestroy*( ) function shall not return a value.

The *hsearch*( ) function shall return a null pointer if either the action is FIND and the item could not be found or the action is ENTER and the table is full.

ERRORS

The *hcreate*( ) and *hsearch*( ) functions may fail if:

[ENOMEM] Insufficient storage space is available.

EXAMPLES

The following example reads in strings followed by two numbers and stores them in a hash table, discarding duplicates. It then reads in strings and finds the matching entry in the hash table and prints it out.

```
#include <stdio.h>
#include <search.h>
#include <string.h>

struct info {        /* This is the info stored in the table */
    int age, room;   /* other than the key. */
};
```

```
#define NUM_EMPL    5000    /* # of elements in search table. */

int main(void)
{
    char string_space[NUM_EMPL*20];   /* Space to store strings. */
    struct info info_space[NUM_EMPL]; /* Space to store employee info. */
    char *str_ptr = string_space;     /* Next space in string_space. */
    struct info *info_ptr = info_space;
                                      /* Next space in info_space. */
    ENTRY item;
    ENTRY *found_item; /* Name to look for in table. */
    char name_to_find[30];

    int i = 0;

    /* Create table; no error checking is performed. */
    (void) hcreate(NUM_EMPL);
    while (scanf("%s%d%d", str_ptr, &info_ptr->age,
           &info_ptr->room) != EOF && i++ < NUM_EMPL) {

        /* Put information in structure, and structure in item. */
        item.key = str_ptr;
        item.data = info_ptr;
        str_ptr += strlen(str_ptr) + 1;
        info_ptr++;

        /* Put item into table. */
        (void) hsearch(item, ENTER);
    }

    /* Access table. */
    item.key = name_to_find;
    while (scanf("%s", item.key) != EOF) {
        if ((found_item = hsearch(item, FIND)) != NULL) {

            /* If item is in the table. */
            (void)printf("found %s, age = %d, room = %d\n",
                found_item->key,
                ((struct info *)found_item->data)->age,
                ((struct info *)found_item->data)->room);
        } else
            (void)printf("no such employee %s\n", name_to_find);
    }
    return 0;
}
```

APPLICATION USAGE

The *hcreate*( ) and *hsearch*( ) functions may use *malloc*( ) to allocate space.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

htonl, htons, ntohl, ntohs — convert values between host and network byte order

SYNOPSIS

```
#include <arpa/inet.h>

uint32_t htonl(uint32_t hostlong);
uint16_t htons(uint16_t hostshort);
uint32_t ntohl(uint32_t netlong);
uint16_t ntohs(uint16_t netshort);
```

DESCRIPTION

These functions shall convert 16-bit and 32-bit quantities between network byte order and host byte order.

On some implementations, these functions are defined as macros.

The **uint32_t** and **uint16_t** types are defined in **<inttypes.h>**.

RETURN VALUE

The *htonl*( ) and *htons*( ) functions shall return the argument value converted from host to network byte order.

The *ntohl*( ) and *ntohs*( ) functions shall return the argument value converted from network to host byte order.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

These functions are most often used in conjunction with IPv4 addresses and ports as returned by *gethostent*( ) and *getservent*( ).

NAME

hypot, hypotf, hypotl — Euclidean distance function

SYNOPSIS

```
#include <math.h>

double hypot(double x, double y);
float hypotf(float x, float y);
long double hypotl(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the value of the square root of x^2+y^2 without undue overflow or underflow.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the length of the hypotenuse of a right-angled triangle with sides of length *x* and *y*.

If the correct value would cause overflow, a range error shall occur and *hypot*( ), *hypotf*( ), and *hypotl*( ) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

MX If *x* or *y* is ±Inf, +Inf shall be returned (even if one of *x* or *y* is NaN).

If *x* or *y* is NaN, and the other is not ±Inf, a NaN shall be returned.

If both arguments are subnormal and the correct result is subnormal, a range error may occur and the correct result is returned.

ERRORS

These functions shall fail if:

Range Error — The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

MX Range Error — The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

See the EXAMPLES section in *atan2( )*.

APPLICATION USAGE

hypot(*x*,*y*), *hypot*(*y*,*x*), and *hypot*(*x*, –*y*) are equivalent.

hypot(*x*, ±0) is equivalent to *fabs*(*x*).

Underflow only happens when both *x* and *y* are subnormal and the (inexact) result is also subnormal.

These functions take precautions against overflow during intermediate steps of the computation.

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.19 (on page 116), **<math.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *hypot( )* function is no longer marked as an extension.

The *hypotf( )* and *hypotl( )* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/49 is applied, updating the EXAMPLES section.

NAME

iconv — codeset conversion function

SYNOPSIS

```
#include <iconv.h>

size_t iconv(iconv_t cd, char **restrict inbuf,
    size_t *restrict inbytesleft, char **restrict outbuf,
    size_t *restrict outbytesleft);
```

DESCRIPTION

The *iconv*( ) function shall convert the sequence of characters from one codeset, in the array specified by *inbuf*, into a sequence of corresponding characters in another codeset, in the array specified by *outbuf*. The codesets are those specified in the *iconv_open*( ) call that returned the conversion descriptor, *cd*. The *inbuf* argument points to a variable that points to the first character in the input buffer and *inbytesleft* indicates the number of bytes to the end of the buffer to be converted. The *outbuf* argument points to a variable that points to the first available byte in the output buffer and *outbytesleft* indicates the number of the available bytes to the end of the buffer.

For state-dependent encodings, the conversion descriptor *cd* is placed into its initial shift state by a call for which *inbuf* is a null pointer, or for which *inbuf* points to a null pointer. When *iconv*( ) is called in this way, and if *outbuf* is not a null pointer or a pointer to a null pointer, and *outbytesleft* points to a positive value, *iconv*( ) shall place, into the output buffer, the byte sequence to change the output buffer to its initial shift state. If the output buffer is not large enough to hold the entire reset sequence, *iconv*( ) shall fail and set *errno* to [E2BIG]. Subsequent calls with *inbuf* as other than a null pointer or a pointer to a null pointer cause the conversion to take place from the current state of the conversion descriptor.

If a sequence of input bytes does not form a valid character in the specified codeset, conversion shall stop after the previous successfully converted character. If the input buffer ends with an incomplete character or shift sequence, conversion shall stop after the previous successfully converted bytes. If the output buffer is not large enough to hold the entire converted input, conversion shall stop just prior to the input bytes that would cause the output buffer to overflow. The variable pointed to by *inbuf* shall be updated to point to the byte following the last byte successfully used in the conversion. The value pointed to by *inbytesleft* shall be decremented to reflect the number of bytes still not converted in the input buffer. The variable pointed to by *outbuf* shall be updated to point to the byte following the last byte of converted output data. The value pointed to by *outbytesleft* shall be decremented to reflect the number of bytes still available in the output buffer. For state-dependent encodings, the conversion descriptor shall be updated to reflect the shift state in effect at the end of the last successfully converted byte sequence.

If *iconv*( ) encounters a character in the input buffer that is valid, but for which an identical character does not exist in the target codeset, *iconv*( ) shall perform an implementation-defined conversion on this character.

RETURN VALUE

The *iconv*( ) function shall update the variables pointed to by the arguments to reflect the extent of the conversion and return the number of non-identical conversions performed. If the entire string in the input buffer is converted, the value pointed to by *inbytesleft* shall be 0. If the input conversion is stopped due to any conditions mentioned above, the value pointed to by *inbytesleft* shall be non-zero and *errno* shall be set to indicate the condition. If an error occurs, *iconv*( ) shall return (**size_t**)–1 and set *errno* to indicate the error.

ERRORS

The *iconv*( ) function shall fail if:

[EILSEQ] Input conversion stopped due to an input byte that does not belong to the input codeset.

[E2BIG] Input conversion stopped due to lack of space in the output buffer.

[EINVAL] Input conversion stopped due to an incomplete character or shift sequence at the end of the input buffer.

The *iconv*( ) function may fail if:

[EBADF] The *cd* argument is not a valid open conversion descriptor.

EXAMPLES

None.

APPLICATION USAGE

The *inbuf* argument indirectly points to the memory area which contains the conversion input data. The *outbuf* argument indirectly points to the memory area which is to contain the result of the conversion. The objects indirectly pointed to by *inbuf* and *outbuf* are not restricted to containing data that is directly representable in the ISO C standard language **char** data type. The type of *inbuf* and *outbuf*, **char** **, does not imply that the objects pointed to are interpreted as null-terminated C strings or arrays of characters. Any interpretation of a byte sequence that represents a character in a given character set encoding scheme is done internally within the codeset converters. For example, the area pointed to indirectly by *inbuf* and/or *outbuf* can contain all zero octets that are not interpreted as string terminators but as coded character data according to the respective codeset encoding scheme. The type of the data (**char**, **short**, **long**, and so on) read or stored in the objects is not specified, but may be inferred for both the input and output data by the converters determined by the *fromcode* and *tocode* arguments of *iconv_open*( ).

Regardless of the data type inferred by the converter, the size of the remaining space in both input and output objects (the *intbytesleft* and *outbytesleft* arguments) is always measured in bytes.

For implementations that support the conversion of state-dependent encodings, the conversion descriptor must be able to accurately reflect the shift-state in effect at the end of the last successful conversion. It is not required that the conversion descriptor itself be updated, which would require it to be a pointer type. Thus, implementations are free to implement the descriptor as a handle (other than a pointer type) by which the conversion information can be accessed and updated.

Issue 6

The SYNOPSIS has been corrected to align with the **<iconv.h>** reference page.

The **restrict** keyword is added to the *iconv*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

The *iconv*( ) function is moved from the XSI option to the Base.

NAME

iconv_close — codeset conversion deallocation function

SYNOPSIS

```
#include <iconv.h>

int iconv_close(iconv_t cd);
```

DESCRIPTION

The *iconv_close*( ) function shall deallocate the conversion descriptor *cd* and all other associated resources allocated by *iconv_open*( ).

If a file descriptor is used to implement the type **iconv_t**, that file descriptor shall be closed.

RETURN VALUE

Upon successful completion, 0 shall be returned; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *iconv_close*( ) function may fail if:

[EBADF] The conversion descriptor is invalid.

CHANGE HISTORY

First released in Issue 4. Derived from the HP-UX Manual.

Issue 7

The *iconv_close*( ) function is moved from the XSI option to the Base.

NAME

iconv_open — codeset conversion allocation function

SYNOPSIS

```
#include <iconv.h>

iconv_t iconv_open(const char *tocode, const char *fromcode);
```

DESCRIPTION

The *iconv_open*( ) function shall return a conversion descriptor that describes a conversion from the codeset specified by the string pointed to by the *fromcode* argument to the codeset specified by the string pointed to by the *tocode* argument. For state-dependent encodings, the conversion descriptor shall be in a codeset-dependent initial shift state, ready for immediate use with *iconv*( ).

Settings of *fromcode* and *tocode* and their permitted combinations are implementation-defined.

A conversion descriptor shall remain valid until it is closed by *iconv_close*( ) or an implicit close.

If a file descriptor is used to implement conversion descriptors, the FD_CLOEXEC flag shall be set; see **<fcntl.h>**.

RETURN VALUE

Upon successful completion, *iconv_open*( ) shall return a conversion descriptor for use on subsequent calls to *iconv*( ). Otherwise, *iconv_open*( ) shall return (**iconv_t**)–1 and set *errno* to indicate the error.

ERRORS

The *iconv_open*( ) function may fail if:

[EMFILE] All file descriptors available to the process are currently open.

[ENFILE] Too many files are currently open in the system.

[ENOMEM] Insufficient storage space is available.

[EINVAL] The conversion specified by *fromcode* and *tocode* is not supported by the implementation.

EXAMPLES

None.

APPLICATION USAGE

Some implementations of *iconv_open*( ) use *malloc*( ) to allocate space for internal buffer areas. The *iconv_open*( ) function may fail if there is insufficient storage space to accommodate these buffers.

Conforming applications must assume that conversion descriptors are not valid after a call to one of the *exec* functions.

Application developers should consult the system documentation to determine the supported codesets and their naming schemes.

NAME

if_indextoname — map a network interface index to its corresponding name

SYNOPSIS

```
#include <net/if.h>

char *if_indextoname(unsigned ifindex, char *ifname);
```

DESCRIPTION

The *if_indextoname*( ) function shall map an interface index to its corresponding name.

When this function is called, *ifname* shall point to a buffer of at least {IF_NAMESIZE} bytes. The function shall place in this buffer the name of the interface with index *ifindex*.

RETURN VALUE

If *ifindex* is an interface index, then the function shall return the value supplied in *ifname*, which points to a buffer now containing the interface name. Otherwise, the function shall return a null pointer and set *errno* to indicate the error.

ERRORS

The *if_indextoname*( ) function shall fail if:

[ENXIO] The interface does not exist.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/28 is applied, changing {IFNAMSIZ} to {IF_NAMESIZ} in the DESCRIPTION.

NAME

if_nameindex — return all network interface names and indexes

SYNOPSIS

```
#include <net/if.h>

struct if_nameindex *if_nameindex(void);
```

DESCRIPTION

The *if_nameindex*( ) function shall return an array of *if_nameindex* structures, one structure per interface. The end of the array is indicated by a structure with an *if_index* field of zero and an *if_name* field of NULL.

Applications should call *if_freenameindex*( ) to release the memory that may be dynamically allocated by this function, after they have finished using it.

RETURN VALUE

An array of structures identifying local interfaces. A null pointer is returned upon an error, with *errno* set to indicate the error.

ERRORS

The *if_nameindex*( ) function may fail if:

[ENOBUFS] Insufficient resources are available to complete the function.

NAME

ilogb, ilogbf, ilogbl — return an unbiased exponent

SYNOPSIS

```
#include <math.h>

int ilogb(double x);
int ilogbf(float x);
int ilogbl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall return the exponent part of their argument x. Formally, the return value is the integral part of $\log_r |x|$ as a signed integral value, for non-zero x, where r is the radix of the machine's floating-point arithmetic, which is the value of FLT_RADIX defined in **<float.h>**.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the exponent part of x as a signed integer value. They are equivalent to calling the corresponding *logb*( ) function and casting the returned value to type **int**.

XSI If x is 0, the value FP_ILOGB0 shall be returned. On XSI-conformant systems, a domain error shall occur;
CX otherwise, a domain error may occur.

XSI If x is ±Inf, the value {INT_MAX} shall be returned. On XSI-conformant systems, a domain error shall occur;
CX otherwise, a domain error may occur.

XSI If x is a NaN, the value FP_ILOGBNAN shall be returned. On XSI-conformant systems, a domain error shall occur;
CX otherwise, a domain error may occur.

MX XSI If the correct value is greater than {INT_MAX}, a domain error shall occur and an unspecified value shall be returned. On XSI-conformant systems, a domain error shall occur and {INT_MAX} shall be returned.

MX XSI If the correct value is less than {INT_MIN}, a domain error shall occur and an unspecified value shall be returned. On XSI-conformant systems, a domain error shall occur and {INT_MIN} shall be returned.

ERRORS

These functions shall fail if:

XSI | MX Domain Error	The correct value is not representable as an integer.
XSI	The x argument is zero, NaN, or ±Inf.
XSI | MX	If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Domain Error — The *x* argument is zero, NaN, or ±Inf.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

The errors come from taking the expected floating-point value and converting it to **int**, which is an invalid operation in IEEE Std 754-1985 (since overflow, infinity, and NaN are not representable in a type **int**), so should be a domain error.

There are no known implementations that overflow. For overflow to happen, {INT_MAX} must be less than LDBL_MAX_EXP**log2*(FLT_RADIX) or {INT_MIN} must be greater than LDBL_MIN_EXP**log2*(FLT_RADIX) if subnormals are not supported, or {INT_MIN} must be greater than (LDBL_MIN_EXP-LDBL_MANT_DIG)**log2*(FLT_RADIX) if subnormals are supported.

FUTURE DIRECTIONS

None.

NAME

imaxdiv — return quotient and remainder

SYNOPSIS

```
#include <inttypes.h>

imaxdiv_t imaxdiv(intmax_t numer, intmax_t denom);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *imaxdiv*( ) function shall compute *numer* / *denom* and *numer* % *denom* in a single operation.

RETURN VALUE

The *imaxdiv*( ) function shall return a structure of type **imaxdiv_t**, comprising both the quotient and the remainder. The structure shall contain (in either order) the members *quot* (the quotient) and *rem* (the remainder), each of which has type **intmax_t**.

If either part of the result cannot be represented, the behavior is undefined.

ERRORS

No errors are defined.

NAME

inet_addr, inet_ntoa — IPv4 address manipulation

SYNOPSIS

```
#include <arpa/inet.h>

in_addr_t inet_addr(const char *cp);
char *inet_ntoa(struct in_addr in);
```

DESCRIPTION

The *inet_addr*( ) function shall convert the string pointed to by *cp*, in the standard IPv4 dotted decimal notation, to an integer value suitable for use as an Internet address.

The *inet_ntoa*( ) function shall convert the Internet host address specified by *in* to a string in the Internet standard dot notation.

The *inet_ntoa*( ) function need not be thread-safe.

All Internet addresses shall be returned in network order (bytes ordered from left to right).

Values specified using IPv4 dotted decimal notation take one of the following forms:

`a.b.c.d` When four parts are specified, each shall be interpreted as a byte of data and assigned, from left to right, to the four bytes of an Internet address.

`a.b.c` When a three-part address is specified, the last part shall be interpreted as a 16-bit quantity and placed in the rightmost two bytes of the network address. This makes the three-part address format convenient for specifying Class B network addresses as `"128.net.host"`.

`a.b` When a two-part address is supplied, the last part shall be interpreted as a 24-bit quantity and placed in the rightmost three bytes of the network address. This makes the two-part address format convenient for specifying Class A network addresses as `"net.host"`.

`a` When only one part is given, the value shall be stored directly in the network address without any byte rearrangement.

All numbers supplied as parts in IPv4 dotted decimal notation may be decimal, octal, or hexadecimal, as specified in the ISO C standard (that is, a leading 0x or 0X implies hexadecimal; otherwise, a leading `'0'` implies octal; otherwise, the number is interpreted as decimal).

RETURN VALUE

Upon successful completion, *inet_addr*( ) shall return the Internet address. Otherwise, it shall return (**in_addr_t**)(–1).

The *inet_ntoa*( ) function shall return a pointer to the network address in Internet standard dot notation.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The return value of *inet_ntoa*( ) may point to static data that may be overwritten by subsequent calls to *inet_ntoa*( ).

RATIONALE

None.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

NAME

inet_ntop, inet_pton — convert IPv4 and IPv6 addresses between binary and text form

SYNOPSIS

```
#include <arpa/inet.h>

const char *inet_ntop(int af, const void *restrict src,
    char *restrict dst, socklen_t size);
int inet_pton(int af, const char *restrict src, void *restrict dst);
```

DESCRIPTION

The *inet_ntop*( ) function shall convert a numeric address into a text string suitable for presentation. The *af* argument shall specify the family of the address. This can be AF_INET or AF_INET6. The *src* argument points to a buffer holding an IPv4 address if the *af* argument is AF_INET, or an IPv6 address if the *af* argument is AF_INET6; the address must be in network byte order. The *dst* argument points to a buffer where the function stores the resulting text string; it shall not be NULL. The *size* argument specifies the size of this buffer, which shall be large enough to hold the text string (INET_ADDRSTRLEN characters for IPv4, INET6_ADDRSTRLEN characters for IPv6).

The *inet_pton*( ) function shall convert an address in its standard text presentation form into its numeric binary form. The *af* argument shall specify the family of the address. The AF_INET and AF_INET6 address families shall be supported. The *src* argument points to the string being passed in. The *dst* argument points to a buffer into which the function stores the numeric address; this shall be large enough to hold the numeric address (32 bits for AF_INET, 128 bits for AF_INET6).

If the *af* argument of *inet_pton*( ) is AF_INET, the *src* string shall be in the standard IPv4 dotted-decimal form:

```
ddd.ddd.ddd.ddd
```

where `"ddd"` is a one to three digit decimal number between 0 and 255 (see *inet_addr*( )). The *inet_pton*( ) function does not accept other formats (such as the octal numbers, hexadecimal numbers, and fewer than four numbers that *inet_addr*( ) accepts).

If the *af* argument of *inet_pton*( ) is AF_INET6, the *src* string shall be in one of the following standard IPv6 text forms:

1. The preferred form is `"x:x:x:x:x:x:x:x"`, where the `'x'`s are the hexadecimal values of the eight 16-bit pieces of the address. Leading zeros in individual fields can be omitted, but there shall be at least one numeral in every field.
2. A string of contiguous zero fields in the preferred form can be shown as `"::"`. The `"::"` can only appear once in an address. Unspecified addresses (`"0:0:0:0:0:0:0:0"`) may be represented simply as `"::"`.
3. A third form that is sometimes more convenient when dealing with a mixed environment of IPv4 and IPv6 nodes is `"x:x:x:x:x:x:d.d.d.d"`, where the `'x'`s are the hexadecimal values of the six high-order 16-bit pieces of the address, and the `'d'`s are the decimal values of the four low-order 8-bit pieces of the address (standard IPv4 representation).

Note: A more extensive description of the standard representations of IPv6 addresses can be found in RFC 2373.

RETURN VALUE

The *inet_ntop*( ) function shall return a pointer to the buffer containing the text string if the conversion succeeds, and NULL otherwise, and set *errno* to indicate the error.

The *inet_pton*( ) function shall return 1 if the conversion succeeds, with the address pointed to by *dst* in network byte order. It shall return 0 if the input is not a valid IPv4 dotted-decimal string or a valid IPv6 address string, or −1 with *errno* set to [EAFNOSUPPORT] if the *af* argument is unknown.

IP6

ERRORS

The *inet_ntop*( ) and *inet_pton*( ) functions shall fail if:

[EAFNOSUPPORT]
The *af* argument is invalid.

[ENOSPC] The size of the *inet_ntop*( ) result buffer is inadequate.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XBD **<arpa/inet.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

IPv6 extensions are marked.

The **restrict** keyword is added to the *inet_ntop*( ) and *inet_pton*( ) prototypes for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/29 is applied, adding "the address must be in network byte order" to the end of the fourth sentence of the first paragraph in the DESCRIPTION.

NAME

initstate, random, setstate, srandom — pseudo-random number functions

SYNOPSIS

XSI

```
#include <stdlib.h>

char *initstate(unsigned seed, char *state, size_t size);
long random(void);
char *setstate(char *state);
void srandom(unsigned seed);
```

DESCRIPTION

The *random*( ) function shall use a non-linear additive feedback random-number generator employing a default state array size of 31 **long** integers to return successive pseudo-random numbers in the range from 0 to 2^{31}–1. The period of this random-number generator is approximately 16 x (2^{31}–1). The size of the state array determines the period of the random-number generator. Increasing the state array size shall increase the period.

With 256 bytes of state information, the period of the random-number generator shall be greater than 2^{69}.

Like *rand*( ), *random*( ) shall produce by default a sequence of numbers that can be duplicated by calling *srandom*( ) with 1 as the seed.

The *srandom*( ) function shall initialize the current state array using the value of *seed*.

The *initstate*( ) and *setstate*( ) functions handle restarting and changing random-number generators. The *initstate*( ) function allows a state array, pointed to by the *state* argument, to be initialized for future use. The *size* argument, which specifies the size in bytes of the state array, shall be used by *initstate*( ) to decide what type of random-number generator to use; the larger the state array, the more random the numbers. Values for the amount of state information are 8, 32, 64, 128, and 256 bytes. Other values greater than 8 bytes are rounded down to the nearest one of these values. If *initstate*( ) is called with 8≤*size*<32, then *random*( ) shall use a simple linear congruential random number generator. The *seed* argument specifies a starting point for the random-number sequence and provides for restarting at the same point. The *initstate*( ) function shall return a pointer to the previous state information array.

If *initstate*( ) has not been called, then *random*( ) shall behave as though *initstate*( ) had been called with *seed*=1 and *size*=128.

Once a state has been initialized, *setstate*( ) allows switching between state arrays. The array defined by the *state* argument shall be used for further random-number generation until *initstate*( ) is called or *setstate*( ) is called again. The *setstate*( ) function shall return a pointer to the previous state array.

RETURN VALUE

If *initstate*( ) is called with *size* less than 8, it shall return NULL.

The *random*( ) function shall return the generated pseudo-random number.

The *srandom*( ) function shall not return a value.

Upon successful completion, *initstate*( ) and *setstate*( ) shall return a pointer to the previous state array; otherwise, a null pointer shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

After initialization, a state array can be restarted at a different point in one of two ways:

1. The *initstate*( ) function can be used, with the desired seed, state array, and size of the array.
2. The *setstate*( ) function, with the desired state, can be used, followed by *srandom*( ) with the desired seed. The advantage of using both of these functions is that the size of the state array does not have to be saved once it is initialized.

Although some implementations of *random*( ) have written messages to standard error, such implementations do not conform to POSIX.1-200x.

Issue 5 restored the historical behavior of this function.

Threaded applications should use *erand48*( ), *nrand48*( ), or *jrand48*( ) instead of *random*( ) when an independent random number sequence in multiple threads is required.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

drand48( ), *rand*( )

XBD **<stdlib.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

In the DESCRIPTION, the phrase "values smaller than 8" is replaced with "values greater than or equal to 8, or less than 32", "*size*<8" is replaced with "8≤*size* <32", and a new first paragraph is added to the RETURN VALUE section. A note is added to the APPLICATION USAGE indicating that these changes restore the historical behavior of the function.

Issue 6

In the DESCRIPTION, duplicate text "For values greater than or equal to 8 . . ." is removed.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/30 is applied, removing *rand_r*( ) from the list of suggested functions in the APPLICATION USAGE section.

Issue 7

The type of the first argument to *setstate*( ) is changed from **const char *** to **char ***. +

NAME

insque, remque — insert or remove an element in a queue

SYNOPSIS

XSI
```
#include <search.h>

void insque(void *element, void *pred);
void remque(void *element);
```

DESCRIPTION

The *insque*( ) and *remque*( ) functions shall manipulate queues built from doubly-linked lists. The queue can be either circular or linear. An application using *insque*( ) or *remque*( ) shall ensure it defines a structure in which the first two members of the structure are pointers to the same type of structure, and any further members are application-specific. The first member of the structure is a forward pointer to the next entry in the queue. The second member is a backward pointer to the previous entry in the queue. If the queue is linear, the queue is terminated with null pointers. The names of the structure and of the pointer members are not subject to any special restriction.

The *insque*( ) function shall insert the element pointed to by *element* into a queue immediately after the element pointed to by *pred*.

The *remque*( ) function shall remove the element pointed to by *element* from a queue.

If the queue is to be used as a linear list, invoking *insque*(&*element*, NULL), where *element* is the initial element of the queue, shall initialize the forward and backward pointers of *element* to null pointers.

If the queue is to be used as a circular list, the application shall ensure it initializes the forward pointer and the backward pointer of the initial element of the queue to the element's own address.

RETURN VALUE

The *insque*( ) and *remque*( ) functions do not return a value.

ERRORS

No errors are defined.

EXAMPLES

Creating a Linear Linked List

The following example creates a linear linked list.

```
#include <search.h>
...
struct myque element1;
struct myque element2;

char *data1 = "DATA1";
char *data2 = "DATA2";
...
element1.data = data1;
element2.data = data2;

insque (&element1, NULL);
insque (&element2, &element1);
```

Creating a Circular Linked List

The following example creates a circular linked list.

```
#include <search.h>
...
struct myque element1;
struct myque element2;

char *data1 = "DATA1";
char *data2 = "DATA2";
...
element1.data = data1;
element2.data = data2;

element1.fwd = &element1;
element1.bck = &element1;

insque (&element2, &element1);
```

Removing an Element

The following example removes the element pointed to by *element1*.

```
#include <search.h>
...
struct myque element1;
...
remque (&element1);
```

APPLICATION USAGE

The historical implementations of these functions described the arguments as being of type **struct qelem** * rather than as being of type **void** * as defined here. In those implementations, **struct qelem** was commonly defined in **<search.h>** as:

```
struct qelem {
    struct qelem  *q_forw;
    struct qelem  *q_back;
};
```

Applications using these functions, however, were never able to use this structure directly since it provided no room for the actual data contained in the elements. Most applications defined structures that contained the two pointers as the initial elements and also provided space for, or pointers to, the object's data. Applications that used these functions to update more than one type of table also had the problem of specifying two or more different structures with the same name, if they literally used **struct qelem** as specified.

As described here, the implementations were actually expecting a structure type where the first two members were forward and backward pointers to structures. With C compilers that didn't provide function prototypes, applications used structures as specified in the DESCRIPTION above and the compiler did what the application expected.

If this method had been carried forward with an ISO C standard compiler and the historical function prototype, most applications would have to be modified to cast pointers to the structures actually used to be pointers to **struct qelem** to avoid compilation warnings. By specifying **void** * as the argument type, applications do not need to change (unless they specifically referenced **struct qelem** and depended on it being defined in **<search.h>**).

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

ioctl — control a STREAMS device (**STREAMS**)

SYNOPSIS

OB XSR
```
#include <stropts.h>

int ioctl(int fildes, int request, ... /* arg */);
```

DESCRIPTION

The *ioctl*( ) function shall perform a variety of control functions on STREAMS devices. For non-STREAMS devices, the functions performed by this call are unspecified. The *request* argument and an optional third argument (with varying type) shall be passed to and interpreted by the appropriate part of the STREAM associated with *fildes*.

The *fildes* argument is an open file descriptor that refers to a device.

The *request* argument selects the control function to be performed and shall depend on the STREAMS device being addressed.

The *arg* argument represents additional information that is needed by this specific STREAMS device to perform the requested function. The type of *arg* depends upon the particular control request, but it shall be either an integer or a pointer to a device-specific data structure.

The *ioctl*( ) commands applicable to STREAMS, their arguments, and error conditions that apply to each individual command are described below.

The following *ioctl*( ) commands, with error values indicated, are applicable to all STREAMS files:

I_PUSH — Pushes the module whose name is pointed to by *arg* onto the top of the current STREAM, just below the STREAM head. It then calls the *open*( ) function of the newly-pushed module.

The *ioctl*( ) function with the I_PUSH command shall fail if:

[EINVAL] Invalid module name.

[ENXIO] Open function of new module failed.

[ENXIO] Hangup received on *fildes*.

I_POP — Removes the module just below the STREAM head of the STREAM pointed to by *fildes*. The *arg* argument should be 0 in an I_POP request.

The *ioctl*( ) function with the I_POP command shall fail if:

[EINVAL] No module present in the STREAM.

[ENXIO] Hangup received on *fildes*.

I_LOOK — Retrieves the name of the module just below the STREAM head of the STREAM pointed to by *fildes*, and places it in a character string pointed to by *arg*. The buffer pointed to by *arg* should be at least FMNAMESZ+1 bytes long, where FMNAMESZ is defined in **<stropts.h>**.

The *ioctl*( ) function with the I_LOOK command shall fail if:

[EINVAL] No module present in the STREAM.

I_FLUSH — Flushes read and/or write queues, depending on the value of *arg*. Valid *arg* values are:

37462 FLUSHR Flush all read queues.

37463 FLUSHW Flush all write queues.

37464 FLUSHRW Flush all read and all write queues.

37465 The *ioctl*( ) function with the I_FLUSH command shall fail if:

37466 [EINVAL] Invalid *arg* value.

37467 [EAGAIN] or [ENOSR]
37468 Unable to allocate buffers for flush message.

37469 [ENXIO] Hangup received on *fildes*.

37470 I_FLUSHBAND Flushes a particular band of messages. The *arg* argument points to a **bandinfo**
37471 structure. The *bi_flag* member may be one of FLUSHR, FLUSHW, or
37472 FLUSHRW as described above. The *bi_pri* member determines the priority
37473 band to be flushed.

37474 I_SETSIG Requests that the STREAMS implementation send the SIGPOLL signal to the
37475 calling process when a particular event has occurred on the STREAM
37476 associated with *fildes*. I_SETSIG supports an asynchronous processing
37477 capability in STREAMS. The value of *arg* is a bitmask that specifies the events
37478 for which the process should be signaled. It is the bitwise-inclusive OR of any
37479 combination of the following constants:

37480 S_RDNORM A normal (priority band set to 0) message has arrived at the
37481 head of a STREAM head read queue. A signal shall be
37482 generated even if the message is of zero length.

37483 S_RDBAND A message with a non-zero priority band has arrived at the
37484 head of a STREAM head read queue. A signal shall be
37485 generated even if the message is of zero length.

37486 S_INPUT A message, other than a high-priority message, has arrived
37487 at the head of a STREAM head read queue. A signal shall be
37488 generated even if the message is of zero length.

37489 S_HIPRI A high-priority message is present on a STREAM head read
37490 queue. A signal shall be generated even if the message is of
37491 zero length.

37492 S_OUTPUT The write queue for normal data (priority band 0) just below
37493 the STREAM head is no longer full. This notifies the process
37494 that there is room on the queue for sending (or writing)
37495 normal data downstream.

37496 S_WRNORM Equivalent to S_OUTPUT.

37497 S_WRBAND The write queue for a non-zero priority band just below the
37498 STREAM head is no longer full. This notifies the process
37499 that there is room on the queue for sending (or writing)
37500 priority data downstream.

37501 S_MSG A STREAMS signal message that contains the SIGPOLL
37502 signal has reached the front of the STREAM head read
37503 queue.

37504 S_ERROR Notification of an error condition has reached the STREAM
37505 head.

37506 S_HANGUP Notification of a hangup has reached the STREAM head.

37507 S_BANDURG When used in conjunction with S_RDBAND, SIGURG is
37508 generated instead of SIGPOLL when a priority message
37509 reaches the front of the STREAM head read queue.

37510 If *arg* is 0, the calling process shall be unregistered and shall not receive further
37511 SIGPOLL signals for the stream associated with *fildes*.

37512 Processes that wish to receive SIGPOLL signals shall ensure that they
37513 explicitly register to receive them using I_SETSIG. If several processes register
37514 to receive this signal for the same event on the same STREAM, each process
37515 shall be signaled when the event occurs.

37516 The *ioctl*( ) function with the I_SETSIG command shall fail if:

37517 [EINVAL] The value of *arg* is invalid.

37518 [EINVAL] The value of *arg* is 0 and the calling process is not registered
37519 to receive the SIGPOLL signal.

37520 [EAGAIN] There were insufficient resources to store the signal request.

37521 I_GETSIG Returns the events for which the calling process is currently registered to be
37522 sent a SIGPOLL signal. The events are returned as a bitmask in an **int** pointed
37523 to by *arg*, where the events are those specified in the description of I_SETSIG
37524 above.

37525 The *ioctl*( ) function with the I_GETSIG command shall fail if:

37526 [EINVAL] Process is not registered to receive the SIGPOLL signal.

37527 I_FIND Compares the names of all modules currently present in the STREAM to the
37528 name pointed to by *arg*, and returns 1 if the named module is present in the
37529 STREAM, or returns 0 if the named module is not present.

37530 The *ioctl*( ) function with the I_FIND command shall fail if:

37531 [EINVAL] *arg* does not contain a valid module name.

37532 I_PEEK Retrieves the information in the first message on the STREAM head read
37533 queue without taking the message off the queue. It is analogous to *getmsg*( )
37534 except that this command does not remove the message from the queue. The
37535 *arg* argument points to a **strpeek** structure.

37536 The application shall ensure that the *maxlen* member in the **ctlbuf** and **databuf**
37537 **strbuf** structures is set to the number of bytes of control information and/or
37538 data information, respectively, to retrieve. The *flags* member may be marked
37539 RS_HIPRI or 0, as described by *getmsg*( ). If the process sets *flags* to RS_HIPRI,
37540 for example, I_PEEK shall only look for a high-priority message on the
37541 STREAM head read queue.

37542 I_PEEK returns 1 if a message was retrieved, and returns 0 if no message was
37543 found on the STREAM head read queue, or if the RS_HIPRI flag was set in
37544 *flags* and a high-priority message was not present on the STREAM head read
37545 queue. It does not wait for a message to arrive. On return, **ctlbuf** specifies
37546 information in the control buffer, **databuf** specifies information in the data

37547 buffer, and *flags* contains the value RS_HIPRI or 0.

37548 I_SRDOPT Sets the read mode using the value of the argument *arg*. Read modes are
37549 described in *read*( ). Valid *arg* flags are:

37550 RNORM Byte-stream mode, the default.

37551 RMSGD Message-discard mode.

37552 RMSGN Message-nondiscard mode.

37553 The bitwise-inclusive OR of RMSGD and RMSGN shall return [EINVAL]. The
37554 bitwise-inclusive OR of RNORM and either RMSGD or RMSGN shall result in
37555 the other flag overriding RNORM which is the default.

37556 In addition, treatment of control messages by the STREAM head may be
37557 changed by setting any of the following flags in *arg*:

37558 RPROTNORM Fail *read*( ) with [EBADMSG] if a message containing a
37559 control part is at the front of the STREAM head read queue.

37560 RPROTDAT Deliver the control part of a message as data when a process
37561 issues a *read*( ).

37562 RPROTDIS Discard the control part of a message, delivering any data
37563 portion, when a process issues a *read*( ).

37564 The *ioctl*( ) function with the I_SRDOPT command shall fail if:

37565 [EINVAL] The *arg* argument is not valid.

37566 I_GRDOPT Returns the current read mode setting, as described above, in an **int** pointed to
37567 by the argument *arg*. Read modes are described in *read*( ).

37568 I_NREAD Counts the number of data bytes in the data part of the first message on the
37569 STREAM head read queue and places this value in the **int** pointed to by *arg*.
37570 The return value for the command shall be the number of messages on the
37571 STREAM head read queue. For example, if 0 is returned in *arg*, but the *ioctl*( )
37572 return value is greater than 0, this indicates that a zero-length message is next
37573 on the queue.

37574 I_FDINSERT Creates a message from specified buffer(s), adds information about another
37575 STREAM, and sends the message downstream. The message contains a
37576 control part and an optional data part. The data and control parts to be sent
37577 are distinguished by placement in separate buffers, as described below. The
37578 *arg* argument points to a **strfdinsert** structure.

37579 The application shall ensure that the *len* member in the **ctlbuf strbuf** structure
37580 is set to the size of a **t_uscalar_t** plus the number of bytes of control
37581 information to be sent with the message. The *fildes* member specifies the file
37582 descriptor of the other STREAM, and the *offset* member, which must be
37583 suitably aligned for use as a **t_uscalar_t**, specifies the offset from the start of
37584 the control buffer where I_FDINSERT shall store a **t_uscalar_t** whose
37585 interpretation is specific to the STREAM end. The application shall ensure that
37586 the *len* member in the **databuf strbuf** structure is set to the number of bytes of
37587 data information to be sent with the message, or to 0 if no data part is to be
37588 sent.

37589 The *flags* member specifies the type of message to be created. A normal
37590 message is created if *flags* is set to 0, and a high-priority message is created if

flags is set to RS_HIPRI. For non-priority messages, I_FDINSERT shall block if the STREAM write queue is full due to internal flow control conditions. For priority messages, I_FDINSERT does not block on this condition. For non-priority messages, I_FDINSERT does not block when the write queue is full and O_NONBLOCK is set. Instead, it fails and sets *errno* to [EAGAIN].

I_FDINSERT also blocks, unless prevented by lack of internal resources, waiting for the availability of message blocks in the STREAM, regardless of priority or whether O_NONBLOCK has been specified. No partial message is sent.

The *ioctl*( ) function with the I_FDINSERT command shall fail if:

[EAGAIN] A non-priority message is specified, the O_NONBLOCK flag is set, and the STREAM write queue is full due to internal flow control conditions.

[EAGAIN] or [ENOSR]
Buffers cannot be allocated for the message that is to be created.

[EINVAL] One of the following:

— The *fildes* member of the **strfdinsert** structure is not a valid, open STREAM file descriptor.

— The size of a **t_uscalar_t** plus *offset* is greater than the *len* member for the buffer specified through **ctlbuf**.

— The *offset* member does not specify a properly-aligned location in the data buffer.

— An undefined value is stored in *flags*.

[ENXIO] Hangup received on the STREAM identified by either the *fildes* argument or the *fildes* member of the **strfdinsert** structure.

[ERANGE] The *len* member for the buffer specified through **databuf** does not fall within the range specified by the maximum and minimum packet sizes of the topmost STREAM module; or the *len* member for the buffer specified through **databuf** is larger than the maximum configured size of the data part of a message; or the *len* member for the buffer specified through **ctlbuf** is larger than the maximum configured size of the control part of a message.

I_STR Constructs an internal STREAMS *ioctl*( ) message from the data pointed to by *arg*, and sends that message downstream.

This mechanism is provided to send *ioctl*( ) requests to downstream modules and drivers. It allows information to be sent with *ioctl*( ), and returns to the process any information sent upstream by the downstream recipient. I_STR shall block until the system responds with either a positive or negative acknowledgement message, or until the request times out after some period of time. If the request times out, it shall fail with *errno* set to [ETIME].

At most, one I_STR can be active on a STREAM. Further I_STR calls shall block until the active I_STR completes at the STREAM head. The default

timeout interval for these requests is 15 seconds. The O_NONBLOCK flag has no effect on this call.

To send requests downstream, the application shall ensure that *arg* points to a **strioctl** structure.

The *ic_cmd* member is the internal *ioctl*( ) command intended for a downstream module or driver and *ic_timout* is the number of seconds (−1=infinite, 0=use implementation-defined timeout interval, >0=as specified) an I_STR request shall wait for acknowledgement before timing out. *ic_len* is the number of bytes in the data argument, and *ic_dp* is a pointer to the data argument. The *ic_len* member has two uses: on input, it contains the length of the data argument passed in, and on return from the command, it contains the number of bytes being returned to the process (the buffer pointed to by *ic_dp* should be large enough to contain the maximum amount of data that any module or the driver in the STREAM can return).

The STREAM head shall convert the information pointed to by the **strioctl** structure to an internal *ioctl*( ) command message and send it downstream.

The *ioctl*( ) function with the I_STR command shall fail if:

[EAGAIN] or [ENOSR]
: Unable to allocate buffers for the *ioctl*( ) message.

[EINVAL]
: The *ic_len* member is less than 0 or larger than the maximum configured size of the data part of a message, or *ic_timout* is less than −1.

[ENXIO]
: Hangup received on *fildes*.

[ETIME]
: A downstream *ioctl*( ) timed out before acknowledgement was received.

An I_STR can also fail while waiting for an acknowledgement if a message indicating an error or a hangup is received at the STREAM head. In addition, an error code can be returned in the positive or negative acknowledgement message, in the event the *ioctl*( ) command sent downstream fails. For these cases, I_STR shall fail with *errno* set to the value in the message.

I_SWROPT
: Sets the write mode using the value of the argument *arg*. Valid bit settings for *arg* are:

  SNDZERO
  : Send a zero-length message downstream when a *write*( ) of 0 bytes occurs. To not send a zero-length message when a *write*( ) of 0 bytes occurs, the application shall ensure that this bit is not set in *arg* (for example, *arg* would be set to 0).

  The *ioctl*( ) function with the I_SWROPT command shall fail if:

  [EINVAL]
  : *arg* is not the above value.

I_GWROPT
: Returns the current write mode setting, as described above, in the **int** that is pointed to by the argument *arg*.

I_SENDFD
: Creates a new reference to the open file description associated with the file descriptor *arg*, and writes a message on the STREAMS-based pipe *fildes* containing this reference, together with the user ID and group ID of the calling process.

The *ioctl*( ) function with the I_SENDFD command shall fail if:

[EAGAIN] The sending STREAM is unable to allocate a message block to contain the file pointer; or the read queue of the receiving STREAM head is full and cannot accept the message sent by I_SENDFD.

[EBADF] The *arg* argument is not a valid, open file descriptor.

[EINVAL] The *fildes* argument is not connected to a STREAM pipe.

[ENXIO] Hangup received on *fildes*.

The *ioctl*( ) function with the I_SENDFD command may fail if:

[EINVAL] The *arg* argument is equal to the *fildes* argument.

I_RECVFD Retrieves the reference to an open file description from a message written to a STREAMS-based pipe using the I_SENDFD command, and allocates a new file descriptor in the calling process that refers to this open file description. The *arg* argument is a pointer to a **strrecvfd** data structure as defined in **<stropts.h>**.

The *fd* member is a file descriptor. The *uid* and *gid* members are the effective user ID and effective group ID, respectively, of the sending process.

If O_NONBLOCK is not set, I_RECVFD shall block until a message is present at the STREAM head. If O_NONBLOCK is set, I_RECVFD shall fail with *errno* set to [EAGAIN] if no message is present at the STREAM head.

If the message at the STREAM head is a message sent by an I_SENDFD, a new file descriptor shall be allocated for the open file descriptor referenced in the message. The new file descriptor is placed in the *fd* member of the **strrecvfd** structure pointed to by *arg*.

The *ioctl*( ) function with the I_RECVFD command shall fail if:

[EAGAIN] A message is not present at the STREAM head read queue and the O_NONBLOCK flag is set.

[EBADMSG] The message at the STREAM head read queue is not a message containing a passed file descriptor.

[EMFILE] All file descriptors available to the process are currently open.

[ENXIO] Hangup received on *fildes*.

I_LIST Allows the process to list all the module names on the STREAM, up to and including the topmost driver name. If *arg* is a null pointer, the return value shall be the number of modules, including the driver, that are on the STREAM pointed to by *fildes*. This lets the process allocate enough space for the module names. Otherwise, it should point to a **str_list** structure.

The *sl_nmods* member indicates the number of entries the process has allocated in the array. Upon return, the *sl_modlist* member of the **str_list** structure shall contain the list of module names, and the number of entries that have been filled into the *sl_modlist* array is found in the *sl_nmods* member (the number includes the number of modules including the driver). The return value from *ioctl*( ) shall be 0. The entries are filled in starting at the top of the

STREAM and continuing downstream until either the end of the STREAM is reached, or the number of requested modules (*sl_nmods*) is satisfied.

The *ioctl*( ) function with the I_LIST command shall fail if:

[EINVAL] The *sl_nmods* member is less than 1.

[EAGAIN] or [ENOSR]
Unable to allocate buffers.

I_ATMARK Allows the process to see if the message at the head of the STREAM head read queue is marked by some module downstream. The *arg* argument determines how the checking is done when there may be multiple marked messages on the STREAM head read queue. It may take on the following values:

ANYMARK Check if the message is marked.

LASTMARK Check if the message is the last one marked on the queue.

The bitwise-inclusive OR of the flags ANYMARK and LASTMARK is permitted.

The return value shall be 1 if the mark condition is satisfied; otherwise, the value shall be 0.

The *ioctl*( ) function with the I_ATMARK command shall fail if:

[EINVAL] Invalid *arg* value.

I_CKBAND Checks if the message of a given priority band exists on the STREAM head read queue. This shall return 1 if a message of the given priority exists, 0 if no such message exists, or –1 on error. *arg* should be of type **int**.

The *ioctl*( ) function with the I_CKBAND command shall fail if:

[EINVAL] Invalid *arg* value.

I_GETBAND Returns the priority band of the first message on the STREAM head read queue in the integer referenced by *arg*.

The *ioctl*( ) function with the I_GETBAND command shall fail if:

[ENODATA] No message on the STREAM head read queue.

I_CANPUT Checks if a certain band is writable. *arg* is set to the priority band in question. The return value shall be 0 if the band is flow-controlled, 1 if the band is writable, or –1 on error.

The *ioctl*( ) function with the I_CANPUT command shall fail if:

[EINVAL] Invalid *arg* value.

I_SETCLTIME This request allows the process to set the time the STREAM head shall delay when a STREAM is closing and there is data on the write queues. Before closing each module or driver, if there is data on its write queue, the STREAM head shall delay for the specified amount of time to allow the data to drain. If, after the delay, data is still present, it shall be flushed. The *arg* argument is a pointer to an integer specifying the number of milliseconds to delay, rounded up to the nearest valid value. If I_SETCLTIME is not performed on a STREAM, an implementation-defined default timeout interval is used.

The *ioctl*( ) function with the I_SETCLTIME command shall fail if:

[EINVAL] Invalid *arg* value.

I_GETCLTIME Returns the close time delay in the integer pointed to by *arg*.

Multiplexed STREAMS Configurations

The following commands are used for connecting and disconnecting multiplexed STREAMS configurations. These commands use an implementation-defined default timeout interval.

I_LINK Connects two STREAMs, where *fildes* is the file descriptor of the STREAM connected to the multiplexing driver, and *arg* is the file descriptor of the STREAM connected to another driver. The STREAM designated by *arg* is connected below the multiplexing driver. I_LINK requires the multiplexing driver to send an acknowledgement message to the STREAM head regarding the connection. This call shall return a multiplexer ID number (an identifier used to disconnect the multiplexer; see I_UNLINK) on success, and –1 on failure.

The *ioctl*( ) function with the I_LINK command shall fail if:

[ENXIO] Hangup received on *fildes*.

[ETIME] Timeout before acknowledgement message was received at STREAM head.

[EAGAIN] or [ENOSR]
Unable to allocate STREAMS storage to perform the I_LINK.

[EBADF] The *arg* argument is not a valid, open file descriptor.

[EINVAL] The *fildes* argument does not support multiplexing; or *arg* is not a STREAM or is already connected downstream from a multiplexer; or the specified I_LINK operation would connect the STREAM head in more than one place in the multiplexed STREAM.

An I_LINK can also fail while waiting for the multiplexing driver to acknowledge the request, if a message indicating an error or a hangup is received at the STREAM head of *fildes*. In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_LINK fails with *errno* set to the value in the message.

I_UNLINK Disconnects the two STREAMs specified by *fildes* and *arg*. *fildes* is the file descriptor of the STREAM connected to the multiplexing driver. The *arg* argument is the multiplexer ID number that was returned by the I_LINK *ioctl*( ) command when a STREAM was connected downstream from the multiplexing driver. If *arg* is MUXID_ALL, then all STREAMs that were connected to *fildes* shall be disconnected. As in I_LINK, this command requires acknowledgement.

The *ioctl*( ) function with the I_UNLINK command shall fail if:

[ENXIO] Hangup received on *fildes*.

37804 [ETIME] Timeout before acknowledgement message was received at
37805 STREAM head.

37806 [EAGAIN] or [ENOSR]
37807 Unable to allocate buffers for the acknowledgement
37808 message.

37809 [EINVAL] Invalid multiplexer ID number.

37810 An I_UNLINK can also fail while waiting for the multiplexing driver to
37811 acknowledge the request if a message indicating an error or a hangup is
37812 received at the STREAM head of *fildes*. In addition, an error code can be
37813 returned in the positive or negative acknowledgement message. For these
37814 cases, I_UNLINK shall fail with *errno* set to the value in the message.

37815 I_PLINK Creates a *persistent connection* between two STREAMs, where *fildes* is the file
37816 descriptor of the STREAM connected to the multiplexing driver, and *arg* is the
37817 file descriptor of the STREAM connected to another driver. This call shall
37818 create a persistent connection which can exist even if the file descriptor *fildes*
37819 associated with the upper STREAM to the multiplexing driver is closed. The
37820 STREAM designated by *arg* gets connected via a persistent connection below
37821 the multiplexing driver. I_PLINK requires the multiplexing driver to send an
37822 acknowledgement message to the STREAM head. This call shall return a
37823 multiplexer ID number (an identifier that may be used to disconnect the
37824 multiplexer; see I_PUNLINK) on success, and –1 on failure.

37825 The *ioctl*( ) function with the I_PLINK command shall fail if:

37826 [ENXIO] Hangup received on *fildes*.

37827 [ETIME] Timeout before acknowledgement message was received at
37828 STREAM head.

37829 [EAGAIN] or [ENOSR]
37830 Unable to allocate STREAMS storage to perform the
37831 I_PLINK.

37832 [EBADF] The *arg* argument is not a valid, open file descriptor.

37833 [EINVAL] The *fildes* argument does not support multiplexing; or *arg* is
37834 not a STREAM or is already connected downstream from a
37835 multiplexer; or the specified I_PLINK operation would
37836 connect the STREAM head in more than one place in the
37837 multiplexed STREAM.

37838 An I_PLINK can also fail while waiting for the multiplexing driver to
37839 acknowledge the request, if a message indicating an error or a hangup is
37840 received at the STREAM head of *fildes*. In addition, an error code can be
37841 returned in the positive or negative acknowledgement message. For these
37842 cases, I_PLINK shall fail with *errno* set to the value in the message.

37843 I_PUNLINK Disconnects the two STREAMs specified by *fildes* and *arg* from a persistent
37844 connection. The *fildes* argument is the file descriptor of the STREAM
37845 connected to the multiplexing driver. The *arg* argument is the multiplexer ID
37846 number that was returned by the I_PLINK *ioctl*( ) command when a STREAM
37847 was connected downstream from the multiplexing driver. If *arg* is
37848 MUXID_ALL, then all STREAMs which are persistent connections to *fildes*
37849 shall be disconnected. As in I_PLINK, this command requires the multiplexing

37850 driver to acknowledge the request.

37851 The *ioctl*( ) function with the I_PUNLINK command shall fail if:

37852 [ENXIO] Hangup received on *fildes*.

37853 [ETIME] Timeout before acknowledgement message was received at
37854 STREAM head.

37855 [EAGAIN] or [ENOSR]
37856 Unable to allocate buffers for the acknowledgement
37857 message.

37858 [EINVAL] Invalid multiplexer ID number.

37859 An I_PUNLINK can also fail while waiting for the multiplexing driver to
37860 acknowledge the request if a message indicating an error or a hangup is
37861 received at the STREAM head of *fildes*. In addition, an error code can be
37862 returned in the positive or negative acknowledgement message. For these
37863 cases, I_PUNLINK shall fail with *errno* set to the value in the message.

37864 **RETURN VALUE**

37865 Upon successful completion, *ioctl*( ) shall return a value other than –1 that depends upon the
37866 STREAMS device control function. Otherwise, it shall return –1 and set *errno* to indicate the
37867 error.

37868 **ERRORS**

37869 Under the following general conditions, *ioctl*( ) shall fail if:

37870 [EBADF] The *fildes* argument is not a valid open file descriptor.

37871 [EINTR] A signal was caught during the *ioctl*( ) operation.

37872 [EINVAL] The STREAM or multiplexer referenced by *fildes* is linked (directly or
37873 indirectly) downstream from a multiplexer.

37874 If an underlying device driver detects an error, then *ioctl*( ) shall fail if:

37875 [EINVAL] The *request* or *arg* argument is not valid for this device.

37876 [EIO] Some physical I/O error has occurred.

37877 [ENOTTY] The file associated with the *fildes* argument is not a STREAMS device that
37878 accepts control functions.

37879 [ENXIO] The *request* and *arg* arguments are valid for this device driver, but the service
37880 requested cannot be performed on this particular sub-device.

37881 [ENODEV] The *fildes* argument refers to a valid STREAMS device, but the corresponding
37882 device driver does not support the *ioctl*( ) function.

37883 If a STREAM is connected downstream from a multiplexer, any *ioctl*( ) command except
37884 I_UNLINK and I_PUNLINK shall set *errno* to [EINVAL].

EXAMPLES

None.

APPLICATION USAGE

The implementation-defined timeout interval for STREAMS has historically been 15 seconds.

RATIONALE

None.

FUTURE DIRECTIONS

The *ioctl*( ) function may be removed in a future version.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The Open Group Corrigendum U028/4 is applied, correcting text in the I_FDINSERT [EINVAL] case to refer to *ctlbuf*.

This function is marked as part of the XSI STREAMS Option Group.

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #155 is applied, adding a "may fail" [EINVAL] error condition for the I_SENDFD command.

SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

The *ioctl*( ) function is marked obsolescent.

NAME

isalnum, isalnum_l — test for an alphanumeric character

SYNOPSIS

```
#include <ctype.h>

int isalnum(int c);
CX int isalnum_l(int c, locale_t locale);
```

DESCRIPTION

CX For *isalnum*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *isalnum*( ) and *isalnum_l*( ) functions shall test whether *c* is a character of class **alpha** or CX **digit** in the current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is an **int**, the value of which the application shall ensure is representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

CX The *isalnum*( ) and *isalnum_l*( ) functions shall return non-zero if *c* is an alphanumeric character; otherwise, they shall return 0.

ERRORS

The *isalnum_l*( ) function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

isalpha( ), *isblank*( ), *iscntrl*( ), *isdigit*( ), *isgraph*( ), *islower*( ), *isprint*( ), *ispunct*( ), *isspace*( ), *isupper*( ), *isxdigit*( ), *setlocale*( ), *uselocale*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

Issue 7

The *isalnum_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

isalpha, isalpha_l — test for an alphabetic character

SYNOPSIS

```
#include <ctype.h>

int isalpha(int c);
CX int isalpha_l(int c, locale_t locale);
```

DESCRIPTION

CX For *isalpha*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *isalpha*( ) and *isalpha_l*( ) functions shall test whether *c* is a character of class **alpha** in the CX current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is an **int**, the value of which the application shall ensure is representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

CX The *isalpha*( ) and *isalpha_l*( ) functions shall return non-zero if *c* is an alphabetic character; otherwise, they shall return 0.

ERRORS

The *isalpha_l*( ) function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

37994 **Issue 7**

37995 The *isalpha_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API
37996 Set Part 4.

NAME

isascii — test for a 7-bit US-ASCII character

SYNOPSIS

OB XSI

```
#include <ctype.h>

int isascii(int c);
```

DESCRIPTION

The *isascii*( ) function shall test whether *c* is a 7-bit US-ASCII character code.

The *isascii*( ) function is defined on all integer values.

RETURN VALUE

The *isascii*( ) function shall return non-zero if *c* is a 7-bit US-ASCII character code between 0 and octal 0177 inclusive; otherwise, it shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *isascii*( ) function cannot be used portably in a localized application.

RATIONALE

None.

FUTURE DIRECTIONS

The *isascii*( ) function may be removed in a future version.

SEE ALSO

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 7

The *isascii*( ) function is marked obsolescent.

38024 **NAME**

38025 isastream — test a file descriptor (**STREAMS**)

38026 **SYNOPSIS**

38027 OB XSR
```
#include <stropts.h>

int isastream(int fildes);
```
38028

38029 **DESCRIPTION**

38030 The *isastream*( ) function shall test whether *fildes*, an open file descriptor, is associated with a
38031 STREAMS-based file.

38032 **RETURN VALUE**

38033 Upon successful completion, *isastream*( ) shall return 1 if *fildes* refers to a STREAMS-based file
38034 and 0 if not. Otherwise, *isastream*( ) shall return –1 and set *errno* to indicate the error.

38035 **ERRORS**

38036 The *isastream*( ) function shall fail if:

38037 [EBADF] The *fildes* argument is not a valid open file descriptor.

38038 **EXAMPLES**

38039 None.

38040 **APPLICATION USAGE**

38041 None.

38042 **RATIONALE**

38043 None.

38044 **FUTURE DIRECTIONS**

38045 The *isastream*( ) function may be removed in a future version.

38046 **SEE ALSO**

38047 XBD **<stropts.h>**

38048 **CHANGE HISTORY**

38049 First released in Issue 4, Version 2.

38050 **Issue 5**

38051 Moved from X/OPEN UNIX extension to BASE.

38052 **Issue 7**

38053 The *isastream*( ) function is marked obsolescent.

38054 **NAME**

38055 isatty — test for a terminal device

38056 **SYNOPSIS**

38057
```
#include <unistd.h>
```

38058
```
int isatty(int fildes);
```

38059 **DESCRIPTION**

38060 The *isatty*( ) function shall test whether *fildes*, an open file descriptor, is associated with a
38061 terminal device.

38062 **RETURN VALUE**

38063 The *isatty*( ) function shall return 1 if *fildes* is associated with a terminal; otherwise, it shall return
38064 0 and may set *errno* to indicate the error.

38065 **ERRORS**

38066 The *isatty*( ) function may fail if:

38067 [EBADF] The *fildes* argument is not a valid open file descriptor.

38068 [ENOTTY] The file associated with the *fildes* argument is not a terminal.

38069 **EXAMPLES**

38070 None.

38071 **APPLICATION USAGE**

38072 The *isatty*( ) function does not necessarily indicate that a human being is available for interaction
38073 via *fildes*. It is quite possible that non-terminal devices are connected to the communications
38074 line.

38075 **RATIONALE**

38076 None.

38077 **FUTURE DIRECTIONS**

38078 None.

38079 **SEE ALSO**

38080 XBD **<unistd.h>**

38081 **CHANGE HISTORY**

38082 First released in Issue 1. Derived from Issue 1 of the SVID.

38083 **Issue 6**

38084 The following new requirements on POSIX implementations derive from alignment with the
38085 Single UNIX Specification:

38086 - The optional setting of *errno* to indicate an error is added.

38087 - The [EBADF] and [ENOTTY] optional error conditions are added.

38088 **Issue 7**

38089 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

NAME

isblank, isblank_l — test for a blank character

SYNOPSIS

```
#include <ctype.h>

int isblank(int c);
CX int isblank_l(int c, locale_t locale);
```

DESCRIPTION

CX For *isblank*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *isblank*( ) and *isblank_l*( ) functions shall test whether *c* is a character of class **blank** in the CX current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is a type **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

CX The *isblank*( ) and *isblank_l*( ) functions shall return non-zero if *c* is a <blank>; otherwise, they shall return 0.

ERRORS

The *isblank_l*( ) function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Chapter 7 (on page 135), **<ctype.h>**, **<locale.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

Issue 7

The *isblank_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

iscntrl, iscntrl_l — test for a control character

SYNOPSIS

```
#include <ctype.h>

int iscntrl(int c);
CX int iscntrl_l(int c, locale_t locale);
```

DESCRIPTION

CX For *iscntrl*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *iscntrl*( ) and *iscntrl_l*( ) functions shall test whether *c* is a character of class **cntrl** in the CX current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is a type **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

CX The *iscntrl*( ) and *iscntrl_l*( ) functions shall return non-zero if *c* is a control character; otherwise, they shall return 0.

ERRORS

The *iscntrl_l*( ) function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

None.

FUTURE DIRECTIONS

None.

isalnum( ), *isalpha*( ), *isblank*( ), *isdigit*( ), *isgraph*( ), *islower*( ), *isprint*( ), *ispunct*( ), *isspace*( ), *isupper*( ), *isxdigit*( ), *setlocale*( ), *uselocale*( )

XBD Chapter 7 (on page 135), **<ctype.h>**, **<locale.h>**

CHANGE HISTORY

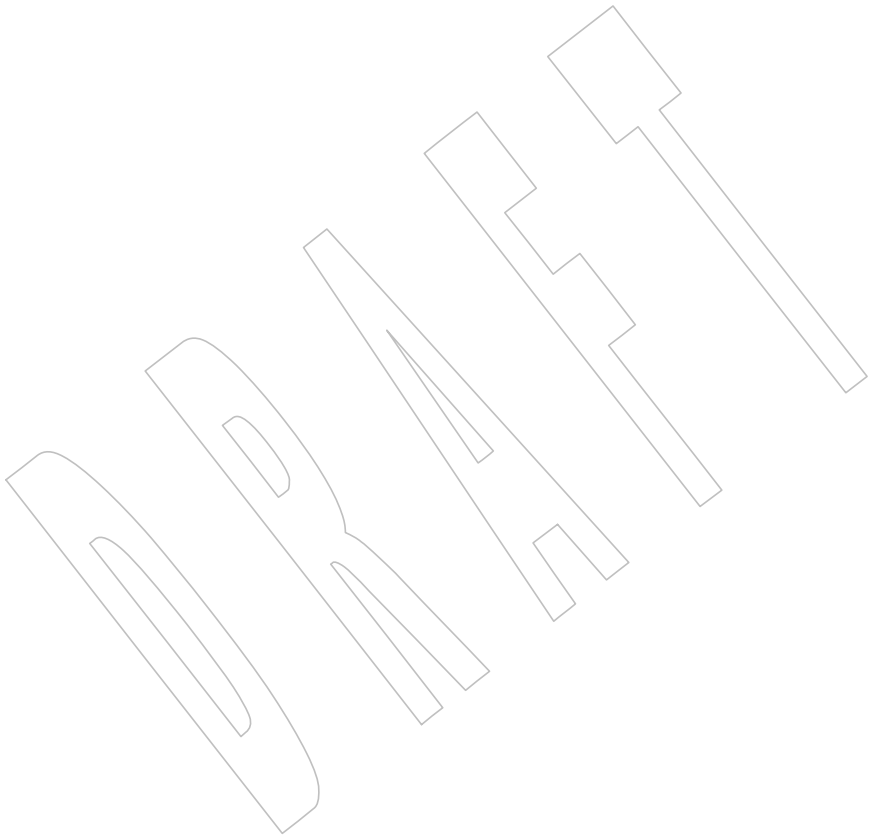
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

38171 **Issue 7**

38172 The *iscntrl_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API
38173 Set Part 4.



38174 **NAME**

38175 isdigit, isdigit_l — test for a decimal digit

38176 **SYNOPSIS**

38177
```
#include <ctype.h>
```

38178
```
int isdigit(int c);
```

38179 CX
```
int isdigit_l(int c, locale_t locale);
```

38180 **DESCRIPTION**

38181 CX For *isdigit*( ): The functionality described on this reference page is aligned with the ISO C
38182 standard. Any conflict between the requirements described here and the ISO C standard is
38183 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

38184 CX The *isdigit*( ) and *isdigit_l*( ) functions shall test whether *c* is a character of class **digit** in the
38185 CX current locale of the process, or in the locale represented by *locale*, respectively; see XBD
38186 Chapter 7 (on page 135).

38187 The *c* argument is an **int**, the value of which the application shall ensure is a character
38188 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
38189 any other value, the behavior is undefined.

38190 **RETURN VALUE**

38191 CX The *isdigit*( ) and *isdigit_l*( ) functions shall return non-zero if *c* is a decimal digit; otherwise,
38192 they shall return 0.

38193 **ERRORS**

38194 The *isdigit_l*( ) function may fail if:

38195 CX [EINVAL] *locale* is not a valid locale object handle.

38196 **EXAMPLES**

38197 None.

38198 **APPLICATION USAGE**

38199 To ensure applications portability, especially across natural languages, only these functions and
38200 the functions in the reference pages listed in the SEE ALSO section should be used for character
38201 classification.

38202 **RATIONALE**

38203 None.

38204 **FUTURE DIRECTIONS**

38205 None.

38206 **SEE ALSO**

38207 *isalnum*( ), *isalpha*( ), *isblank*( ), *iscntrl*( ), *isgraph*( ), *islower*( ), *isprint*( ), *ispunct*( ), *isspace*( ),
38208 *isupper*( ), *isxdigit*( )

38209 XBD Chapter 7 (on page 135), **<ctype.h>**, **<locale.h>**

38210 **CHANGE HISTORY**

38211 First released in Issue 1. Derived from Issue 1 of the SVID.

38212 **Issue 6**

38213 The normative text is updated to avoid use of the term "must" for application requirements.

38214 **Issue 7**

38215 The *isdigit_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API
38216 Set Part 4.

38217 **NAME**

38218 isfinite — test for finite value

38219 **SYNOPSIS**

38220
```
#include <math.h>
```

38221
```
int isfinite(real-floating x);
```

38222 **DESCRIPTION**

38223 CX The functionality described on this reference page is aligned with the ISO C standard. Any
38224 conflict between the requirements described here and the ISO C standard is unintentional. This
38225 volume of POSIX.1-200x defers to the ISO C standard.

38226 The *isfinite*( ) macro shall determine whether its argument has a finite value (zero, subnormal, or
38227 normal, and not infinite or NaN). First, an argument represented in a format wider than its
38228 semantic type is converted to its semantic type. Then determination is based on the type of the
38229 argument.

38230 **RETURN VALUE**

38231 The *isfinite*( ) macro shall return a non-zero value if and only if its argument has a finite value.

38232 **ERRORS**

38233 No errors are defined.

38234 **EXAMPLES**

38235 None.

38236 **APPLICATION USAGE**

38237 None.

38238 **RATIONALE**

38239 None.

38240 **FUTURE DIRECTIONS**

38241 None.

38242 **SEE ALSO**

38243 *fpclassify*( ), *isinf*( ), *isnan*( ), *isnormal*( ), *signbit*( )

38244 XBD **<math.h>**

38245 **CHANGE HISTORY**

38246 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

isgraph, isgraph_l — test for a visible character

SYNOPSIS

```
#include <ctype.h>

int isgraph(int c);
CX int isgraph_l(int c, locale_t locale);
```

DESCRIPTION

CX For *isgraph*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *isgraph*( ) and *isgraph_l*( ) functions shall test whether *c* is a character of class **graph** in the CX current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

CX The *isgraph*( ) and *isgraph_l*( ) functions shall return non-zero if *c* is a character with a visible representation; otherwise, they shall return 0.

ERRORS

The *isgraph_l*( ) function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

isalnum( ), *isalpha*( ), *isblank*( ), *iscntrl*( ), *isdigit*( ), *islower*( ), *isprint*( ), *ispunct*( ), *isspace*( ), *isupper*( ), *isxdigit*( ), *setlocale*( ), *uselocale*( )

XBD Chapter 7 (on page 135), **<ctype.h>**, **<locale.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

The *isgraph_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

38290 **NAME**

38291 isgreater — test if x greater than y

38292 **SYNOPSIS**

38293
```
#include <math.h>
```

38294
```
int isgreater(real-floating x, real-floating y);
```

38295 **DESCRIPTION**

38296 CX The functionality described on this reference page is aligned with the ISO C standard. Any
38297 conflict between the requirements described here and the ISO C standard is unintentional. This
38298 volume of POSIX.1-200x defers to the ISO C standard.

38299 The *isgreater*( ) macro shall determine whether its first argument is greater than its second
38300 argument. The value of *isgreater*(*x*, *y*) shall be equal to (*x*) > (*y*); however, unlike (*x*) > (*y*),
38301 *isgreater*(*x*, *y*) shall not raise the invalid floating-point exception when *x* and *y* are unordered.

38302 **RETURN VALUE**

38303 Upon successful completion, the *isgreater*( ) macro shall return the value of (*x*) > (*y*).

38304 If *x* or *y* is NaN, 0 shall be returned.

38305 **ERRORS**

38306 No errors are defined.

38307 **EXAMPLES**

38308 None.

38309 **APPLICATION USAGE**

38310 The relational and equality operators support the usual mathematical relationships between
38311 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
38312 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
38313 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
38314 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
38315 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
38316 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
38317 indicates that the argument shall be an expression of **real-floating** type.

38318 **RATIONALE**

38319 None.

38320 **FUTURE DIRECTIONS**

38321 None.

38322 **SEE ALSO**

38323 *isgreaterequal*( ), *isless*( ), *islessequal*( ), *islessgreater*( ), *isunordered*( )

38324 XBD **<math.h>**

38325 **CHANGE HISTORY**

38326 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

38327 **NAME**

38328 isgreaterequal — test if x is greater than or equal to y

38329 **SYNOPSIS**

38330
```
#include <math.h>
```

38331
```
int isgreaterequal(real-floating x, real-floating y);
```

38332 **DESCRIPTION**

38333 CX The functionality described on this reference page is aligned with the ISO C standard. Any
38334 conflict between the requirements described here and the ISO C standard is unintentional. This
38335 volume of POSIX.1-200x defers to the ISO C standard.

38336 The *isgreaterequal*( ) macro shall determine whether its first argument is greater than or equal to
38337 its second argument. The value of *isgreaterequal*(x, y) shall be equal to $(x) \geq (y)$; however, unlike
38338 $(x) \geq (y)$, *isgreaterequal*(x, y) shall not raise the invalid floating-point exception when x and y are
38339 unordered.

38340 **RETURN VALUE**

38341 Upon successful completion, the *isgreaterequal*( ) macro shall return the value of $(x) \geq (y)$.

38342 If x or y is NaN, 0 shall be returned.

38343 **ERRORS**

38344 No errors are defined.

38345 **EXAMPLES**

38346 None.

38347 **APPLICATION USAGE**

38348 The relational and equality operators support the usual mathematical relationships between
38349 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
38350 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
38351 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
38352 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
38353 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
38354 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
38355 indicates that the argument shall be an expression of **real-floating** type.

38356 **RATIONALE**

38357 None.

38358 **FUTURE DIRECTIONS**

38359 None.

38360 **SEE ALSO**

38361 *isgreater*( ), *isless*( ), *islessequal*( ), *islessgreater*( ), *isunordered*( )

38362 XBD **<math.h>**

38364 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

38365 **NAME**

38366 isinf — test for infinity

38367 **SYNOPSIS**

38368
```
#include <math.h>
```

38369
```
int isinf(real-floating x);
```

38370 **DESCRIPTION**

38371 CX The functionality described on this reference page is aligned with the ISO C standard. Any
38372 conflict between the requirements described here and the ISO C standard is unintentional. This
38373 volume of POSIX.1-200x defers to the ISO C standard.

38374 The *isinf*( ) macro shall determine whether its argument value is an infinity (positive or
38375 negative). First, an argument represented in a format wider than its semantic type is converted
38376 to its semantic type. Then determination is based on the type of the argument.

38377 **RETURN VALUE**

38378 The *isinf*( ) macro shall return a non-zero value if and only if its argument has an infinite value.

38379 **ERRORS**

38380 No errors are defined.

38381 **EXAMPLES**

38382 None.

38383 **APPLICATION USAGE**

38384 None.

38385 **RATIONALE**

38386 None.

38387 **FUTURE DIRECTIONS**

38394 **NAME**

38395 isless — test if x is less than y

38396 **SYNOPSIS**

38397
```
#include <math.h>
```

38398
```
int isless(real-floating x, real-floating y);
```

38399 **DESCRIPTION**

38400 CX The functionality described on this reference page is aligned with the ISO C standard. Any
38401 conflict between the requirements described here and the ISO C standard is unintentional. This
38402 volume of POSIX.1-200x defers to the ISO C standard.

38403 The *isless*( ) macro shall determine whether its first argument is less than its second argument.
38404 The value of *isless*(*x*, *y*) shall be equal to (*x*) < (*y*); however, unlike (*x*) < (*y*), *isless*(*x*, *y*) shall not
38405 raise the invalid floating-point exception when *x* and *y* are unordered.

38406 **RETURN VALUE**

38407 Upon successful completion, the *isless*( ) macro shall return the value of (*x*) < (*y*).

38408 If *x* or *y* is NaN, 0 shall be returned.

38409 **ERRORS**

38410 No errors are defined.

38411 **EXAMPLES**

38412 None.

38413 **APPLICATION USAGE**

38414 The relational and equality operators support the usual mathematical relationships between
38415 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
38416 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
38417 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
38418 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
38419 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
38420 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
38421 indicates that the argument shall be an expression of **real-floating** type.

38422 **RATIONALE**

38423 None.

38424 **FUTURE DIRECTIONS**

38425 None.

38426 **SEE ALSO**

38427 *isgreater*( ), *isgreaterequal*( ), *islessequal*( ), *islessgreater*( ), *isunordered*( )

38428 XBD **<math.h>**

38429 **CHANGE HISTORY**

38430 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

38431 **NAME**

38432 islessequal — test if x is less than or equal to y

38433 **SYNOPSIS**

38434
```
#include <math.h>
```

38435
```
int islessequal(real-floating x, real-floating y);
```

38436 **DESCRIPTION**

38437 CX The functionality described on this reference page is aligned with the ISO C standard. Any
38438 conflict between the requirements described here and the ISO C standard is unintentional. This
38439 volume of POSIX.1-200x defers to the ISO C standard.

38440 The *islessequal*( ) macro shall determine whether its first argument is less than or equal to its
38441 second argument. The value of *islessequal*(*x*, *y*) shall be equal to (*x*) <= (*y*); however, unlike
38442 (*x*) <= (*y*), *islessequal*(*x*, *y*) shall not raise the invalid floating-point exception when *x* and *y* are
38443 unordered.

38444 **RETURN VALUE**

38445 Upon successful completion, the *islessequal*( ) macro shall return the value of (*x*) <= (*y*).

38446 If *x* or *y* is NaN, 0 shall be returned.

38447 **ERRORS**

38448 No errors are defined.

38449 **EXAMPLES**

38450 None.

38451 **APPLICATION USAGE**

38452 The relational and equality operators support the usual mathematical relationships between
38453 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
38454 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
38455 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
38456 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
38457 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
38458 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
38459 indicates that the argument shall be an expression of **real-floating** type.

38460 **RATIONALE**

38461 None.

38462 **FUTURE DIRECTIONS**

38463 None.

38467 **CHANGE HISTORY**

38468 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

38469 **NAME**

38470 islessgreater — test if x is less than or greater than y

38471 **SYNOPSIS**

38472
```
#include <math.h>
```

38473
```
int islessgreater(real-floating x, real-floating y);
```

38474 **DESCRIPTION**

38475 CX The functionality described on this reference page is aligned with the ISO C standard. Any
38476 conflict between the requirements described here and the ISO C standard is unintentional. This
38477 volume of POSIX.1-200x defers to the ISO C standard.

38478 The *islessgreater*( ) macro shall determine whether its first argument is less than or greater than
38479 its second argument. The *islessgreater*(*x*, *y*) macro is similar to (*x*) < (*y*) || (*x*) > (*y*); however,
38480 *islessgreater*(*x*, *y*) shall not raise the invalid floating-point exception when *x* and *y* are unordered
38481 (nor shall it evaluate *x* and *y* twice).

38482 **RETURN VALUE**

38483 Upon successful completion, the *islessgreater*( ) macro shall return the value of
38484 (*x*) < (*y*) || (*x*) > (*y*).

38485 If *x* or *y* is NaN, 0 shall be returned.

38486 **ERRORS**

38487 No errors are defined.

38488 **EXAMPLES**

38489 None.

38490 **APPLICATION USAGE**

38491 The relational and equality operators support the usual mathematical relationships between
38492 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
38493 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
38494 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
38495 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
38496 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
38497 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
38498 indicates that the argument shall be an expression of **real-floating** type.

38499 **RATIONALE**

38507 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

islower, islower_l — test for a lowercase letter

SYNOPSIS

```
#include <ctype.h>

int islower(int c);
int islower_l(int c, locale_t locale);
```

DESCRIPTION

For *islower*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *islower*( ) and *islower_l*( ) functions shall test whether *c* is a character of class **lower** in the current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

The *islower*( ) and *islower_l*( ) functions shall return non-zero if *c* is a lowercase letter; otherwise, they shall return 0.

ERRORS

The *islower_l*( ) function may fail if:

[EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

Testing for a Lowercase Letter

Two examples follow, the first using *islower*( ), the second using multiple concurrent locales and *islower_l*( ).

The examples test whether the value is a lowercase letter, based on the locale of the user, then use it as part of a key value.

```
/* Example 1 -- using islower() */
#include <ctype.h>
#include <stdlib.h>
#include <locale.h>
...
char *keystr;
int elementlen, len;
char c;
...
setlocale(LC_ALL, "");
...
len = 0;
while (len < elementlen) {
    c = (char) (rand() % 256);
...
    if (islower(c))
```

```
            keystr[len++] = c;
        }
    ...
    /* Example 2 -- using islower_l() */
    #include <ctype.h>
    #include <stdlib.h>
    #include <locale.h>
    ...
    char *keystr;
    int elementlen, len;
    char c;
    ...
    locale_t loc = newlocale (LC_ALL_MASK, "", (locale_t) 0);
    ...
    len = 0;
    while (len < elementlen) {
        c = (char) (rand() % 256);
    ...
        if (islower_l(c, loc))
            keystr[len++] = c;
        }
    ...
```

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

isalnum( ), *isalpha( )*, *isblank( )*, *iscntrl( )*, *isdigit( )*, *isgraph( )*, *isprint( )*, *ispunct( )*, *isspace( )*, *isupper( )*, *isxdigit( )*, *setlocale( )*, *uselocale( )*

XBD Chapter 7 (on page 135), **<ctype.h>**, **<locale.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

An example is added.

Issue 7

The *islower_l( )* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

38594 **NAME**

38595 isnan — test for a NaN

38596 **SYNOPSIS**

38597
```
#include <math.h>
```

38598
```
int isnan(real-floating x);
```

38599 **DESCRIPTION**

38600 CX The functionality described on this reference page is aligned with the ISO C standard. Any
38601 conflict between the requirements described here and the ISO C standard is unintentional. This
38602 volume of POSIX.1-200x defers to the ISO C standard.

38603 The *isnan*( ) macro shall determine whether its argument value is a NaN. First, an argument
38604 represented in a format wider than its semantic type is converted to its semantic type. Then
38605 determination is based on the type of the argument.

38606 **RETURN VALUE**

38607 The *isnan*( ) macro shall return a non-zero value if and only if its argument has a NaN value.

38608 **ERRORS**

38609 No errors are defined.

38610 **EXAMPLES**

38611 None.

38612 **APPLICATION USAGE**

38613 None.

38614 **RATIONALE**

38615 None.

38616 **FUTURE DIRECTIONS**

38617 None.

38618 **SEE ALSO**

38620 XBD **<math.h>**

38621 **CHANGE HISTORY**

38622 First released in Issue 3.

38623 **Issue 5**

38624 The DESCRIPTION is updated to indicate the return value when NaN is not supported. This
38625 text was previously published in the APPLICATION USAGE section.

38626 **Issue 6**

38627 Re-written for alignment with the ISO/IEC 9899: 1999 standard.

38628 **NAME**

38629 isnormal — test for a normal value

38630 **SYNOPSIS**

38631
```
#include <math.h>
```

38632
```
int isnormal(real-floating x);
```

38633 **DESCRIPTION**

38634 CX The functionality described on this reference page is aligned with the ISO C standard. Any
38635 conflict between the requirements described here and the ISO C standard is unintentional. This
38636 volume of POSIX.1-200x defers to the ISO C standard.

38637 The *isnormal*( ) macro shall determine whether its argument value is normal (neither zero,
38638 subnormal, infinite, nor NaN). First, an argument represented in a format wider than its
38639 semantic type is converted to its semantic type. Then determination is based on the type of the
38640 argument.

38641 **RETURN VALUE**

38642 The *isnormal*( ) macro shall return a non-zero value if and only if its argument has a normal
38643 value.

38644 **ERRORS**

38645 No errors are defined.

38646 **EXAMPLES**

38647 None.

38648 **APPLICATION USAGE**

38649 None.

38650 **RATIONALE**

38651 None.

38656 XBD **<math.h>**

38657 **CHANGE HISTORY**

38658 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

38659 **NAME**

38660 isprint, isprint_l — test for a printable character

38661 **SYNOPSIS**

38662
```
#include <ctype.h>
```

38663
```
int isprint(int c);
```

38664 CX
```
int isprint_l(int c, locale_t locale);
```

38665 **DESCRIPTION**

38666 CX For *isprint*( ): The functionality described on this reference page is aligned with the ISO C
38667 standard. Any conflict between the requirements described here and the ISO C standard is
38668 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

38669 CX The *isprint*( ) and *isprint_l*( ) functions shall test whether *c* is a character of class **print** in the
38670 CX current locale of the process, or in the locale represented by *locale*, respectively; see XBD
38671 Chapter 7 (on page 135).

38672 The *c* argument is an **int**, the value of which the application shall ensure is a character
38673 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
38674 any other value, the behavior is undefined.

38675 **RETURN VALUE**

38676 CX The *isprint*( ) and *isprint_l*( ) functions shall return non-zero if *c* is a printable character;
38677 otherwise, they shall return 0.

38678 **ERRORS**

38679 The *isprint_l*( ) function may fail if:

38680 CX [EINVAL] *locale* is not a valid locale object handle.

38681 **EXAMPLES**

38682 None.

38683 **APPLICATION USAGE**

38684 To ensure applications portability, especially across natural languages, only these functions and
38685 the functions in the reference pages listed in the SEE ALSO section should be used for character
38686 classification.

38687 **RATIONALE**

38697 **Issue 6**

38698 The normative text is updated to avoid use of the term “must” for application requirements.

Issue 7

The *isprint_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

ispunct, ispunct_l — test for a punctuation character

SYNOPSIS

```
#include <ctype.h>

int ispunct(int c);
CX int ispunct_l(int c, locale_t locale);
```

DESCRIPTION

CX For *ispunct*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *ispunct*( ) and *ispunct_l*( ) functions shall test whether *c* is a character of class **punct** in the CX current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

CX The *ispunct*( ) and *ispunct_l*( ) functions shall return non-zero if *c* is a punctuation character; otherwise, they shall return 0.

ERRORS

The *ispunct_l*( ) function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

Issue 7

The *ispunct_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

isspace, isspace_l — test for a white-space character

SYNOPSIS

```
#include <ctype.h>

int isspace(int c);
CX int isspace_l(int c, locale_t locale);
```

DESCRIPTION

CX For *isspace*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *isspace*( ) and *isspace_l*( ) functions shall test whether *c* is a character of class **space** in the CX current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

CX The *isspace*( ) and *isspace_l*( ) functions shall return non-zero if *c* is a white-space character; otherwise, they shall return 0.

ERRORS

The *isspace_l*( ) function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

38788 **NAME**

38789 isunordered — test if arguments are unordered

38790 **SYNOPSIS**

38791
```
#include <math.h>
```

38792
```
int isunordered(real-floating x, real-floating y);
```

38793 **DESCRIPTION**

38794 CX The functionality described on this reference page is aligned with the ISO C standard. Any
38795 conflict between the requirements described here and the ISO C standard is unintentional. This
38796 volume of POSIX.1-200x defers to the ISO C standard.

38797 The *isunordered*( ) macro shall determine whether its arguments are unordered.

38798 **RETURN VALUE**

38799 Upon successful completion, the *isunordered*( ) macro shall return 1 if its arguments are
38800 unordered, and 0 otherwise.

38801 If *x* or *y* is NaN, 1 shall be returned.

38802 **ERRORS**

38803 No errors are defined.

38804 **EXAMPLES**

38805 None.

38806 **APPLICATION USAGE**

38807 The relational and equality operators support the usual mathematical relationships between
38808 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
38809 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
38810 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
38811 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
38812 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
38813 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
38814 indicates that the argument shall be an expression of **real-floating** type.

NAME

iswalnum, iswalnum_l — test for an alphanumeric wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswalnum(wint_t wc);
int iswalnum_l(wint_t wc, locale_t locale);
```

DESCRIPTION

For *iswalnum*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *iswalnum*( ) and *iswalnum_l*( ) functions shall test whether *wc* is a wide-character code representing a character of class **alpha** or **digit** in the current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the current locale, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

The *iswalnum*( ) and *iswalnum_l*( ) functions shall return non-zero if *wc* is an alphanumeric wide-character code; otherwise, they shall return 0.

ERRORS

The *iswalnum_l*( ) function may fail if:

[EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

CHANGE HISTORY

First released as a World-wide Portability Interface in Issue 4.

Issue 5

The following change has been made in this version for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

The *iswalnum_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

iswalpha, iswalpha_l — test for an alphabetic wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswalpha(wint_t wc);
CX int iswalpha_l(wint_t wc, locale_t locale);
```

DESCRIPTION

CX For *iswalpha*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *iswalpha*( ) and *iswalpha_l*( ) functions shall test whether *wc* is a wide-character code CX representing a character of class **alpha** in the current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the current locale, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

CX The *iswalpha*( ) and *iswalpha_l*( ) functions shall return non-zero if *wc* is an alphabetic wide-character code; otherwise, they shall return 0.

ERRORS

The *iswalpha_l*( ) function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

Issue 5

The following change has been made in this version for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

The *iswalpha_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

iswblank, iswblank_l — test for a blank wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswblank(wint_t wc);
int iswblank_l(wint_t wc, locale_t locale);
```

DESCRIPTION

For *iswblank*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *iswblank*( ) and *iswblank*( ) functions shall test whether *wc* is a wide-character code representing a character of class **blank** in the current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the current locale, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

The *iswblank*( ) and *iswblank_l*( ) functions shall return non-zero if *wc* is a blank wide-character code; otherwise, they shall return 0.

ERRORS

The *iswblank_l*( ) function may fail if:

[EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

XBD Chapter 7 (on page 135), **<locale.h>**, **<wctype.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

Issue 7

The *iswblank_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

iswcntrl, iswcntrl_l — test for a control wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswcntrl(wint_t wc);
CX int iswcntrl_l(wint_t wc, locale_t locale);
```

DESCRIPTION

CX For *iswcntrl*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *iswcntrl*( ) and *iswcntrl_l*( ) functions shall test whether *wc* is a wide-character code CX representing a character of class **cntrl** in the current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the current locale, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

CX The *iswcntrl*( ) and *iswcntrl_l*( ) functions shall return non-zero if *wc* is a control wide-character code; otherwise, they shall return 0.

ERRORS

The *iswcntrl_l*( ) function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

CHANGE HISTORY

First released in Issue 4.

Issue 5

The following change has been made in this version for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

The *iswcntrl_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

iswctype, iswctype_l — test character for a specified class

SYNOPSIS

```
#include <wctype.h>

int iswctype(wint_t wc, wctype_t charclass);
int iswctype_l(wint_t wc, wctype_t charclass,
    locale_t locale);
```

DESCRIPTION

For *iswctype*(): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *iswctype*( ) and *iswctype_l*( ) functions shall determine whether the wide-character code *wc* has the character class *charclass*, returning true or false. The *iswctype*( ) and *iswctype_l*( ) functions are defined on WEOF and wide-character codes corresponding to the valid character encodings in the current locale, or in the locale represented by *locale*, respectively. If the *wc* argument is not in the domain of the function, the result is undefined. If the value of *charclass* is invalid (that is, not obtained by a call to *wctype*( ) or *charclass* is invalidated by a subsequent call to *setlocale*( ) that has affected category *LC_CTYPE*) the result is unspecified.

RETURN VALUE

The *iswctype*( ) and *iswctype_l*( ) functions shall return non-zero (true) if and only if *wc* has the property described by *charclass*. If *charclass* is 0, these functions shall return 0.

ERRORS

The *iswctype_l*( ) function may fail if:

[EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

Testing for a Valid Character

```
#include <wctype.h>
...
int yes_or_no;
wint_t wc;
wctype_t valid_class;
...
if ((valid_class=wctype("vowel")) == (wctype_t)0)
    /* Invalid character class. */
yes_or_no=iswctype(wc,valid_class);
```

APPLICATION USAGE

The twelve strings `"alnum"`, `"alpha"`, `"blank"`, `"cntrl"`, `"digit"`, `"graph"`, `"lower"`, `"print"`, `"punct"`, `"space"`, `"upper"`, and `"xdigit"` are reserved for the standard character classes. In the table below, the functions in the left column are equivalent to the functions in the right column.

```
iswalnum(wc)            iswctype(wc, wctype("alnum"))
iswalnum_l(wc, locale)  iswctype_l(wc, wctype("alnum"), locale)
iswalpha(wc)            iswctype(wc, wctype("alpha"))
iswalpha_l(wc, locale)  iswctype_l(wc, wctype("alpha"), locale)
iswblank(wc)            iswctype(wc, wctype("blank"))
```

```
iswblank_l(wc, locale)  iswctype_l(wc, wctype("blank"), locale)
iswcntrl(wc)            iswctype(wc, wctype("cntrl"))
iswcntrl_l(wc, locale)  iswctype_l(wc, wctype("cntrl"), locale)
iswdigit(wc)            iswctype(wc, wctype("digit"))
iswdigit_l(wc, locale)  iswctype_l(wc, wctype("digit"), locale)
iswgraph(wc)            iswctype(wc, wctype("graph"))
iswgraph_l(wc, locale)  iswctype_l(wc, wctype("graph"), locale)
iswlower(wc)            iswctype(wc, wctype("lower"))
iswlower_l(wc, locale)  iswctype_l(wc, wctype("lower"), locale)
iswprint(wc)            iswctype(wc, wctype("print"))
iswprint_l(wc, locale)  iswctype_l(wc, wctype("print"), locale)
iswpunct(wc)            iswctype(wc, wctype("punct"))
iswpunct_l(wc, locale)  iswctype_l(wc, wctype("punct"), locale)
iswspace(wc)            iswctype(wc, wctype("space"))
iswspace_l(wc, locale)  iswctype_l(wc, wctype("space"), locale)
iswupper(wc)            iswctype(wc, wctype("upper"))
iswupper_l(wc, locale)  iswctype_l(wc, wctype("upper"), locale)
iswxdigit(wc)           iswctype(wc, wctype("xdigit"))
iswxdigit_l(wc, locale) iswctype_l(wc, wctype("xdigit"), locale)
```

XBD **<locale.h>**, **<wctype.h>**

CHANGE HISTORY

First released as World-wide Portability Interfaces in Issue 4.

Issue 5

The following change has been made in this version for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

Issue 6

The behavior of *n*=0 is now described.

An example is added.

A new function, *iswblank( )*, is added to the list in the APPLICATION USAGE.

Issue 7

The *iswctype_l( )* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

iswdigit, iswdigit_l — test for a decimal digit wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswdigit(wint_t wc);
int iswdigit_l(wint_t wc, locale_t locale);
```

DESCRIPTION

For *iswdigit*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *iswdigit*( ) and *iswdigit_l*( ) functions shall test whether *wc* is a wide-character code representing a character of class **digit** in the current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the current locale, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

The *iswdigit*( ) and *iswdigit_l*( ) functions shall return non-zero if *wc* is a decimal digit wide-character code; otherwise, they shall return 0.

ERRORS

The *iswdigit_l*( ) function may fail if:

[EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

The following change has been made in this version for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

The *iswdigit_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

iswgraph, iswgraph_l — test for a visible wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswgraph(wint_t wc);
CX int iswgraph_l(wint_t wc, locale_t locale);
```

DESCRIPTION

CX For *iswgraph*(): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *iswgraph*() and *iswgraph_l*() functions shall test whether *wc* is a wide-character code CX representing a character of class **graph** in the current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the current locale, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

CX The *iswgraph*() and *iswgraph_l*() functions shall return non-zero if *wc* is a wide-character code with a visible representation; otherwise, they shall return 0.

ERRORS

The *iswgraph_l*() function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

Issue 7

The *iswgraph_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

iswlower, iswlower_l — test for a lowercase letter wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswlower(wint_t wc);
int iswlower_l(wint_t wc, locale_t locale);
```

DESCRIPTION

For *iswlower*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *iswlower*( ) and *iswlower_l*( ) functions shall test whether *wc* is a wide-character code representing a character of class **lower** in the current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the current locale, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

The *iswlower*( ) and *iswlower_l*( ) functions shall return non-zero if *wc* is a lowercase letter wide-character code; otherwise, they shall return 0.

ERRORS

The *iswlower_l*( ) function may fail if:

[EINVAL] *locale* is not a valid locale object handle.

NAME

iswprint, iswprint_l — test for a printable wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswprint(wint_t wc);
CX int iswprint_l(wint_t wc, locale_t locale);
```

DESCRIPTION

CX For *iswprint*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *iswprint*( ) and *iswprint_l*( ) functions shall test whether *wc* is a wide-character code CX representing a character of class **print** in the current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the current locale, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

CX The *iswprint*( ) and *iswprint_l*( ) functions shall return non-zero if *wc* is a printable wide-character code; otherwise, they shall return 0.

ERRORS

The *iswprint_l*( ) function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

CHANGE HISTORY

First released in Issue 4.

Issue 5

The following change has been made in this version for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

The *iswspace_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

iswupper, iswupper_l — test for an uppercase letter wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswupper(wint_t wc);
CX int iswupper_l(wint_t wc, locale_t locale);
```

DESCRIPTION

CX For *iswupper*(): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *iswupper*() and *iswupper_l*() functions shall test whether *wc* is a wide-character code CX representing a character of class **upper** in the current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the current locale, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

CX The *iswupper*() and *iswupper_l*() functions shall return non-zero if *wc* is an uppercase letter wide-character code; otherwise, they shall return 0.

ERRORS

The *iswupper_l*() function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

NAME

iswxdigit, iswxdigit_l — test for a hexadecimal digit wide-character code

SYNOPSIS

```
#include <wctype.h>

int iswxdigit(wint_t wc);
int iswxdigit_l(wint_t wc, locale_t locale);
```

DESCRIPTION

For *iswxdigit*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *iswxdigit*( ) and *iswxdigit_l*( ) functions shall test whether *wc* is a wide-character code representing a character of class **xdigit** in the current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the current locale, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

The *iswxdigit*( ) and *iswxdigit_l*( ) functions shall return non-zero if *wc* is a hexadecimal digit wide-character code; otherwise, they shall return 0.

ERRORS

The *iswxdigit_l*( ) function may fail if:

[EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

NAME

isxdigit, isxdigit_l — test for a hexadecimal digit

SYNOPSIS

```
#include <ctype.h>

int isxdigit(int c);
CX int isxdigit_l(int c, locale_t locale);
```

DESCRIPTION

CX For *isxdigit*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *isxdigit*( ) and *isxdigit_l*( ) functions shall test whether *c* is a character of class **xdigit** in the CX current locale of the process, or in the locale represented by *locale*, respectively; see XBD Chapter 7 (on page 135).

The *c* argument is an **int**, the value of which the application shall ensure is a character representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE

CX The *isxdigit*( ) and *isxdigit_l*( ) functions shall return non-zero if *c* is a hexadecimal digit; otherwise, they shall return 0.

ERRORS

The *isxdigit_l*( ) function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

Issue 7

The *isxdigit_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

j0, j1, jn — Bessel functions of the first kind

SYNOPSIS

XSI

```
#include <math.h>

double j0(double x);
double j1(double x);
double jn(int n, double x);
```

DESCRIPTION

The *j0*( ), *j1*( ), and *jn*( ) functions shall compute Bessel functions of *x* of the first kind of orders 0, 1, and *n*, respectively.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the relevant Bessel value of *x* of the first kind.

If the *x* argument is too large in magnitude, or the correct result would cause underflow, 0 shall be returned and a range error may occur.

If *x* is NaN, a NaN shall be returned.

ERRORS

These functions may fail if:

Range Error — The value of *x* was too large in magnitude, or an underflow occurred.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

No other errors shall occur.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.19 (on page 116), **<math.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The may fail [EDOM] error is removed for the case for NaN.

The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling with the ISO/IEC 9899: 1999 standard.

jrand48( )

NAME

jrand48 — generate a uniformly distributed pseudo-random long signed integer

SYNOPSIS

XSI

```
#include <stdlib.h>

long jrand48(unsigned short xsubi[3]);
```

DESCRIPTION

Refer to *drand48( )*.

NAME

kill — send a signal to a process or a group of processes

SYNOPSIS

CX
```
#include <signal.h>

int kill(pid_t pid, int sig);
```

DESCRIPTION

The *kill*( ) function shall send a signal to a process or a group of processes specified by *pid*. The signal to be sent is specified by *sig* and is either one from the list given in **<signal.h>** or 0. If *sig* is 0 (the null signal), error checking is performed but no signal is actually sent. The null signal can be used to check the validity of *pid*.

For a process to have permission to send a signal to a process designated by *pid*, unless the sending process has appropriate privileges, the real or effective user ID of the sending process shall match the real or saved set-user-ID of the receiving process.

If *pid* is greater than 0, *sig* shall be sent to the process whose process ID is equal to *pid*.

If *pid* is 0, *sig* shall be sent to all processes (excluding an unspecified set of system processes) whose process group ID is equal to the process group ID of the sender, and for which the process has permission to send a signal.

If *pid* is –1, *sig* shall be sent to all processes (excluding an unspecified set of system processes) for which the process has permission to send that signal.

If *pid* is negative, but not –1, *sig* shall be sent to all processes (excluding an unspecified set of system processes) whose process group ID is equal to the absolute value of *pid*, and for which the process has permission to send a signal.

If the value of *pid* causes *sig* to be generated for the sending process, and if *sig* is not blocked for the calling thread and if no other thread has *sig* unblocked or is waiting in a *sigwait*( ) function for *sig*, either *sig* or at least one pending unblocked signal shall be delivered to the sending thread before *kill*( ) returns.

The user ID tests described above shall not be applied when sending SIGCONT to a process that is a member of the same session as the sending process.

An implementation that provides extended security controls may impose further implementation-defined restrictions on the sending of signals, including the null signal. In particular, the system may deny the existence of some or all of the processes specified by *pid*.

The *kill*( ) function is successful if the process has permission to send *sig* to any of the processes specified by *pid*. If *kill*( ) fails, no signal shall be sent.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *kill*( ) function shall fail if:

[EINVAL] The value of the *sig* argument is an invalid or unsupported signal number.

[EPERM] The process does not have permission to send the signal to any receiving process.

39664 [ESRCH] No process or process group can be found corresponding to that specified by
39665 *pid*.

39666 **EXAMPLES**

39667 None.

39668 **APPLICATION USAGE**

39669 None.

39670 **RATIONALE**

39671 The semantics for permission checking for *kill*( ) differed between System V and most other
39672 implementations, such as Version 7 or 4.3 BSD. The semantics chosen for this volume of
39673 POSIX.1-200x agree with System V. Specifically, a set-user-ID process cannot protect itself against
39674 signals (or at least not against SIGKILL) unless it changes its real user ID. This choice allows the
39675 user who starts an application to send it signals even if it changes its effective user ID. The other
39676 semantics give more power to an application that wants to protect itself from the user who ran
39677 it.

39678 Some implementations provide semantic extensions to the *kill*( ) function when the absolute
39679 value of *pid* is greater than some maximum, or otherwise special, value. Negative values are a
39680 flag to *kill*( ). Since most implementations return [ESRCH] in this case, this behavior is not
39681 included in this volume of POSIX.1-200x, although a conforming implementation could provide
39682 such an extension.

39683 The unspecified processes to which a signal cannot be sent may include the scheduler or *init*.

39684 There was initially strong sentiment to specify that, if *pid* specifies that a signal be sent to the
39685 calling process and that signal is not blocked, that signal would be delivered before *kill*( )
39686 returns. This would permit a process to call *kill*( ) and be guaranteed that the call never return.
39687 However, historical implementations that provide only the *signal*( ) function make only the
39688 weaker guarantee in this volume of POSIX.1-200x, because they only deliver one signal each
39689 time a process enters the kernel. Modifications to such implementations to support the
39690 *sigaction*( ) function generally require entry to the kernel following return from a signal-catching
39691 function, in order to restore the signal mask. Such modifications have the effect of satisfying the
39692 stronger requirement, at least when *sigaction*( ) is used, but not necessarily when *signal*( ) is used.
39693 The standard developers considered making the stronger requirement except when *signal*( ) is
39694 used, but felt this would be unnecessarily complex. Implementors are encouraged to meet the
39695 stronger requirement whenever possible. In practice, the weaker requirement is the same, except
39696 in the rare case when two signals arrive during a very short window. This reasoning also applies
39697 to a similar requirement for *sigprocmask*( ).

39698 In 4.2 BSD, the SIGCONT signal can be sent to any descendant process regardless of user-ID
39699 security checks. This allows a job control shell to continue a job even if processes in the job have
39700 altered their user IDs (as in the *su* command). In keeping with the addition of the concept of
39701 sessions, similar functionality is provided by allowing the SIGCONT signal to be sent to any
39702 process in the same session regardless of user ID security checks. This is less restrictive than BSD
39703 in the sense that ancestor processes (in the same session) can now be the recipient. It is more
39704 restrictive than BSD in the sense that descendant processes that form new sessions are now
39705 subject to the user ID checks. A similar relaxation of security is not necessary for the other job
39706 control signals since those signals are typically sent by the terminal driver in recognition of
39707 special characters being typed; the terminal driver bypasses all security checks.

39708 In secure implementations, a process may be restricted from sending a signal to a process having
39709 a different security label. In order to prevent the existence or nonexistence of a process from
39710 being used as a covert channel, such processes should appear nonexistent to the sender; that is,
39711 [ESRCH] should be returned, rather than [EPERM], if *pid* refers only to such processes.

Existing implementations vary on the result of a *kill*( ) with *pid* indicating an inactive process (a terminated process that has not been waited for by its parent). Some indicate success on such a call (subject to permission checking), while others give an error of [ESRCH]. Since the definition of process lifetime in this volume of POSIX.1-200x covers inactive processes, the [ESRCH] error as described is inappropriate in this case. In particular, this means that an application cannot have a parent process check for termination of a particular child with *kill*( ). (Usually this is done with the null signal; this can be done reliably with *waitpid*( ).)

There is some belief that the name *kill*( ) is misleading, since the function is not always intended to cause process termination. However, the name is common to all historical implementations, and any change would be in conflict with the goal of minimal changes to existing application code.

FUTURE DIRECTIONS

None.

getpid( ), *raise*( ), *setsid*( ), *sigaction*( ), *sigqueue*( ), *wait*( )

XBD **<signal.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the second paragraph is reworded to indicate that the saved set-user-ID of the calling process is checked in place of its effective user ID. This is a FIPS requirement.
- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The behavior when *pid* is –1 is now specified. It was previously explicitly unspecified in the POSIX.1-1988 standard.

The normative text is updated to avoid use of the term "must" for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/51 is applied, correcting the RATIONALE section.

NAME

killpg — send a signal to a process group

SYNOPSIS

XSI

```
#include <signal.h>

int killpg(pid_t pgrp, int sig);
```

DESCRIPTION

The *killpg*( ) function shall send the signal specified by *sig* to the process group specified by *pgrp*.

If *pgrp* is greater than 1, *killpg*(*pgrp*, *sig*) shall be equivalent to *kill*(–*pgrp*, *sig*). If *pgrp* is less than or equal to 1, the behavior of *killpg*( ) is undefined.

RETURN VALUE

Refer to *kill*( ).

ERRORS

Refer to *kill*( ).

EXAMPLES

Sending a Signal to All Other Members of a Process Group

The following example shows how the calling process could send a signal to all other members of its process group. To prevent itself from receiving the signal it first makes itself immune to the signal by ignoring it.

```
#include <signal.h>
#include <unistd.h>
...
    if (signal(SIGUSR1, SIG_IGN) == SIG_ERR)
        /* Handle error */;

    if (killpg(getpgrp(), SIGUSR1) == -1)
        /* Handle error */;"
```

NAME

l64a — convert a 32-bit integer to a radix-64 ASCII string

SYNOPSIS

XSI

```
#include <stdlib.h>

char *l64a(long value);
```

DESCRIPTION

Refer to *a64l( )*.

NAME

labs, llabs — return a long integer absolute value

SYNOPSIS

```
#include <stdlib.h>

long labs(long i);
long long llabs(long long i);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *labs*( ) function shall compute the absolute value of the **long** integer operand *i*. The *llabs*( ) function shall compute the absolute value of the **long long** integer operand *i*. If the result cannot be represented, the behavior is undefined.

RETURN VALUE

The *labs*( ) function shall return the absolute value of the **long** integer operand.

The *llabs*( ) function shall return the absolute value of the **long long** integer operand.

ERRORS

No errors are defined.

NAME

lchown — change the owner and group of a symbolic link

SYNOPSIS

```
#include <unistd.h>

int lchown(const char *path, uid_t owner, gid_t group);
```

DESCRIPTION

The *lchown*( ) function shall be equivalent to *chown*( ), except in the case where the named file is a symbolic link. In this case, *lchown*( ) shall change the ownership of the symbolic link file itself, while *chown*( ) changes the ownership of the file or directory to which the symbolic link refers.

RETURN VALUE

Upon successful completion, *lchown*( ) shall return 0. Otherwise, it shall return –1 and set *errno* to indicate an error.

ERRORS

The *lchown*( ) function shall fail if:

[EACCES] Search permission is denied on a component of the path prefix of *path*.

[EINVAL] The owner or group ID is not a value supported by the implementation.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG] The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix is not a directory, or the *path* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

[EPERM] The effective user ID does not match the owner of the file and the process does not have appropriate privileges.

[EROFS] The file resides on a read-only file system.

The *lchown*( ) function may fail if:

[EIO] An I/O error occurred while reading or writing to the file system.

[EINTR] A signal was caught during execution of the function.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG] The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

EXAMPLES

Changing the Current Owner of a File

The following example shows how to change the ownership of the symbolic link named **/modules/pass1** to the user ID associated with "jones" and the group ID associated with "cnd".

The numeric value for the user ID is obtained by using the *getpwnam*( ) function. The numeric value for the group ID is obtained by using the *getgrnam*( ) function.

```
#include <sys/types.h>
#include <unistd.h>
#include <pwd.h>
#include <grp.h>

struct passwd *pwd;
struct group  *grp;
char          *path = "/modules/pass1";
...
pwd = getpwnam("jones");
grp = getgrnam("cnd");
lchown(path, pwd->pw_uid, grp->gr_gid);
```

APPLICATION USAGE

On implementations which support symbolic links as directory entries rather than files, *lchown*( ) may fail.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

chown( ), *symlink*( )

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

The Open Group Base Resolution bwg2001-013 is applied, adding wording to the APPLICATION USAGE.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *lchown*( ) function is moved from the XSI option to the Base.

The [EOPNOTSUPP] error is removed.

39907 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a + 39908 pathname exists but is not a directory or a symbolic link to a directory.

39909 **NAME**

39910 lcong48 — seed a uniformly distributed pseudo-random signed long integer generator

39911 **SYNOPSIS**

39912 XSI
```
#include <stdlib.h>

void lcong48(unsigned short param[7]);
```

39914 **DESCRIPTION**

39915 Refer to *drand48( )*.

NAME

ldexp, ldexpf, ldexpl — load exponent of a floating-point number

SYNOPSIS

```
#include <math.h>

double ldexp(double x, int exp);
float ldexpf(float x, int exp);
long double ldexpl(long double x, int exp);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the quantity $x * 2^{exp}$.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return *x* multiplied by 2, raised to the power *exp*.

If these functions would cause overflow, a range error shall occur and *ldexp*( ), *ldexpf*( ), and *ldexpl*( ) shall return ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (according to the sign of *x*), respectively.

If the correct value would cause underflow, and is not representable, a range error may occur, and MX either 0.0 (if supported), or an implementation-defined value shall be returned.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0 or ±Inf, *x* shall be returned.

If *exp* is 0, *x* shall be returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

ERRORS

These functions shall fail if:

Range Error — The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

Range Error — The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.19 (on page 116), **<math.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *ldexpf*( ) and *ldexpl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

ldiv, lldiv — compute quotient and remainder of a long division

SYNOPSIS

```
#include <stdlib.h>

ldiv_t ldiv(long numer, long denom);
lldiv_t lldiv(long long numer, long long denom);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the quotient and remainder of the division of the numerator *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the **long** integer (for the *ldiv*( ) function) or **long long** integer (for the *lldiv*( ) function) of lesser magnitude that is the nearest to the algebraic quotient. If the result cannot be represented, the behavior is undefined; otherwise, *quot* * *denom*+*rem* shall equal *numer*.

RETURN VALUE

The *ldiv*( ) function shall return a structure of type **ldiv_t**, comprising both the quotient and the remainder. The structure shall include the following members, in any order:

```
long   quot;    /* Quotient */
long   rem;     /* Remainder */
```

The *lldiv*( ) function shall return a structure of type **lldiv_t**, comprising both the quotient and the remainder. The structure shall include the following members, in any order:

```
long long   quot;    /* Quotient */
long long   rem;     /* Remainder */
```

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4. Derived from the ISO C standard.

Issue 6

The *lldiv*( ) function is added for alignment with the ISO/IEC 9899: 1999 standard.

40023 **NAME**

40024 lfind — find entry in a linear search table

40025 **SYNOPSIS**

40026 XSI
```
#include <search.h>

void *lfind(const void *key, const void *base, size_t *nelp,
    size_t width, int (*compar)(const void *, const void *));
```

40029 **DESCRIPTION**

40030 Refer to *lsearch( )*.

40031 **NAME**

40032 lgamma, lgammaf, lgammal, signgam — log gamma function

40033 **SYNOPSIS**

40034
```
#include <math.h>
```

40035
```
double lgamma(double x);
```
40036
```
float lgammaf(float x);
```
40037
```
long double lgammal(long double x);
```
40038 XSI
```
extern int signgam;
```

40039 **DESCRIPTION**

40040 CX The functionality described on this reference page is aligned with the ISO C standard. Any
40041 conflict between the requirements described here and the ISO C standard is unintentional. This
40042 volume of POSIX.1-200x defers to the ISO C standard.

40043 These functions shall compute $\log_e|\Gamma(x)|$ where $\Gamma(x)$ is defined as $\int_0^\infty e^{-t}t^{x-1}dt$. The argument x
40044 need not be a non-positive integer ($\Gamma(x)$ is defined over the reals, except the non-positive
40045 integers).

40046 XSI If x is NaN, –Inf, or a negative integer, the value of *signgam* is unspecified.

40047 CX These functions need not be thread-safe.

40048 An application wishing to check for error situations should set *errno* to zero and call
40049 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
40050 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
40051 zero, an error has occurred.

40052 **RETURN VALUE**

40053 Upon successful completion, these functions shall return the logarithmic gamma of x.

40054 If x is a non-positive integer, a pole error shall occur and *lgamma*( ), *lgammaf*( ), and *lgammal*( )
40055 shall return +HUGE_VAL, +HUGE_VALF, and +HUGE_VALL, respectively.

40056 If the correct value would cause overflow, a range error shall occur and *lgamma*( ), *lgammaf*( ),
40057 and *lgammal*( ) shall return ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (having the same
40058 sign as the correct value), respectively.

40059 MX If x is NaN, a NaN shall be returned.

40060 If x is 1 or 2, +0 shall be returned.

40061 If x is ±Inf, +Inf shall be returned.

40062 **ERRORS**

40063 These functions shall fail if:

40064 Pole Error — The x argument is a negative integer or zero.

40065 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
40066 then *errno* shall be set to [ERANGE]. If the integer expression
40067 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
40068 floating-point exception shall be raised.

40069 Range Error — The result overflows.

40070 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
40071 then *errno* shall be set to [ERANGE]. If the integer expression

(*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.19 (on page 116), **<math.h>**

CHANGE HISTORY

First released in Issue 3.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *lgamma*( ) function is no longer marked as an extension.

The *lgammaf*( ) and *lgammal*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

Functionality relating to the XSI option is marked.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

The DESCRIPTION is clarified regarding the value of *signgam* when *x* is Nan, –Inf, or a negative integer.

NAME

link, linkat — link one file to another file relative to two directory file descriptors

SYNOPSIS

```
#include <unistd.h>

int link(const char *path1, const char *path2);
int linkat(int fd1, const char *path1, int fd2, const char *path2,
    int flag);
```

DESCRIPTION

The *link*( ) function shall create a new link (directory entry) for the existing file, *path1*.

The *path1* argument points to a pathname naming an existing file. The *path2* argument points to a pathname naming the new directory entry to be created. The *link*( ) function shall atomically create a new link for the existing file and the link count of the file shall be incremented by one.

If *path1* names a directory, *link*( ) shall fail unless the process has appropriate privileges and the implementation supports using *link*( ) on directories.

If *path1* names a symbolic link, it is implementation-defined whether *link*( ) follows the symbolic link, or creates a new link to the symbolic link itself.

Upon successful completion, *link*( ) shall mark for update the last file status change timestamp of the file. Also, the last data modification and last file status change timestamps of the directory that contains the new entry shall be marked for update.

If *link*( ) fails, no link shall be created and the link count of the file shall remain unchanged.

The implementation may require that the calling process has permission to access the existing file.

The *linkat*( ) function shall be equivalent to the *link*( ) function except in the case where either *path1* or *path2* or both are relative paths. In this case a relative path *path1* is interpreted relative to the directory associated with the file descriptor *fd1* instead of the current working directory and similarly for *path2* and the file descriptor *fd2*. It is unspecified whether directory searches are permitted based on whether the file was opened with search permission or on the current permissions of the directory underlying the file descriptor.

Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in **<fcntl.h>**:

AT_SYMLINK_FOLLOW
: If *path1* names a symbolic link, a new link for the target of the symbolic link is created.

If *linkat*( ) is passed the special value AT_FDCWD in the *fd1* or *fd2* parameter, the current working directory is used for the respective *path* argument. If both *fd1* and *fd2* have value AT_FDCWD, the behavior shall be identical to a call to *link*( ).

If the AT_SYMLINK_FOLLOW flag is clear in the *flag* argument and the *path1* argument names a symbolic link, a new link is created for the symbolic link *path1* and not its target.

RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return −1 and set *errno* to indicate the error.

ERRORS

These functions shall fail if:

[EACCES] A component of either path prefix denies search permission, or the requested link requires writing in a directory that denies write permission, or the calling process does not have permission to access the existing file and this is required by the implementation.

[EEXIST] The *path2* argument resolves to an existing directory entry or refers to a symbolic link.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path1* or *path2* argument.

[EMLINK] The number of links to the file named by *path1* would exceed {LINK_MAX}.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of either path prefix does not exist; the file named by *path1* does not exist; or *path1* or *path2* points to an empty string.

[ENOSPC] The directory to contain the link cannot be extended.

[ENOTDIR] A component of either path prefix is not a directory, or the *path1* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

[EPERM] The file named by *path1* is a directory and either the calling process does not have appropriate privileges or the implementation prohibits using *link*( ) on directories.

[EROFS] The requested link requires writing in a directory on a read-only file system.

[EXDEV] The link named by *path2* and the file named by *path1* are on different file systems and the implementation does not support links between file systems.

OB XSR [EXDEV] *path1* refers to a named STREAM.

The *linkat*( ) function shall fail if:

[EBADF] The *path1* or *path2* argument does not specify an absolute path and the *fd1* or *fd2* argument, respectively, is neither AT_FDCWD nor a valid file descriptor open for reading.

These functions may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path1* or *path2* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

The *linkat*( ) function may fail if:

[EINVAL] The value of the *flag* argument is not valid.

[ENOTDIR] The *path1* or *path2* argument is not an absolute path and *fd1* or *fd2*, respectively, is neither AT_FDCWD nor a file descriptor associated with a directory.

EXAMPLES

Creating a Link to a File

The following example shows how to create a link to a file named **/home/cnd/mod1** by creating a new directory entry named **/modules/pass1**.

```
#include <unistd.h>

char *path1 = "/home/cnd/mod1";
char *path2 = "/modules/pass1";
int   status;
...
status = link (path1, path2);
```

Creating a Link to a File Within a Program

In the following program example, the *link*( ) function links the **/etc/passwd** file (defined as **PASSWDFILE**) to a file named **/etc/opasswd** (defined as **SAVEFILE**), which is used to save the current password file. Then, after removing the current password file (defined as **PASSWDFILE**), the new password file is saved as the current password file using the *link*( ) function again.

```
#include <unistd.h>

#define LOCKFILE "/etc/ptmp"
#define PASSWDFILE "/etc/passwd"
#define SAVEFILE "/etc/opasswd"
...
/* Save current password file */
link (PASSWDFILE, SAVEFILE);

/* Remove current password file. */
unlink (PASSWDFILE);

/* Save new password file as current password file. */
link (LOCKFILE,PASSWDFILE);
```

APPLICATION USAGE

Some implementations do allow links between file systems.

If *path1* refers to a symbolic link, application developers should use *linkat*( ) with appropriate flags to select whether or not the symbolic link should be resolved.

RATIONALE

Linking to a directory is restricted to the superuser in most historical implementations because this capability may produce loops in the file hierarchy or otherwise corrupt the file system. This volume of POSIX.1-200x continues that philosophy by prohibiting *link*( ) and *unlink*( ) from doing this. Other functions could do it if the implementor designed such an extension.

Some historical implementations allow linking of files on different file systems. Wording was

40225 added to explicitly allow this optional behavior.

40226 The exception for cross-file system links is intended to apply only to links that are
40227 programmatically indistinguishable from "hard" links.

40228 The purpose of the *linkat*( ) function is to link files in directories other than the current working
40229 directory without exposure to race conditions. Any part of the path of a file could be changed in
40230 parallel to a call to *link*( ), resulting in unspecified behavior. By opening a file descriptor for the
40231 directory of both the existing file and the target location and using the *linkat*( ) function it can be
40232 guaranteed that the both filenames are in the desired directories.

40233 The AT_SYMLINK_FOLLOW flag allows for implementing both common behaviors of the
40234 *link*( ) function. The POSIX specification requires that if *path1* is a symbolic link, a new link for
40235 the target of the symbolic link is created. Many systems by default or as an alternative provide a
40236 mechanism to avoid the implicit symbolic link lookup and create a new link for the symbolic
40237 link itself.

40238 Earlier versions of this standard specified only the *link*( ) function, and required it to behave like
40239 *linkat*( ) with the AT_SYMLINK_FOLLOW flag. However, historical practice from SVR4 and
40240 Linux kernels had *link*( ) behaving like *linkat*( ) with no flags, and many systems that attempted
40241 to provide a conforming *link*( ) function did so in a way that was rarely used, and when it was
40242 used did not conform to the standard (e.g., by not being atomic, or by dereferencing the
40243 symbolic link incorrectly). Since applications could not rely on *link*( ) following links in practice,
40244 the *linkat*( ) function was added taking a flag to specify the desired behavior for the application.

40245 **FUTURE DIRECTIONS**

40246 None.

40247 **SEE ALSO**

40248 *rename*( ), *symlink*( ), *unlink*( )

40249 XBD **<fcntl.h>**, **<unistd.h>**

40250 **CHANGE HISTORY**

40251 First released in Issue 1. Derived from Issue 1 of the SVID.

40252 **Issue 6**

40253 The following new requirements on POSIX implementations derive from alignment with the
40254 Single UNIX Specification:

40255 • The [ELOOP] mandatory error condition is added.

40256 • A second [ENAMETOOLONG] is added as an optional error condition.

40257 The following changes were made to align with the IEEE P1003.1a draft standard:

40258 • An explanation is added of the action when *path2* refers to a symbolic link.

40259 • The [ELOOP] optional error condition is added.

40260 **Issue 7**

40261 Austin Group Interpretation 1003.1-2001 #143 is applied.

40262 SD5-XSH-ERN-93 is applied, adding RATIONALE.

40263 The *linkat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set
40264 Part 2.

40265 Functionality relating to XSI STREAMS is marked obsolescent.

40266 Changes are made related to support for finegrained timestamps.

40267 The [EOPNOTSUPP] error is removed.

NAME

lio_listio — list directed I/O

SYNOPSIS

```
#include <aio.h>

int lio_listio(int mode, struct aiocb *restrict const list[restrict],
    int nent, struct sigevent *restrict sig);
```

DESCRIPTION

The *lio_listio*( ) function shall initiate a list of I/O requests with a single function call.

The *mode* argument takes one of the values LIO_WAIT or LIO_NOWAIT declared in **<aio.h>** and determines whether the function returns when the I/O operations have been completed, or as soon as the operations have been queued. If the *mode* argument is LIO_WAIT, the function shall wait until all I/O is complete and the *sig* argument shall be ignored.

If the *mode* argument is LIO_NOWAIT, the function shall return immediately, and asynchronous notification shall occur, according to the *sig* argument, when all the I/O operations complete. If *sig* is NULL, then no asynchronous notification shall occur. If *sig* is not NULL, asynchronous notification occurs as specified in Section 2.4.1 (on page 484) when all the requests in *list* have completed.

The I/O requests enumerated by *list* are submitted in an unspecified order.

The *list* argument is an array of pointers to **aiocb** structures. The array contains *nent* elements. The array may contain NULL elements, which shall be ignored.

If the buffer pointed to by *list* or the **aiocb** structures pointed to by the elements of the array *list* become illegal addresses before all asynchronous I/O completed and, if necessary, the notification is sent, then the behavior is undefined. If the buffers pointed to by the *aio_buf* member of the **aiocb** structure pointed to by the elements of the array *list* become illegal addresses prior to the asynchronous I/O associated with that **aiocb** structure being completed, the behavior is undefined.

The *aio_lio_opcode* field of each **aiocb** structure specifies the operation to be performed. The supported operations are LIO_READ, LIO_WRITE, and LIO_NOP; these symbols are defined in **<aio.h>**. The LIO_NOP operation causes the list entry to be ignored. If the *aio_lio_opcode* element is equal to LIO_READ, then an I/O operation is submitted as if by a call to *aio_read*( ) with the *aiocbp* equal to the address of the **aiocb** structure. If the *aio_lio_opcode* element is equal to LIO_WRITE, then an I/O operation is submitted as if by a call to *aio_write*( ) with the *aiocbp* equal to the address of the **aiocb** structure.

The *aio_fildes* member specifies the file descriptor on which the operation is to be performed.

The *aio_buf* member specifies the address of the buffer to or from which the data is transferred.

The *aio_nbytes* member specifies the number of bytes of data to be transferred.

The members of the **aiocb** structure further describe the I/O operation to be performed, in a manner identical to that of the corresponding **aiocb** structure when used by the *aio_read*( ) and *aio_write*( ) functions.

The *nent* argument specifies how many elements are members of the list; that is, the length of the array.

The behavior of this function is altered according to the definitions of synchronized I/O data integrity completion and synchronized I/O file integrity completion if synchronized I/O is enabled on the file associated with *aio_fildes*.

For regular files, no data transfer shall occur past the offset maximum established in the open file description associated with *aiocbp->aio_fildes*.

If *sig->sigev_notify* is SIGEV_THREAD and *sig->sigev_notify_attributes* is a non-null pointer and the block pointed to by this pointer becomes an illegal address prior to all asynchronous I/O being completed, then the behavior is undefined.

RETURN VALUE

If the *mode* argument has the value LIO_NOWAIT, the *lio_listio*( ) function shall return the value zero if the I/O operations are successfully queued; otherwise, the function shall return the value –1 and set *errno* to indicate the error.

If the *mode* argument has the value LIO_WAIT, the *lio_listio*( ) function shall return the value zero when all the indicated I/O has completed successfully. Otherwise, *lio_listio*( ) shall return a value of –1 and set *errno* to indicate the error.

In either case, the return value only indicates the success or failure of the *lio_listio*( ) call itself, not the status of the individual I/O requests. In some cases one or more of the I/O requests contained in the list may fail. Failure of an individual request does not prevent completion of any other individual request. To determine the outcome of each I/O request, the application shall examine the error status associated with each **aiocb** control block. The error statuses so returned are identical to those returned as the result of an *aio_read*( ) or *aio_write*( ) function.

ERRORS

The *lio_listio*( ) function shall fail if:

[EAGAIN] The resources necessary to queue all the I/O requests were not available. The application may check the error status for each **aiocb** to determine the individual request(s) that failed.

[EAGAIN] The number of entries indicated by *nent* would cause the system-wide limit {AIO_MAX} to be exceeded.

[EINVAL] The *mode* argument is not a proper value, or the value of *nent* was greater than {AIO_LISTIO_MAX}.

[EINTR] A signal was delivered while waiting for all I/O requests to complete during an LIO_WAIT operation. Note that, since each I/O operation invoked by *lio_listio*( ) may possibly provoke a signal when it completes, this error return may be caused by the completion of one (or more) of the very I/O operations being awaited. Outstanding I/O requests are not canceled, and the application shall examine each list element to determine whether the request was initiated, canceled, or completed.

[EIO] One or more of the individual I/O operations failed. The application may check the error status for each **aiocb** structure to determine the individual request(s) that failed.

In addition to the errors returned by the *lio_listio*( ) function, if the *lio_listio*( ) function succeeds or fails with errors of [EAGAIN], [EINTR], or [EIO], then some of the I/O specified by the list may have been initiated. If the *lio_listio*( ) function fails with an error code other than [EAGAIN], [EINTR], or [EIO], no operations from the list shall have been initiated. The I/O operation indicated by each list element can encounter errors specific to the individual read or write function being performed. In this event, the error status for each **aiocb** control block contains the associated error code. The error codes that can be set are the same as would be set by a *read*( ) or *write*( ) function, with the following additional error codes possible:

40357 [EAGAIN] The requested I/O operation was not queued due to resource limitations.

40358 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit
40359 *aio_cancel*( ) request.

40360 [EFBIG] The *aiocbp->aio_lio_opcode* is LIO_WRITE, the file is a regular file,
40361 *aiocbp->aio_nbytes* is greater than 0, and the *aiocbp->aio_offset* is greater than or
40362 equal to the offset maximum in the open file description associated with
40363 *aiocbp->aio_fildes*.

40364 [EINPROGRESS] The requested I/O is in progress.

40365 [EOVERFLOW] The *aiocbp->aio_lio_opcode* is LIO_READ, the file is a regular file,
40366 *aiocbp->aio_nbytes* is greater than 0, and the *aiocbp->aio_offset* is before the
40367 end-of-file and is greater than or equal to the offset maximum in the open file
40368 description associated with *aiocbp->aio_fildes*.

40369 **EXAMPLES**

40370 None.

40371 **APPLICATION USAGE**

40372 None.

40373 **RATIONALE**

40374 Although it may appear that there are inconsistencies in the specified circumstances for error
40375 codes, the [EIO] error condition applies when any circumstance relating to an individual
40376 operation makes that operation fail. This might be due to a badly formulated request (for
40377 example, the *aio_lio_opcode* field is invalid, and *aio_error*( ) returns [EINVAL]) or might arise from
40378 application behavior (for example, the file descriptor is closed before the operation is initiated,
40379 and *aio_error*( ) returns [EBADF]).

40380 The limitation on the set of error codes returned when operations from the list shall have been
40381 initiated enables applications to know when operations have been started and whether
40382 *aio_error*( ) is valid for a specific operation.

40383 **FUTURE DIRECTIONS**

40384 None.

40385 **SEE ALSO**

40386 *aio_read*( ), *aio_write*( ), *aio_error*( ), *aio_return*( ), *aio_cancel*( ), *close*( ), *exec*, *exit*( ), *fork*( ), *lseek*( ),
40387 *read*( )

40388 XBD **<aio.h>**

40389 **CHANGE HISTORY**

40390 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

40391 Large File Summit extensions are added.

40392 **Issue 6**

40393 The [ENOSYS] error condition has been removed as stubs need not be provided if an
40394 implementation does not support the Asynchronous Input and Output option.

40395 The *lio_listio*( ) function is marked as part of the Asynchronous Input and Output option.

40396 The following new requirements on POSIX implementations derive from alignment with the
40397 Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs past the offset maximum established in the open file description associated with *aiocbp->aio_fildes*. This change is to support large files.
- The [EBIG] and [EOVERFLOW] error conditions are defined. This change is to support large files.

The normative text is updated to avoid use of the term "must" for application requirements.

The **restrict** keyword is added to the *lio_listio*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 6

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/53 is applied, adding new text for symmetry with the *aio_read*( ) and *aio_write*( ) functions to the DESCRIPTION.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/54 is applied, adding text to the DESCRIPTION making it explicit that the user is required to keep the structure pointed to by *sig->sigev_notify_attributes* valid until the last asynchronous operation finished and the notification has been sent.

Issue 7

The *lio_listio*( ) function is moved from the Asynchronous Input and Output option to the Base.

40415 **NAME**

40416 listen — listen for socket connections and limit the queue of incoming connections

40417 **SYNOPSIS**

40418 `#include <sys/socket.h>`

40419 `int listen(int socket, int backlog);`

40420 **DESCRIPTION**

40421 The *listen*( ) function shall mark a connection-mode socket, specified by the *socket* argument, as
40422 accepting connections.

40423 The *backlog* argument provides a hint to the implementation which the implementation shall use
40424 to limit the number of outstanding connections in the socket's listen queue. Implementations
40425 may impose a limit on *backlog* and silently reduce the specified value. Normally, a larger *backlog*
40426 argument value shall result in a larger or equal length of the listen queue. Implementations shall
40427 support values of *backlog* up to SOMAXCONN, defined in **<sys/socket.h>**.

40428 The implementation may include incomplete connections in its listen queue. The limits on the
40429 number of incomplete connections and completed connections queued may be different.

40430 The implementation may have an upper limit on the length of the listen queue—either global or
40431 per accepting socket. If *backlog* exceeds this limit, the length of the listen queue is set to the limit.

40432 If *listen*( ) is called with a *backlog* argument value that is less than 0, the function behaves as if it
40433 had been called with a *backlog* argument value of 0.

40434 A *backlog* argument of 0 may allow the socket to accept connections, in which case the length of
40435 the listen queue may be set to an implementation-defined minimum value.

40436 The socket in use may require the process to have appropriate privileges to use the *listen*( )
40437 function.

40438 **RETURN VALUE**

40439 Upon successful completions, *listen*( ) shall return 0; otherwise, –1 shall be returned and *errno* set
40440 to indicate the error.

40441 **ERRORS**

40442 The *listen*( ) function shall fail if:

40443 [EBADF] The *socket* argument is not a valid file descriptor.

40444 [EDESTADDRREQ]
40445 The socket is not bound to a local address, and the protocol does not support
40446 listening on an unbound socket.

40447 [EINVAL] The *socket* is already connected.

40448 [ENOTSOCK] The *socket* argument does not refer to a socket.

40449 [EOPNOTSUPP] The socket protocol does not support *listen*( ).

40450 The *listen*( ) function may fail if:

40451 [EACCES] The calling process does not have appropriate privileges.

40452 [EINVAL] The *socket* has been shut down.

40453 [ENOBUFS] Insufficient resources are available in the system to complete the call.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The DESCRIPTION is updated to describe the relationship of SOMAXCONN and the *backlog* argument.

40469 **NAME**

40470 llabs — return a long integer absolute value

40471 **SYNOPSIS**

40472 `#include <stdlib.h>`

40473 `long long llabs(long long i);`

40474 **DESCRIPTION**

40475 Refer to *labs( )*.

lldiv( )

40476 **NAME**

40477 lldiv — compute quotient and remainder of a long division

40478 **SYNOPSIS**

40479 ```
#include <stdlib.h>
```

40480 ```
lldiv_t lldiv(long long numer, long long denom);
```

40481 **DESCRIPTION**

40482 Refer to *ldiv*( ).

NAME

llrint, llrintf, llrintl — round to the nearest integer value using current rounding direction

SYNOPSIS

```
#include <math.h>

long long llrint(double x);
long long llrintf(float x);
long long llrintl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall round their argument to the nearest integer value, rounding according to the current rounding direction.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the rounded integer value.

MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.

If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

If *x* is –Inf, a domain error shall occur and an unspecified value is returned.

If the correct value is positive and too large to represent as a **long long**, an unspecified value
MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall occur;
CX otherwise, a domain error may occur.

If the correct value is negative and too large to represent as a **long long**, an unspecified value
MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall occur;
CX otherwise, a domain error may occur.

ERRORS

These functions shall fail if:

MX Domain Error — The *x* argument is NaN or ±Inf, or the correct value is not representable as an integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Domain Error — The correct value is not representable as an integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

These functions provide floating-to-integer conversions. They round according to the current rounding direction. If the rounded value is outside the range of the return type, the numeric result is unspecified and the invalid floating-point exception is raised. When they raise no other floating-point exception and the result differs from the argument, they raise the inexact floating-point exception.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

Issue 7

ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #53 is applied.

NAME

llround, llroundf, llroundl — round to nearest integer value

SYNOPSIS

```
#include <math.h>

long long llround(double x);
long long llroundf(float x);
long long llroundl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall round their argument to the nearest integer value, rounding halfway cases away from zero, regardless of the current rounding direction.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the rounded integer value.

MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.

If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

If *x* is –Inf, a domain error shall occur and an unspecified value is returned.

If the correct value is positive and too large to represent as a **long long**, an unspecified value
MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall occur;
CX otherwise, a domain error may occur.

If the correct value is negative and too large to represent as a **long long**, an unspecified value
MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall occur;
CX otherwise, a domain error may occur.

ERRORS

These functions shall fail if:

MX Domain Error — The *x* argument is NaN or ±Inf, or the correct value is not representable as an integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Domain Error — The correct value is not representable as an integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

These functions differ from the *llrint*( ) functions in that the default rounding direction for the *llround*( ) functions round halfway cases away from zero and need not raise the inexact floating-point exception for non-integer arguments that round to within the range of the return type.

FUTURE DIRECTIONS

None.

NAME

localeconv — return locale-specific information

SYNOPSIS

```
#include <locale.h>

struct lconv *localeconv(void);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *localeconv*( ) function shall set the components of an object with the type **struct lconv** with the values appropriate for the formatting of numeric quantities (monetary and otherwise) according to the rules of the current locale.

The members of the structure with type **char *** are pointers to strings, any of which (except **decimal_point**) can point to "", to indicate that the value is not available in the current locale or is of zero length. The members with type **char** are non-negative numbers, any of which can be {CHAR_MAX} to indicate that the value is not available in the current locale.

The members include the following:

char *decimal_point
The radix character used to format non-monetary quantities.

char *thousands_sep
The character used to separate groups of digits before the decimal-point character in formatted non-monetary quantities.

char *grouping
A string whose elements taken as one-byte integer values indicate the size of each group of digits in formatted non-monetary quantities.

char *int_curr_symbol
The international currency symbol applicable to the current locale. The first three characters contain the alphabetic international currency symbol in accordance with those specified in the ISO 4217: 2001 standard. The fourth character (immediately preceding the null byte) is the character used to separate the international currency symbol from the monetary quantity.

char *currency_symbol
The local currency symbol applicable to the current locale.

char *mon_decimal_point
The radix character used to format monetary quantities.

char *mon_thousands_sep
The separator for groups of digits before the decimal-point in formatted monetary quantities.

char *mon_grouping
A string whose elements taken as one-byte integer values indicate the size of each group of digits in formatted monetary quantities.

char *positive_sign
The string used to indicate a non-negative valued formatted monetary quantity.

40652 **char *negative_sign**
40653 The string used to indicate a negative valued formatted monetary quantity.

40654 **char int_frac_digits**
40655 The number of fractional digits (those after the decimal-point) to be displayed in an
40656 internationally formatted monetary quantity.

40657 **char frac_digits**
40658 The number of fractional digits (those after the decimal-point) to be displayed in a
40659 formatted monetary quantity.

40660 **char p_cs_precedes**
40661 Set to 1 if the **currency_symbol** precedes the value for a non-negative formatted monetary
40662 quantity. Set to 0 if the symbol succeeds the value.

40663 **char p_sep_by_space**
40664 Set to a value indicating the separation of the **currency_symbol**, the sign string, and the
40665 value for a non-negative formatted monetary quantity.

40666 **char n_cs_precedes**
40667 Set to 1 if the **currency_symbol** precedes the value for a negative formatted monetary
40668 quantity. Set to 0 if the symbol succeeds the value.

40669 **char n_sep_by_space**
40670 Set to a value indicating the separation of the **currency_symbol**, the sign string, and the
40671 value for a negative formatted monetary quantity.

40672 **char p_sign_posn**
40673 Set to a value indicating the positioning of the **positive_sign** for a non-negative formatted
40674 monetary quantity.

40675 **char n_sign_posn**
40676 Set to a value indicating the positioning of the **negative_sign** for a negative formatted
40677 monetary quantity.

40678 **char int_p_cs_precedes**
40679 Set to 1 or 0 if the **int_curr_symbol** respectively precedes or succeeds the value for a non-
40680 negative internationally formatted monetary quantity.

40681 **char int_n_cs_precedes**
40682 Set to 1 or 0 if the **int_curr_symbol** respectively precedes or succeeds the value for a
40683 negative internationally formatted monetary quantity.

40684 **char int_p_sep_by_space**
40685 Set to a value indicating the separation of the **int_curr_symbol**, the sign string, and the
40686 value for a non-negative internationally formatted monetary quantity.

40687 **char int_n_sep_by_space**
40688 Set to a value indicating the separation of the **int_curr_symbol**, the sign string, and the
40689 value for a negative internationally formatted monetary quantity.

40690 **char int_p_sign_posn**
40691 Set to a value indicating the positioning of the **positive_sign** for a non-negative
40692 internationally formatted monetary quantity.

40693 **char int_n_sign_posn**
40694 Set to a value indicating the positioning of the **negative_sign** for a negative internationally
40695 formatted monetary quantity.

The elements of **grouping** and **mon_grouping** are interpreted according to the following:

{CHAR_MAX} No further grouping is to be performed.

0 The previous element is to be repeatedly used for the remainder of the digits.

other The integer value is the number of digits that comprise the current group. The next element is examined to determine the size of the next group of digits before the current group.

The values of **p_sep_by_space**, **n_sep_by_space**, **int_p_sep_by_space**, and **int_n_sep_by_space** are interpreted according to the following:

0 No space separates the currency symbol and value.

1 If the currency symbol and sign string are adjacent, a space separates them from the value; otherwise, a space separates the currency symbol from the value.

2 If the currency symbol and sign string are adjacent, a space separates them; otherwise, a space separates the sign string from the value.

For **int_p_sep_by_space** and **int_n_sep_by_space**, the fourth character of **int_curr_symbol** is used instead of a space.

The values of **p_sign_posn**, **n_sign_posn**, **int_p_sign_posn**, and **int_n_sign_posn** are interpreted according to the following:

0 Parentheses surround the quantity and **currency_symbol** or **int_curr_symbol**.

1 The sign string precedes the quantity and **currency_symbol** or **int_curr_symbol**.

2 The sign string succeeds the quantity and **currency_symbol** or **int_curr_symbol**.

3 The sign string immediately precedes the **currency_symbol** or **int_curr_symbol**.

4 The sign string immediately succeeds the **currency_symbol** or **int_curr_symbol**.

The implementation shall behave as if no function in this volume of POSIX.1-200x calls *localeconv*( ).

CX The *localeconv*( ) function need not be thread-safe.

RETURN VALUE

The *localeconv*( ) function shall return a pointer to the filled-in object. The application shall not modify the structure pointed to by the return value which may be overwritten by a subsequent call to *localeconv*( ). In addition, calls to *setlocale*( ) with the categories *LC_ALL*, *LC_MONETARY*, or *LC_NUMERIC* or calls to *uselocale*( ) which change the categories *LC_MONETARY* or *LC_NUMERIC* may overwrite the contents of the structure.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The following table illustrates the rules which may be used by four countries to format monetary quantities.

Country	Positive Format	Negative Format	International Format
Italy	€.1.230	–€.1.230	EUR.1.230
Netherlands	€ 1.234,56	€ –1.234,56	EUR 1.234,56
Norway	kr1.234,56	kr1.234,56–	NOK 1.234,56
Switzerland	SFrs.1,234.56	SFrs.1,234.56C	CHF 1,234.56

For these four countries, the respective values for the monetary members of the structure returned by *localeconv*( ) are:

	Italy	Netherlands	Norway	Switzerland
int_curr_symbol	"EUR."	"EUR "	"NOK "	"CHF "
currency_symbol	"€."	"€"	"kr"	"SFrs."
mon_decimal_point	""	","	","	"."
mon_thousands_sep	"."	"."	"."	","
mon_grouping	"\3"	"\3"	"\3"	"\3"
positive_sign	""	""	""	""
negative_sign	"-"	"-"	"-"	"C"
int_frac_digits	0	2	2	2
frac_digits	0	2	2	2
p_cs_precedes	1	1	1	1
p_sep_by_space	0	1	0	0
n_cs_precedes	1	1	1	1
n_sep_by_space	0	1	0	0
p_sign_posn	1	1	1	1
n_sign_posn	1	4	2	2
int_p_cs_precedes	1	1	1	1
int_n_cs_precedes	1	1	1	1
int_p_sep_by_space	0	0	0	0
int_n_sep_by_space	0	0	0	0
int_p_sign_posn	1	1	1	1
int_n_sign_posn	1	4	4	2

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4. Derived from the ANSI C standard.

Issue 6

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

The RETURN VALUE section is rewritten to avoid use of the term "must".

This reference page is updated for alignment with the ISO/IEC 9899: 1999 standard.

ISO/IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/31 is applied, removing references to **int_curr_symbol** and updating the descriptions of **p_sep_by_space** and **n_sep_by_space**. These changes are for alignment with the ISO C standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

The definitions of **int_curr_symbol** and **currency_symbol** are updated.

The examples in the APPLICATION USAGE section are updated.

NAME

localtime, localtime_r — convert a time value to a broken-down local time

SYNOPSIS

```
#include <time.h>

struct tm *localtime(const time_t *timer);
CX struct tm *localtime_r(const time_t *restrict timer,
        struct tm *restrict result);
```

DESCRIPTION

CX For *localtime*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *localtime*( ) function shall convert the time in seconds since the Epoch pointed to by *timer* into a broken-down time, expressed as a local time. The function corrects for the timezone and any seasonal time adjustments. CX Local timezone information is used as though *localtime*( ) calls *tzset*( ).

The relationship between a time in seconds since the Epoch used as an argument to *localtime*( ) and the **tm** structure (defined in the **<time.h>** header) is that the result shall be as specified in the expression given in the definition of seconds since the Epoch (see XBD Section 4.15, on page 113) corrected for timezone and any seasonal time adjustments, where the names in the structure and in the expression correspond.

The same relationship shall apply for *localtime_r*( ).

The *localtime*( ) function need not be thread-safe.

The *asctime*( ), *ctime*( ), *gmtime*( ), and *localtime*( ) functions shall return values in one of two static objects: a broken-down time structure and an array of type **char**. Execution of any of the functions may overwrite the information returned in either of these objects by any of the other functions.

The *localtime_r*( ) function shall convert the time in seconds since the Epoch pointed to by *timer* into a broken-down time stored in the structure to which *result* points. The *localtime_r*( ) function shall also return a pointer to that same structure.

Unlike *localtime*( ), the *localtime_r*( ) function is not required to set *tzname*. If *localtime_r*( ) does not set *tzname*, it shall not set *daylight* and shall not set *timezone*.

RETURN VALUE

Upon successful completion, the *localtime*( ) function shall return a pointer to the broken-down time structure. CX If an error is detected, *localtime*( ) shall return a null pointer and set *errno* to indicate the error.

Upon successful completion, *localtime_r*( ) shall return a pointer to the structure pointed to by the argument *result*. If an error is detected, *localtime_r*( ) shall return a null pointer and set *errno* to indicate the error.

ERRORS

CX The *localtime*( ) and *localtime_r*( ) functions shall fail if:

CX [EOVERFLOW] The result cannot be represented.

EXAMPLES

Getting the Local Date and Time

The following example uses the *time*( ) function to calculate the time elapsed, in seconds, since January 1, 1970 0:00 UTC (the Epoch), *localtime*( ) to convert that value to a broken-down time, and *asctime*( ) to convert the broken-down time values into a printable string.

```
#include <stdio.h>
#include <time.h>

int main(void)
{
    time_t result;

    result = time(NULL);
    printf("%s%ju secs since the Epoch\n",
        asctime(localtime(&result)),
            (uintmax_t)result);
    return(0);
}
```

This example writes the current time to *stdout* in a form like this:

```
Wed Jun 26 10:32:15 1996
835810335 secs since the Epoch
```

Getting the Modification Time for a File

The following example prints the last data modification timestamp in the local timezone for a given file.

```
#include <stdio.h>
#include <time.h>
#include <sys/stat.h>

int
print_file_time(const char *filename)
{
    struct stat statbuf;
    struct tm *tm;
    char timestr[BUFSIZ];

    if(stat(filename, &statbuf) == -1)
        return -1;
    if((tm = localtime(&statbuf.st_mtime)) == NULL)
        return -1;
    if(strftime(timestr, sizeof(timestr), "%Y-%m-%d %H:%M:%S", tm) == 0)
        return -1;
    printf("%s: %s.%09ld\n", filename, timestr, statbuf.st_mtim.tv_nsec);
    return 0;
}
```

40866 **Timing an Event**

40867 The following example gets the current time, converts it to a string using *localtime*( ) and
40868 *asctime*( ), and prints it to standard output using *fputs*( ). It then prints the number of minutes to
40869 an event being timed.

```
40870 #include <time.h>
40871 #include <stdio.h>
40872 ...
40873 time_t now;
40874 int minutes_to_event;
40875 ...
40876 time(&now);
40877 printf("The time is ");
40878 fputs(asctime(localtime(&now)), stdout);
40879 printf("There are still %d minutes to the event.\n",
40880     minutes_to_event);
40881 ...
```

40882 **APPLICATION USAGE**

40883 The *localtime_r*( ) function is thread-safe and returns values in a user-supplied buffer instead of
40884 possibly using a static data area that may be overwritten by each call.

40885 **RATIONALE**

40886 None.

40887 **FUTURE DIRECTIONS**

40888 None.

40889 **SEE ALSO**

40890 *asctime*( ), *clock*( ), *ctime*( ), *difftime*( ), *getdate*( ), *gmtime*( ), *mktime*( ), *strftime*( ), *strptime*( ), *time*( ),
40891 *tzset*( ), *utime*( )

40892 XBD Section 4.15 (on page 113), **<time.h>**

40893 **CHANGE HISTORY**

40894 First released in Issue 1. Derived from Issue 1 of the SVID.

40895 **Issue 5**

40896 A note indicating that the *localtime*( ) function need not be reentrant is added to the
40897 DESCRIPTION.

40898 The *localtime_r*( ) function is included for alignment with the POSIX Threads Extension.

40899 **Issue 6**

40900 The *localtime_r*( ) function is marked as part of the Thread-Safe Functions option.

40901 Extensions beyond the ISO C standard are marked.

40902 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
40903 its avoidance of possibly using a static data area.

40904 The **restrict** keyword is added to the *localtime_r*( ) prototype for alignment with the
40905 ISO/IEC 9899: 1999 standard.

40906 Examples are added.

40907 IEEE Std 1003.1-2001/Cor 1-2002, itemm XSH/TC1/D6/32 is applied, adding the
40908 [EOVERFLOW] error.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/55 is applied, updating the error handling for *localtime_r*( ).

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/56 is applied, adding a requirement that if *localtime_r*( ) does not set the *tzname* variable, it shall not set the *daylight* or *timezone* variables. On systems supporting XSI, the *daylight*, *timezone*, and *tzname* variables should all be set to provide information for the same timezone. This updates the description of *localtime_r*( ) to mention *daylight* and *timezone* as well as *tzname*. The SEE ALSO section is updated.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

The *localtime_r*( ) function is moved from the Thread-Safe Functions option to the Base.

Changes are made to the EXAMPLES section related to support for finegrained timestamps.

NAME

lockf — record locking on files

SYNOPSIS

XSI
```
#include <unistd.h>

int lockf(int fildes, int function, off_t size);
```

DESCRIPTION

The *lockf*( ) function shall lock sections of a file with advisory-mode locks. Calls to *lockf*( ) from threads in other processes which attempt to lock the locked file section shall either return an error value or block until the section becomes unlocked. All the locks for a process are removed when the process terminates. Record locking with *lockf*( ) shall be supported for regular files and may be supported for other files.

The *fildes* argument is an open file descriptor. To establish a lock with this function, the file descriptor shall be opened with write-only permission (O_WRONLY) or with read/write permission (O_RDWR).

The *function* argument is a control value which specifies the action to be taken. The permissible values for *function* are defined in **<unistd.h>** as follows:

Function	Description
F_ULOCK	Unlock locked sections.
F_LOCK	Lock a section for exclusive use.
F_TLOCK	Test and lock a section for exclusive use.
F_TEST	Test a section for locks by other processes.

F_TEST shall detect if a lock by another process is present on the specified section.

F_LOCK and F_TLOCK shall both lock a section of a file if the section is available.

F_ULOCK shall remove locks from a section of the file.

The *size* argument is the number of contiguous bytes to be locked or unlocked. The section to be locked or unlocked starts at the current offset in the file and extends forward for a positive size or backward for a negative size (the preceding bytes up to but not including the current offset). If *size* is 0, the section from the current offset through the largest possible file offset shall be locked (that is, from the current offset through the present or any future end-of-file). An area need not be allocated to the file to be locked because locks may exist past the end-of-file.

The sections locked with F_LOCK or F_TLOCK may, in whole or in part, contain or be contained by a previously locked section for the same process. When this occurs, or if adjacent locked sections would occur, the sections shall be combined into a single locked section. If the request would cause the number of locks to exceed a system-imposed limit, the request shall fail.

F_LOCK and F_TLOCK requests differ only by the action taken if the section is not available. F_LOCK shall block the calling thread until the section is available. F_TLOCK shall cause the function to fail if the section is already locked by another process.

File locks shall be released on first close by the locking process of any file descriptor for the file.

F_ULOCK requests may release (wholly or in part) one or more locked sections controlled by the process. Locked sections shall be unlocked starting at the current file offset through *size* bytes or to the end-of-file if *size* is (**off_t**)0. When all of a locked section is not released (that is, when the beginning or end of the area to be unlocked falls within a locked section), the remaining portions of that section shall remain locked by the process. Releasing the center portion of a locked section shall cause the remaining locked beginning and end portions to become two separate

locked sections. If the request would cause the number of locks in the system to exceed a system-imposed limit, the request shall fail.

A potential for deadlock occurs if the threads of a process controlling a locked section are blocked by accessing a locked section of another process. If the system detects that deadlock would occur, *lockf*( ) shall fail with an [EDEADLK] error.

The interaction between *fcntl*( ) and *lockf*( ) locks is unspecified.

Blocking on a section shall be interrupted by any signal.

An F_ULOCK request in which *size* is non-zero and the offset of the last byte of the requested section is the maximum value for an object of type **off_t**, when the process has an existing lock in which *size* is 0 and which includes the last byte of the requested section, shall be treated as a request to unlock from the start of the requested section with a size equal to 0. Otherwise, an F_ULOCK request shall attempt to unlock only the requested section.

Attempting to lock a section of a file that is associated with a buffered stream produces unspecified results.

RETURN VALUE

Upon successful completion, *lockf*( ) shall return 0. Otherwise, it shall return –1, set *errno* to indicate an error, and existing locks shall not be changed.

ERRORS

The *lockf*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid open file descriptor; or *function* is F_LOCK or F_TLOCK and *fildes* is not a valid file descriptor open for writing.

[EACCES] or [EAGAIN]
The *function* argument is F_TLOCK or F_TEST and the section is already locked by another process.

[EDEADLK] The *function* argument is F_LOCK and a deadlock is detected.

[EINTR] A signal was caught during execution of the function.

[EINVAL] The *function* argument is not one of F_LOCK, F_TLOCK, F_TEST, or F_ULOCK; or *size* plus the current file offset is less than 0.

[EOVERFLOW] The offset of the first, or if *size* is not 0 then the last, byte in the requested section cannot be represented correctly in an object of type **off_t**.

The *lockf*( ) function may fail if:

[EAGAIN] The *function* argument is F_LOCK or F_TLOCK and the file is mapped with *mmap*( ).

[EDEADLK] or [ENOLCK]
The *function* argument is F_LOCK, F_TLOCK, or F_ULOCK, and the request would cause the number of locks to exceed a system-imposed limit.

[EOPNOTSUPP] or [EINVAL]
The implementation does not support the locking of files of the type indicated by the *fildes* argument.

EXAMPLES

Locking a Portion of a File

In the following example, a file named **/home/cnd/mod1** is being modified. Other processes that use locking are prevented from changing it during this process. Only the first 10 000 bytes are locked, and the lock call fails if another process has any part of this area locked already.

```
#include <fcntl.h>
#include <unistd.h>

int fildes;
int status;
...
fildes = open("/home/cnd/mod1", O_RDWR);
status = lockf(fildes, F_TLOCK, (off_t)10000);
```

APPLICATION USAGE

Record-locking should not be used in combination with the *fopen*( ), *fread*( ), *fwrite*( ), and other *stdio* functions. Instead, the more primitive, non-buffered functions (such as *open*( )) should be used. Unexpected results may occur in processes that do buffering in the user address space. The process may later read/write data which is/was locked. The *stdio* functions are the most common source of unexpected buffering.

The *alarm*( ) function may be used to provide a timeout facility in applications requiring it.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Large File Summit extensions are added. In particular, the description of [EINVAL] is clarified and moved from optional to mandatory status.

A note is added to the DESCRIPTION indicating the effects of attempting to lock a section of a file that is associated with a buffered stream.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #054 is applied, updating the DESCRIPTION.

41041 **NAME**

41042 log, logf, logl — natural logarithm function

41043 **SYNOPSIS**

41044
```
#include <math.h>
```

41045
```
double log(double x);
```
41046
```
float logf(float x);
```
41047
```
long double logl(long double x);
```

41048 **DESCRIPTION**

41049 CX The functionality described on this reference page is aligned with the ISO C standard. Any
41050 conflict between the requirements described here and the ISO C standard is unintentional. This
41051 volume of POSIX.1-200x defers to the ISO C standard.

41052 These functions shall compute the natural logarithm of their argument x, $\log_e(x)$.

41053 An application wishing to check for error situations should set *errno* to zero and call
41054 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
41055 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
41056 zero, an error has occurred.

41057 **RETURN VALUE**

41058 Upon successful completion, these functions shall return the natural logarithm of x.

41059 If x is ±0, a pole error shall occur and *log*( ), *logf*( ), and *logl*( ) shall return –HUGE_VAL,
41060 –HUGE_VALF, and –HUGE_VALL, respectively.

41061 MX For finite values of x that are less than 0, or if x is –Inf, a domain error shall occur, and either a
41062 NaN (if supported), or an implementation-defined value shall be returned.

41063 MX If x is NaN, a NaN shall be returned.

41064 If x is 1, +0 shall be returned.

41065 If x is +Inf, x shall be returned.

41066 **ERRORS**

41067 These functions shall fail if:

41068 MX Domain Error The finite value of x is negative, or x is –Inf.

41069 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
41070 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
41071 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
41072 shall be raised.

41073 Pole Error The value of x is zero.

41074 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
41075 then *errno* shall be set to [ERANGE]. If the integer expression
41076 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
41077 floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

The *logf*( ) and *logl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

log10, log10f, log10l — base 10 logarithm function

SYNOPSIS

```
#include <math.h>

double log10(double x);
float log10f(float x);
long double log10l(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the base 10 logarithm of their argument x, $\log_{10}(x)$.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the base 10 logarithm of x.

If x is ±0, a pole error shall occur and *log10*( ), *log10f*( ), and *log10l*( ) shall return –HUGE_VAL, –HUGE_VALF, and –HUGE_VALL, respectively.

MX For finite values of x that are less than 0, or if x is –Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

MX If x is NaN, a NaN shall be returned.

If x is 1, +0 shall be returned.

If x is +Inf, +Inf shall be returned.

ERRORS

These functions shall fail if:

MX Domain Error — The finite value of x is negative, or x is –Inf.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

Pole Error — The value of x is zero.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

41164 **NAME**

41165 log1p, log1pf, log1pl — compute a natural logarithm

41166 **SYNOPSIS**

41167
```
#include <math.h>
```

41168
```
double log1p(double x);
```
41169
```
float log1pf(float x);
```
41170
```
long double log1pl(long double x);
```

41171 **DESCRIPTION**

41172 CX The functionality described on this reference page is aligned with the ISO C standard. Any
41173 conflict between the requirements described here and the ISO C standard is unintentional. This
41174 volume of POSIX.1-200x defers to the ISO C standard.

41175 These functions shall compute $\log_e(1.0 + x)$.

41176 An application wishing to check for error situations should set *errno* to zero and call
41177 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
41178 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
41179 zero, an error has occurred.

41180 **RETURN VALUE**

41181 Upon successful completion, these functions shall return the natural logarithm of 1.0 + *x*.

41182 If *x* is –1, a pole error shall occur and *log1p*( ), *log1pf*( ), and *log1pl*( ) shall return –HUGE_VAL,
41183 –HUGE_VALF, and –HUGE_VALL, respectively.

41184 MX For finite values of *x* that are less than –1, or if *x* is –Inf, a domain error shall occur, and either a
41185 NaN (if supported), or an implementation-defined value shall be returned.

41186 MX If *x* is NaN, a NaN shall be returned.

41187 If *x* is ±0, or +Inf, *x* shall be returned.

41188 If *x* is subnormal, a range error may occur and *x* should be returned.

41189 **ERRORS**

41190 These functions shall fail if:

41191 MX Domain Error The finite value of *x* is less than –1, or *x* is –Inf.

41192 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
41193 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
41194 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
41195 shall be raised.

41196 Pole Error The value of *x* is –1.

41197 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
41198 then *errno* shall be set to [ERANGE]. If the integer expression
41199 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
41200 floating-point exception shall be raised.

41201 These functions may fail if:

41202 MX Range Error The value of *x* is subnormal.

41203 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
41204 then *errno* shall be set to [ERANGE]. If the integer expression
41205 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
41206 floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

41283 **NAME**

41284 logb, logbf, logbl — radix-independent exponent

41285 **SYNOPSIS**

41286
```
#include <math.h>
```

41287
```
double logb(double x);
```
41288
```
float logbf(float x);
```
41289
```
long double logbl(long double x);
```

41290 **DESCRIPTION**

41291 CX The functionality described on this reference page is aligned with the ISO C standard. Any
41292 conflict between the requirements described here and the ISO C standard is unintentional. This
41293 volume of POSIX.1-200x defers to the ISO C standard.

41294 These functions shall compute the exponent of x, which is the integral part of $\log_r |x|$, as a
41295 signed floating-point value, for non-zero x, where r is the radix of the machine's floating-point
41296 arithmetic, which is the value of FLT_RADIX defined in the **<float.h>** header.

41297 If x is subnormal it is treated as though it were normalized; thus for finite positive x:

41298
```
1 <= x * FLT_RADIX^-logb(x) < FLT_RADIX
```

41299 An application wishing to check for error situations should set *errno* to zero and call
41300 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
41301 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
41302 zero, an error has occurred.

41303 **RETURN VALUE**

41304 Upon successful completion, these functions shall return the exponent of x.

41305 If x is ±0, *logb*(), *logbf*(), and *logbl*() shall return –HUGE_VAL, –HUGE_VALF, and
41306 MX –HUGE_VALL, respectively. On systems that support the IEC 60559 Floating-Point option, a
41307 pole error shall occur;
41308 CX otherwise, a pole error may occur.

41309 MX If x is NaN, a NaN shall be returned.

41310 MX If x is ±Inf, +Inf shall be returned.

41311 **ERRORS**

41312 These functions shall fail if:

41313 MX Pole Error The value of x is ±0.

41314 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
41315 then *errno* shall be set to [ERANGE]. If the integer expression
41316 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
41317 floating-point exception shall be raised.

41318 These functions may fail if:

41319 Pole Error The value of x is 0.

41320 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
41321 then *errno* shall be set to [ERANGE]. If the integer expression
41322 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
41323 floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *longjmp*( ) function shall restore the environment saved by the most recent invocation of *setjmp*( ) in the same thread, with the corresponding **jmp_buf** argument. If there is no such invocation, or if the function containing the invocation of *setjmp*( ) has terminated execution in the interim, or if the invocation of *setjmp*( ) was within the scope of an identifier with variably CX modified type and execution has left that scope in the interim, the behavior is undefined. It is unspecified whether *longjmp*( ) restores the signal mask, leaves the signal mask unchanged, or restores it to its value at the time *setjmp*( ) was called.

All accessible objects have values, and all other components of the abstract machine have state (for example, floating-point status flags and open files), as of the time *longjmp*( ) was called, except that the values of objects of automatic storage duration are unspecified if they meet all the following conditions:

- They are local to the function containing the corresponding *setjmp*( ) invocation.
- They do not have volatile-qualified type.
- They are changed between the *setjmp*( ) invocation and *longjmp*( ) call.

CX As it bypasses the usual function call and return mechanisms, *longjmp*( ) shall execute correctly in contexts of interrupts, signals, and any of their associated functions. However, if *longjmp*( ) is invoked from a nested signal handler (that is, from a function invoked as a result of a signal raised during the handling of another signal), the behavior is undefined.

The effect of a call to *longjmp*( ) where initialization of the **jmp_buf** structure was not performed in the calling thread is undefined.

RETURN VALUE

After *longjmp*( ) is completed, program execution continues as if the corresponding invocation of *setjmp*( ) had just returned the value specified by *val*. The *longjmp*( ) function shall not cause *setjmp*( ) to return 0; if *val* is 0, *setjmp*( ) shall return 1.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Applications whose behavior depends on the value of the signal mask should not use *longjmp*( ) and *setjmp*( ), since their effect on the signal mask is unspecified, but should instead use the *siglongjmp*( ) and *sigsetjmp*( ) functions (which can save and restore the signal mask under application control).

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION now explicitly makes *longjmp( )*'s effect on the signal mask unspecified.

The DESCRIPTION is updated for alignment with the ISO/IEC 9899: 1999 standard.

NAME

lrand48 — generate uniformly distributed pseudo-random non-negative long integers

SYNOPSIS

XSI

```
#include <stdlib.h>

long lrand48(void);
```

DESCRIPTION

Refer to *drand48( )*.

41424 **NAME**

41425 lrint, lrintf, lrintl — round to nearest integer value using current rounding direction

41426 **SYNOPSIS**

41427
```
#include <math.h>
```

41428
```
long lrint(double x);
```
41429
```
long lrintf(float x);
```
41430
```
long lrintl(long double x);
```

41431 **DESCRIPTION**

41432 CX The functionality described on this reference page is aligned with the ISO C standard. Any
41433 conflict between the requirements described here and the ISO C standard is unintentional. This
41434 volume of POSIX.1-200x defers to the ISO C standard.

41435 These functions shall round their argument to the nearest integer value, rounding according to
41436 the current rounding direction.

41437 An application wishing to check for error situations should set *errno* to zero and call
41438 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
41439 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
41440 zero, an error has occurred.

41441 **RETURN VALUE**

41442 Upon successful completion, these functions shall return the rounded integer value.

41443 MX If *x* is NaN, a domain error shall occur and an unspecified value is returned.

41444 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

41445 If *x* is –Inf, a domain error shall occur and an unspecified value is returned.

41446 If the correct value is positive and too large to represent as a **long**, an unspecified value shall be
41447 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall
41448 occur;
41449 CX otherwise, a domain error may occur.

41450 If the correct value is negative and too large to represent as a **long**, an unspecified value shall be
41451 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall
41452 occur;
41453 CX otherwise, a domain error may occur.

41454 **ERRORS**

41455 These functions shall fail if:

41456 MX Domain Error The *x* argument is NaN or ±Inf, or the correct value is not representable as an
41457 integer.

41458 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
41459 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
41460 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
41461 shall be raised.

41462 These functions may fail if:

41463 Domain Error The correct value is not representable as an integer.

41464 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
41465 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
41466 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
41467 shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

These functions provide floating-to-integer conversions. They round according to the current rounding direction. If the rounded value is outside the range of the return type, the numeric result is unspecified and the invalid floating-point exception is raised. When they raise no other floating-point exception and the result differs from the argument, they raise the inexact floating-point exception.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

Issue 7

ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #53 (SD5-XSH-ERN-77) is applied.

NAME

lround, lroundf, lroundl — round to nearest integer value

SYNOPSIS

```
#include <math.h>

long lround(double x);
long lroundf(float x);
long lroundl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall round their argument to the nearest integer value, rounding halfway cases away from zero, regardless of the current rounding direction.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the rounded integer value.

MX If *x* is NaN, a domain error shall occur and an unspecified value is returned.

If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

If *x* is –Inf, a domain error shall occur and an unspecified value is returned.

If the correct value is positive and too large to represent as a **long**, an unspecified value shall be returned. MX On systems that support the IEC 60559 Floating-Point option, a domain shall occur; CX otherwise, a domain error may occur.

If the correct value is negative and too large to represent as a **long**, an unspecified value shall be returned. MX On systems that support the IEC 60559 Floating-Point option, a domain shall occur; CX otherwise, a domain error may occur.

ERRORS

These functions shall fail if:

MX Domain Error — The *x* argument is NaN or ±Inf, or the correct value is not representable as an integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Domain Error — The correct value is not representable as an integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

These functions differ from the *lrint*( ) functions in the default rounding direction, with the *lround*( ) functions rounding halfway cases away from zero and needing not to raise the inexact floating-point exception for non-integer arguments that round to within the range of the return type.

FUTURE DIRECTIONS

None.

XBD Section 4.19 (on page 116), **<math.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

Issue 7

ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #54 (SD5-XSH-ERN-78) is applied.

NAME

lsearch, lfind — linear search and update

SYNOPSIS

XSI

```
#include <search.h>

void *lsearch(const void *key, void *base, size_t *nelp, size_t width,
    int (*compar)(const void *, const void *));
void *lfind(const void *key, const void *base, size_t *nelp,
    size_t width, int (*compar)(const void *, const void *));
```

DESCRIPTION

The *lsearch*( ) function shall linearly search the table and return a pointer into the table for the matching entry. If the entry does not occur, it shall be added at the end of the table. The *key* argument points to the entry to be sought in the table. The *base* argument points to the first element in the table. The *width* argument is the size of an element in bytes. The *nelp* argument points to an integer containing the current number of elements in the table. The integer to which *nelp* points shall be incremented if the entry is added to the table. The *compar* argument points to a comparison function which the application shall supply (for example, *strcmp*( )). It is called with two arguments that point to the elements being compared. The application shall ensure that the function returns 0 if the elements are equal, and non-zero otherwise.

The *lfind*( ) function shall be equivalent to *lsearch*( ), except that if the entry is not found, it is not added to the table. Instead, a null pointer is returned.

RETURN VALUE

If the searched for entry is found, both *lsearch*( ) and *lfind*( ) shall return a pointer to it. Otherwise, *lfind*( ) shall return a null pointer and *lsearch*( ) shall return a pointer to the newly added element.

Both functions shall return a null pointer in case of error.

ERRORS

No errors are defined.

EXAMPLES

Storing Strings in a Table

This fragment reads in less than or equal to TABSIZE strings of length less than or equal to ELSIZE and stores them in a table, eliminating duplicates.

```
#include <stdio.h>
#include <string.h>
#include <search.h>

#define TABSIZE 50
#define ELSIZE 120

...
    char line[ELSIZE], tab[TABSIZE][ELSIZE];
    size_t nel = 0;
    ...
    while (fgets(line, ELSIZE, stdin) != NULL && nel < TABSIZE)
        (void) lsearch(line, tab, &nel,
            ELSIZE, (int (*)(const void *, const void *)) strcmp);
    ...
```

Finding a Matching Entry

The following example finds any line that reads "This is a test.".

```
#include <search.h>
#include <string.h>
...
char line[ELSIZE], tab[TABSIZE][ELSIZE];
size_t nel = 0;
char *findline;
void *entry;

findline = "This is a test.\n";

entry = lfind(findline, tab, &nel, ELSIZE, (
    int (*)(const void *, const void *)) strcmp);
```

APPLICATION USAGE

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

Undefined results can occur if there is not enough room in the table to add a new item.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

41620 **NAME**

41621 lseek — move the read/write file offset

41622 **SYNOPSIS**

41623
```
#include <unistd.h>
```

41624
```
off_t lseek(int fildes, off_t offset, int whence);
```

41625 **DESCRIPTION**

41626 The *lseek*( ) function shall set the file offset for the open file description associated with the file
41627 descriptor *fildes*, as follows:

41628 • If *whence* is SEEK_SET, the file offset shall be set to *offset* bytes.

41629 • If *whence* is SEEK_CUR, the file offset shall be set to its current location plus *offset*.

41630 • If *whence* is SEEK_END, the file offset shall be set to the size of the file plus *offset*.

41631 The symbolic constants SEEK_SET, SEEK_CUR, and SEEK_END are defined in **<unistd.h>**.

41632 The behavior of *lseek*( ) on devices which are incapable of seeking is implementation-defined.
41633 The value of the file offset associated with such a device is undefined.

41634 The *lseek*( ) function shall allow the file offset to be set beyond the end of the existing data in the
41635 file. If data is later written at this point, subsequent reads of data in the gap shall return bytes
41636 with the value 0 until data is actually written into the gap.

41637 The *lseek*( ) function shall not, by itself, extend the size of a file.

41638 SHM If *fildes* refers to a shared memory object, the result of the *lseek*( ) function is unspecified.

41639 TYM If *fildes* refers to a typed memory object, the result of the *lseek*( ) function is unspecified.

41640 **RETURN VALUE**

41641 Upon successful completion, the resulting offset, as measured in bytes from the beginning of the
41642 file, shall be returned. Otherwise, (**off_t**)–1 shall be returned, *errno* shall be set to indicate the
41643 error, and the file offset shall remain unchanged.

41644 **ERRORS**

41645 The *lseek*( ) function shall fail if:

41646 [EBADF] The *fildes* argument is not an open file descriptor.

41647 [EINVAL] The *whence* argument is not a proper value, or the resulting file offset would
41648 be negative for a regular file, block special file, or directory.

41649 [EOVERFLOW] The resulting file offset would be a value which cannot be represented
41650 correctly in an object of type **off_t**.

41651 [ESPIPE] The *fildes* argument is associated with a pipe, FIFO, or socket.

41652 **EXAMPLES**

41653 None.

41654 **APPLICATION USAGE**

41655 None.

41656 **RATIONALE**

41657 The ISO C standard includes the functions *fgetpos*( ) and *fsetpos*( ), which work on very large files
41658 by use of a special positioning type.

41659 Although *lseek*( ) may position the file offset beyond the end of the file, this function does not
41660 itself extend the size of the file. While the only function in POSIX.1-200x that may directly

extend the size of the file is *write*( ), *truncate*( ), and *ftruncate*( ), several functions originally derived from the ISO C standard, such as *fwrite*( ), *fprintf*( ), and so on, may do so (by causing calls on *write*( )).

An invalid file offset that would cause [EINVAL] to be returned may be both implementation-defined and device-dependent (for example, memory may have few invalid values). A negative file offset may be valid for some devices in some implementations.

The POSIX.1-1990 standard did not specifically prohibit *lseek*( ) from returning a negative offset. Therefore, an application was required to clear *errno* prior to the call and check *errno* upon return to determine whether a return value of (**off_t**)–1 is a negative offset or an indication of an error condition. The standard developers did not wish to require this action on the part of a conforming application, and chose to require that *errno* be set to [EINVAL] when the resulting file offset would be negative for a regular file, block special file, or directory.

FUTURE DIRECTIONS

None.

SEE ALSO

open( )

XBD **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EOVERFLOW] error condition is added. This change is to support large files.

An additional [ESPIPE] error condition is added for sockets.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *lseek*( ) results are unspecified for typed memory objects.

41694 **NAME**

41695 lstat — get file status

41696 **SYNOPSIS**

41697 `#include <sys/stat.h>`

41698 `int lstat(const char *restrict path, struct stat *restrict buf);`

41699 **DESCRIPTION**

41700 Refer to *fstatat( )*.

NAME

malloc — a memory allocator

SYNOPSIS

```
#include <stdlib.h>

void *malloc(size_t size);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *malloc*( ) function shall allocate unused space for an object whose size in bytes is specified by *size* and whose value is unspecified.

The order and contiguity of storage allocated by successive calls to *malloc*( ) is unspecified. The pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to a pointer to any type of object and then used to access such an object in the space allocated (until the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object disjoint from any other object. The pointer returned points to the start (lowest byte address) of the allocated space. If the space cannot be allocated, a null pointer shall be returned. If the size of the space requested is 0, the behavior is implementation-defined: the value returned shall be either a null pointer or a unique pointer.

RETURN VALUE

Upon successful completion with *size* not equal to 0, *malloc*( ) shall return a pointer to the allocated space. If *size* is 0, either a null pointer or a unique pointer that can be successfully CX passed to *free*( ) shall be returned. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

ERRORS

The *malloc*( ) function shall fail if:

CX [ENOMEM] Insufficient storage space is available.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

XBD **<stdlib.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, the requirement to set *errno* to indicate an error is added.
- The [ENOMEM] error condition is added.

NAME

mblen — get number of bytes in a character

SYNOPSIS

```
#include <stdlib.h>

int mblen(const char *s, size_t n);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

If *s* is not a null pointer, *mblen*( ) shall determine the number of bytes constituting the character pointed to by *s*. Except that the shift state of *mbtowc*( ) is not affected, it shall be equivalent to:

```
mbtowc((wchar_t *)0, s, n);
```

The implementation shall behave as if no function defined in this volume of POSIX.1-200x calls *mblen*( ).

The behavior of this function is affected by the *LC_CTYPE* category of the current locale. For a state-dependent encoding, this function shall be placed into its initial state by a call for which its character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a null pointer shall cause this function to return a non-zero value if encodings have state dependency, and 0 otherwise. If the implementation employs special bytes to change the shift state, these bytes shall not produce separate wide-character codes, but shall be grouped with an adjacent character. Changing the *LC_CTYPE* category causes the shift state of this function to be unspecified.

RETURN VALUE

If *s* is a null pointer, *mblen*( ) shall return a non-zero or 0 value, if character encodings, respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mblen*( ) shall either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the character (if the next *n* or fewer bytes form a valid character), or return −1 (if they do not form a valid character) CX and may set *errno* to indicate the error. In no case shall the value returned be greater than *n* or the value of the {MB_CUR_MAX} macro.

ERRORS

The *mblen*( ) function may fail if:

XSI [EILSEQ] An invalid character sequence is detected.

EXAMPLES

None.

APPLICATION USAGE

None.

41789 *mbtowc( )*, *mbstowcs( )*, *wctomb( )*, *wcstombs( )*

41790 XBD **<stdlib.h>**

41791 **CHANGE HISTORY**

41792 First released in Issue 4. Aligned with the ISO C standard.

41793 **NAME**

41794 mbrlen — get number of bytes in a character (restartable)

41795 **SYNOPSIS**

41796
```
#include <wchar.h>
```

41797
```
size_t mbrlen(const char *restrict s, size_t n,
```
41798
```
    mbstate_t *restrict ps);
```

41799 **DESCRIPTION**

41800 CX The functionality described on this reference page is aligned with the ISO C standard. Any
41801 conflict between the requirements described here and the ISO C standard is unintentional. This
41802 volume of POSIX.1-200x defers to the ISO C standard.

41803 If *s* is not a null pointer, *mbrlen*( ) shall determine the number of bytes constituting the character
41804 pointed to by *s*. It shall be equivalent to:

41805
```
mbstate_t internal;
```
41806
```
mbrtowc(NULL, s, n, ps != NULL ? ps : &internal);
```

41807 If *ps* is a null pointer, the *mbrlen*( ) function shall use its own internal **mbstate_t** object, which is
41808 initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object
41809 pointed to by *ps* shall be used to completely describe the current conversion state of the
41810 associated character sequence. The implementation shall behave as if no function defined in this
41811 volume of POSIX.1-200x calls *mbrlen*( ).

41812 The behavior of this function is affected by the *LC_CTYPE* category of the current locale.

41813 **RETURN VALUE**

41814 The *mbrlen*( ) function shall return the first of the following that applies:

41815 0 If the next *n* or fewer bytes complete the character that corresponds to the null
41816 wide character.

41817 *positive* If the next *n* or fewer bytes complete a valid character; the value returned shall
41818 be the number of bytes that complete the character.

41819 (**size_t**)–2 If the next *n* bytes contribute to an incomplete but potentially valid character,
41820 and all *n* bytes have been processed. When *n* has at least the value of the
41821 {MB_CUR_MAX} macro, this case can only occur if *s* points at a sequence of
41822 redundant shift sequences (for implementations with state-dependent
41823 encodings).

41824 (**size_t**)–1 If an encoding error occurs, in which case the next *n* or fewer bytes do not
41825 contribute to a complete and valid character. In this case, [EILSEQ] shall be
41826 stored in *errno* and the conversion state is undefined.

41827 **ERRORS**

41828 The *mbrlen*( ) function shall fail if:

41829 [EILSEQ] An invalid character sequence is detected.

41830 The *mbrlen*( ) function may fail if:

41831 [EINVAL] *ps* points to an object that contains an invalid conversion state.

41832 **EXAMPLES**

41833 None.

41834 **APPLICATION USAGE**

41835 None.

41836 **RATIONALE**

41837 None.

41850 **NAME**

41851 mbrtowc — convert a character to a wide-character code (restartable)

41852 **SYNOPSIS**

41853 ```
#include <wchar.h>
```

41854 ```
size_t mbrtowc(wchar_t *restrict pwc, const char *restrict s,
```

41855 ```
    size_t n, mbstate_t *restrict ps);
```

41856 **DESCRIPTION**

41857 CX The functionality described on this reference page is aligned with the ISO C standard. Any
41858 conflict between the requirements described here and the ISO C standard is unintentional. This
41859 volume of POSIX.1-200x defers to the ISO C standard.

41860 If *s* is a null pointer, the *mbrtowc*( ) function shall be equivalent to the call:

41861 ```
mbrtowc(NULL, "", 1, ps)
```

41862 In this case, the values of the arguments *pwc* and *n* are ignored.

41863 If *s* is not a null pointer, the *mbrtowc*( ) function shall inspect at most *n* bytes beginning at the
41864 byte pointed to by *s* to determine the number of bytes needed to complete the next character
41865 (including any shift sequences). If the function determines that the next character is completed,
41866 it shall determine the value of the corresponding wide character and then, if *pwc* is not a null
41867 pointer, shall store that value in the object pointed to by *pwc*. If the corresponding wide
41868 character is the null wide character, the resulting state described shall be the initial conversion
41869 state.

41870 If *ps* is a null pointer, the *mbrtowc*( ) function shall use its own internal **mbstate_t** object, which
41871 shall be initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t**
41872 object pointed to by *ps* shall be used to completely describe the current conversion state of the
41873 associated character sequence. The implementation shall behave as if no function defined in this
41874 volume of POSIX.1-200x calls *mbrtowc*( ).

41875 The behavior of this function is affected by the *LC_CTYPE* category of the current locale.

41876 **RETURN VALUE**

41877 The *mbrtowc*( ) function shall return the first of the following that applies:

41878 0 If the next *n* or fewer bytes complete the character that corresponds to the null
41879 wide character (which is the value stored).

41880 between 1 and *n* inclusive
41881 If the next *n* or fewer bytes complete a valid character (which is the value
41882 stored); the value returned shall be the number of bytes that complete the
41883 character.

41884 (**size_t**)–2 If the next *n* bytes contribute to an incomplete but potentially valid character,
41885 and all *n* bytes have been processed (no value is stored). When *n* has at least
41886 the value of the {MB_CUR_MAX} macro, this case can only occur if *s* points at
41887 a sequence of redundant shift sequences (for implementations with state-
41888 dependent encodings).

41889 (**size_t**)–1 If an encoding error occurs, in which case the next *n* or fewer bytes do not
41890 contribute to a complete and valid character (no value is stored). In this case,
41891 [EILSEQ] shall be stored in *errno* and the conversion state is undefined.

41892 **ERRORS**

41893 The *mbrtowc*( ) function shall fail if:

41894 [EILSEQ] An invalid character sequence is detected.

41895 The *mbrtowc*( ) function may fail if:

41896 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

41897 **EXAMPLES**

41898 None.

41899 **APPLICATION USAGE**

41900 None.

41901 **RATIONALE**

41902 None.

41903 **FUTURE DIRECTIONS**

41904 None.

41905 **SEE ALSO**

41906 *mbsinit*( ), *mbsrtowcs*( )

41907 XBD **<wchar.h>**

41908 **CHANGE HISTORY**

41909 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
41910 (E).

41911 **Issue 6**

41912 The *mbrtowc*( ) prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

41913 The following new requirements on POSIX implementations derive from alignment with the
41914 Single UNIX Specification:

41915 • The [EINVAL] error condition is added.

41916 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

41917 **Issue 7**

41918 Austin Group Interpretation 1003.1-2001 #170 is applied.

41919 **NAME**

41920 mbsinit — determine conversion object status

41921 **SYNOPSIS**

41922
```
#include <wchar.h>
```

41923
```
int mbsinit(const mbstate_t *ps);
```

41924 **DESCRIPTION**

41925 CX The functionality described on this reference page is aligned with the ISO C standard. Any
41926 conflict between the requirements described here and the ISO C standard is unintentional. This
41927 volume of POSIX.1-200x defers to the ISO C standard.

41928 If *ps* is not a null pointer, the *mbsinit*( ) function shall determine whether the object pointed to by
41929 *ps* describes an initial conversion state.

41930 **RETURN VALUE**

41931 The *mbsinit*( ) function shall return non-zero if *ps* is a null pointer, or if the pointed-to object
41932 describes an initial conversion state; otherwise, it shall return zero.

41933 If an **mbstate_t** object is altered by any of the functions described as "restartable", and is then
41934 used with a different character sequence, or in the other conversion direction, or with a different
41935 *LC_CTYPE* category setting than on earlier function calls, the behavior is undefined.

41936 **ERRORS**

41937 No errors are defined.

41938 **EXAMPLES**

41939 None.

41940 **APPLICATION USAGE**

41941 The **mbstate_t** object is used to describe the current conversion state from a particular character
41942 sequence to a wide-character sequence (or *vice versa*) under the rules of a particular setting of the
41943 *LC_CTYPE* category of the current locale.

41944 The initial conversion state corresponds, for a conversion in either direction, to the beginning of
41945 a new character sequence in the initial shift state. A zero valued **mbstate_t** object is at least one
41946 way to describe an initial conversion state. A zero valued **mbstate_t** object can be used to initiate
41947 conversion involving any character sequence, in any *LC_CTYPE* category setting.

41948 **RATIONALE**

41949 None.

41950 **FUTURE DIRECTIONS**

41951 None.

41956 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
41957 (E).

41958 **NAME**

41959 mbsnrtowcs, mbsrtowcs — convert a character string to a wide-character string (restartable)

41960 **SYNOPSIS**

41961
```
#include <wchar.h>
```

41962 CX
```
size_t mbsnrtowcs(wchar_t *restrict dst, const char **restrict src,
41963     size_t nmc, size_t len, mbstate_t *restrict ps);
41964 size_t mbsrtowcs(wchar_t *restrict dst, const char **restrict src,
41965     size_t len, mbstate_t *restrict ps);
```

41966 **DESCRIPTION**

41967 CX For *mbsrtowcs*( ): The functionality described on this reference page is aligned with the ISO C
41968 standard. Any conflict between the requirements described here and the ISO C standard is
41969 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

41970 The *mbsrtowcs*( ) function shall convert a sequence of characters, beginning in the conversion
41971 state described by the object pointed to by *ps*, from the array indirectly pointed to by *src* into a
41972 sequence of corresponding wide characters. If *dst* is not a null pointer, the converted characters
41973 shall be stored into the array pointed to by *dst*. Conversion continues up to and including a
41974 terminating null character, which shall also be stored. Conversion shall stop early in either of the
41975 following cases:

41976 - A sequence of bytes is encountered that does not form a valid character.
41977 - *len* codes have been stored into the array pointed to by *dst* (and *dst* is not a null pointer).

41978 Each conversion shall take place as if by a call to the *mbrtowc*( ) function.

41979 If *dst* is not a null pointer, the pointer object pointed to by *src* shall be assigned either a null
41980 pointer (if conversion stopped due to reaching a terminating null character) or the address just
41981 past the last character converted (if any). If conversion stopped due to reaching a terminating
41982 null character, and if *dst* is not a null pointer, the resulting state described shall be the initial
41983 conversion state.

41984 If *ps* is a null pointer, the *mbsrtowcs*( ) function shall use its own internal **mbstate_t** object, which
41985 is initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object
41986 pointed to by *ps* shall be used to completely describe the current conversion state of the
41987 associated character sequence.

41988 CX The *mbsnrtowcs*( ) function shall be equivalent to the *mbsrtowcs*( ) function, except that the
41989 conversion of characters pointed to by *src* is limited to at most *nmc* bytes (the size of the input
41990 buffer).

41991 The behavior of these functions shall be affected by the *LC_CTYPE* category of the current locale.

41992 The implementation shall behave as if no function defined in this volume of POSIX.1-200x calls
41993 these functions.

41994 **RETURN VALUE**

41995 If the input conversion encounters a sequence of bytes that do not form a valid character, an
41996 encoding error occurs. In this case, these functions shall store the value of the macro [EILSEQ] in
41997 *errno* and shall return (**size_t**)–1; the conversion state is undefined. Otherwise, these functions
41998 shall return the number of characters successfully converted, not including the terminating null
41999 (if any).

42000 **ERRORS**

42001 These functions shall fail if:

42002 [EILSEQ] An invalid character sequence is detected.

42003 These functions may fail if:

42004 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

42005 **EXAMPLES**

42006 None.

42007 **APPLICATION USAGE**

42008 None.

42009 **RATIONALE**

42010 None.

42011 **FUTURE DIRECTIONS**

42012 None.

42018 (E).

42019 **Issue 6**

42020 The *mbsrtowcs( )* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

42021 The [EINVAL] error condition is marked CX.

42022 **Issue 7**

42023 Austin Group Interpretation 1003.1-2001 #170 is applied.

42024 The *mbsnrtowcs( )* function is added from The Open Group Technical Standard, 2006, Extended
42025 API Set Part 1.

NAME

mbstowcs — convert a character string to a wide-character string

SYNOPSIS

```
#include <stdlib.h>

size_t mbstowcs(wchar_t *restrict pwcs, const char *restrict s,
    size_t n);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *mbstowcs*( ) function shall convert a sequence of characters that begins in the initial shift state from the array pointed to by *s* into a sequence of corresponding wide-character codes and shall store not more than *n* wide-character codes into the array pointed to by *pwcs*. No characters that follow a null byte (which is converted into a wide-character code with value 0) shall be examined or converted. Each character shall be converted as if by a call to *mbtowc*( ), except that the shift state of *mbtowc*( ) is not affected.

No more than *n* elements shall be modified in the array pointed to by *pwcs*. If copying takes place between objects that overlap, the behavior is undefined.

XSI The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale. If *pwcs* is a null pointer, *mbstowcs*( ) shall return the length required to convert the entire array regardless of the value of *n*, but no values are stored.

RETURN VALUE

CX If an invalid character is encountered, *mbstowcs*( ) shall return (**size_t**)–1 and may set *errno* to indicate the error.

XSI Otherwise, *mbstowcs*( ) shall return the number of the array elements modified (or required if *pwcs* is null), not including a terminating 0 code, if any. The array shall not be zero-terminated if the value returned is *n*.

ERRORS

The *mbstowcs*( ) function shall fail if:

XSI [EILSEQ] An invalid byte sequence is detected.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

CHANGE HISTORY

First released in Issue 4. Aligned with the ISO C standard.

Issue 6

The *mbstowcs*( ) prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.

Extensions beyond the ISO C standard are marked.

Issue 7

Austin Group Interpretation 1003.1-2001 #170 is applied.

NAME

mbtowc — convert a character to a wide-character code

SYNOPSIS

```
#include <stdlib.h>

int mbtowc(wchar_t *restrict pwc, const char *restrict s, size_t n);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

If *s* is not a null pointer, *mbtowc*( ) shall determine the number of bytes that constitute the character pointed to by *s*. It shall then determine the wide-character code for the value of type **wchar_t** that corresponds to that character. (The value of the wide-character code corresponding to the null byte is 0.) If the character is valid and *pwc* is not a null pointer, *mbtowc*( ) shall store the wide-character code in the object pointed to by *pwc*.

The behavior of this function is affected by the *LC_CTYPE* category of the current locale. For a state-dependent encoding, this function is placed into its initial state by a call for which its character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a null pointer shall cause this function to return a non-zero value if encodings have state dependency, and 0 otherwise. If the implementation employs special bytes to change the shift state, these bytes shall not produce separate wide-character codes, but shall be grouped with an adjacent character. Changing the *LC_CTYPE* category causes the shift state of this function to be unspecified. At most *n* bytes of the array pointed to by *s* shall be examined.

The implementation shall behave as if no function defined in this volume of POSIX.1-200x calls *mbtowc*( ).

RETURN VALUE

If *s* is a null pointer, *mbtowc*( ) shall return a non-zero or 0 value, if character encodings, respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mbtowc*( ) shall either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the CX converted character (if the next *n* or fewer bytes form a valid character), or return −1 and may set *errno* to indicate the error (if they do not form a valid character).

In no case shall the value returned be greater than *n* or the value of the {MB_CUR_MAX} macro.

ERRORS

The *mbtowc*( ) function shall fail if:

XSI [EILSEQ] An invalid character sequence is detected.

EXAMPLES

42127 **NAME**

42128 memccpy — copy bytes in memory

42129 **SYNOPSIS**

42130 XSI
```
#include <string.h>

void *memccpy(void *restrict s1, const void *restrict s2,
    int c, size_t n);
```

42133 **DESCRIPTION**

42134 The *memccpy*( ) function shall copy bytes from memory area *s2* into *s1*, stopping after the first
42135 occurrence of byte *c* (converted to an **unsigned char**) is copied, or after *n* bytes are copied,
42136 whichever comes first. If copying takes place between objects that overlap, the behavior is
42137 undefined.

42138 **RETURN VALUE**

42139 The *memccpy*( ) function shall return a pointer to the byte after the copy of *c* in *s1*, or a null
42140 pointer if *c* was not found in the first *n* bytes of *s2*.

42141 **ERRORS**

42142 No errors are defined.

42143 **EXAMPLES**

42144 None.

42145 **APPLICATION USAGE**

42146 The *memccpy*( ) function does not check for the overflow of the receiving memory area.

42147 **RATIONALE**

42148 None.

42153 **CHANGE HISTORY**

42154 First released in Issue 1. Derived from Issue 1 of the SVID.

42155 **Issue 6**

42156 The **restrict** keyword is added to the *memccpy*( ) prototype for alignment with the
42157 ISO/IEC 9899: 1999 standard.

42158 **NAME**

42159 memchr — find byte in memory

42160 **SYNOPSIS**

42161
```
#include <string.h>
```

42162
```
void *memchr(const void *s, int c, size_t n);
```

42163 **DESCRIPTION**

42164 CX The functionality described on this reference page is aligned with the ISO C standard. Any
42165 conflict between the requirements described here and the ISO C standard is unintentional. This
42166 volume of POSIX.1-200x defers to the ISO C standard.

42167 The *memchr*( ) function shall locate the first occurrence of *c* (converted to an **unsigned char**) in
42168 the initial *n* bytes (each interpreted as **unsigned char**) of the object pointed to by *s*.

42169 **RETURN VALUE**

42170 The *memchr*( ) function shall return a pointer to the located byte, or a null pointer if the byte does
42171 not occur in the object.

42172 **ERRORS**

42173 No errors are defined.

42174 **EXAMPLES**

42175 None.

42176 **APPLICATION USAGE**

42177 None.

NAME

memcmp — compare bytes in memory

SYNOPSIS

```
#include <string.h>

int memcmp(const void *s1, const void *s2, size_t n);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *memcmp*( ) function shall compare the first *n* bytes (each interpreted as **unsigned char**) of the object pointed to by *s1* to the first *n* bytes of the object pointed to by *s2*.

The sign of a non-zero return value shall be determined by the sign of the difference between the values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the objects being compared.

RETURN VALUE

The *memcmp*( ) function shall return an integer greater than, equal to, or less than 0, if the object pointed to by *s1* is greater than, equal to, or less than the object pointed to by *s2*, respectively.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

mkdir, mkdirat — make a directory relative to directory file descriptor

SYNOPSIS

```
#include <sys/stat.h>

int mkdir(const char *path, mode_t mode);
int mkdirat(int fd, const char *path, mode_t mode);
```

DESCRIPTION

The *mkdir*( ) function shall create a new directory with name *path*. The file permission bits of the new directory shall be initialized from *mode*. These file permission bits of the *mode* argument shall be modified by the process' file creation mask.

When bits in *mode* other than the file permission bits are set, the meaning of these additional bits is implementation-defined.

The directory's user ID shall be set to the process' effective user ID. The directory's group ID shall be set to the group ID of the parent directory or to the effective group ID of the process. Implementations shall provide a way to initialize the directory's group ID to the group ID of the parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the directory's group ID to the effective group ID of the calling process.

The newly created directory shall be an empty directory.

If *path* names a symbolic link, *mkdir*( ) shall fail and set *errno* to [EEXIST].

Upon successful completion, *mkdir*( ) shall mark for update the last data access, last data modification, and last file status change timestamps of the directory. Also, the last data modification and last file status change timestamps of the directory that contains the new entry shall be marked for update.

The *mkdirat*( ) function shall be equivalent to the *mkdir*( ) function except in the case where *path* specifies a relative path. In this case the newly created directory is created relative to the directory associated with the file descriptor *fd* instead of the current working directory. It is unspecified whether directory searches are permitted based on whether the file was opened with search permission or on the current permissions of the directory underlying the file descriptor.

If *mkdirat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working directory is used and the behavior shall be identical to a call to *mkdir*( ).

RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return –1 and set *errno* to indicate the error. If –1 is returned, no directory shall be created.

ERRORS

These functions shall fail if:

[EACCES] Search permission is denied on a component of the path prefix, or write permission is denied on the parent directory of the directory to be created.

[EEXIST] The named file exists.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[EMLINK] The link count of the parent directory would exceed {LINK_MAX}.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of the path prefix specified by *path* does not name an existing directory or *path* is an empty string.

[ENOSPC] The file system does not contain enough space to hold the contents of the new directory or to extend the parent directory of the new directory.

[ENOTDIR] A component of the path prefix is not a directory.

[EROFS] The parent directory resides on a read-only file system.

In addition, the *mkdirat*( ) function shall fail if:

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading.

These functions may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

The *mkdirat*( ) function may fail if:

[ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a file descriptor associated with a directory.

EXAMPLES

Creating a Directory

The following example shows how to create a directory named **/home/cnd/mod1**, with read/write/search permissions for owner and group, and with read/search permissions for others.

```
#include <sys/types.h>
#include <sys/stat.h>

int status;
...
status = mkdir("/home/cnd/mod1", S_IRWXU | S_IRWXG | S_IROTH | S_IXOTH);
```

APPLICATION USAGE

None.

RATIONALE

The *mkdir*( ) function originated in 4.2 BSD and was added to System V in Release 3.0.

4.3 BSD detects [ENAMETOOLONG].

The POSIX.1-1990 standard required that the group ID of a newly created directory be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not

assume which group ID will be used. If it matters, an application can use *chown*( ) to set the group ID after the directory is created, or determine under what conditions the implementation will set the desired group ID.

The purpose of the *mkdirat*( ) function is to create a directory in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to the call to *mkdir*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *mkdirat*( ) function it can be guaranteed that the newly created directory is located relative to the desired directory.

FUTURE DIRECTIONS

None.

SEE ALSO

chmod( ), *mkdtemp*( ), *mknod*( ), *umask*( )

XBD **<sys/stat.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *mkdirat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

NAME

mkdtemp, mkstemp — create a unique directory or file

SYNOPSIS

CX
```
#include <stdlib.h>

char *mkdtemp(char *template);
int mkstemp(char *template);
```

DESCRIPTION

The *mkdtemp*( ) function uses the contents of *template* to construct a unique directory name. The string provided in *template* shall be a filename ending with six trailing 'X's. The *mkdtemp*( ) function shall replace each 'X' with a character from the portable filename character set. The characters are chosen such that the resulting name does not duplicate the name of an existing file at the time of a call to *mkdtemp*( ). The unique directory name is used to attempt to create the directory using mode 0700 as modified by the file creation mask.

The *mkstemp*( ) function shall replace the contents of the string pointed to by *template* by a unique filename, and return a file descriptor for the file open for reading and writing. The *mkstemp*( ) function shall create the file, and obtain a file descriptor for it, as if by a call to:

```
open(filename, O_RDWR|O_CREAT|O_EXCL, S_IRUSR|S_IWUSR)
```

The function thus prevents any possible race condition between testing whether the file exists and opening it for use. The string in *template* should look like a filename with six trailing 'X's; *mkstemp*( ) replaces each 'X' with a character from the portable filename character set. The characters are chosen such that the resulting name does not duplicate the name of an existing file at the time of a call to *mkstemp*( ).

RETURN VALUE

Upon successful completion, the *mkdtemp*( ) function shall return a pointer to the string containing the directory name if it was created. Otherwise, it shall return a null pointer and shall set *errno* to indicate the error.

Upon successful completion, the *mkstemp*( ) function shall return an open file descriptor. Otherwise, it shall return –1 if no suitable file could be created.

ERRORS

The *mkdtemp*( ) function shall fail if:

[EACCES] Search permission is denied on a component of the path prefix, or write permission is denied on the parent directory of the directory to be created.

[EINVAL] The string pointed to by *template* does not end in "XXXXXX".

[ELOOP] A loop exists in symbolic links encountered during resolution of the path of the directory to be created.

[EMLINK] The link count of the parent directory would exceed {LINK_MAX}.

[ENAMETOOLONG] The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of the path prefix specified by the *template* argument does not name an existing directory.

[ENOSPC] The file system does not contain enough space to hold the contents of the new directory or to extend the parent directory of the new directory.

[ENOTDIR] A component of the path prefix is not a directory.

[EROFS] The parent directory resides on a read-only file system.

The *mkdtemp*( ) function may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the path of the directory to be created.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

The error conditions for the *mkstemp*( ) function are defined in *open*( ).

EXAMPLES

Generating a Filename

The following example creates a file with a 10-character name beginning with the characters `"file"` and opens the file for reading and writing. The value returned as the value of *fd* is a file descriptor that identifies the file.

```
#include <stdlib.h>
...
char template[] = "/tmp/fileXXXXXX";
int fd;

fd = mkstemp(template);
```

APPLICATION USAGE

It is possible to run out of letters.

The *mkdtemp*( ) and *mkstemp*( ) functions need not check to determine whether the filename part of *template* exceeds the maximum allowable filename length.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

SD5-XSH-ERN-168 is applied, clarifying file permissions upon creation.

The *mkstemp*( ) function is moved from the XSI option to the Base.

The *mkdtemp*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

NAME

mkfifo, mkfifoat — make a FIFO special file relative to directory file descriptor

SYNOPSIS

```
#include <sys/stat.h>

int mkfifo(const char *path, mode_t mode);
int mkfifoat(int fd, const char *path, mode_t mode);
```

DESCRIPTION

The *mkfifo*( ) function shall create a new FIFO special file named by the pathname pointed to by *path*. The file permission bits of the new FIFO shall be initialized from *mode*. The file permission bits of the *mode* argument shall be modified by the process' file creation mask.

When bits in *mode* other than the file permission bits are set, the effect is implementation-defined.

If *path* names a symbolic link, *mkfifo*( ) shall fail and set *errno* to [EEXIST].

The FIFO's user ID shall be set to the process' effective user ID. The FIFO's group ID shall be set to the group ID of the parent directory or to the effective group ID of the process. Implementations shall provide a way to initialize the FIFO's group ID to the group ID of the parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the FIFO's group ID to the effective group ID of the calling process.

Upon successful completion, *mkfifo*( ) shall mark for update the last data access, last data modification, and last file status change timestamps of the file. Also, the last data modification and last file status change timestamps of the directory that contains the new entry shall be marked for update.

The *mkfifoat*( ) function shall be equivalent to the *mkfifo*( ) function except in the case where *path* specifies a relative path. In this case the newly created FIFO is created relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function shall not perform the check.

If *mkfifoat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working directory is used and the behavior shall be identical to a call to *mkfifo*( ).

RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return –1 and set *errno* to indicate the error. If –1 is returned, no FIFO shall be created.

ERRORS

These functions shall fail if:

[EACCES] A component of the path prefix denies search permission, or write permission is denied on the parent directory of the FIFO to be created.

[EEXIST] The named file already exists.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG] The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of the path prefix specified by *path* does not name an existing directory or *path* is an empty string.

[ENOSPC] The directory that would contain the new file cannot be extended or the file system is out of file-allocation resources.

[ENOTDIR] A component of the path prefix is not a directory.

[EROFS] The named file resides on a read-only file system.

The *mkfifoat*( ) function shall fail if:

[EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

These functions may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

The *mkfifoat*( ) function may fail if:

[ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a file descriptor associated with a directory.

EXAMPLES

Creating a FIFO File

The following example shows how to create a FIFO file named **/home/cnd/mod_done**, with read/write permissions for owner, and with read permissions for group and others.

```
#include <sys/types.h>
#include <sys/stat.h>

int status;
...
status = mkfifo("/home/cnd/mod_done", S_IWUSR | S_IRUSR |
    S_IRGRP | S_IROTH);
```

APPLICATION USAGE

None.

RATIONALE

The syntax of this function is intended to maintain compatibility with historical implementations of *mknod*( ). The latter function was included in the 1984 /usr/group standard but only for use in creating FIFO special files. The *mknod*( ) function was originally excluded from the POSIX.1-1988 standard as implementation-defined and replaced by *mkdir*( ) and *mkfifo*( ). The *mknod*( ) function is now included for alignment with the Single UNIX Specification.

The POSIX.1-1990 standard required that the group ID of a newly created FIFO be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2

required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use *chown*( ) to set the group ID after the FIFO is created, or determine under what conditions the implementation will set the desired group ID.

The purpose of the *mkfifoat*( ) function is to create a FIFO special file in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *mkfifo*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *mkfifoat*( ) function it can be guaranteed that the newly created FIFO is located relative to the desired directory.

FUTURE DIRECTIONS

None.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

NAME

mknod, mknodat — make directory, special file, or regular file

SYNOPSIS

XSI
```
#include <sys/stat.h>

int mknod(const char *path, mode_t mode, dev_t dev);
int mknodat(int fd, const char *path, mode_t mode, dev_t dev);
```

DESCRIPTION

The *mknod*( ) function shall create a new file named by the pathname to which the argument *path* points.

The file type for *path* is OR'ed into the *mode* argument, and the application shall select one of the following symbolic constants:

Name	Description
S_IFIFO	FIFO-special
S_IFCHR	Character-special (non-portable)
S_IFDIR	Directory (non-portable)
S_IFBLK	Block-special (non-portable)
S_IFREG	Regular (non-portable)

The only portable use of *mknod*( ) is to create a FIFO-special file. If *mode* is not S_IFIFO or *dev* is not 0, the behavior of *mknod*( ) is unspecified.

The permissions for the new file are OR'ed into the *mode* argument, and may be selected from any combination of the following symbolic constants:

Name	Description
S_ISUID	Set user ID on execution.
S_ISGID	Set group ID on execution.
S_IRWXU	Read, write, or execute (search) by owner.
S_IRUSR	Read by owner.
S_IWUSR	Write by owner.
S_IXUSR	Execute (search) by owner.
S_IRWXG	Read, write, or execute (search) by group.
S_IRGRP	Read by group.
S_IWGRP	Write by group.
S_IXGRP	Execute (search) by group.
S_IRWXO	Read, write, or execute (search) by others.
S_IROTH	Read by others.
S_IWOTH	Write by others.
S_IXOTH	Execute (search) by others.
S_ISVTX	On directories, restricted deletion flag.

The user ID of the file shall be initialized to the effective user ID of the process. The group ID of the file shall be initialized to either the effective group ID of the process or the group ID of the parent directory. Implementations shall provide a way to initialize the file's group ID to the group ID of the parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the file's group ID to the effective group ID of the calling process. The owner, group, and other permission bits of *mode* shall be modified by the file mode creation mask of the process. The *mknod*( ) function shall clear each bit whose corresponding bit in the file mode creation mask of the process is set.

If *path* names a symbolic link, *mknod*( ) shall fail and set *errno* to [EEXIST].

Upon successful completion, *mknod*( ) shall mark for update the last data access, last data modification, and last file status change timestamps of the file. Also, the last data modification and last file status change timestamps of the directory that contains the new entry shall be marked for update.

Only a process with appropriate privileges may invoke *mknod*( ) for file types other than FIFO-special.

The *mknodat*( ) function shall be equivalent to the *mknod*( ) function except in the case where *path* specifies a relative path. In this case the newly created directory, special file, or regular file is located relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function shall not perform the check.

If *mknodat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working directory is used and the behavior shall be identical to a call to *mknod*( ).

RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return –1 and set *errno* to indicate the error. If –1 is returned, the new file shall not be created.

ERRORS

These functions shall fail if:

[EACCES] A component of the path prefix denies search permission, or write permission is denied on the parent directory.

[EEXIST] The named file exists.

[EINVAL] An invalid argument exists.

[EIO] An I/O error occurred while accessing the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG] The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of the path prefix specified by *path* does not name an existing directory or *path* is an empty string.

[ENOSPC] The directory that would contain the new file cannot be extended or the file system is out of file allocation resources.

[ENOTDIR] A component of the path prefix is not a directory.

[EPERM] The invoking process does not have appropriate privileges and the file type is not FIFO-special.

[EROFS] The directory in which the file is to be created is located on a read-only file system.

The *mknodat*( ) function shall fail if:

[EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

These functions may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

The *mknodat*( ) function may fail if:

[ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a file descriptor associated with a directory.

EXAMPLES

Creating a FIFO Special File

The following example shows how to create a FIFO special file named **/home/cnd/mod_done**, with read/write permissions for owner, and with read permissions for group and others.

```
#include <sys/types.h>
#include <sys/stat.h>

dev_t dev;
int   status;
...
status  = mknod("/home/cnd/mod_done", S_IFIFO | S_IWUSR |
    S_IRUSR | S_IRGRP | S_IROTH, dev);
```

APPLICATION USAGE

The *mkfifo*( ) function is preferred over this function for making FIFO special files.

RATIONALE

The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use *chown*( ) to set the group ID after the file is created, or determine under what conditions the implementation will set the desired group ID.

The purpose of the *mknodat*( ) function is to create directories, special files, or regular files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *mknod*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *mknodat*( ) function it can be guaranteed that the newly created directory, special file, or regular file is located relative to the desired directory.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *mknodat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

mkstemp( )

NAME

mkstemp — create a unique directory

SYNOPSIS

CX

```
#include <stdlib.h>

int mkstemp(char *template);
```

DESCRIPTION

Refer to *mkdtemp( )*.

NAME

mktime — convert broken-down time into time since the Epoch

SYNOPSIS

```
#include <time.h>

time_t mktime(struct tm *timeptr);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *mktime*( ) function shall convert the broken-down time, expressed as local time, in the structure pointed to by *timeptr*, into a time since the Epoch value with the same encoding as that of the values returned by *time*( ). The original values of the *tm_wday* and *tm_yday* components of the structure are ignored, and the original values of the other components are not restricted to the ranges described in **<time.h>**.

CX A positive or 0 value for *tm_isdst* shall cause *mktime*( ) to presume initially that Daylight Savings Time, respectively, is or is not in effect for the specified time. A negative value for *tm_isdst* shall cause *mktime*( ) to attempt to determine whether Daylight Savings Time is in effect for the specified time.

Local timezone information shall be set as though *mktime*( ) called *tzset*( ).

The relationship between the **tm** structure (defined in the **<time.h>** header) and the time in seconds since the Epoch is that the result shall be as specified in the expression given in the definition of seconds since the Epoch (see XBD Section 4.15, on page 113) corrected for timezone and any seasonal time adjustments, where the names in the structure and in the expression correspond.

Upon successful completion, the values of the *tm_wday* and *tm_yday* components of the structure shall be set appropriately, and the other components are set to represent the specified time since the Epoch, but with their values forced to the ranges indicated in the **<time.h>** entry; the final value of *tm_mday* shall not be set until *tm_mon* and *tm_year* are determined.

RETURN VALUE

The *mktime*( ) function shall return the specified time since the Epoch encoded as a value of type **time_t**. If the time since the Epoch cannot be represented, the function shall return the value (**time_t**)–1 CX and may set *errno* to indicate the error.

ERRORS

The *mktime*( ) function may fail if:

CX [EOVERFLOW] The result cannot be represented.

EXAMPLES

What day of the week is July 4, 2001?

```
#include <stdio.h>
#include <time.h>

struct tm time_str;

char daybuf[20];

int main(void)
{
    time_str.tm_year = 2001 – 1900;
```

```
        time_str.tm_mon = 7 – 1;
        time_str.tm_mday = 4;
        time_str.tm_hour = 0;
        time_str.tm_min = 0;
        time_str.tm_sec = 1;
        time_str.tm_isdst = –1;
        if (mktime(&time_str) == -1)
            (void)puts("-unknown-");
        else {
            (void)strftime(daybuf, sizeof(daybuf), "%A", &time_str);
            (void)puts(daybuf);
        }
        return 0;
    }
```

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ANSI C standard.

Issue 6

Extensions beyond the ISO C standard are marked.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/58 is applied, updating the RETURN VALUE and ERRORS sections to add the optional [EOVERFLOW] error as a CX extension.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/59 is applied, adding the *tzset( )* function to the SEE ALSO section.

NAME

mlock, munlock — lock or unlock a range of process address space (**REALTIME**)

SYNOPSIS

MLR

```
#include <sys/mman.h>

int mlock(const void *addr, size_t len);
int munlock(const void *addr, size_t len);
```

DESCRIPTION

The *mlock*( ) function shall cause those whole pages containing any part of the address space of the process starting at address *addr* and continuing for *len* bytes to be memory-resident until unlocked or until the process exits or *exec*s another process image. The implementation may require that *addr* be a multiple of {PAGESIZE}.

The *munlock*( ) function shall unlock those whole pages containing any part of the address space of the process starting at address *addr* and continuing for *len* bytes, regardless of how many times *mlock*( ) has been called by the process for any of the pages in the specified range. The implementation may require that *addr* be a multiple of {PAGESIZE}.

If any of the pages in the range specified to a call to *munlock*( ) are also mapped into the address spaces of other processes, any locks established on those pages by another process are unaffected by the call of this process to *munlock*( ). If any of the pages in the range specified by a call to *munlock*( ) are also mapped into other portions of the address space of the calling process outside the range specified, any locks established on those pages via the other mappings are also unaffected by this call.

Upon successful return from *mlock*( ), pages in the specified range shall be locked and memory-resident. Upon successful return from *munlock*( ), pages in the specified range shall be unlocked with respect to the address space of the process. Memory residency of unlocked pages is unspecified.

Appropriate privileges are required to lock process memory with *mlock*( ).

RETURN VALUE

Upon successful completion, the *mlock*( ) and *munlock*( ) functions shall return a value of zero. Otherwise, no change is made to any locks in the address space of the process, and the function shall return a value of –1 and set *errno* to indicate the error.

ERRORS

The *mlock*( ) and *munlock*( ) functions shall fail if:

[ENOMEM] Some or all of the address range specified by the *addr* and *len* arguments does not correspond to valid mapped pages in the address space of the process.

The *mlock*( ) function shall fail if:

[EAGAIN] Some or all of the memory identified by the operation could not be locked when the call was made.

The *mlock*( ) and *munlock*( ) functions may fail if:

[EINVAL] The *addr* argument is not a multiple of {PAGESIZE}.

The *mlock*( ) function may fail if:

[ENOMEM] Locking the pages mapped by the specified range would exceed an implementation-defined limit on the amount of memory that the process may lock.

[EPERM] The calling process does not have appropriate privileges to perform the requested operation.

The *mlock*( ) and *munlock*( ) functions are marked as part of the Range Memory Locking option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Range Memory Locking option.

NAME

mlockall, munlockall — lock/unlock the address space of a process (**REALTIME**)

SYNOPSIS

ML
```
#include <sys/mman.h>

int mlockall(int flags);
int munlockall(void);
```

DESCRIPTION

The *mlockall*( ) function shall cause all of the pages mapped by the address space of a process to be memory-resident until unlocked or until the process exits or *exec*s another process image. The *flags* argument determines whether the pages to be locked are those currently mapped by the address space of the process, those that are mapped in the future, or both. The *flags* argument is constructed from the bitwise-inclusive OR of one or more of the following symbolic constants, defined in **<sys/mman.h>**:

MCL_CURRENT Lock all of the pages currently mapped into the address space of the process.

MCL_FUTURE Lock all of the pages that become mapped into the address space of the process in the future, when those mappings are established.

If MCL_FUTURE is specified, and the automatic locking of future mappings eventually causes the amount of locked memory to exceed the amount of available physical memory or any other implementation-defined limit, the behavior is implementation-defined. The manner in which the implementation informs the application of these situations is also implementation-defined.

The *munlockall*( ) function shall unlock all currently mapped pages of the address space of the process. Any pages that become mapped into the address space of the process after a call to *munlockall*( ) shall not be locked, unless there is an intervening call to *mlockall*( ) specifying MCL_FUTURE or a subsequent call to *mlockall*( ) specifying MCL_CURRENT. If pages mapped into the address space of the process are also mapped into the address spaces of other processes and are locked by those processes, the locks established by the other processes shall be unaffected by a call by this process to *munlockall*( ).

Upon successful return from the *mlockall*( ) function that specifies MCL_CURRENT, all currently mapped pages of the address space of the process shall be memory-resident and locked. Upon return from the *munlockall*( ) function, all currently mapped pages of the address space of the process shall be unlocked with respect to the address space of the process. The memory residency of unlocked pages is unspecified.

Appropriate privileges are required to lock process memory with *mlockall*( ).

RETURN VALUE

Upon successful completion, the *mlockall*( ) function shall return a value of zero. Otherwise, no additional memory shall be locked, and the function shall return a value of −1 and set *errno* to indicate the error. The effect of failure of *mlockall*( ) on previously existing locks in the address space is unspecified.

If it is supported by the implementation, the *munlockall*( ) function shall always return a value of zero. Otherwise, the function shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *mlockall*( ) function shall fail if:

[EAGAIN] Some or all of the memory identified by the operation could not be locked when the call was made.

[EINVAL] The *flags* argument is zero, or includes unimplemented flags.

The *mlockall*( ) function may fail if:

[ENOMEM] Locking all of the pages currently mapped into the address space of the process would exceed an implementation-defined limit on the amount of memory that the process may lock.

[EPERM] The calling process does not have appropriate privileges to perform the requested operation.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Process Memory Locking option.

NAME

mmap — map pages of memory

SYNOPSIS

```
#include <sys/mman.h>

void *mmap(void *addr, size_t len, int prot, int flags,
    int fildes, off_t off);
```

DESCRIPTION

The *mmap*( ) function shall establish a mapping between an address space of a process and a memory object.

The *mmap*( ) function shall be supported for the following memory objects:

- Regular files
- SHM Shared memory objects
- TYM Typed memory objects

Support for any other type of file is unspecified.

The format of the call is as follows:

```
pa=mmap(addr, len, prot, flags, fildes, off);
```

The *mmap*( ) function shall establish a mapping between the address space of the process at an address *pa* for *len* bytes to the memory object represented by the file descriptor *fildes* at offset *off* for *len* bytes. The value of *pa* is an implementation-defined function of the parameter *addr* and the values of *flags*, further described below. A successful *mmap*( ) call shall return *pa* as its result. The address range starting at *pa* and continuing for *len* bytes shall be legitimate for the possible (not necessarily current) address space of the process. The range of bytes starting at *off* and continuing for *len* bytes shall be legitimate for the possible (not necessarily current) offsets in the memory object represented by *fildes*.

TYM If *fildes* represents a typed memory object opened with either the POSIX_TYPED_MEM_ALLOCATE flag or the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, the memory object to be mapped shall be that portion of the typed memory object allocated by the implementation as specified below. In this case, if *off* is non-zero, the behavior of *mmap*( ) is undefined. If *fildes* refers to a valid typed memory object that is not accessible from the calling process, *mmap*( ) shall fail.

The mapping established by *mmap*( ) shall replace any previous mappings for those whole pages containing any part of the address space of the process starting at *pa* and continuing for *len* bytes.

If the size of the mapped file changes after the call to *mmap*( ) as a result of some other operation on the mapped file, the effect of references to portions of the mapped region that correspond to added or removed portions of the file is unspecified.

If *len* is zero, *mmap*( ) shall fail and no mapping shall be established.

The parameter *prot* determines whether read, write, execute, or some combination of accesses are permitted to the data being mapped. The *prot* shall be either PROT_NONE or the bitwise-inclusive OR of one or more of the other flags in the following table, defined in the **<sys/mman.h>** header.

Symbolic Constant	Description
PROT_READ	Data can be read.
PROT_WRITE	Data can be written.
PROT_EXEC	Data can be executed.
PROT_NONE	Data cannot be accessed.

If an implementation cannot support the combination of access types specified by *prot*, the call to *mmap*( ) shall fail.

An implementation may permit accesses other than those specified by *prot*; however, the implementation shall not permit a write to succeed where PROT_WRITE has not been set and shall not permit any access where PROT_NONE alone has been set. The implementation shall support at least the following values of *prot*: PROT_NONE, PROT_READ, PROT_WRITE, and the bitwise-inclusive OR of PROT_READ and PROT_WRITE. The file descriptor *fildes* shall have been opened with read permission, regardless of the protection options specified. If PROT_WRITE is specified, the application shall ensure that it has opened the file descriptor *fildes* with write permission unless MAP_PRIVATE is specified in the *flags* parameter as described below.

The parameter *flags* provides other information about the handling of the mapped data. The value of *flags* is the bitwise-inclusive OR of these options, defined in **<sys/mman.h>**:

Symbolic Constant	Description
MAP_SHARED	Changes are shared.
MAP_PRIVATE	Changes are private.
MAP_FIXED	Interpret *addr* exactly.

XSI It is implementation-defined whether MAP_FIXED shall be supported. MAP_FIXED shall be supported on XSI-conformant systems.

MAP_SHARED and MAP_PRIVATE describe the disposition of write references to the memory object. If MAP_SHARED is specified, write references shall change the underlying object. If MAP_PRIVATE is specified, modifications to the mapped data by the calling process shall be visible only to the calling process and shall not change the underlying object. It is unspecified whether modifications to the underlying object done after the MAP_PRIVATE mapping is established are visible through the MAP_PRIVATE mapping. Either MAP_SHARED or MAP_PRIVATE can be specified, but not both. The mapping type is retained across *fork*( ).

The state of synchronization objects such as mutexes, semaphores, barriers, and conditional variables placed in shared memory mapped with MAP_SHARED becomes undefined when the last region in any process containing the synchronization object is unmapped.

TYM When *fildes* represents a typed memory object opened with either the POSIX_TYPED_MEM_ALLOCATE flag or the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, *mmap*( ) shall, if there are enough resources available, map *len* bytes allocated from the corresponding typed memory object which were not previously allocated to any process in any processor that may access that typed memory object. If there are not enough resources available, the function shall fail. If *fildes* represents a typed memory object opened with the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, these allocated bytes shall be contiguous within the typed memory object. If *fildes* represents a typed memory object opened with the POSIX_TYPED_MEM_ALLOCATE flag, these allocated bytes may be composed of non-contiguous fragments within the typed memory object. If *fildes* represents a typed memory object opened with neither the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag nor the POSIX_TYPED_MEM_ALLOCATE flag, *len* bytes starting at offset *off* within the typed memory object are mapped, exactly as when mapping a file or shared memory object. In this case, if two

processes map an area of typed memory using the same *off* and *len* values and using file descriptors that refer to the same memory pool (either from the same port or from a different port), both processes shall map the same region of storage.

When MAP_FIXED is set in the *flags* argument, the implementation is informed that the value of *pa* shall be *addr*, exactly. If MAP_FIXED is set, *mmap*( ) may return MAP_FAILED and set *errno* to [EINVAL]. If a MAP_FIXED request is successful, the mapping established by *mmap*( ) replaces any previous mappings for the pages in the range [*pa*,*pa*+*len*) of the process.

When MAP_FIXED is not set, the implementation uses *addr* in an implementation-defined manner to arrive at *pa*. The *pa* so chosen shall be an area of the address space that the implementation deems suitable for a mapping of *len* bytes to the file. All implementations interpret an *addr* value of 0 as granting the implementation complete freedom in selecting *pa*, subject to constraints described below. A non-zero value of *addr* is taken to be a suggestion of a process address near which the mapping should be placed. When the implementation selects a value for *pa*, it never places a mapping at address 0, nor does it replace any extant mapping.

If MAP_FIXED is specified and *addr* is non-zero, it shall have the same remainder as the *off* parameter, modulo the page size as returned by *sysconf*( ) when passed _SC_PAGESIZE or _SC_PAGE_SIZE. The implementation may require that off is a multiple of the page size. If MAP_FIXED is specified, the implementation may require that *addr* is a multiple of the page size. The system performs mapping operations over whole pages. Thus, while the parameter *len* need not meet a size or alignment constraint, the system shall include, in any mapping operation, any partial page specified by the address range starting at *pa* and continuing for *len* bytes.

The system shall always zero-fill any partial page at the end of an object. Further, the system shall never write out any modified portions of the last page of an object which are beyond its end. References within the address range starting at *pa* and continuing for *len* bytes to whole pages following the end of an object shall result in delivery of a SIGBUS signal.

An implementation may generate SIGBUS signals when a reference would cause an error in the mapped object, such as out-of-space condition.

The *mmap*( ) function shall add an extra reference to the file associated with the file descriptor *fildes* which is not removed by a subsequent *close*( ) on that file descriptor. This reference shall be removed when there are no more mappings to the file.

The last data access timestamp of the mapped file may be marked for update at any time between the *mmap*( ) call and the corresponding *munmap*( ) call. The initial read or write reference to a mapped region shall cause the file's last data access timestamp to be marked for update if it has not already been marked for update.

The last data modification and last file status change timestamps of a file that is mapped with MAP_SHARED and PROT_WRITE shall be marked for update at some point in the interval between a write reference to the mapped region and the next call to *msync*( ) with MS_ASYNC or MS_SYNC for that portion of the file by any process. If there is no such call and if the underlying file is modified as a result of a write reference, then these timestamps shall be marked for update at some time after the write reference.

There may be implementation-defined limits on the number of memory regions that can be mapped (per process or per system).

XSI If such a limit is imposed, whether the number of memory regions that can be mapped by a process is decreased by the use of *shmat*( ) is implementation-defined.

If *mmap*( ) fails for reasons other than [EBADF], [EINVAL], or [ENOTSUP], some of the

mappings in the address range starting at *addr* and continuing for *len* bytes may have been unmapped.

RETURN VALUE

Upon successful completion, the *mmap*( ) function shall return the address at which the mapping was placed (*pa*); otherwise, it shall return a value of MAP_FAILED and set *errno* to indicate the error. The symbol MAP_FAILED is defined in the **<sys/mman.h>** header. No successful return from *mmap*( ) shall return the value MAP_FAILED.

ERRORS

The *mmap*( ) function shall fail if:

[EACCES] The *fildes* argument is not open for read, regardless of the protection specified, or *fildes* is not open for write and PROT_WRITE was specified for a MAP_SHARED type mapping.

ML [EAGAIN] The mapping could not be locked in memory, if required by *mlockall*( ), due to a lack of resources.

[EBADF] The *fildes* argument is not a valid open file descriptor.

[EINVAL] The value of *len* is zero.

[EINVAL] The value of *flags* is invalid (neither MAP_PRIVATE nor MAP_SHARED is set).

[EMFILE] The number of mapped regions would exceed an implementation-defined limit (per process or per system).

[ENODEV] The *fildes* argument refers to a file whose type is not supported by *mmap*( ).

[ENOMEM] MAP_FIXED was specified, and the range [*addr*,*addr*+*len*) exceeds that allowed for the address space of a process; or, if MAP_FIXED was not specified and there is insufficient room in the address space to effect the mapping.

ML [ENOMEM] The mapping could not be locked in memory, if required by *mlockall*( ), because it would require more space than the system is able to supply.

TYM [ENOMEM] Not enough unallocated memory resources remain in the typed memory object designated by *fildes* to allocate *len* bytes.

[ENOTSUP] MAP_FIXED or MAP_PRIVATE was specified in the *flags* argument and the implementation does not support this functionality.

The implementation does not support the combination of accesses requested in the *prot* argument.

[ENXIO] Addresses in the range [*off*,*off*+*len*) are invalid for the object specified by *fildes*.

[ENXIO] MAP_FIXED was specified in *flags* and the combination of *addr*, *len*, and *off* is invalid for the object specified by *fildes*.

TYM [ENXIO] The *fildes* argument refers to a typed memory object that is not accessible from the calling process.

[EOVERFLOW] The file is a regular file and the value of *off* plus *len* exceeds the offset maximum established in the open file description associated with *fildes*.

The *mmap*( ) function may fail if:

[EINVAL] The *addr* argument (if MAP_FIXED was specified) or *off* is not a multiple of the page size as returned by *sysconf*( ), or is considered invalid by the implementation.

EXAMPLES

None.

APPLICATION USAGE

Use of *mmap*( ) may reduce the amount of memory available to other memory allocation functions.

Use of MAP_FIXED may result in unspecified behavior in further use of *malloc*( ) and *shmat*( ). The use of MAP_FIXED is discouraged, as it may prevent an implementation from making the most effective use of resources. Most implementations require that *off* and *addr* are multiples of the page size as returned by *sysconf*( ).

The application must ensure correct synchronization when using *mmap*( ) in conjunction with any other file access method, such as *read*( ) and *write*( ), standard input/output, and *shmat*( ).

The *mmap*( ) function allows access to resources via address space manipulations, instead of *read*( )/*write*( ). Once a file is mapped, all a process has to do to access it is use the data at the address to which the file was mapped. So, using pseudo-code to illustrate the way in which an existing program might be changed to use *mmap*( ), the following:

```
fildes = open(...)
lseek(fildes, some_offset)
read(fildes, buf, len)
/* Use data in buf. */
```

becomes:

```
fildes = open(...)
address = mmap(0, len, PROT_READ, MAP_PRIVATE, fildes, some_offset)
/* Use data at address. */
```

RATIONALE

After considering several other alternatives, it was decided to adopt the *mmap*( ) definition found in SVR4 for mapping memory objects into process address spaces. The SVR4 definition is minimal, in that it describes only what has been built, and what appears to be necessary for a general and portable mapping facility.

Note that while *mmap*( ) was first designed for mapping files, it is actually a general-purpose mapping facility. It can be used to map any appropriate object, such as memory, files, devices, and so on, into the address space of a process.

When a mapping is established, it is possible that the implementation may need to map more than is requested into the address space of the process because of hardware requirements. An application, however, cannot count on this behavior. Implementations that do not use a paged architecture may simply allocate a common memory region and return the address of it; such implementations probably do not allocate any more than is necessary. References past the end of the requested area are unspecified.

If an application requests a mapping that would overlay existing mappings in the process, it might be desirable that an implementation detect this and inform the application. However, the default, portable (not MAP_FIXED) operation does not overlay existing mappings. On the other hand, if the program specifies a fixed address mapping (which requires some implementation

knowledge to determine a suitable address, if the function is supported at all), then the program is presumed to be successfully managing its own address space and should be trusted when it asks to map over existing data structures. Furthermore, it is also desirable to make as few system calls as possible, and it might be considered onerous to require an *munmap*( ) before an *mmap*( ) to the same address range. This volume of POSIX.1-200x specifies that the new mappings replace any existing mappings, following existing practice in this regard.

It is not expected that all hardware implementations are able to support all combinations of permissions at all addresses. Implementations are required to disallow write access to mappings without write permission and to disallow access to mappings without any access permission. Other than these restrictions, implementations may allow access types other than those requested by the application. For example, if the application requests only PROT_WRITE, the implementation may also allow read access. A call to *mmap*( ) fails if the implementation cannot support allowing all the access requested by the application. For example, some implementations cannot support a request for both write access and execute access simultaneously. All implementations must support requests for no access, read access, write access, and both read and write access. Strictly conforming code must only rely on the required checks. These restrictions allow for portability across a wide range of hardware.

The MAP_FIXED address treatment is likely to fail for non-page-aligned values and for certain architecture-dependent address ranges. Conforming implementations cannot count on being able to choose address values for MAP_FIXED without utilizing non-portable, implementation-defined knowledge. Nonetheless, MAP_FIXED is provided as a standard interface conforming to existing practice for utilizing such knowledge when it is available.

Similarly, in order to allow implementations that do not support virtual addresses, support for directly specifying any mapping addresses via MAP_FIXED is not required and thus a conforming application may not count on it.

The MAP_PRIVATE function can be implemented efficiently when memory protection hardware is available. When such hardware is not available, implementations can implement such "mappings" by simply making a real copy of the relevant data into process private memory, though this tends to behave similarly to *read*( ).

The function has been defined to allow for many different models of using shared memory. However, all uses are not equally portable across all machine architectures. In particular, the *mmap*( ) function allows the system as well as the application to specify the address at which to map a specific region of a memory object. The most portable way to use the function is always to let the system choose the address, specifying NULL as the value for the argument *addr* and not to specify MAP_FIXED.

If it is intended that a particular region of a memory object be mapped at the same address in a group of processes (on machines where this is even possible), then MAP_FIXED can be used to pass in the desired mapping address. The system can still be used to choose the desired address if the first such mapping is made without specifying MAP_FIXED, and then the resulting mapping address can be passed to subsequent processes for them to pass in via MAP_FIXED. The availability of a specific address range cannot be guaranteed, in general.

The *mmap*( ) function can be used to map a region of memory that is larger than the current size of the object. Memory access within the mapping but beyond the current end of the underlying objects may result in SIGBUS signals being sent to the process. The reason for this is that the size of the object can be manipulated by other processes and can change at any moment. The implementation should tell the application that a memory reference is outside the object where this can be detected; otherwise, written data may be lost and read data may not reflect actual data in the object.

Note that references beyond the end of the object do not extend the object as the new end cannot be determined precisely by most virtual memory hardware. Instead, the size can be directly manipulated by *ftruncate*( ).

Process memory locking does apply to shared memory regions, and the MEMLOCK_FUTURE argument to *mlockall*( ) can be relied upon to cause new shared memory regions to be automatically locked.

Existing implementations of *mmap*( ) return the value –1 when unsuccessful. Since the casting of this value to type **void** * cannot be guaranteed by the ISO C standard to be distinct from a successful value, this volume of POSIX.1-200x defines the symbol MAP_FAILED, which a conforming implementation does not return as the result of a successful call.

FUTURE DIRECTIONS

None.

XBD **<sys/mman.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Aligned with *mmap*( ) in the POSIX Realtime Extension as follows:

- The DESCRIPTION is extensively reworded.
- The [EAGAIN] and [ENOTSUP] mandatory error conditions are added.
- New cases of [ENOMEM] and [ENXIO] are added as mandatory error conditions.
- The value returned on failure is the value of the constant MAP_FAILED; this was previously defined as –1.

Large File Summit extensions are added.

Issue 6

The *mmap*( ) function is marked as part of the Memory Mapped Files option.

The Open Group Corrigendum U028/6 is applied, changing (**void** *)–1 to MAP_FAILED.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to describe the use of MAP_FIXED.
- The DESCRIPTION is updated to describe the addition of an extra reference to the file associated with the file descriptor passed to *mmap*( ).
- The DESCRIPTION is updated to state that there may be implementation-defined limits on the number of memory regions that can be mapped.
- The DESCRIPTION is updated to describe constraints on the alignment and size of the *off* argument.

- The [EINVAL] and [EMFILE] error conditions are added.
- The [EOVERFLOW] error condition is added. This change is to support large files.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The DESCRIPTION is updated to describe the cases when MAP_PRIVATE and MAP_FIXED need not be supported.

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- Semantics for typed memory objects are added to the DESCRIPTION.
- New [ENOMEM] and [ENXIO] errors are added to the ERRORS section.
- The *posix_typed_mem_open( )* function is added to the SEE ALSO section.

The normative text is updated to avoid use of the term "must" for application requirements.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM).

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/60 is applied, updating the DESCRIPTION and ERRORS sections to add the [EINVAL] error when *len* is zero.

Issue 7

Austin Group Interpretations 1003.1-2001 #078 and #079 are applied, clarifying page alignment requirements and adding a note about the state of synchronization objects becoming undefined when a shared region is unmapped.

Functionality relating to the Memory Protection and Memory Mapped Files options is moved to the Base.

Changes are made related to support for finegrained timestamps.

NAME

modf, modff, modfl — decompose a floating-point number

SYNOPSIS

```
#include <math.h>

double modf(double x, double *iptr);
float modff(float value, float *iptr);
long double modfl(long double value, long double *iptr);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall break the argument *x* into integral and fractional parts, each of which has the same sign as the argument. It stores the integral part as a **double** (for the *modf*( ) function), a **float** (for the *modff*( ) function), or a **long double** (for the *modfl*( ) function), in the object pointed to by *iptr*.

RETURN VALUE

Upon successful completion, these functions shall return the signed fractional part of *x*.

MX If *x* is NaN, a NaN shall be returned, and **iptr* shall be set to a NaN.

If *x* is ±Inf, ±0 shall be returned, and **iptr* shall be set to ±Inf.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *modf*( ) function computes the function result and **iptr* such that:

```
a = modf(x, iptr) ;
x == a+*iptr ;
```

allowing for the usual floating-point inaccuracies.

RATIONALE

None.

FUTURE DIRECTIONS

None.

frexp( ), *isnan*( ), *ldexp*( )

XBD **<math.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *modff*( ) and *modfl*( ) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/35 is applied, correcting the code example in the APPLICATION USAGE section.

NAME

mprotect — set protection of memory mapping

SYNOPSIS

```
#include <sys/mman.h>

int mprotect(void *addr, size_t len, int prot);
```

DESCRIPTION

The *mprotect*( ) function shall change the access protections to be that specified by *prot* for those whole pages containing any part of the address space of the process starting at address *addr* and continuing for *len* bytes. The parameter *prot* determines whether read, write, execute, or some combination of accesses are permitted to the data being mapped. The *prot* argument should be either PROT_NONE or the bitwise-inclusive OR of one or more of PROT_READ, PROT_WRITE, and PROT_EXEC.

If an implementation cannot support the combination of access types specified by *prot*, the call to *mprotect*( ) shall fail.

An implementation may permit accesses other than those specified by *prot*; however, no implementation shall permit a write to succeed where PROT_WRITE has not been set or shall permit any access where PROT_NONE alone has been set. Implementations shall support at least the following values of *prot*: PROT_NONE, PROT_READ, PROT_WRITE, and the bitwise-inclusive OR of PROT_READ and PROT_WRITE. If PROT_WRITE is specified, the application shall ensure that it has opened the mapped objects in the specified address range with write permission, unless MAP_PRIVATE was specified in the original mapping, regardless of whether the file descriptors used to map the objects have since been closed.

The implementation may require that *addr* be a multiple of the page size as returned by *sysconf*( ).

The behavior of this function is unspecified if the mapping was not established by a call to *mmap*( ).

When *mprotect*( ) fails for reasons other than [EINVAL], the protections on some of the pages in the range [*addr*,*addr*+*len*) may have been changed.

RETURN VALUE

Upon successful completion, *mprotect*( ) shall return 0; otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *mprotect*( ) function shall fail if:

[EACCES] The *prot* argument specifies a protection that violates the access permission the process has to the underlying memory object.

[EAGAIN] The *prot* argument specifies PROT_WRITE over a MAP_PRIVATE mapping and there are insufficient memory resources to reserve for locking the private page.

[ENOMEM] Addresses in the range [*addr*,*addr*+*len*) are invalid for the address space of a process, or specify one or more pages which are not mapped.

[ENOMEM] The *prot* argument specifies PROT_WRITE on a MAP_PRIVATE mapping, and it would require more space than the system is able to supply for locking the private pages, if required.

43397 [ENOTSUP] The implementation does not support the combination of accesses requested
43398 in the *prot* argument.

43399 The *mprotect*( ) function may fail if:

43400 [EINVAL] The *addr* argument is not a multiple of the page size as returned by *sysconf*( ).

43401 **EXAMPLES**

43402 None.

43403 **APPLICATION USAGE**

43404 Most implementations require that *addr* is a multiple of the page size as returned by *sysconf*( ).

43405 **RATIONALE**

43406 None.

43407 **FUTURE DIRECTIONS**

43408 None.

43409 **SEE ALSO**

43410 *mmap*( ), *sysconf*( )

43411 XBD **<sys/mman.h>**

43412 **CHANGE HISTORY**

43413 First released in Issue 4, Version 2.

43414 **Issue 5**

43415 Moved from X/OPEN UNIX extension to BASE.

43416 Aligned with *mprotect*( ) in the POSIX Realtime Extension as follows:

43417 • The DESCRIPTION is largely reworded.

43418 • [ENOTSUP] and a second form of [ENOMEM] are added as mandatory error conditions.

43419 • [EAGAIN] is moved from the optional to the mandatory error conditions.

43420 **Issue 6**

43421 The *mprotect*( ) function is marked as part of the Memory Protection option.

43422 The following new requirements on POSIX implementations derive from alignment with the
43423 Single UNIX Specification:

43424 • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple
43425 of the page size as returned by *sysconf*( ).

43426 • The [EINVAL] error condition is added.

43427 The normative text is updated to avoid use of the term "must" for application requirements.

43428 **Issue 7**

43429 SD5-XSH-ERN-22 is applied, deleting erroneous APPLICATION USAGE.

43430 Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment
43431 requirements.

43432 The *mprotect*( ) function is moved from the Memory Protection option to the Base.

NAME

mq_close — close a message queue (**REALTIME**)

SYNOPSIS

MSG

```
#include <mqueue.h>

int mq_close(mqd_t mqdes);
```

DESCRIPTION

The *mq_close*( ) function shall remove the association between the message queue descriptor, *mqdes*, and its message queue. The results of using this message queue descriptor after successful return from this *mq_close*( ), and until the return of this message queue descriptor from a subsequent *mq_open*( ), are undefined.

If the process has successfully attached a notification request to the message queue via this *mqdes*, this attachment shall be removed, and the message queue is available for another process to attach for notification.

RETURN VALUE

Upon successful completion, the *mq_close*( ) function shall return a value of zero; otherwise, the function shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *mq_close*( ) function shall fail if:

[EBADF] The *mqdes* argument is not a valid message queue descriptor.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XBD **<mqueue.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_close*( ) function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

NAME

mq_getattr — get message queue attributes (**REALTIME**)

SYNOPSIS

MSG
```
#include <mqueue.h>

int mq_getattr(mqd_t mqdes, struct mq_attr *mqstat);
```

DESCRIPTION

The *mq_getattr*( ) function shall obtain status information and attributes of the message queue and the open message queue description associated with the message queue descriptor.

The *mqdes* argument specifies a message queue descriptor.

The results shall be returned in the **mq_attr** structure referenced by the *mqstat* argument.

Upon return, the following members shall have the values associated with the open message queue description as set when the message queue was opened and as modified by subsequent *mq_setattr*( ) calls: *mq_flags*.

The following attributes of the message queue shall be returned as set at message queue creation: *mq_maxmsg*, *mq_msgsize*.

Upon return, the following members within the **mq_attr** structure referenced by the *mqstat* argument shall be set to the current state of the message queue:

mq_curmsgs The number of messages currently on the queue.

RETURN VALUE

Upon successful completion, the *mq_getattr*( ) function shall return zero. Otherwise, the function shall return –1 and set *errno* to indicate the error.

ERRORS

The *mq_getattr*( ) function may fail if:

[EBADF] The *mqdes* argument is not a valid message queue descriptor.

EXAMPLES

See *mq_notify*( ).

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD **<mqueue.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_getattr*( ) function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The *mq_timedsend*( ) function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/61 is applied, updating the ERRORS section to change the [EBADF] error from mandatory to optional.

NAME

mq_notify — notify process that a message is available (**REALTIME**)

SYNOPSIS

MSG

```
#include <mqueue.h>

int mq_notify(mqd_t mqdes, const struct sigevent *notification);
```

DESCRIPTION

If the argument *notification* is not NULL, this function shall register the calling process to be notified of message arrival at an empty message queue associated with the specified message queue descriptor, *mqdes*. The notification specified by the *notification* argument shall be sent to the process when the message queue transitions from empty to non-empty. At any time, only one process may be registered for notification by a message queue. If the calling process or any other process has already registered for notification of message arrival at the specified message queue, subsequent attempts to register for that message queue shall fail.

If *notification* is NULL and the process is currently registered for notification by the specified message queue, the existing registration shall be removed.

When the notification is sent to the registered process, its registration shall be removed. The message queue shall then be available for registration.

If a process has registered for notification of message arrival at a message queue and some thread is blocked in *mq_receive*( ) or *mq_timedreceive*( ) waiting to receive a message when a message arrives at the queue, the arriving message shall satisfy the appropriate *mq_receive*( ) or *mq_timedreceive*( ), respectively. The resulting behavior is as if the message queue remains empty, and no notification shall be sent.

RETURN VALUE

Upon successful completion, the *mq_notify*( ) function shall return a value of zero; otherwise, the function shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *mq_notify*( ) function shall fail if:

[EBADF] The *mqdes* argument is not a valid message queue descriptor.

[EBUSY] A process is already registered for notification by the message queue.

The *mq_notify*( ) function may fail if:

[EINVAL] The *notification* argument is NULL and the process is currently not registered.

EXAMPLES

The following program registers a notification request for the message queue named in its command-line argument. Notification is performed by creating a thread. The thread executes a function which reads one message from the queue and then terminates the process.

```
#include <pthread.h>
#include <mqueue.h>
#include <assert.h>
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>

static void                     /* Thread start function */
tfunc(union sigval sv)
{
```

```
43558           struct mq_attr attr;
43559           ssize_t nr;
43560           void *buf;
43561           mqd_t mqdes = *((mqd_t *) sv.sival_ptr);
43562           /* Determine maximum msg size; allocate buffer to receive msg */
43563           if (mq_getattr(mqdes, &attr) == -1) {
43564               perror("mq_getattr");
43565               exit(EXIT_FAILURE);
43566           }
43567           buf = malloc(attr.mq_msgsize);
43568           if (buf == NULL) {
43569               perror("malloc");
43570               exit(EXIT_FAILURE);
43571           }
43572           nr = mq_receive(mqdes, buf, attr.mq_msgsize, NULL);
43573           if (nr == -1) {
43574               perror("mq_receive");
43575               exit(EXIT_FAILURE);
43576           }
43577           printf("Read %ld bytes from message queue\n", (long) nr);
43578           free(buf);
43579           exit(EXIT_SUCCESS);         /* Terminate the process */
43580       }
43581       int
43582       main(int argc, char *argv[])
43583       {
43584           mqd_t mqdes;
43585           struct sigevent not;
43586           assert(argc == 2);
43587           mqdes = mq_open(argv[1], O_RDONLY);
43588           if (mqdes == (mqd_t) -1) {
43589               perror("mq_open");
43590               exit(EXIT_FAILURE);
43591           }
43592           not.sigev_notify = SIGEV_THREAD;
43593           not.sigev_notify_function = tfunc;
43594           not.sigev_notify_attributes = NULL;
43595           not.sigev_value.sival_ptr = &mqdes;   /* Arg. to thread func. */
43596           if (mq_notify(mqdes, &not) == -1) {
43597               perror("mq_notify");
43598               exit(EXIT_FAILURE);
43599           }
43600           pause();    /* Process will be terminated by thread function */
43601       }
```

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_notify*( ) function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The *mq_timedsend*( ) function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

Issue 7

SD5-XSH-ERN-38 is applied, adding the *mq_timedreceive*( ) function to the DESCRIPTION.

Austin Group Interpretation 1003.1-2001 #032 is applied, adding the [EINVAL] error.

An example is added.

NAME

mq_open — open a message queue (**REALTIME**)

SYNOPSIS

MSG

```
#include <mqueue.h>

mqd_t mq_open(const char *name, int oflag, ...);
```

DESCRIPTION

The *mq_open*( ) function shall establish the connection between a process and a message queue with a message queue descriptor. It shall create an open message queue description that refers to the message queue, and a message queue descriptor that refers to that open message queue description. The message queue descriptor is used by other functions to refer to that message queue. The *name* argument points to a string naming a message queue. It is unspecified whether the name appears in the file system and is visible to other functions that take pathnames as arguments. The *name* argument conforms to the construction rules for a pathname, except that the interpretation of <slash> characters other than the leading <slash> character in *name* is implementation-defined, and that the length limits for the *name* argument are implementation-defined and need not be the same as the pathname limits {PATH_MAX} and {NAME_MAX}. If *name* begins with the <slash> character, then processes calling *mq_open*( ) with the same value of *name* shall refer to the same message queue object, as long as that name has not been removed. If *name* does not begin with the <slash> character, the effect is implementation-defined. If the *name* argument is not the name of an existing message queue and creation is not requested, *mq_open*( ) shall fail and return an error.

A message queue descriptor may be implemented using a file descriptor, in which case applications can open up to at least {OPEN_MAX} file and message queues.

The *oflag* argument requests the desired receive and/or send access to the message queue. The requested access permission to receive messages or send messages shall be granted if the calling process would be granted read or write access, respectively, to an equivalently protected file.

The value of *oflag* is the bitwise-inclusive OR of values from the following list. Applications shall specify exactly one of the first three values (access modes) below in the value of *oflag*:

O_RDONLY — Open the message queue for receiving messages. The process can use the returned message queue descriptor with *mq_receive*( ), but not *mq_send*( ). A message queue may be open multiple times in the same or different processes for receiving messages.

O_WRONLY — Open the queue for sending messages. The process can use the returned message queue descriptor with *mq_send*( ) but not *mq_receive*( ). A message queue may be open multiple times in the same or different processes for sending messages.

O_RDWR — Open the queue for both receiving and sending messages. The process can use any of the functions allowed for O_RDONLY and O_WRONLY. A message queue may be open multiple times in the same or different processes for sending messages.

Any combination of the remaining flags may be specified in the value of *oflag*:

O_CREAT — Create a message queue. It requires two additional arguments: *mode*, which shall be of type **mode_t**, and *attr*, which shall be a pointer to an **mq_attr** structure. If the pathname *name* has already been used to create a message queue that still exists, then this flag shall have no effect, except as noted under O_EXCL. Otherwise, a message queue shall be created without any messages

in it. The user ID of the message queue shall be set to the effective user ID of the process. The group ID of the message queue shall be set to the effective group ID of the process; however, if the *name* argument is visible in the file system, the group ID may be set to the group ID of the containing directory. When bits in *mode* other than the file permission bits are specified, the effect is unspecified. If *attr* is NULL, the message queue shall be created with implementation-defined default message queue attributes. If *attr* is non-NULL and the calling process has appropriate privileges on *name*, the message queue *mq_maxmsg* and *mq_msgsize* attributes shall be set to the values of the corresponding members in the **mq_attr** structure referred to by *attr*. If *attr* is non-NULL, but the calling process does not have appropriate privileges on *name*, the *mq_open*( ) function shall fail and return an error without creating the message queue.

O_EXCL — If O_EXCL and O_CREAT are set, *mq_open*( ) shall fail if the message queue *name* exists. The check for the existence of the message queue and the creation of the message queue if it does not exist shall be atomic with respect to other threads executing *mq_open*( ) naming the same *name* with O_EXCL and O_CREAT set. If O_EXCL is set and O_CREAT is not set, the result is undefined.

O_NONBLOCK — Determines whether an *mq_send*( ) or *mq_receive*( ) waits for resources or messages that are not currently available, or fails with *errno* set to [EAGAIN]; see *mq_send*( ) and *mq_receive*( ) for details.

The *mq_open*( ) function does not add or remove messages from the queue.

RETURN VALUE

Upon successful completion, the function shall return a message queue descriptor; otherwise, the function shall return (**mqd_t**)–1 and set *errno* to indicate the error.

ERRORS

The *mq_open*( ) function shall fail if:

[EACCES] — The message queue exists and the permissions specified by *oflag* are denied, or the message queue does not exist and permission to create the message queue is denied.

[EEXIST] — O_CREAT and O_EXCL are set and the named message queue already exists.

[EINTR] — The *mq_open*( ) function was interrupted by a signal.

[EINVAL] — The *mq_open*( ) function is not supported for the given name.

[EINVAL] — O_CREAT was specified in *oflag*, the value of *attr* is not NULL, and either *mq_maxmsg* or *mq_msgsize* was less than or equal to zero.

[EMFILE] — Too many message queue descriptors or file descriptors are currently in use by this process.

[ENFILE] — Too many message queues are currently open in the system.

[ENOENT] — O_CREAT is not set and the named message queue does not exist.

[ENOSPC] — There is insufficient space for the creation of the new message queue.

If any of the following conditions occur, the *mq_open*( ) function may return (**mqd_t**)–1 and set *errno* to the corresponding value.

[ENAMETOOLONG]

The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems that do not support the XSI option XSI or exceeds {_XOPEN_PATH_MAX} on XSI systems, or has a pathname component that is longer than {_POSIX_NAME_MAX} on systems that do not support the XSI option XSI or longer than {_XOPEN_NAME_MAX} on XSI systems.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

A future version might require the *mq_open*( ) and *mq_unlink*( ) functions to have semantics similar to normal file system operations.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_open*( ) function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The *mq_timedreceive*( ) and *mq_timedsend*( ) functions are added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

The DESCRIPTION of O_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/62 is applied, updating the description of the permission bits in the DESCRIPTION. The change is made for consistency with the *shm_open*( ) and *sem_open*( ) functions.

Issue 7

Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and changing [ENAMETOOLONG] from a "shall fail" to a "may fail" error.

Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the user ID and group ID of the message queue.

NAME

mq_receive, mq_timedreceive — receive a message from a message queue (**REALTIME**)

SYNOPSIS

MSG

```
#include <mqueue.h>

ssize_t mq_receive(mqd_t mqdes, char *msg_ptr, size_t msg_len,
    unsigned *msg_prio);

#include <mqueue.h>
#include <time.h>

ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,
    size_t msg_len, unsigned *restrict msg_prio,
    const struct timespec *restrict abstime);
```

DESCRIPTION

The *mq_receive*( ) function shall receive the oldest of the highest priority message(s) from the message queue specified by *mqdes*. If the size of the buffer in bytes, specified by the *msg_len* argument, is less than the *mq_msgsize* attribute of the message queue, the function shall fail and return an error. Otherwise, the selected message shall be removed from the queue and copied to the buffer pointed to by the *msg_ptr* argument.

If the value of *msg_len* is greater than {SSIZE_MAX}, the result is implementation-defined.

If the argument *msg_prio* is not NULL, the priority of the selected message shall be stored in the location referenced by *msg_prio*.

If the specified message queue is empty and O_NONBLOCK is not set in the message queue description associated with *mqdes*, *mq_receive*( ) shall block until a message is enqueued on the message queue or until *mq_receive*( ) is interrupted by a signal. If more than one thread is waiting to receive a message when a message arrives at an empty queue and the Priority Scheduling option is supported, then the thread of highest priority that has been waiting the longest shall be selected to receive the message. Otherwise, it is unspecified which waiting thread receives the message. If the specified message queue is empty and O_NONBLOCK is set in the message queue description associated with *mqdes*, no message shall be removed from the queue, and *mq_receive*( ) shall return an error.

The *mq_timedreceive*( ) function shall receive the oldest of the highest priority messages from the message queue specified by *mqdes* as described for the *mq_receive*( ) function. However, if O_NONBLOCK was not specified when the message queue was opened via the *mq_open*( ) function, and no message exists on the queue to satisfy the receive, the wait for such a message shall be terminated when the specified timeout expires. If O_NONBLOCK is set, this function is equivalent to *mq_receive*( ).

The timeout expires when the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the call.

The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall be the resolution of the clock on which it is based. The *timespec* argument is defined in the **<time.h>** header.

Under no circumstance shall the operation fail with a timeout if a message can be removed from the message queue immediately. The validity of the *abstime* parameter need not be checked if a message can be removed from the message queue immediately.

RETURN VALUE

Upon successful completion, the *mq_receive*( ) and *mq_timedreceive*( ) functions shall return the length of the selected message in bytes and the message shall be removed from the queue. Otherwise, no message shall be removed from the queue, the functions shall return a value of –1, and set *errno* to indicate the error.

ERRORS

These functions shall fail if:

[EAGAIN] O_NONBLOCK was set in the message description associated with *mqdes*, and the specified message queue is empty.

[EBADF] The *mqdes* argument is not a valid message queue descriptor open for reading.

[EMSGSIZE] The specified message buffer size, *msg_len*, is less than the message size attribute of the message queue.

[EINTR] The *mq_receive*( ) or *mq_timedreceive*( ) operation was interrupted by a signal.

[EINVAL] The process or thread would have blocked, and the *abstime* parameter specified a nanoseconds field value less than zero or greater than or equal to 1 000 million.

[ETIMEDOUT] The O_NONBLOCK flag was not set when the message queue was opened, but no message arrived on the queue before the specified timeout expired.

These functions may fail if:

[EBADMSG] The implementation has detected a data corruption problem with the message.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

mq_open( ), *mq_send*( ), *msgctl*( ), *msgget*( ), *msgrcv*( ), *msgsnd*( ), *time*( )

XBD **<mqueue.h>**, **<time.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_receive*( ) function is marked as part of the Message Passing option.

The Open Group Corrigendum U021/4 is applied. The DESCRIPTION is changed to refer to *msg_len* rather than *maxsize*.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In this function it is possible for the return value to exceed the range of the type **ssize_t** (since **size_t** has a larger range of positive values than **ssize_t**). A sentence restricting the size of the **size_t** object is added to the description to resolve this conflict.

The *mq_timedreceive*( ) function is added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *mq_timedreceive*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE PASC Interpretation 1003.1 #109 is applied, correcting the return type for *mq_timedreceive*( ) from **int** to **ssize_t**.

Issue 7

The *mq_timedreceive*( ) function is moved from the Timeouts option to the Base.

Functionality relating to the Timers option is moved to the Base.

NAME

mq_send, mq_timedsend — send a message to a message queue (**REALTIME**)

SYNOPSIS

MSG

```
#include <mqueue.h>

int mq_send(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
    unsigned msg_prio);

#include <mqueue.h>
#include <time.h>

int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
    unsigned msg_prio, const struct timespec *abstime);
```

DESCRIPTION

The *mq_send*( ) function shall add the message pointed to by the argument *msg_ptr* to the message queue specified by *mqdes*. The *msg_len* argument specifies the length of the message, in bytes, pointed to by *msg_ptr*. The value of *msg_len* shall be less than or equal to the *mq_msgsize* attribute of the message queue, or *mq_send*( ) shall fail.

If the specified message queue is not full, *mq_send*( ) shall behave as if the message is inserted into the message queue at the position indicated by the *msg_prio* argument. A message with a larger numeric value of *msg_prio* shall be inserted before messages with lower values of *msg_prio*. A message shall be inserted after other messages in the queue, if any, with equal *msg_prio*. The value of *msg_prio* shall be less than {MQ_PRIO_MAX}.

If the specified message queue is full and O_NONBLOCK is not set in the message queue description associated with *mqdes*, *mq_send*( ) shall block until space becomes available to enqueue the message, or until *mq_send*( ) is interrupted by a signal. If more than one thread is waiting to send when space becomes available in the message queue and the Priority Scheduling option is supported, then the thread of the highest priority that has been waiting the longest shall be unblocked to send its message. Otherwise, it is unspecified which waiting thread is unblocked. If the specified message queue is full and O_NONBLOCK is set in the message queue description associated with *mqdes*, the message shall not be queued and *mq_send*( ) shall return an error.

The *mq_timedsend*( ) function shall add a message to the message queue specified by *mqdes* in the manner defined for the *mq_send*( ) function. However, if the specified message queue is full and O_NONBLOCK is not set in the message queue description associated with *mqdes*, the wait for sufficient room in the queue shall be terminated when the specified timeout expires. If O_NONBLOCK is set in the message queue description, this function shall be equivalent to *mq_send*( ).

The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the call.

The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall be the resolution of the clock on which it is based. The *timespec* argument is defined in the **<time.h>** header.

Under no circumstance shall the operation fail with a timeout if there is sufficient room in the queue to add the message immediately. The validity of the *abstime* parameter need not be checked when there is sufficient room in the queue.

RETURN VALUE

Upon successful completion, the *mq_send*( ) and *mq_timedsend*( ) functions shall return a value of zero. Otherwise, no message shall be enqueued, the functions shall return –1, and *errno* shall be set to indicate the error.

ERRORS

The *mq_send*( ) and *mq_timedsend*( ) functions shall fail if:

[EAGAIN] The O_NONBLOCK flag is set in the message queue description associated with *mqdes*, and the specified message queue is full.

[EBADF] The *mqdes* argument is not a valid message queue descriptor open for writing.

[EINTR] A signal interrupted the call to *mq_send*( ) or *mq_timedsend*( ).

[EINVAL] The value of *msg_prio* was outside the valid range.

[EINVAL] The process or thread would have blocked, and the *abstime* parameter specified a nanoseconds field value less than zero or greater than or equal to 1 000 million.

[EMSGSIZE] The specified message length, *msg_len*, exceeds the message size attribute of the message queue.

[ETIMEDOUT] The O_NONBLOCK flag was not set when the message queue was opened, but the timeout expired before the message could be added to the queue.

EXAMPLES

None.

APPLICATION USAGE

The value of the symbol {MQ_PRIO_MAX} limits the number of priority levels supported by the application. Message priorities range from 0 to {MQ_PRIO_MAX}–1.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD **<mqueue.h>**, **<time.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_send*( ) function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The *mq_timedsend*( ) function is added for alignment with IEEE Std 1003.1d-1999.

Issue 7

The *mq_timedsend*( ) function is moved from the Timeouts option to the Base.

Functionality relating to the Timers option is moved to the Base.

NAME

mq_setattr — set message queue attributes (**REALTIME**)

SYNOPSIS

MSG

```
#include <mqueue.h>

int mq_setattr(mqd_t mqdes, const struct mq_attr *restrict mqstat,
    struct mq_attr *restrict omqstat);
```

DESCRIPTION

The *mq_setattr*( ) function shall set attributes associated with the open message queue description referenced by the message queue descriptor specified by *mqdes*.

The message queue attributes corresponding to the following members defined in the **mq_attr** structure shall be set to the specified values upon successful completion of *mq_setattr*( ):

mq_flags The value of this member is the bitwise-logical OR of zero or more of O_NONBLOCK and any implementation-defined flags.

The values of the *mq_maxmsg*, *mq_msgsize*, and *mq_curmsgs* members of the **mq_attr** structure shall be ignored by *mq_setattr*( ).

If *omqstat* is non-NULL, the *mq_setattr*( ) function shall store, in the location referenced by *omqstat*, the previous message queue attributes and the current queue status. These values shall be the same as would be returned by a call to *mq_getattr*( ) at that point.

RETURN VALUE

Upon successful completion, the function shall return a value of zero and the attributes of the message queue shall have been changed as specified.

Otherwise, the message queue attributes shall be unchanged, and the function shall return a value of –1 and set *errno* to indicate the error.

ERRORS

The *mq_setattr*( ) function shall fail if:

[EBADF] The *mqdes* argument is not a valid message queue descriptor.

EXAMPLES

None.

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_setattr*( ) function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The *mq_timedsend*( ) function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *mq_setattr*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

NAME

mq_timedreceive — receive a message from a message queue (**ADVANCED REALTIME**)

SYNOPSIS

MSG

```
#include <mqueue.h>
#include <time.h>

ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,
    size_t msg_len, unsigned *restrict msg_prio,
    const struct timespec *restrict abstime);
```

DESCRIPTION

Refer to *mq_receive( )*.

mq_timedsend( )

NAME

mq_timedsend — send a message to a message queue (**ADVANCED REALTIME**)

SYNOPSIS

MSG

```
#include <mqueue.h>
#include <time.h>

int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
    unsigned msg_prio, const struct timespec *abstime);
```

DESCRIPTION

Refer to *mq_send( )*.

43998 **NAME**

43999 mq_unlink — remove a message queue (**REALTIME**)

44000 **SYNOPSIS**

44001 MSG
```
#include <mqueue.h>
```
44002
```
int mq_unlink(const char *name);
```

44003 **DESCRIPTION**

44004 The *mq_unlink*( ) function shall remove the message queue named by the string name. If one or
44005 more processes have the message queue open when *mq_unlink*( ) is called, destruction of the
44006 message queue shall be postponed until all references to the message queue have been closed.
44007 However, the *mq_unlink*( ) call need not block until all references have been closed; it may return
44008 immediately.

44009 After a successful call to *mq_unlink*( ), reuse of the name shall subsequently cause *mq_open*( ) to
44010 behave as if no message queue of this name exists (that is, *mq_open*( ) will fail if O_CREAT is not
44011 set, or will create a new message queue if O_CREAT is set).

44012 **RETURN VALUE**

44013 Upon successful completion, the function shall return a value of zero. Otherwise, the named
44014 message queue shall be unchanged by this function call, and the function shall return a value of
44015 −1 and set *errno* to indicate the error.

44016 **ERRORS**

44017 The *mq_unlink*( ) function shall fail if:

44018 [EACCES] Permission is denied to unlink the named message queue.

44019 [ENOENT] The named message queue does not exist.

44020 The *mq_unlink*( ) function may fail if:

44021 [ENAMETOOLONG]

44022 The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems
44023 XSI that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI
44024 systems, or has a pathname component that is longer than
44025 XSI {_POSIX_NAME_MAX} on systems that do not support the XSI option or
44026 longer than {_XOPEN_NAME_MAX} on XSI systems. A call to *mq_unlink*( )
44027 with a *name* argument that contains the same message queue name as was
44028 previously used in a successful *mq_open*( ) call shall not give an
44029 [ENAMETOOLONG] error.

44030 **EXAMPLES**

44031 None.

44032 **APPLICATION USAGE**

44033 None.

44034 **RATIONALE**

44035 None.

44036 **FUTURE DIRECTIONS**

44037 A future version might require the *mq_open*( ) and *mq_unlink*( ) functions to have semantics
44038 similar to normal file system operations.

SEE ALSO

mq_close( ), *mq_open*( ), *msgctl*( ), *msgget*( ), *msgrcv*( ), *msgsnd*( )

XBD **<mqueue.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_unlink*( ) function is marked as part of the Message Passing option.

The Open Group Corrigendum U021/5 is applied, clarifying that upon unsuccessful completion, the named message queue is unchanged by this function.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

Issue 7

Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a "shall fail" to a "may fail" error .

Austin Group Interpretation 1003.1-2001 #141 is applied.

NAME

mrand48 — generate uniformly distributed pseudo-random signed long integers

SYNOPSIS

XSI

```
#include <stdlib.h>

long mrand48(void);
```

DESCRIPTION

Refer to *drand48( )*.

NAME

msgctl — XSI message control operations

SYNOPSIS

XSI

```
#include <sys/msg.h>

int msgctl(int msqid, int cmd, struct msqid_ds *buf);
```

DESCRIPTION

The *msgctl*( ) function operates on XSI message queues (see XBD Section 3.224, on page 69). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 497).

The *msgctl*( ) function shall provide message control operations as specified by *cmd*. The following values for *cmd*, and the message control operations they specify, are:

IPC_STAT
: Place the current value of each member of the **msqid_ds** data structure associated with *msqid* into the structure pointed to by *buf*. The contents of this structure are defined in **<sys/msg.h>**.

IPC_SET
: Set the value of the following members of the **msqid_ds** data structure associated with *msqid* to the corresponding value found in the structure pointed to by *buf*:

```
msg_perm.uid
msg_perm.gid
msg_perm.mode
msg_qbytes
```

: IPC_SET can only be executed by a process with appropriate privileges or that has an effective user ID equal to the value of **msg_perm.cuid** or **msg_perm.uid** in the **msqid_ds** data structure associated with *msqid*. Only a process with appropriate privileges can raise the value of **msg_qbytes**.

IPC_RMID
: Remove the message queue identifier specified by *msqid* from the system and destroy the message queue and **msqid_ds** data structure associated with it. IPC_RMD can only be executed by a process with appropriate privileges or one that has an effective user ID equal to the value of **msg_perm.cuid** or **msg_perm.uid** in the **msqid_ds** data structure associated with *msqid*.

RETURN VALUE

Upon successful completion, *msgctl*( ) shall return 0; otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *msgctl*( ) function shall fail if:

[EACCES]
: The argument *cmd* is IPC_STAT and the calling process does not have read permission; see Section 2.7 (on page 496).

[EINVAL]
: The value of *msqid* is not a valid message queue identifier; or the value of *cmd* is not a valid command.

[EPERM]
: The argument *cmd* is IPC_RMID or IPC_SET and the effective user ID of the calling process is not equal to that of a process with appropriate privileges and it is not equal to the value of **msg_perm.cuid** or **msg_perm.uid** in the data structure associated with *msqid*.

[EPERM] The argument *cmd* is IPC_SET, an attempt is being made to increase to the value of **msg_qbytes**, and the effective user ID of the calling process does not have appropriate privileges.

EXAMPLES

None.

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication (IPC). Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 496) can be easily modified to use the alternative interfaces.

Issue 5

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.

NAME

msgget — get the XSI message queue identifier

SYNOPSIS

XSI
```
#include <sys/msg.h>

int msgget(key_t key, int msgflg);
```

DESCRIPTION

The *msgget*( ) function operates on XSI message queues (see XBD Section 3.224, on page 69). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 497).

The *msgget*( ) function shall return the message queue identifier associated with the argument *key*.

A message queue identifier, associated message queue, and data structure (see **<sys/msg.h>**), shall be created for the argument *key* if one of the following is true:

- The argument *key* is equal to IPC_PRIVATE.
- The argument *key* does not already have a message queue identifier associated with it, and (*msgflg* & IPC_CREAT) is non-zero.

Upon creation, the data structure associated with the new message queue identifier shall be initialized as follows:

- **msg_perm.cuid**, **msg_perm.uid**, **msg_perm.cgid**, and **msg_perm.gid** shall be set equal to the effective user ID and effective group ID, respectively, of the calling process.
- The low-order 9 bits of **msg_perm.mode** shall be set equal to the low-order 9 bits of *msgflg*.
- **msg_qnum**, **msg_lspid**, **msg_lrpid**, **msg_stime**, and **msg_rtime** shall be set equal to 0.
- **msg_ctime** shall be set equal to the current time.
- **msg_qbytes** shall be set equal to the system limit.

RETURN VALUE

Upon successful completion, *msgget*( ) shall return a non-negative integer, namely a message queue identifier. Otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *msgget*( ) function shall fail if:

[EACCES] A message queue identifier exists for the argument *key*, but operation permission as specified by the low-order 9 bits of *msgflg* would not be granted; see Section 2.7 (on page 496).

[EEXIST] A message queue identifier exists for the argument *key* but ((*msgflg* & IPC_CREAT) && (*msgflg* & IPC_EXCL)) is non-zero.

[ENOENT] A message queue identifier does not exist for the argument *key* and (*msgflg* & IPC_CREAT) is 0.

[ENOSPC] A message queue identifier is to be created but the system-imposed limit on the maximum number of allowed message queue identifiers system-wide would be exceeded.

EXAMPLES

None.

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication (IPC). Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 496) can be easily modified to use the alternative interfaces.

Issue 5

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.

NAME

msgrcv — XSI message receive operation

SYNOPSIS

XSI
```
#include <sys/msg.h>

ssize_t msgrcv(int msqid, void *msgp, size_t msgsz, long msgtyp,
    int msgflg);
```

DESCRIPTION

The *msgrcv*( ) function operates on XSI message queues (see XBD Section 3.224, on page 69). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 497).

The *msgrcv*( ) function shall read a message from the queue associated with the message queue identifier specified by *msqid* and place it in the user-defined buffer pointed to by *msgp*.

The application shall ensure that the argument *msgp* points to a user-defined buffer that contains first a field of type **long** specifying the type of the message, and then a data portion that holds the data bytes of the message. The structure below is an example of what this user-defined buffer might look like:

```
struct mymsg {
    long    mtype;     /* Message type. */
    char    mtext[1];  /* Message text. */
}
```

The structure member *mtype* is the received message's type as specified by the sending process.

The structure member *mtext* is the text of the message.

The argument *msgsz* specifies the size in bytes of *mtext*. The received message shall be truncated to *msgsz* bytes if it is larger than *msgsz* and (*msgflg* & MSG_NOERROR) is non-zero. The truncated part of the message shall be lost and no indication of the truncation shall be given to the calling process.

If the value of *msgsz* is greater than {SSIZE_MAX}, the result is implementation-defined.

The argument *msgtyp* specifies the type of message requested as follows:

- If *msgtyp* is 0, the first message on the queue shall be received.
- If *msgtyp* is greater than 0, the first message of type *msgtyp* shall be received.
- If *msgtyp* is less than 0, the first message of the lowest type that is less than or equal to the absolute value of *msgtyp* shall be received.

The argument *msgflg* specifies the action to be taken if a message of the desired type is not on the queue. These are as follows:

- If (*msgflg* & IPC_NOWAIT) is non-zero, the calling thread shall return immediately with a return value of –1 and *errno* set to [ENOMSG].
- If (*msgflg* & IPC_NOWAIT) is 0, the calling thread shall suspend execution until one of the following occurs:
  - — A message of the desired type is placed on the queue.
  - — The message queue identifier *msqid* is removed from the system; when this occurs, *errno* shall be set equal to [EIDRM] and –1 shall be returned.

— The calling thread receives a signal that is to be caught; in this case a message is not received and the calling thread resumes execution in the manner prescribed in *sigaction( )*.

Upon successful completion, the following actions are taken with respect to the data structure associated with *msqid*:

- **msg_qnum** shall be decremented by 1.
- **msg_lrpid** shall be set equal to the process ID of the calling process.
- **msg_rtime** shall be set equal to the current time.

RETURN VALUE

Upon successful completion, *msgrcv( )* shall return a value equal to the number of bytes actually placed into the buffer *mtext*. Otherwise, no message shall be received, *msgrcv( )* shall return (**ssize_t**)–1, and *errno* shall be set to indicate the error.

ERRORS

The *msgrcv( )* function shall fail if:

[E2BIG] The value of *mtext* is greater than *msgsz* and (*msgflg* & MSG_NOERROR) is 0.

[EACCES] Operation permission is denied to the calling process; see Section 2.7 (on page 496).

[EIDRM] The message queue identifier *msqid* is removed from the system.

[EINTR] The *msgrcv( )* function was interrupted by a signal.

[EINVAL] *msqid* is not a valid message queue identifier.

[ENOMSG] The queue does not contain a message of the desired type and (*msgflg* & IPC_NOWAIT) is non-zero.

EXAMPLES

Receiving a Message

The following example receives the first message on the queue (based on the value of the *msgtyp* argument, 0). The queue is identified by the *msqid* argument (assuming that the value has previously been set). This call specifies that an error should be reported if no message is available, but not if the message is too large. The message size is calculated directly using the *sizeof* operator.

```
#include <sys/msg.h>
...
int result;
int msqid;
struct message {
    long type;
    char text[20];
} msg;
long msgtyp = 0;
...
result = msgrcv(msqid, (void *) &msg, sizeof(msg.text),
         msgtyp, MSG_NOERROR | IPC_NOWAIT);
```

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication (IPC). Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 496) can be easily modified to use the alternative interfaces.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 3.224 (on page 69), **<sys/msg.h>**

CHANGE HISTORY

First released in Issue 2. Derived from Issue 2 of the SVID.

Issue 5

The type of the return value is changed from **int** to **ssize_t**, and a warning is added to the DESCRIPTION about values of *msgsz* larger the {SSIZE_MAX}.

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to the APPLICATION USAGE section.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

NAME

msgsnd — XSI message send operation

SYNOPSIS

XSI
```
#include <sys/msg.h>

int msgsnd(int msqid, const void *msgp, size_t msgsz, int msgflg);
```

DESCRIPTION

The *msgsnd*( ) function operates on XSI message queues (see XBD Section 3.224, on page 69). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 497).

The *msgsnd*( ) function shall send a message to the queue associated with the message queue identifier specified by *msqid*.

The application shall ensure that the argument *msgp* points to a user-defined buffer that contains first a field of type **long** specifying the type of the message, and then a data portion that holds the data bytes of the message. The structure below is an example of what this user-defined buffer might look like:

```
struct mymsg {
    long   mtype;       /* Message type. */
    char   mtext[1];    /* Message text. */
}
```

The structure member *mtype* is a non-zero positive type **long** that can be used by the receiving process for message selection.

The structure member *mtext* is any text of length *msgsz* bytes. The argument *msgsz* can range from 0 to a system-imposed maximum.

The argument *msgflg* specifies the action to be taken if one or more of the following is true:

- The number of bytes already on the queue is equal to **msg_qbytes**; see **<sys/msg.h>**.
- The total number of messages on all queues system-wide is equal to the system-imposed limit.

These actions are as follows:

- If (*msgflg* & IPC_NOWAIT) is non-zero, the message shall not be sent and the calling thread shall return immediately.
- If (*msgflg* & IPC_NOWAIT) is 0, the calling thread shall suspend execution until one of the following occurs:
  - — The condition responsible for the suspension no longer exists, in which case the message is sent.
  - — The message queue identifier *msqid* is removed from the system; when this occurs, *errno* shall be set equal to [EIDRM] and –1 shall be returned.
  - — The calling thread receives a signal that is to be caught; in this case the message is not sent and the calling thread resumes execution in the manner prescribed in *sigaction*( ).

Upon successful completion, the following actions are taken with respect to the data structure associated with *msqid*; see **<sys/msg.h>**:

- **msg_qnum** shall be incremented by 1.
- **msg_lspid** shall be set equal to the process ID of the calling process.
- **msg_stime** shall be set equal to the current time.

RETURN VALUE

Upon successful completion, *msgsnd*( ) shall return 0; otherwise, no message shall be sent, *msgsnd*( ) shall return –1, and *errno* shall be set to indicate the error.

ERRORS

The *msgsnd*( ) function shall fail if:

[EACCES] Operation permission is denied to the calling process; see Section 2.7 (on page 496).

[EAGAIN] The message cannot be sent for one of the reasons cited above and (*msgflg* & IPC_NOWAIT) is non-zero.

[EIDRM] The message queue identifier *msqid* is removed from the system.

[EINTR] The *msgsnd*( ) function was interrupted by a signal.

[EINVAL] The value of *msqid* is not a valid message queue identifier, or the value of *mtype* is less than 1; or the value of *msgsz* is less than 0 or greater than the system-imposed limit.

EXAMPLES

Sending a Message

The following example sends a message to the queue identified by the *msqid* argument (assuming that value has previously been set). This call specifies that an error should be reported if no message is available. The message size is calculated directly using the *sizeof* operator.

```
#include <sys/msg.h>
...
int result;
int msqid;
struct message {
    long type;
    char text[20];
} msg;

msg.type = 1;
strcpy(msg.text, "This is message 1");
...
result = msgsnd(msqid, (void *) &msg, sizeof(msg.text), IPC_NOWAIT);
```

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication (IPC). Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 496) can be easily modified to use the alternative interfaces.

CHANGE HISTORY

First released in Issue 2. Derived from Issue 2 of the SVID.

Issue 5

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

NAME

msync — synchronize memory with physical storage

SYNOPSIS

XSI | SIO

```
#include <sys/mman.h>

int msync(void *addr, size_t len, int flags);
```

DESCRIPTION

The *msync*( ) function shall write all modified data to permanent storage locations, if any, in those whole pages containing any part of the address space of the process starting at address *addr* and continuing for *len* bytes. If no such storage exists, *msync*( ) need not have any effect. If requested, the *msync*( ) function shall then invalidate cached copies of data.

The implementation may require that *addr* be a multiple of the page size as returned by *sysconf*( ).

For mappings to files, the *msync*( ) function shall ensure that all write operations are completed as defined for synchronized I/O data integrity completion. It is unspecified whether the implementation also writes out other file attributes. When the *msync*( ) function is called on MAP_PRIVATE mappings, any modified data shall not be written to the underlying object and shall not cause such data to be made visible to other processes. It is unspecified whether data in MAP_PRIVATE mappings has any permanent storage locations. The effect of *msync*( ) on a shared memory object or a typed memory object is unspecified. The behavior of this function is unspecified if the mapping was not established by a call to *mmap*( ).

SHM | TYM

The *flags* argument is constructed from the bitwise-inclusive OR of one or more of the following flags defined in the **<sys/mman.h>** header:

Symbolic Constant	Description
MS_ASYNC	Perform asynchronous writes.
MS_SYNC	Perform synchronous writes.
MS_INVALIDATE	Invalidate cached data.

When MS_ASYNC is specified, *msync*( ) shall return immediately once all the write operations are initiated or queued for servicing; when MS_SYNC is specified, *msync*( ) shall not return until all write operations are completed as defined for synchronized I/O data integrity completion. Either MS_ASYNC or MS_SYNC shall be specified, but not both.

When MS_INVALIDATE is specified, *msync*( ) shall invalidate all cached copies of mapped data that are inconsistent with the permanent storage locations such that subsequent references shall obtain data that was consistent with the permanent storage locations sometime between the call to *msync*( ) and the first subsequent memory reference to the data.

If *msync*( ) causes any write to a file, the file's last data modification and last file status change timestamps shall be marked for update.

RETURN VALUE

Upon successful completion, *msync*( ) shall return 0; otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *msync*( ) function shall fail if:

[EBUSY] Some or all of the addresses in the range starting at *addr* and continuing for *len* bytes are locked, and MS_INVALIDATE is specified.

[EINVAL] The value of *flags* is invalid.

[ENOMEM] The addresses in the range starting at *addr* and continuing for *len* bytes are outside the range allowed for the address space of a process or specify one or more pages that are not mapped.

The *msync*( ) function may fail if:

[EINVAL] The value of *addr* is not a multiple of the page size as returned by *sysconf*( ).

EXAMPLES

None.

APPLICATION USAGE

The *msync*( ) function is only supported if the Synchronized Input and Output option is supported, and thus need not be available on all implementations.

The *msync*( ) function should be used by programs that require a memory object to be in a known state; for example, in building transaction facilities.

Normal system activity can cause pages to be written to disk. Therefore, there are no guarantees that *msync*( ) is the only control over when pages are or are not written to disk.

RATIONALE

The *msync*( ) function writes out data in a mapped region to the permanent storage for the underlying object. The call to *msync*( ) ensures data integrity of the file.

After the data is written out, any cached data may be invalidated if the MS_INVALIDATE flag was specified. This is useful on systems that do not support read/write consistency.

FUTURE DIRECTIONS

None.

XBD **<sys/mman.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Aligned with *msync*( ) in the POSIX Realtime Extension as follows:

- The DESCRIPTION is extensively reworded.
- [EBUSY] and a new form of [EINVAL] are added as mandatory error conditions.

Issue 6

The *msync*( ) function is marked as part of the Memory Mapped Files and Synchronized Input and Output options.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The [EBUSY] mandatory error condition is added.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to state that implementations require *addr* to be a multiple of the page size.
- The second [EINVAL] error condition is made mandatory.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding reference to typed memory objects.

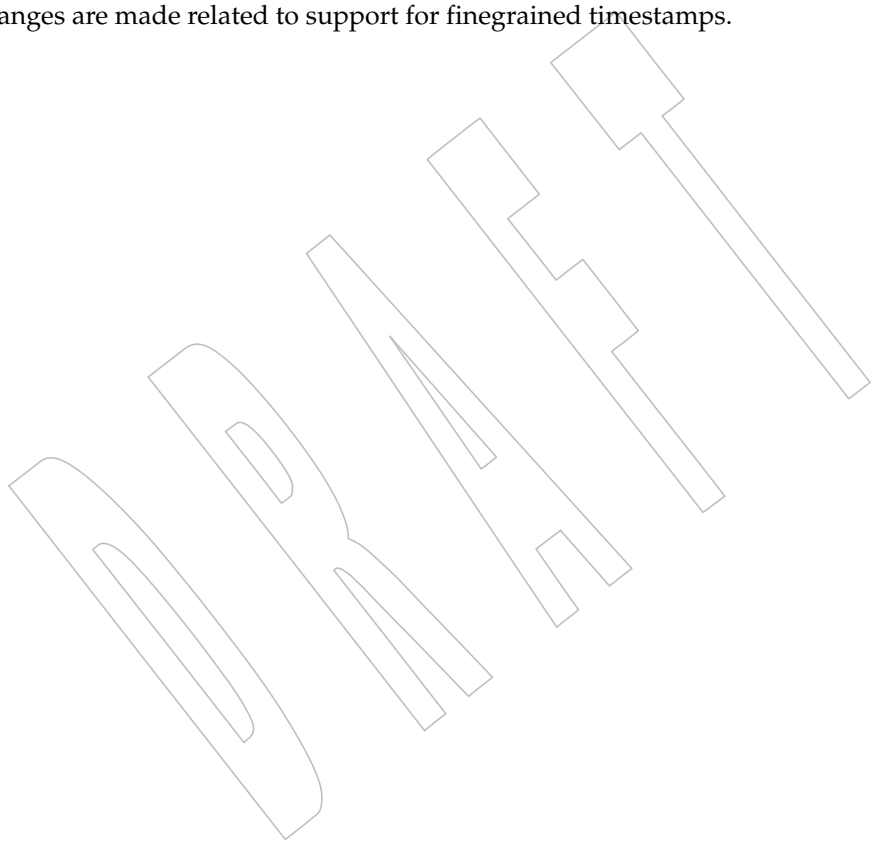
Issue 7

Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment requirements.

SD5-XSH-ERN-110 is applied.

The *msync*( ) function is marked as part of the Synchronized Input and Output option or XSI option as the Memory Mapped Files is moved to the Base.

Changes are made related to support for finegrained timestamps.



NAME

munlock — unlock a range of process address space

SYNOPSIS

MLR

```
#include <sys/mman.h>

int munlock(const void *addr, size_t len);
```

DESCRIPTION

Refer to *mlock( )*.

munlockall( )

NAME

munlockall — unlock the address space of a process

SYNOPSIS

ML

```
#include <sys/mman.h>

int munlockall(void);
```

DESCRIPTION

Refer to *mlockall( )*.

NAME

munmap — unmap pages of memory

SYNOPSIS

```
#include <sys/mman.h>

int munmap(void *addr, size_t len);
```

DESCRIPTION

The *munmap*( ) function shall remove any mappings for those entire pages containing any part of the address space of the process starting at *addr* and continuing for *len* bytes. Further references to these pages shall result in the generation of a SIGSEGV signal to the process. If there are no mappings in the specified address range, then *munmap*( ) has no effect.

The implementation may require that *addr* be a multiple of the page size as returned by *sysconf*( ).

If a mapping to be removed was private, any modifications made in this address range shall be discarded.

ML | MLR Any memory locks (see *mlock*( ) and *mlockall*( )) associated with this address range shall be removed, as if by an appropriate call to *munlock*( ).

TYM If a mapping removed from a typed memory object causes the corresponding address range of the memory pool to be inaccessible by any process in the system except through allocatable mappings (that is, mappings of typed memory objects opened with the POSIX_TYPED_MEM_MAP_ALLOCATABLE flag), then that range of the memory pool shall become deallocated and may become available to satisfy future typed memory allocation requests.

A mapping removed from a typed memory object opened with the POSIX_TYPED_MEM_MAP_ALLOCATABLE flag shall not affect in any way the availability of that typed memory for allocation.

The behavior of this function is unspecified if the mapping was not established by a call to *mmap*( ).

RETURN VALUE

Upon successful completion, *munmap*( ) shall return 0; otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *munmap*( ) function shall fail if:

[EINVAL] Addresses in the range [*addr*,*addr*+*len*) are outside the valid range for the address space of a process.

[EINVAL] The *len* argument is 0.

The *munmap*( ) function may fail if:

[EINVAL] The *addr* argument is not a multiple of the page size as returned by *sysconf*( ).

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *munmap*( ) function corresponds to SVR4, just as the *mmap*( ) function does.

It is possible that an application has applied process memory locking to a region that contains shared memory. If this has occurred, the *munmap*( ) call ignores those locks and, if necessary, causes those locks to be removed.

Most implementations require that *addr* is a multiple of the page size as returned by *sysconf*( ).

FUTURE DIRECTIONS

None.

SEE ALSO

mlock( ), *mlockall*( ), *mmap*( ), *posix_typed_mem_open*( ), *sysconf*( )

XBD **<sys/mman.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Aligned with *munmap*( ) in the POSIX Realtime Extension as follows:

- The DESCRIPTION is extensively reworded.
- The SIGBUS error is no longer permitted to be generated.

Issue 6

The *munmap*( ) function is marked as part of the Memory Mapped Files and Shared Memory Objects option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to state that implementations require *addr* to be a multiple of the page size.
- The [EINVAL] error conditions are added.

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- Semantics for typed memory objects are added to the DESCRIPTION.
- The *posix_typed_mem_open*( ) function is added to the SEE ALSO section.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM).

Issue 7

Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment requirements.

The *munmap*( ) function is moved from the Memory Mapped Files option to the Base.

NAME

nan, nanf, nanl — return quiet NaN

SYNOPSIS

```
#include <math.h>

double nan(const char *tagp);
float nanf(const char *tagp);
long double nanl(const char *tagp);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The function call *nan*("*n-char-sequence*") shall be equivalent to:

```
strtod("NAN(n-char-sequence)", (char **) NULL);
```

The function call *nan*("") shall be equivalent to:

```
strtod("NAN()", (char **) NULL)
```

If *tagp* does not point to an *n*-**char** sequence or an empty string, the function call shall be equivalent to:

```
strtod("NAN", (char **) NULL)
```

Function calls to *nanf*( ) and *nanl*( ) are equivalent to the corresponding function calls to *strtof*( ) and *strtold*( ).

RETURN VALUE

These functions shall return a quiet NaN, if available, with content indicated through *tagp*.

If the implementation does not support quiet NaNs, these functions shall return zero.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

NAME

nanosleep — high resolution sleep

SYNOPSIS

CX
```
#include <time.h>

int nanosleep(const struct timespec *rqtp, struct timespec *rmtp);
```

DESCRIPTION

The *nanosleep*( ) function shall cause the current thread to be suspended from execution until either the time interval specified by the *rqtp* argument has elapsed or a signal is delivered to the calling thread, and its action is to invoke a signal-catching function or to terminate the process. The suspension time may be longer than requested because the argument value is rounded up to an integer multiple of the sleep resolution or because of the scheduling of other activity by the system. But, except for the case of being interrupted by a signal, the suspension time shall not be less than the time specified by *rqtp*, as measured by the system clock CLOCK_REALTIME.

The use of the *nanosleep*( ) function has no effect on the action or blockage of any signal.

RETURN VALUE

If the *nanosleep*( ) function returns because the requested time has elapsed, its return value shall be zero.

If the *nanosleep*( ) function returns because it has been interrupted by a signal, it shall return a value of −1 and set *errno* to indicate the interruption. If the *rmtp* argument is non-NULL, the **timespec** structure referenced by it is updated to contain the amount of time remaining in the interval (the requested time minus the time actually slept). The *rqtp* and *rmtp* arguments may point to the same object. If the *rmtp* argument is NULL, the remaining time is not returned.

If *nanosleep*( ) fails, it shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *nanosleep*( ) function shall fail if:

[EINTR] The *nanosleep*( ) function was interrupted by a signal.

[EINVAL] The *rqtp* argument specified a nanosecond value less than zero or greater than or equal to 1 000 million.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

It is common to suspend execution of a thread for an interval in order to poll the status of a non-interrupting function. A large number of actual needs can be met with a simple extension to *sleep*( ) that provides finer resolution.

In the POSIX.1-1990 standard and SVR4, it is possible to implement such a routine, but the frequency of wakeup is limited by the resolution of the *alarm*( ) and *sleep*( ) functions. In 4.3 BSD, it is possible to write such a routine using no static storage and reserving no system facilities. Although it is possible to write a function with similar functionality to *sleep*( ) using the remainder of the *timer_**( ) functions, such a function requires the use of signals and the reservation of some signal number. This volume of POSIX.1-200x requires that *nanosleep*( ) be non-intrusive of the signals function.

The *nanosleep*( ) function shall return a value of 0 on success and −1 on failure or if interrupted.

This latter case is different from *sleep*( ). This was done because the remaining time is returned via an argument structure pointer, *rmtp*, instead of as the return value.

FUTURE DIRECTIONS

None.

SEE ALSO

clock_nanosleep( ), *sleep*( )

XBD **<time.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *nanosleep*( ) function is marked as part of the Timers option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/37 is applied, updating the SEE ALSO section to include the *clock_nanosleep*( ) function.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/63 is applied, correcting text in the RATIONALE section.

Issue 7

SD5-XBD-ERN-33 is applied.

The *nanosleep*( ) function is moved from the Timers option to the Base.

NAME

nearbyint, nearbyintf, nearbyintl — floating-point rounding functions

SYNOPSIS

```
#include <math.h>

double nearbyint(double x);
float nearbyintf(float x);
long double nearbyintl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall round their argument to an integer value in floating-point format, using the current rounding direction and without raising the inexact floating-point exception.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the rounded integer value.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, ±0 shall be returned.

If *x* is ±Inf, *x* shall be returned.

XSI If the correct value would cause overflow, a range error shall occur and *nearbyint*( ), *nearbyintf*( ), and *nearbyintl*( ) shall return the value of the macro ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (with the same sign as *x*), respectively.

ERRORS

These functions shall fail if:

XSI

Range Error	The result would cause an overflow.
	If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

newlocale — create or modify a locale object

SYNOPSIS

CX
```
#include <locale.h>

locale_t newlocale(int category_mask, const char *locale,
    locale_t base);
```

DESCRIPTION

The *newlocale*( ) function shall create a new locale object or modify an existing one. If the *base* argument is (**locale_t**)0, a new locale object shall be created. It is unspecified whether the locale object pointed to by *base* shall be modified or freed and a new locale object created.

The *category_mask* argument specifies the locale categories to be set or modified. Values for *category_mask* shall be constructed by a bitwise-inclusive OR of the symbolic constants *LC_CTYPE_MASK*, *LC_NUMERIC_MASK*, *LC_TIME_MASK*, *LC_COLLATE_MASK*, *LC_MONETARY_MASK*, and *LC_MESSAGES_MASK*, or any of the other implementation-defined *LC_*_MASK* values defined in **<locale.h>**.

For each category with the corresponding bit set in *category_mask* the data from the locale named by *locale* shall be used. In the case of modifying an existing locale object, the data from the locale named by *locale* shall replace the existing data within the locale object. If a completely new locale object is created, the data for all sections not requested by *category_mask* shall be taken from the default locale.

The following preset values of *locale* are defined for all settings of *category_mask*:

"POSIX" Specifies the minimal environment for C-language translation called the POSIX locale.

"C" Equivalent to `"POSIX"`.

"" Specifies an implementation-defined native environment. This corresponds to the value of the associated environment variables, *LC_** and *LANG*; see XBD Chapter 7 (on page 135) and Chapter 8 (on page 173).

If the *base* argument is not (**locale_t**)0 and the *newlocale*( ) function call succeeds, the contents of *base* are unspecified. Applications shall ensure that they stop using *base* as a locale object before calling *newlocale*( ). If the function call fails and the *base* argument is not (**locale_t**)0, the contents of *base* shall remain valid and unchanged.

The results are undefined if the *base* argument is the special locale object *LC_GLOBAL_LOCALE*.

RETURN VALUE

Upon successful completion, the *newlocale*( ) function shall return a handle which the caller may use on subsequent calls to *duplocale*( ), *freelocale*( ), and other functions taking a **locale_t** argument.

Upon failure, the *newlocale*( ) function shall return (**locale_t**)0 and set *errno* to indicate the error.

ERRORS

The *newlocale*( ) function shall fail if:

[ENOMEM] There is not enough memory available to create the locale object or load the locale data.

[EINVAL] The *category_mask* contains a bit that does not correspond to a valid category.

[ENOENT] For any of the categories in *category_mask,* the locale data is not available.

The *newlocale*( ) function may fail if:

[EINVAL] The *locale* argument is not a valid string pointer.

EXAMPLES

Constructing a Locale Object from Different Locales

The following example shows the construction of a locale where the *LC_CTYPE* category data comes from a locale *loc1* and the *LC_TIME* category data from a locale *tok2*:

```
#include <locale.h>
...
locale_t loc, new_loc;

/* Get the "loc1" data. */

loc = newlocale (LC_CTYPE_MASK, "loc1", NULL);
if (loc == (locale_t) 0)
    abort ();

/* Get the "loc2" data. */

new_loc = newlocale (LC_TIME_MASK, "loc2", loc);
if (new_loc != (locale_t) 0)
    /* We don t abort if this fails. In this case this
       simply used to unchanged locale object. */
    loc = new_loc;

...
```

Freeing up a Locale Object

The following example shows a code fragment to free a locale object created by *newlocale*( ):

```
#include <locale.h>
...
/* Every locale object allocated with newlocale() should be
 * freed using freelocale():
 */

locale_t loc;

/* Get the locale. */

loc = newlocale (LC_CTYPE_MASK | LC_TIME_MASK, "locname", NULL);

/* ... Use the locale object ... */
...

/* Free the locale object resources. */
freelocale (loc);
```

APPLICATION USAGE

Handles for locale objects created by the *newlocale*( ) function should be released by a corresponding call to *freelocale*( ).

The special locale object *LC_GLOBAL_LOCALE* must not be passed for the *base* argument, even when returned by the *uselocale*( ) function.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

duplocale( ), *freelocale*( ), *uselocale*( )

NAME

nextafter, nextafterf, nextafterl, nexttoward, nexttowardf, nexttowardl — next representable floating-point number

SYNOPSIS

```
#include <math.h>

double nextafter(double x, double y);
float nextafterf(float x, float y);
long double nextafterl(long double x, long double y);
double nexttoward(double x, long double y);
float nexttowardf(float x, long double y);
long double nexttowardl(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *nextafter*( ), *nextafterf*( ), and *nextafterl*( ) functions shall compute the next representable floating-point value following *x* in the direction of *y*. Thus, if *y* is less than *x*, *nextafter*( ) shall return the largest representable floating-point number less than *x*. The *nextafter*( ), *nextafterf*( ), and *nextafterl*( ) functions shall return *y* if *x* equals *y*.

The *nexttoward*( ), *nexttowardf*( ), and *nexttowardl*( ) functions shall be equivalent to the corresponding *nextafter*( ) functions, except that the second parameter shall have type **long double** and the functions shall return *y* converted to the type of the function if *x* equals *y*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the next representable floating-point value following *x* in the direction of *y*.

If *x*==*y*, *y* (of the type *x*) shall be returned.

If *x* is finite and the correct function value would overflow, a range error shall occur and ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (with the same sign as *x*) shall be returned as appropriate for the return type of the function.

MX If *x* or *y* is NaN, a NaN shall be returned.

If *x*!=*y* and the correct function value is subnormal, zero, or underflows, a range error shall occur, and either the correct function value (if representable) or 0.0 shall be returned.

ERRORS

These functions shall fail if:

Range Error — The correct value overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

MX | Range Error | The correct value is subnormal or underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The *nextafter*( ) function is no longer marked as an extension.

The *nextafterf*( ), *nextafterl*( ), *nexttoward*( ), *nexttowardf*( ), and *nexttowardl*( ) functions are added for alignment with the ISO/IEC 9899: 1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899: 1999 standard.

IEC 60559: 1989 standard floating-point extensions over the ISO/IEC 9899: 1999 standard are marked.

NAME

nftw — walk a file tree

SYNOPSIS

XSI

```
#include <ftw.h>

int nftw(const char *path, int (*fn)(const char *,
    const struct stat *, int, struct FTW *), int fd_limit, int flags);
```

DESCRIPTION

The *nftw*( ) function shall recursively descend the directory hierarchy rooted in *path*. The *nftw*( ) function has a similar effect to *ftw*( ) except that it takes an additional argument *flags*, which is a bitwise-inclusive OR of zero or more of the following flags:

FTW_CHDIR — If set, *nftw*( ) shall change the current working directory to each directory as it reports files in that directory. If clear, *nftw*( ) shall not change the current working directory.

FTW_DEPTH — If set, *nftw*( ) shall report all files in a directory before reporting the directory itself. If clear, *nftw*( ) shall report any directory before reporting the files in that directory.

FTW_MOUNT — If set, *nftw*( ) shall only report files in the same file system as *path*. If clear, *nftw*( ) shall report all files encountered during the walk.

FTW_PHYS — If set, *nftw*( ) shall perform a physical walk and shall not follow symbolic links.

If FTW_PHYS is clear and FTW_DEPTH is set, *nftw*( ) shall follow links instead of reporting them, but shall not report any directory that would be a descendant of itself. If FTW_PHYS is clear and FTW_DEPTH is clear, *nftw*( ) shall follow links instead of reporting them, but shall not report the contents of any directory that would be a descendant of itself.

At each file it encounters, *nftw*( ) shall call the user-supplied function *fn* with four arguments:

- The first argument is the pathname of the object.
- The second argument is a pointer to the **stat** buffer containing information on the object, filled in as if *fstatat*( ), *stat*( ), or *lstat*( ) had been called to retrieve the information.
- The third argument is an integer giving additional information. Its value is one of the following:

  FTW_D — The object is a directory.

  FTW_DNR — The object is a directory that cannot be read. The *fn* function shall not be called for any of its descendants.

  FTW_DP — The object is a directory and subdirectories have been visited. (This condition shall only occur if the FTW_DEPTH flag is included in *flags*.)

  FTW_F — The object is a file.

  FTW_NS — The *stat*( ) function failed on the object because of lack of appropriate permission. The **stat** buffer passed to *fn* is undefined. Failure of *stat*( ) for any other reason is considered an error and *nftw*( ) shall return –1.

  FTW_SL — The object is a symbolic link. (This condition shall only occur if the FTW_PHYS flag is included in *flags*.)

FTW_SLN The object is a symbolic link that does not name an existing file. (This condition shall only occur if the FTW_PHYS flag is not included in *flags*.)

- The fourth argument is a pointer to an **FTW** structure. The value of **base** is the offset of the object's filename in the pathname passed as the first argument to *fn*. The value of **level** indicates depth relative to the root of the walk, where the root level is 0.

The results are unspecified if the application-supplied *fn* function does not preserve the current working directory.

The argument *fd_limit* sets the maximum number of file descriptors that shall be used by *nftw*( ) while traversing the file tree. At most one file descriptor shall be used for each directory level.

The *nftw*( ) function need not be thread-safe.

RETURN VALUE

The *nftw*( ) function shall continue until the first of the following conditions occurs:

- An invocation of *fn* shall return a non-zero value, in which case *nftw*( ) shall return that value.
- The *nftw*( ) function detects an error other than [EACCES] (see FTW_DNR and FTW_NS above), in which case *nftw*( ) shall return –1 and set *errno* to indicate the error.
- The tree is exhausted, in which case *nftw*( ) shall return 0.

ERRORS

The *nftw*( ) function shall fail if:

[EACCES] Search permission is denied for any component of *path* or read permission is denied for *path*, or *fn* returns –1 and does not reset *errno*.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of *path* is not a directory.

[EOVERFLOW] A field in the **stat** structure cannot be represented correctly in the current programming environment for one or more files found in the file hierarchy.

The *nftw*( ) function may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[EMFILE] All file descriptors available to the process are currently open.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[ENFILE] Too many files are currently open in the system.

In addition, *errno* may be set if the function pointed to by *fn* causes *errno* to be set.

EXAMPLES

The following program traverses the directory tree under the path named in its first command-line argument, or under the current directory if no argument is supplied. It displays various information about each file. The second command-line argument can be used to specify characters that control the value assigned to the *flags* argument when calling *nftw*( ).

```
#include <ftw.h>
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <stdint.h>

static int
display_info(const char *fpath, const struct stat *sb,
    int tflag, struct FTW *ftwbuf)
{
    printf("%-3s %2d %7jd   %-40s %d %s\n",
        (tflag == FTW_D) ?   "d"   : (tflag == FTW_DNR) ? "dnr" :
        (tflag == FTW_DP) ?  "dp"  : (tflag == FTW_F) ?   "f" :
        (tflag == FTW_NS) ?  "ns"  : (tflag == FTW_SL) ?  "sl" :
        (tflag == FTW_SLN) ? "sln" : "???",
        ftwbuf->level, (intmax_t) sb->st_size,
        fpath, ftwbuf->base, fpath + ftwbuf->base);
    return 0;           /* To tell nftw() to continue */
}

int
main(int argc, char *argv[])
{
    int flags = 0;

    if (argc > 2 && strchr(argv[2], 'd') != NULL)
        flags |= FTW_DEPTH;
    if (argc > 2 && strchr(argv[2], 'p') != NULL)
        flags |= FTW_PHYS;

    if (nftw((argc < 2) ? "." : argv[1], display_info, 20, flags) == -1)
    {
        perror("nftw");
        exit(EXIT_FAILURE);
    }

    exit(EXIT_SUCCESS);
}
```

APPLICATION USAGE

The *nftw*( ) function may allocate dynamic storage during its operation. If *nftw*( ) is forcibly terminated, such as by *longjmp*( ) or *siglongjmp*( ) being executed by the function pointed to by *fn* or an interrupt routine, *nftw*( ) does not have a chance to free that storage, so it remains permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has occurred, and arrange to have the function pointed to by *fn* return a non-zero value at its next invocation.

45006 **RATIONALE**

45007 None.

45012 XBD **<ftw.h>**

45013 **CHANGE HISTORY**

45014 First released in Issue 4, Version 2.

45015 **Issue 5**

45016 Moved from X/OPEN UNIX extension to BASE.

45017 In the DESCRIPTION, the definition of the *depth* argument is clarified.

45018 **Issue 6**

45019 The Open Group Base Resolution bwg97-003 is applied.

45020 The ERRORS section is updated as follows:

45021 • The wording of the mandatory [ELOOP] error condition is updated.

45022 • A second optional [ELOOP] error condition is added.

45023 • The [EOVERFLOW] mandatory error condition is added.

45024 Text is added to the DESCRIPTION to say that the *nftw*( ) function need not be reentrant and that
45025 the results are unspecified if the application-supplied *fn* function does not preserve the current
45026 working directory.

45027 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/64 is applied, changing the argument
45028 *depth* to *fd_limit* throughout and changing "to a maximum of 5 levels deep" to "using a
45029 maximum of 5 file descriptors" in the EXAMPLES section.

45030 **Issue 7**

45031 Austin Group Interpretations 1003.1-2001 #143 and #156 are applied.

45032 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

45033 SD5-XBD-ERN-61 is applied.

45034 APPLICATION USAGE is added and the EXAMPLES section is replaced with a new example.

NAME

nice — change the nice value of a process

SYNOPSIS

XSI

```
#include <unistd.h>

int nice(int incr);
```

DESCRIPTION

The *nice*( ) function shall add the value of *incr* to the nice value of the calling process. A nice value of a process is a non-negative number for which a more positive value shall result in less favorable scheduling.

A maximum nice value of 2*{NZERO}–1 and a minimum nice value of 0 shall be imposed by the system. Requests for values above or below these limits shall result in the nice value being set to the corresponding limit. Only a process with appropriate privileges can lower the nice value.

PS | TPS

Calling the *nice*( ) function has no effect on the priority of processes or threads with policy SCHED_FIFO or SCHED_RR. The effect on processes or threads with other scheduling policies is implementation-defined.

The nice value set with *nice*( ) shall be applied to the process. If the process is multi-threaded, the nice value shall affect all system scope threads in the process.

As –1 is a permissible return value in a successful situation, an application wishing to check for error situations should set *errno* to 0, then call *nice*( ), and if it returns –1, check to see whether *errno* is non-zero.

RETURN VALUE

Upon successful completion, *nice*( ) shall return the new nice value –{NZERO}. Otherwise, –1 shall be returned, the nice value of the process shall not be changed, and *errno* shall be set to indicate the error.

ERRORS

The *nice*( ) function shall fail if:

[EPERM] The *incr* argument is negative and the calling process does not have appropriate privileges.

EXAMPLES

Changing the Nice Value

The following example adds the value of the *incr* argument, –20, to the nice value of the calling process.

```
#include <unistd.h>
...
int incr = -20;
int ret;

ret = nice(incr);
```

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A statement is added to the description indicating the effects of this function on the different scheduling policies and multi-threaded processes.

45086 **NAME**

45087 nl_langinfo, nl_langinfo_l — language information

45088 **SYNOPSIS**

45089
```
#include <langinfo.h>
```

45090
```
char *nl_langinfo(nl_item item);
```
45091
```
char *nl_langinfo_l(nl_item item, locale_t locale);
```

45092 **DESCRIPTION**

45093 The *nl_langinfo*( ) and *nl_langinfo_l*( ) functions shall return a pointer to a string containing
45094 information relevant to the particular language or cultural area defined in the locale of the
45095 process, or in the locale represented by *locale*, respectively (see **<langinfo.h>**). The manifest
45096 constant names and values of *item* are defined in **<langinfo.h>**. For example:

45097
```
nl_langinfo(ABDAY_1)
```

45098 would return a pointer to the string `"Dom"` if the identified language was Portuguese, and
45099 `"Sun"` if the identified language was English.

45100
```
nl_langinfo_l(ABDAY_1, loc)
```

45101 would return a pointer to the string `"Dom"` if the identified language of the locale represented by
45102 *loc* was Portuguese, and `"Sun"` if the identified language of the locale represented by *loc* was
45103 English.

45104 Calls to *setlocale*( ) with a category corresponding to the category of *item* (see **<langinfo.h>**), or to
45105 the category *LC_ALL*, may overwrite the array pointed to by the return value. Calls to *uselocale*( )
45106 which change the category corresponding to the category of *item* may overwrite the array
45107 pointed to by the return value.

45108 The *nl_langinfo*( ) function need not be thread-safe.

45109 **RETURN VALUE**

45110 In a locale where *langinfo* data is not defined, these functions shall return a pointer to the
45111 corresponding string in the POSIX locale. In all locales, these functions shall return a pointer to
45112 an empty string if *item* contains an invalid setting.

45113 This pointer may point to static data that may be overwritten on the next call to either function.

45114 **ERRORS**

45115 The *nl_langinfo_l*( ) function may fail if:

45116 [EINVAL] *locale* is not a valid locale object handle.

45117 **EXAMPLES**

45118 **Getting Date and Time Formatting Information**

45119 The following example returns a pointer to a string containing date and time formatting
45120 information, as defined in the *LC_TIME* category of the current locale.

45121
```
#include <time.h>
```
45122
```
#include <langinfo.h>
```
45123
```
...
```
45124
```
strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);
```
45125
```
...
```

APPLICATION USAGE

The array pointed to by the return value should not be modified by the program, but may be modified by further calls to these functions.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 2.

Issue 5

The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

The *nl_langinfo*( ) function is moved from the XSI option to the Base.

The *nl_langinfo_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

nrand48 — generate uniformly distributed pseudo-random non-negative long integers

SYNOPSIS

XSI

```
#include <stdlib.h>

long nrand48(unsigned short xsubi[3]);
```

DESCRIPTION

Refer to *drand48( )*.

45153 **NAME**

45154 ntohl, ntohs — convert values between host and network byte order

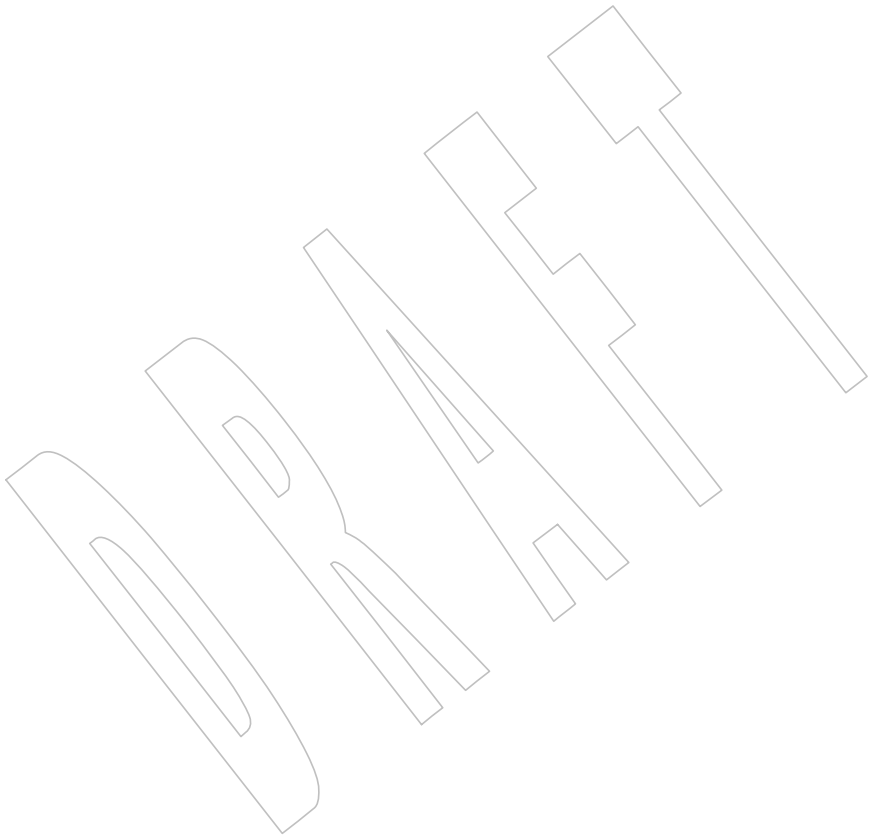
45155 **SYNOPSIS**

45156
```
#include <arpa/inet.h>
```

45157
```
uint32_t ntohl(uint32_t netlong);
```
45158
```
uint16_t ntohs(uint16_t netshort);
```

45159 **DESCRIPTION**

45160 Refer to *htonl( )*.



45161 **NAME**

45162 open, openat — open file relative to directory file descriptor

45163 **SYNOPSIS**

45164 OH
```
#include <sys/stat.h>
```
45165
```
#include <fcntl.h>

int open(const char *path, int oflag, ...);
int openat(int fd, const char *path, int oflag, ...);
```
45166
45167

45168 **DESCRIPTION**

45169 The *open*( ) function shall establish the connection between a file and a file descriptor. It shall
45170 create an open file description that refers to a file and a file descriptor that refers to that open file
45171 description. The file descriptor is used by other I/O functions to refer to that file. The *path*
45172 argument points to a pathname naming the file.

45173 The *open*( ) function shall return a file descriptor for the named file that is the lowest file
45174 descriptor not currently open for that process. The open file description is new, and therefore the
45175 file descriptor shall not share it with any other process in the system. The FD_CLOEXEC file
45176 descriptor flag associated with the new file descriptor shall be cleared unless the O_CLOEXEC
45177 flag is set in *oflag*.

45178 The file offset used to mark the current position within the file shall be set to the beginning of
45179 the file.

45180 The file status flags and file access modes of the open file description shall be set according to
45181 the value of *oflag*.

45182 Values for *oflag* are constructed by a bitwise-inclusive OR of flags from the following list, defined
45183 in **<fcntl.h>**. Applications shall specify exactly one of the first five values (file access modes)
45184 below in the value of *oflag*:

45185 O_EXEC Open for execute only (non-directory files). The result is unspecified if
45186 this flag is applied to a directory.

45187 O_RDONLY Open for reading only.

45188 O_RDWR Open for reading and writing. The result is undefined if this flag is
45189 applied to a FIFO.

45190 O_SEARCH Open directory for search only. The result is unspecified if this flag is
45191 applied to a non-directory file.

45192 O_WRONLY Open for writing only.

45193 Any combination of the following may be used:

45194 O_APPEND If set, the file offset shall be set to the end of the file prior to each write.

45195 O_CLOEXEC If set, the FD_CLOEXEC flag for the new file descriptor shall be set.

45196 O_CREAT If the file exists, this flag has no effect except as noted under O_EXCL
45197 below. Otherwise, the file shall be created; the user ID of the file shall be
45198 set to the effective user ID of the process; the group ID of the file shall be
45199 set to the group ID of the file's parent directory or to the effective group
45200 ID of the process; and the access permission bits (see **<sys/stat.h>**) of the
45201 file mode shall be set to the value of the argument following the *oflag*
45202 argument taken as type **mode_t** modified as follows: a bitwise AND is
45203 performed on the file-mode bits and the corresponding bits in the
45204 complement of the process' file mode creation mask. Thus, all bits in the

file mode whose corresponding bit in the file mode creation mask is set are cleared. When bits other than the file permission bits are set, the effect is unspecified. The argument following the *oflag* argument does not affect whether the file is open for reading, writing, or for both. Implementations shall provide a way to initialize the file's group ID to the group ID of the parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the file's group ID to the effective group ID of the calling process.

O_DIRECTORY — If *path* does not name a directory, fail and set *errno* to [ENOTDIR].

SIO O_DSYNC — Write I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion.

O_EXCL — If O_CREAT and O_EXCL are set, *open*( ) shall fail if the file exists. The check for the existence of the file and the creation of the file if it does not exist shall be atomic with respect to other threads executing *open*( ) naming the same filename in the same directory with O_EXCL and O_CREAT set. If O_EXCL and O_CREAT are set, and *path* names a symbolic link, *open*( ) shall fail and set *errno* to [EEXIST], regardless of the contents of the symbolic link. If O_EXCL is set and O_CREAT is not set, the result is undefined.

O_NOCTTY — If set and *path* identifies a terminal device, *open*( ) shall not cause the terminal device to become the controlling terminal for the process. If *path* does not identify a terminal device, O_NOCTTY shall be ignored.

O_NOFOLLOW — If *path* names a symbolic link, fail and set *errno* to [ELOOP].

O_NONBLOCK — When opening a FIFO with O_RDONLY or O_WRONLY set:

- If O_NONBLOCK is set, an *open*( ) for reading-only shall return without delay. An *open*( ) for writing-only shall return an error if no process currently has the file open for reading.
- If O_NONBLOCK is clear, an *open*( ) for reading-only shall block the calling thread until a thread opens the file for writing. An *open*( ) for writing-only shall block the calling thread until a thread opens the file for reading.

When opening a block special or character special file that supports non-blocking opens:

- If O_NONBLOCK is set, the *open*( ) function shall return without blocking for the device to be ready or available. Subsequent behavior of the device is device-specific.
- If O_NONBLOCK is clear, the *open*( ) function shall block the calling thread until the device is ready or available before returning.

Otherwise, the behavior of O_NONBLOCK is unspecified.

SIO O_RSYNC — Read I/O operations on the file descriptor shall complete at the same level of integrity as specified by the O_DSYNC and O_SYNC flags. If both O_DSYNC and O_RSYNC are set in *oflag*, all I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion. If both O_SYNC and O_RSYNC are set in flags, all I/O operations on the file descriptor shall complete as defined by

synchronized I/O file integrity completion.

XSI|SIO O_SYNC Write I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.

XSI The O_SYNC flag shall be supported for regular files, even if the Synchronized Input and Output option is not supported.

O_TRUNC If the file exists and is a regular file, and the file is successfully opened O_RDWR or O_WRONLY, its length shall be truncated to 0, and the mode and owner shall be unchanged. It shall have no effect on FIFO special files or terminal device files. Its effect on other file types is implementation-defined. The result of using O_TRUNC without either O_RDWR or O_WRONLY is undefined.

O_TTY_INIT If *path* identifies a terminal device other than a pseudo-terminal, the device is not already open in any process, and either O_TTY_INIT is set in *oflag* or O_TTY_INIT has the value zero, *open*( ) shall set any non-standard **termios** structure terminal parameters to a state that provides conforming behavior; see XBD Section 11.2 (on page 205). It is unspecified whether O_TTY_INIT has any effect if the device is already open in any process. If *path* identifies the slave side of a pseudo-terminal that is not already open in any process, *open*( ) shall set any non-standard **termios** structure terminal parameters to a state that provides conforming behavior, regardless of whether O_TTY_INIT is set. If *path* does not identify a terminal device, O_TTY_INIT shall be ignored.

If O_CREAT is set and the file did not previously exist, upon successful completion, *open*( ) shall mark for update the last data access, last data modification, and last file status change timestamps of the file and the last data modification and last file status change timestamps of the parent directory.

If O_TRUNC is set and the file did previously exist, upon successful completion, *open*( ) shall mark for update the last data modification and last file status change timestamps of the file.

SIO If both the O_SYNC and O_DSYNC flags are set, the effect is as if only the O_SYNC flag was set.

OB XSR If *path* refers to a STREAMS file, *oflag* may be constructed from O_NONBLOCK OR'ed with either O_RDONLY, O_WRONLY, or O_RDWR. Other flag values are not applicable to STREAMS devices and shall have no effect on them. The value O_NONBLOCK affects the operation of STREAMS drivers and certain functions applied to file descriptors associated with STREAMS files. For STREAMS drivers, the implementation of O_NONBLOCK is device-specific.

The application shall ensure that it specifies the O_TTY_INIT flag on the first open of a terminal device since system boot or since the device was closed by the process that last had it open. The

XSI application need not specify the O_TTY_INIT flag when opening pseudo-terminals. If *path* names the master side of a pseudo-terminal device, then it is unspecified whether *open*( ) locks the slave side so that it cannot be opened. Conforming applications shall call *unlockpt*( ) before opening the slave side.

The largest value that can be represented correctly in an object of type **off_t** shall be established as the offset maximum in the open file description.

The *openat*( ) function shall be equivalent to the *open*( ) function except in the case where *path* specifies a relative path. In this case the file to be opened is determined relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file

descriptor was opened without O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function shall not perform the check.

The *oflag* parameter and the optional fourth parameter correspond exactly to the parameters of *open*( ).

If *openat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working directory is used and the behavior shall be identical to a call to *open*( ).

RETURN VALUE

Upon successful completion, these functions shall open the file and return a non-negative integer representing the lowest numbered unused file descriptor. Otherwise, these functions shall return –1 and set *errno* to indicate the error. If – is returned, no files shall be created or modified.

ERRORS

These functions shall fail if:

[EACCES] Search permission is denied on a component of the path prefix, or the file exists and the permissions specified by *oflag* are denied, or the file does not exist and write permission is denied for the parent directory of the file to be created, or O_TRUNC is specified and write permission is denied.

[EEXIST] O_CREAT and O_EXCL are set, and the named file exists.

[EINTR] A signal was caught during *open*( ).

SIO [EINVAL] The implementation does not support synchronized I/O for this file.

OB XSR [EIO] The *path* argument names a STREAMS file and a hangup or error occurred during the *open*( ).

[EISDIR] The named file is a directory and *oflag* includes O_WRONLY or O_RDWR.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument, or O_NOFOLLOW was specified and the *path* argument names a symbolic link.

[EMFILE] All file descriptors available to the process are currently open.

[ENAMETOOLONG] The length of a component of a pathname is longer than {NAME_MAX}.

[ENFILE] The maximum allowable number of files is currently open in the system.

[ENOENT] O_CREAT is not set and the named file does not exist; or O_CREAT is set and either the path prefix does not exist or the *path* argument points to an empty string.

OB XSR [ENOSR] The *path* argument names a STREAMS-based file and the system is unable to allocate a STREAM.

[ENOSPC] The directory or file system that would contain the new file cannot be expanded, the file does not exist, and O_CREAT is specified.

[ENOTDIR] A component of the path prefix is not a directory; or O_CREAT and O_EXCL are not specified, the *path* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters, and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory; or O_DIRECTORY was specified and the *path*

argument does not name a directory.

[ENXIO] O_NONBLOCK is set, the named file is a FIFO, O_WRONLY is set, and no process has the file open for reading.

[ENXIO] The named file is a character special or block special file, and the device associated with this special file does not exist.

[EOVERFLOW] The named file is a regular file and the size of the file cannot be represented correctly in an object of type **off_t**.

[EROFS] The named file resides on a read-only file system and either O_WRONLY, O_RDWR, O_CREAT (if the file does not exist), or O_TRUNC is set in the *oflag* argument.

The *openat*( ) function shall fail if:

[EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

These functions may fail if:

XSI [EAGAIN] The *path* argument names the slave side of a pseudo-terminal device that is locked.

[EINVAL] The value of the *oflag* argument is not valid.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

OB XSR [ENOMEM] The *path* argument names a STREAMS file and the system is unable to allocate resources.

[ETXTBSY] The file is a pure procedure (shared text) file that is being executed and *oflag* is O_WRONLY or O_RDWR.

The *openat*( ) function may fail if:

[ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a file descriptor associated with a directory.

EXAMPLES

Opening a File for Writing by the Owner

The following example opens the file **/tmp/file**, either by creating it (if it does not already exist), or by truncating its length to 0 (if it does exist). In the former case, if the call creates a new file, the access permission bits in the file mode of the file are set to permit reading and writing by the owner, and to permit reading only by group members and others.

If the call to *open*( ) is successful, the file is opened for writing.

```
#include <fcntl.h>
...
```

```
int fd;
mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;
char *filename = "/tmp/file";
...
fd = open(filename, O_WRONLY | O_CREAT | O_TRUNC, mode);
...
```

Opening a File Using an Existence Check

The following example uses the *open*( ) function to try to create the **LOCKFILE** file and open it for writing. Since the *open*( ) function specifies the O_EXCL flag, the call fails if the file already exists. In that case, the program assumes that someone else is updating the password file and exits.

```
#include <fcntl.h>
#include <stdio.h>
#include <stdlib.h>

#define LOCKFILE "/etc/ptmp"
...
int pfd; /* Integer for file descriptor returned by open() call. */
...
if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
    S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
{
    fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
    exit(1);
}
...
```

Opening a File for Writing

The following example opens a file for writing, creating the file if it does not already exist. If the file does exist, the system truncates the file to zero bytes.

```
#include <fcntl.h>
#include <stdio.h>
#include <stdlib.h>

#define LOCKFILE "/etc/ptmp"
...
int pfd;
char filename[PATH_MAX+1];
...
if ((pfd = open(filename, O_WRONLY | O_CREAT | O_TRUNC,
    S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
{
    perror("Cannot open output file\n"); exit(1);
}
...
```

APPLICATION USAGE

POSIX.1-200x does not require that terminal parameters be automatically set to any state on first open, nor that they be reset after the last close. It is possible for a non-conforming application to leave a terminal device in a state where the next process to use that device finds it in a non-conforming state, but has no way of determining this. To ensure that the device is set to a conforming initial state, applications which perform a first open of a terminal (other than a pseudo-terminal) should do so using the O_TTY_INIT flag to set the parameters associated with the terminal to a conforming state.

RATIONALE

Except as specified in this volume of POSIX.1-200x, the flags allowed in *oflag* are not mutually-exclusive and any number of them may be used simultaneously.

Some implementations permit opening FIFOs with O_RDWR. Since FIFOs could be implemented in other ways, and since two file descriptors can be used to the same effect, this possibility is left as undefined.

See *getgroups( )* about the group of a newly created file.

The use of *open( )* to create a regular file is preferable to the use of *creat( )*, because the latter is redundant and included only for historical reasons.

The use of the O_TRUNC flag on FIFOs and directories (pipes cannot be *open( )*-ed) must be permissible without unexpected side-effects (for example, *creat( )* on a FIFO must not remove data). Since terminal special files might have type-ahead data stored in the buffer, O_TRUNC should not affect their content, particularly if a program that normally opens a regular file should open the current controlling terminal instead. Other file types, particularly implementation-defined ones, are left implementation-defined.

POSIX.1-200x permits [EACCES] to be returned for conditions other than those explicitly listed.

The O_NOCTTY flag was added to allow applications to avoid unintentionally acquiring a controlling terminal as a side-effect of opening a terminal file. This volume of POSIX.1-200x does not specify how a controlling terminal is acquired, but it allows an implementation to provide this on *open( )* if the O_NOCTTY flag is not set and other conditions specified in XBD Chapter 11 (on page 199) are met.

In historical implementations the value of O_RDONLY is zero. Because of that, it is not possible to detect the presence of O_RDONLY and another option. Future implementations should encode O_RDONLY and O_WRONLY as bit flags so that:

```
O_RDONLY | O_WRONLY == O_RDWR
```

O_EXEC and O_SEARCH are specified as two of the five file access modes. Since O_EXEC does not apply to directories, and O_SEARCH only applies to directories, their values need not be distinct. Since O_RDONLY has historically had the value zero, implementations are not able to distinguish between O_SEARCH and O_SEARCH | O_RDONLY, and similarly for O_EXEC.

In general, the *open( )* function follows the symbolic link if *path* names a symbolic link. However, the *open( )* function, when called with O_CREAT and O_EXCL, is required to fail with [EEXIST] if *path* names an existing symbolic link, even if the symbolic link refers to a nonexistent file. This behavior is required so that privileged applications can create a new file in a known location without the possibility that a symbolic link might cause the file to be created in a different location.

For example, a privileged application that must create a file with a predictable name in a user-writable directory, such as the user's home directory, could be compromised if the user creates a symbolic link with that name that refers to a nonexistent file in a system directory. If the user can

influence the contents of a file, the user could compromise the system by creating a new system configuration or spool file that would then be interpreted by the system. The test for a symbolic link which refers to a nonexisting file must be atomic with the creation of a new file.

In addition, the *open*( ) function refuses to open non-directories if the O_DIRECTORY flag is set. This avoids race conditions whereby a user might compromise the system by substituting a hard link to a sensitive file (e.g., a device or a FIFO) while a privileged application is running, where opening a file even for read access might have undesirable side-effects.

In addition, the *open*( ) function does not follow symbolic links if the O_NOFOLLOW flag is set. This avoids race conditions whereby a user might compromise the system by substituting a symbolic link to a sensitive file (e.g., a device) while a privileged application is running, where opening a file even for read access might have undesirable side-effects.

The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use *chown*( ) to set the group ID after the file is created, or determine under what conditions the implementation will set the desired group ID.

The purpose of the *openat*( ) function is to enable opening files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *open*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *openat*( ) function it can be guaranteed that the opened file is located relative to the desired directory. Some implementations use the *openat*( ) function for other purposes as well. In some cases, if the *oflag* parameter has the O_XATTR bit set, the returned file descriptor provides access to extended attributes. This functionality is not standardized here.

FUTURE DIRECTIONS

None.

XBD Chapter 11 (on page 199), **<fcntl.h>**, **<sys/stat.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the DESCRIPTION, O_CREAT is amended to state that the group ID of the file is set to the group ID of the file's parent directory or to the effective group ID of the process. This is a FIPS requirement.
- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support large files.
- The [ENXIO] mandatory error condition is added.
- The [EINVAL], [ENAMETOOLONG], and [ETXTBSY] optional error conditions are added.

The DESCRIPTION and ERRORS sections are updated so that items related to the optional XSI STREAMS Option Group are marked.

The following changes were made to align with the IEEE P1003.1a draft standard:

- An explanation is added of the effect of the O_CREAT and O_EXCL flags when the path refers to a symbolic link.
- The [ELOOP] optional error condition is added.

The normative text is updated to avoid use of the term "must" for application requirements.

The DESCRIPTION of O_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.

Issue 7

Austin Group Interpretations 1003.1-2001 #113 and #143 are applied.

Austin Group Interpretation 1003.1-2001 #144 is applied, adding the O_TTY_INIT flag.

Austin Group Interpretation 1003.1-2001 #171 is applied, adding support to set the FD_CLOEXEC flag atomically at *open*( ), and adding the F_DUPFD_CLOEXEC flag.

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

This page is revised and the *openat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Functionality relating to the XSI STREAMS option is marked obsolescent.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

45541 **NAME**

45542 open_memstream, open_wmemstream — open a dynamic memory buffer stream

45543 **SYNOPSIS**

45544 CX
```
#include <stdio.h>

FILE *open_memstream(char **bufp, size_t *sizep);

#include <wchar.h>

FILE *open_wmemstream(wchar_t **bufp, size_t *sizep);
```

45548 **DESCRIPTION**

45549 The *open_memstream*( ) and *open_wmemstream*( ) functions shall create an I/O stream associated
45550 with a dynamically allocated memory buffer. The stream shall be opened for writing and shall
45551 be seekable.

45552 The stream associated with a call to *open_memstream*( ) shall be byte-oriented.

45553 The stream associated with a call to *open_wmemstream*( ) shall be wide-oriented.

45554 The stream shall maintain a current position in the allocated buffer and a current buffer length.
45555 The position shall be initially set to zero (the start of the buffer). Each write to the stream shall
45556 start at the current position and move this position by the number of successfully written bytes
45557 for *open_memstream*( ) or the number of successfully written wide characters for
45558 *open_wmemstream*( ). The length shall be initially set to zero. If a write moves the position to a
45559 value larger than the current length, the current length shall be set to this position. In this case a
45560 null character for *open_memstream*( ) or a null wide character for *open_wmemstream*( ) shall be
45561 appended to the current buffer. For both functions the terminating null is not included in the
45562 calculation of the buffer length.

45563 After a successful *fflush*( ) or *fclose*( ), the pointer referenced by *bufp* shall contain the address of
45564 the buffer, and the variable pointed to by *sizep* shall contain the smaller of the current buffer
45565 length and the number of bytes for *open_memstream*( ), or the number of wide characters for
45566 *open_wmemstream*( ), between the beginning of the buffer and the current file position indicator.

45567 After a successful *fflush*( ) the pointer referenced by *bufp* and the variable referenced by *sizep*
45568 remain valid only until the next write operation on the stream or a call to *fclose*( ).

45569 **RETURN VALUE**

45570 Upon successful completion, these functions shall return a pointer to the object controlling the
45571 stream. Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

45572 **ERRORS**

45573 These functions may fail if:

45574 [EINVAL] *bufp* or *sizep* are NULL.

45575 [EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

45576 [ENOMEM] Memory for the stream or the buffer could not be allocated.

EXAMPLES

```
#include <stdio.h>
#include <stdlib.h>

int
main (void)
{
    FILE *stream;
    char *buf;
    size_t len;
    off_t eob;

    stream = open_memstream (&buf, &len);
    if (stream == NULL)
        /* handle error */ ;
    fprintf (stream, "hello my world");
    fflush (stream);
    printf ("buf=%s, len=%zu\n", buf, len);
    eob = ftello(stream);
    fseeko (stream, 0, SEEK_SET);
    fprintf (stream, "good-bye");
    fseeko (stream, eob, SEEK_SET);
    fclose (stream);
    printf ("buf=%s, len=%zu\n", buf, len);
    free (buf);
    return 0;
}
```

This program produces the following output:

```
buf=hello my world, len=14
buf=good-bye world, len=14
```

APPLICATION USAGE

The buffer created by these functions should be freed by the application after closing the stream, by means of a call to *free*( ).

RATIONALE

These functions are similar to *fmemopen*( ) except that the memory is always allocated dynamically by the function, and the stream is opened only for output.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 7.

openat( )

45618 **NAME**

45619 openat — open file relative to directory file descriptor

45620 **SYNOPSIS**

45621 ```
#include <fcntl.h>
```

45622 ```
int openat(int fd, const char *path, int oflag, ...);
```

45623 **DESCRIPTION**

45624 Refer to *open( )*.

45625 **NAME**

45626 opendir — open directory associated with file descriptor

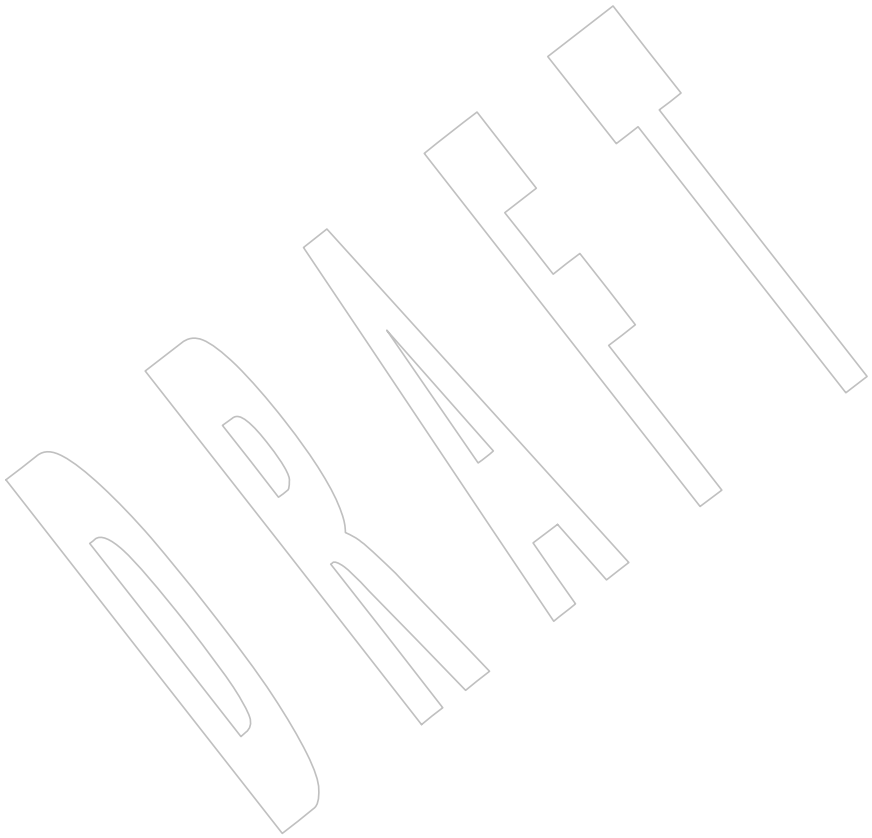
45627 **SYNOPSIS**

45628 `#include <dirent.h>`

45629 `DIR *opendir(const char *`*`dirname`*`);`

45630 **DESCRIPTION**

45631 Refer to *fdopendir( )*.



openlog( )

45632 **NAME**

45633 openlog — open a connection to the logging facility

45634 **SYNOPSIS**

45635 XSI
```
#include <syslog.h>

void openlog(const char *ident, int logopt, int facility);
```

45636

45637 **DESCRIPTION**

45638 Refer to *closelog( )*.

NAME

optarg, opterr, optind, optopt — options parsing variables

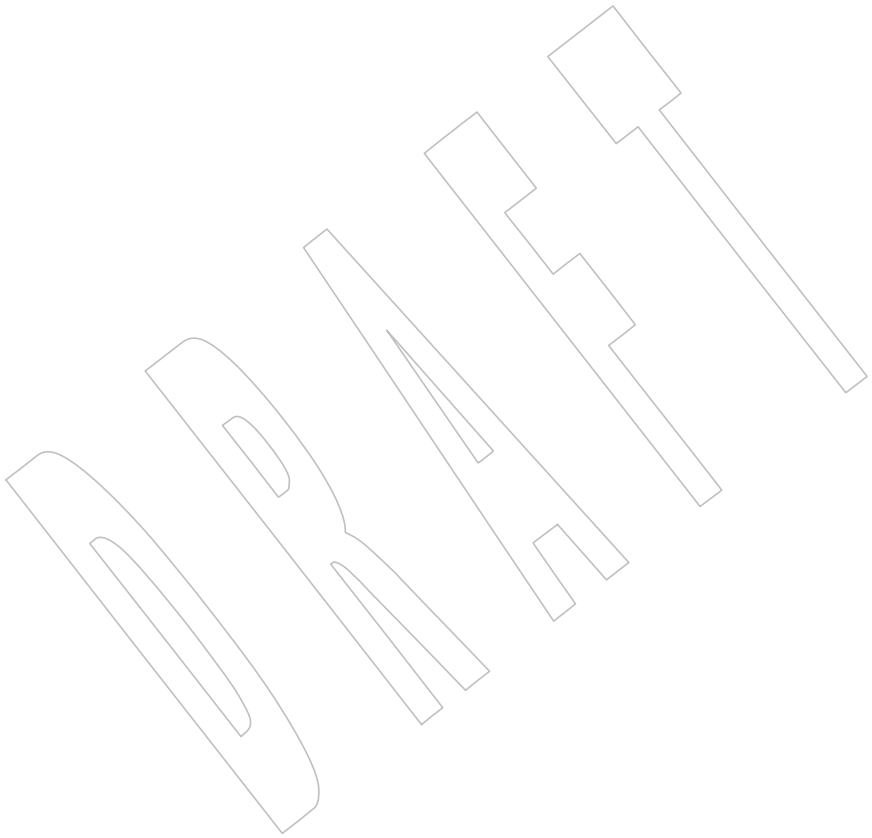
SYNOPSIS

```
#include <unistd.h>

extern char *optarg;
extern int opterr, optind, optopt;
```

DESCRIPTION

Refer to *getopt*( ).



pathconf( )

45647 **NAME**

45648 pathconf — get configurable pathname variables

45649 **SYNOPSIS**

45650 ```
#include <unistd.h>
```

45651 ```
long pathconf(const char *path, int name);
```

45652 **DESCRIPTION**

45653 Refer to *fpathconf( )*.

45654 **NAME**

45655 pause — suspend the thread until a signal is received

45656 **SYNOPSIS**

45657
```
#include <unistd.h>
```

45658
```
int pause(void);
```

45659 **DESCRIPTION**

45660 The *pause*( ) function shall suspend the calling thread until delivery of a signal whose action is
45661 either to execute a signal-catching function or to terminate the process.

45662 If the action is to terminate the process, *pause*( ) shall not return.

45663 If the action is to execute a signal-catching function, *pause*( ) shall return after the signal-catching
45664 function returns.

45665 **RETURN VALUE**

45666 Since *pause*( ) suspends thread execution indefinitely unless interrupted by a signal, there is no
45667 successful completion return value. A value of –1 shall be returned and *errno* set to indicate the
45668 error.

45669 **ERRORS**

45670 The *pause*( ) function shall fail if:

45671 [EINTR] A signal is caught by the calling process and control is returned from the
45672 signal-catching function.

45673 **EXAMPLES**

45674 None.

45675 **APPLICATION USAGE**

45676 Many common uses of *pause*( ) have timing windows. The scenario involves checking a
45677 condition related to a signal and, if the signal has not occurred, calling *pause*( ). When the signal
45678 occurs between the check and the call to *pause*( ), the process often blocks indefinitely. The
45679 *sigprocmask*( ) and *sigsuspend*( ) functions can be used to avoid this type of problem.

45680 **RATIONALE**

45681 None.

45682 **FUTURE DIRECTIONS**

45683 None.

45684 **SEE ALSO**

45690 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

45691 **Issue 6**

45692 The APPLICATION USAGE section is added.

NAME

pclose — close a pipe stream to or from a process

SYNOPSIS

CX
```
#include <stdio.h>

int pclose(FILE *stream);
```

DESCRIPTION

The *pclose*( ) function shall close a stream that was opened by *popen*( ), wait for the command to terminate, and return the termination status of the process that was running the command language interpreter. However, if a call caused the termination status to be unavailable to *pclose*( ), then *pclose*( ) shall return –1 with *errno* set to [ECHILD] to report this situation. This can happen if the application calls one of the following functions:

- *wait*( )
- *waitpid*( ) with a *pid* argument less than or equal to 0 or equal to the process ID of the command line interpreter
- Any other function not defined in this volume of POSIX.1-200x that could do one of the above

In any case, *pclose*( ) shall not return before the child process created by *popen*( ) has terminated.

If the command language interpreter cannot be executed, the child termination status returned by *pclose*( ) shall be as if the command language interpreter terminated using *exit*(127) or *_exit*(127).

The *pclose*( ) function shall not affect the termination status of any child of the calling process other than the one created by *popen*( ) for the associated stream.

If the argument *stream* to *pclose*( ) is not a pointer to a stream created by *popen*( ), the result of *pclose*( ) is undefined.

RETURN VALUE

Upon successful return, *pclose*( ) shall return the termination status of the command language interpreter. Otherwise, *pclose*( ) shall return –1 and set *errno* to indicate the error.

ERRORS

The *pclose*( ) function shall fail if:

[ECHILD] The status of the child process could not be obtained, as described above.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

There is a requirement that *pclose*( ) not return before the child process terminates. This is intended to disallow implementations that return [EINTR] if a signal is received while waiting. If *pclose*( ) returned before the child terminated, there would be no way for the application to discover which child used to be associated with the stream, and it could not do the cleanup itself.

If the stream pointed to by *stream* was not created by *popen*( ), historical implementations of *pclose*( ) return –1 without setting *errno*. To avoid requiring *pclose*( ) to set *errno* in this case, POSIX.1-200x makes the behavior unspecified. An application should not use *pclose*( ) to close

any stream that was not created by *popen*( ).

Some historical implementations of *pclose*( ) either block or ignore the signals SIGINT, SIGQUIT, and SIGHUP while waiting for the child process to terminate. Since this behavior is not described for the *pclose*( ) function in POSIX.1-200x, such implementations are not conforming. Also, some historical implementations return [EINTR] if a signal is received, even though the child process has not terminated. Such implementations are also considered non-conforming.

Consider, for example, an application that uses:

```
popen("command", "r")
```

to start *command*, which is part of the same application. The parent writes a prompt to its standard output (presumably the terminal) and then reads from the *popen*( )ed stream. The child reads the response from the user, does some transformation on the response (pathname expansion, perhaps) and writes the result to its standard output. The parent process reads the result from the pipe, does something with it, and prints another prompt. The cycle repeats. Assuming that both processes do appropriate buffer flushing, this would be expected to work.

To conform to POSIX.1-200x, *pclose*( ) must use *waitpid*( ), or some similar function, instead of *wait*( ).

The code sample below illustrates how the *pclose*( ) function might be implemented on a system conforming to POSIX.1-200x.

```
int pclose(FILE *stream)
{
    int stat;
    pid_t pid;

    pid = <pid for process created for stream by popen()>
    (void) fclose(stream);
    while (waitpid(pid, &stat, 0) == -1) {
        if (errno != EINTR){
            stat = -1;
            break;
        }
    }
    return(stat);
}
```

FUTURE DIRECTIONS

None.

SEE ALSO

fork( ), *popen*( ), *wait*( )

XBD **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

NAME

perror — write error messages to standard error

SYNOPSIS

```
#include <stdio.h>

void perror(const char *s);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *perror*( ) function shall map the error number accessed through the symbol *errno* to a language-dependent error message, which shall be written to the standard error stream as follows:

- First (if *s* is not a null pointer and the character pointed to by *s* is not the null byte), the string pointed to by *s* followed by a <colon> and a <space>.
- Then an error message string followed by a <newline>.

The contents of the error message strings shall be the same as those returned by *strerror*( ) with argument *errno*.

CX The *perror*( ) function shall mark for update the last data modification and last file status change timestamps of the file associated with the standard error stream at some time between its successful completion and *exit*( ), *abort*( ), or the completion of *fflush*( ) or *fclose*( ) on *stderr*.

The *perror*( ) function shall not change the orientation of the standard error stream.

RETURN VALUE

The *perror*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

Printing an Error Message for a Function

The following example replaces *bufptr* with a buffer that is the necessary size. If an error occurs, the *perror*( ) function prints a message and the program exits.

```
#include <stdio.h>
#include <stdlib.h>
...
char *bufptr;
size_t szbuf;
...
if ((bufptr = malloc(szbuf)) == NULL) {
    perror("malloc"); exit(2);
}
...
```

APPLICATION USAGE

Changes are made related to support for finegrained timestamps.

NAME

pipe — create an interprocess channel

SYNOPSIS

```
#include <unistd.h>

int pipe(int fildes[2]);
```

DESCRIPTION

The *pipe*( ) function shall create a pipe and place two file descriptors, one each into the arguments *fildes*[0] and *fildes*[1], that refer to the open file descriptions for the read and write ends of the pipe. Their integer values shall be the two lowest available at the time of the *pipe*( ) call. The O_NONBLOCK and FD_CLOEXEC flags shall be clear on both file descriptors. (The *fcntl*( ) function can be used to set both these flags.)

Data can be written to the file descriptor *fildes*[1] and read from the file descriptor *fildes*[0]. A read on the file descriptor *fildes*[0] shall access data written to the file descriptor *fildes*[1] on a first-in-first-out basis. It is unspecified whether *fildes*[0] is also open for writing and whether *fildes*[1] is also open for reading.

A process has the pipe open for reading (correspondingly writing) if it has a file descriptor open that refers to the read end, *fildes*[0] (write end, *fildes*[1]).

The pipe's user ID shall be set to the effective user ID of the calling process.

The pipe's group ID shall be set to the effective group ID of the calling process.

Upon successful completion, *pipe*( ) shall mark for update the last data access, last data modification, and last file status change timestamps of the pipe.

RETURN VALUE

Upon successful completion, 0 shall be returned; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *pipe*( ) function shall fail if:

[EMFILE] All, or all but one, of the file descriptors available to the process are currently open.

[ENFILE] The number of simultaneously open files in the system would exceed a system-imposed limit.

EXAMPLES

Using a Pipe to Pass Data Between a Parent Process and a Child Process

The following example demonstrates the use of a pipe to transfer data between a parent process and a child process. Error handling is excluded, but otherwise this code demonstrates good practice when using pipes: after the *fork*( ) the two processes close the unused ends of the pipe before they commence transferring data.

```
#include <stdlib.h>
#include <unistd.h>
...

int fildes[2];
const int BSIZE = 100;
char buf[BSIZE];
ssize_t nbytes;
```

```
45876       int status;
45877       status = pipe(fildes);
45878       if (status == –1 ) {
45879           /* an error occurred */
45880           ...
45881       }
45882       switch (fork()) {
45883       case –1: /* Handle error */
45884           break;
45885       case 0:  /* Child - reads from pipe */
45886           close(fildes[1]);                       /* Write end is unused */
45887           nbytes = read(fildes[0], buf, BSIZE);   /* Get data from pipe */
45888           /* At this point, a further read would see end of file ... */
45889           close(fildes[0]);                       /* Finished with pipe */
45890           exit(EXIT_SUCCESS);
45891       default:  /* Parent - writes to pipe */
45892           close(fildes[0]);                       /* Read end is unused */
45893           write(fildes[1], "Hello world\n", 12);  /* Write data on pipe */
45894           close(fildes[1]);                       /* Child will see EOF */
45895           exit(EXIT_SUCCESS);
45896       }
```

APPLICATION USAGE

None.

RATIONALE

The wording carefully avoids using the verb "to open" in order to avoid any implication of use of *open*( ); see also *write*( ).

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to indicate that certain dispositions of *fildes*[0] and *fildes*[1] are unspecified.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/65 is applied, adding the example to the EXAMPLES section.

45916 **Issue 7**

45917 SD5-XSH-ERN-156 is applied, updating the DESCRIPTION to state the setting of the pipe's user
45918 ID and group ID.

45919 Changes are made related to support for finegrained timestamps.

NAME

poll — input/output multiplexing

SYNOPSIS

```
#include <poll.h>

int poll(struct pollfd fds[], nfds_t nfds, int timeout);
```

DESCRIPTION

The *poll*( ) function provides applications with a mechanism for multiplexing input/output over a set of file descriptors. For each member of the array pointed to by *fds*, *poll*( ) shall examine the given file descriptor for the event(s) specified in *events*. The number of **pollfd** structures in the *fds* array is specified by *nfds*. The *poll*( ) function shall identify those file descriptors on which an application can read or write data, or on which certain events have occurred.

The *fds* argument specifies the file descriptors to be examined and the events of interest for each file descriptor. It is a pointer to an array with one member for each open file descriptor of interest. The array's members are **pollfd** structures within which *fd* specifies an open file descriptor and *events* and *revents* are bitmasks constructed by OR'ing a combination of the following event flags:

POLLIN — Data other than high-priority data may be read without blocking.

OB XSR — For STREAMS, this flag is set in *revents* even if the message is of zero length. This flag shall be equivalent to POLLRDNORM | POLLRDBAND.

POLLRDNORM — Normal data may be read without blocking.

OB XSR — For STREAMS, data on priority band 0 may be read without blocking. This flag is set in *revents* even if the message is of zero length.

POLLRDBAND — Priority data may be read without blocking.

OB XSR — For STREAMS, data on priority bands greater than 0 may be read without blocking. This flag is set in *revents* even if the message is of zero length.

POLLPRI — High-priority data may be read without blocking.

OB XSR — For STREAMS, this flag is set in *revents* even if the message is of zero length.

POLLOUT — Normal data may be written without blocking.

OB XSR — For STREAMS, data on priority band 0 may be written without blocking.

POLLWRNORM — Equivalent to POLLOUT.

POLLWRBAND — Priority data may be written.

OB XSR — For STREAMS, data on priority bands greater than 0 may be written without blocking. If any priority band has been written to on this STREAM, this event only examines bands that have been written to at least once.

POLLERR — An error has occurred on the device or stream. This flag is only valid in the *revents* bitmask; it shall be ignored in the *events* member.

POLLHUP — A device has been disconnected, or a pipe or FIFO has been closed by the last process that had it open for writing. Once set, the hangup state of a FIFO shall persist until some process opens the FIFO for writing or until all read-only file descriptors for the FIFO are closed. This event and POLLOUT are mutually-exclusive; a stream can never be writable if a hangup has occurred. However, this event and POLLIN, POLLRDNORM, POLLRDBAND, or POLLPRI are not mutually-exclusive. This flag is only valid in the *revents* bitmask; it shall be

ignored in the *events* member.

POLLNVAL The specified *fd* value is invalid. This flag is only valid in the *revents* member; it shall ignored in the *events* member.

The significance and semantics of normal, priority, and high-priority data are file and device-specific.

If the value of *fd* is less than 0, *events* shall be ignored, and *revents* shall be set to 0 in that entry on return from *poll*( ).

In each **pollfd** structure, *poll*( ) shall clear the *revents* member, except that where the application requested a report on a condition by setting one of the bits of *events* listed above, *poll*( ) shall set the corresponding bit in *revents* if the requested condition is true. In addition, *poll*( ) shall set the POLLHUP, POLLERR, and POLLNVAL flag in *revents* if the condition is true, even if the application did not set the corresponding bit in *events*.

If none of the defined events have occurred on any selected file descriptor, *poll*( ) shall wait at least *timeout* milliseconds for an event to occur on any of the selected file descriptors. If the value of *timeout* is 0, *poll*( ) shall return immediately. If the value of *timeout* is –1, *poll*( ) shall block until a requested event occurs or until the call is interrupted.

Implementations may place limitations on the granularity of timeout intervals. If the requested timeout interval requires a finer granularity than the implementation supports, the actual timeout interval shall be rounded up to the next supported value.

The *poll*( ) function shall not be affected by the O_NONBLOCK flag.

The *poll*( ) function shall support regular files, terminal and pseudo-terminal devices, FIFOs, OB XSR pipes, sockets and STREAMS-based files. The behavior of *poll*( ) on elements of *fds* that refer to other types of file is unspecified.

Regular files shall always poll TRUE for reading and writing.

A file descriptor for a socket that is listening for connections shall indicate that it is ready for reading, once connections are available. A file descriptor for a socket that is connecting asynchronously shall indicate that it is ready for writing, once a connection has been established.

RETURN VALUE

Upon successful completion, *poll*( ) shall return a non-negative value. A positive value indicates the total number of file descriptors that have been selected (that is, file descriptors for which the *revents* member is non-zero). A value of 0 indicates that the call timed out and no file descriptors have been selected. Upon failure, *poll*( ) shall return –1 and set *errno* to indicate the error.

ERRORS

The *poll*( ) function shall fail if:

[EAGAIN] The allocation of internal data structures failed but a subsequent request may succeed.

[EINTR] A signal was caught during *poll*( ).

OB XSR [EINVAL] The *nfds* argument is greater than {OPEN_MAX}, or one of the *fd* members refers to a STREAM or multiplexer that is linked (directly or indirectly) downstream from a multiplexer.

EXAMPLES

Checking for Events on a Stream

The following example opens a pair of STREAMS devices and then waits for either one to become writable. This example proceeds as follows:

1. Sets the *timeout* parameter to 500 milliseconds.
2. Opens the STREAMS devices **/dev/dev0** and **/dev/dev1**, and then polls them, specifying POLLOUT and POLLWRBAND as the events of interest.

   The STREAMS device names **/dev/dev0** and **/dev/dev1** are only examples of how STREAMS devices can be named; STREAMS naming conventions may vary among systems conforming to the POSIX.1-200x.
3. Uses the *ret* variable to determine whether an event has occurred on either of the two STREAMS. The *poll*( ) function is given 500 milliseconds to wait for an event to occur (if it has not occurred prior to the *poll*( ) call).
4. Checks the returned value of *ret*. If a positive value is returned, one of the following can be done:
   a. Priority data can be written to the open STREAM on priority bands greater than 0, because the POLLWRBAND event occurred on the open STREAM (*fds*[0] or *fds*[1]).
   b. Data can be written to the open STREAM on priority-band 0, because the POLLOUT event occurred on the open STREAM (*fds*[0] or *fds*[1]).
5. If the returned value is not a positive value, permission to write data to the open STREAM (on any priority band) is denied.
6. If the POLLHUP event occurs on the open STREAM (*fds*[0] or *fds*[1]), the device on the open STREAM has disconnected.

```
#include <stropts.h>
#include <poll.h>
...
struct pollfd fds[2];
int timeout_msecs = 500;
int ret;
    int i;

/* Open STREAMS device. */
fds[0].fd = open("/dev/dev0", ...);
fds[1].fd = open("/dev/dev1", ...);
fds[0].events = POLLOUT | POLLWRBAND;
fds[1].events = POLLOUT | POLLWRBAND;

ret = poll(fds, 2, timeout_msecs);

if (ret > 0) {
    /* An event on one of the fds has occurred. */
    for (i=0; i<2; i++) {
        if (fds[i].revents & POLLWRBAND) {
        /* Priority data may be written on device number i. */
...
        }
        if (fds[i].revents & POLLOUT) {
```

```
                /* Data may be written on device number i. */
        ...
                }
                if (fds[i].revents & POLLHUP) {
                /* A hangup has occurred on device number i. */
        ...
                }
            }
        }
```

APPLICATION USAGE

None.

RATIONALE

The POLLHUP event does not occur for FIFOs just because the FIFO is not open for writing. It only occurs when the FIFO is closed by the last writer and persists until some process opens the FIFO for writing or until all read-only file descriptors for the FIFO are closed.

FUTURE DIRECTIONS

None.

XBD **<poll.h>**, **<stropts.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The description of POLLWRBAND is updated.

Issue 6

Text referring to sockets is added to the DESCRIPTION.

Functionality relating to the XSI STREAMS Option Group is marked.

The Open Group Corrigendum U055/3 is applied, updating the DESCRIPTION of POLLWRBAND.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/66 is applied, correcting the spacing in the EXAMPLES section.

Issue 7

Austin Group Interpretation 1003.1-2001 #209 is applied, clarifying the POLLHUP event.

The *poll( )* function is moved from the XSI option to the Base.

Functionality relating to the XSI STREAMS option is marked obsolescent.

NAME

popen — initiate pipe streams to or from a process

SYNOPSIS

CX
```
#include <stdio.h>

FILE *popen(const char *command, const char *mode);
```

DESCRIPTION

The *popen*( ) function shall execute the command specified by the string *command*. It shall create a pipe between the calling program and the executed command, and shall return a pointer to a stream that can be used to either read from or write to the pipe.

The environment of the executed command shall be as if a child process were created within the *popen*( ) call using the *fork*( ) function, and the child invoked the *sh* utility using the call:

```
execl(shell path, "sh", "-c", command, (char *)0);
```

where *shell path* is an unspecified pathname for the *sh* utility.

The *popen*( ) function shall ensure that any streams from previous *popen*( ) calls that remain open in the parent process are closed in the new child process.

The *mode* argument to *popen*( ) is a string that specifies I/O mode:

1. If *mode* is *r*, when the child process is started, its file descriptor STDOUT_FILENO shall be the writable end of the pipe, and the file descriptor *fileno*(*stream*) in the calling process, where *stream* is the stream pointer returned by *popen*( ), shall be the readable end of the pipe.
2. If *mode* is *w*, when the child process is started its file descriptor STDIN_FILENO shall be the readable end of the pipe, and the file descriptor *fileno*(*stream*) in the calling process, where *stream* is the stream pointer returned by *popen*( ), shall be the writable end of the pipe.
3. If *mode* is any other value, the result is unspecified.

After *popen*( ), both the parent and the child process shall be capable of executing independently before either terminates.

Pipe streams are byte-oriented.

RETURN VALUE

Upon successful completion, *popen*( ) shall return a pointer to an open stream that can be used to read or write to the pipe. Otherwise, it shall return a null pointer and may set *errno* to indicate the error.

ERRORS

The *popen*( ) function shall fail if:

[EMFILE] {STREAM_MAX} streams are currently open in the calling process.

The *popen*( ) function may fail if:

[EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

[EINVAL] The *mode* argument is invalid.

The *popen*( ) function may also set *errno* values as described by *fork*( ) or *pipe*( ).

EXAMPLES

Using popen( ) to Obtain a List of Files from the ls Utility

The following example demonstrates the use of *popen*( ) and *pclose*( ) to execute the command *ls** in order to obtain a list of files in the current directory:

```
#include <stdio.h>
...

FILE *fp;
int status;
char path[PATH_MAX];

fp = popen("ls *", "r");
if (fp == NULL)
    /* Handle error */;

while (fgets(path, PATH_MAX, fp) != NULL)
    printf("%s", path);

status = pclose(fp);
if (status == -1) {
    /* Error reported by pclose() */
    ...
} else {
    /* Use macros described under wait() to inspect 'status' in order
       to determine success/failure of command executed by popen() */
    ...
}
```

APPLICATION USAGE

Since open files are shared, a mode *r* command can be used as an input filter and a mode *w* command as an output filter.

Buffered reading before opening an input filter may leave the standard input of that filter mispositioned. Similar problems with an output filter may be prevented by careful buffer flushing; for example, with *fflush*( ).

A stream opened by *popen*( ) should be closed by *pclose*( ).

The behavior of *popen*( ) is specified for values of *mode* of *r* and *w*. Other modes such as *rb* and *wb* might be supported by specific implementations, but these would not be portable features. Note that historical implementations of *popen*( ) only check to see if the first character of *mode* is *r*. Thus, a *mode* of *robert the robot* would be treated as *mode r*, and a *mode* of *anything else* would be treated as *mode w*.

If the application calls *waitpid*( ) or *waitid*( ) with a *pid* argument greater than 0, and it still has a stream that was called with *popen*( ) open, it must ensure that *pid* does not refer to the process started by *popen*( ).

To determine whether or not the environment specified in the Shell and Utilities volume of POSIX.1-200x is present, use the function call:

```
sysconf(_SC_2_VERSION)
```

(See *sysconf*( )).

RATIONALE

The *popen*( ) function should not be used by programs that have set user (or group) ID privileges. The *fork*( ) and *exec* family of functions (except *execlp*( ) and *execvp*( )), should be used instead. This prevents any unforeseen manipulation of the environment of the user that could cause execution of commands not anticipated by the calling program.

If the original and *popen*( )ed processes both intend to read or write or read and write a common file, and either will be using FILE-type C functions (*fread*( ), *fwrite*( ), and so on), the rules for sharing file handles must be observed (see Section 2.5.1, on page 491).

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A statement is added to the DESCRIPTION indicating that pipe streams are byte-oriented.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The optional [EMFILE] error condition is added.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/67 is applied, adding the example to the EXAMPLES section.

Issue 7

Austin Group Interpretation 1003.1-2001 #029 is applied, clarifying the values for *mode* in the DESCRIPTION.

SD5-XSH-ERN-149 is applied, changing the {STREAM_MAX} [EMFILE] error condition from a "may fail" to a "shall fail".

NAME

posix_fadvise — file advisory information (**ADVANCED REALTIME**)

SYNOPSIS

ADV
```
#include <fcntl.h>

int posix_fadvise(int fd, off_t offset, off_t len, int advice);
```

DESCRIPTION

The *posix_fadvise*( ) function shall advise the implementation on the expected behavior of the application with respect to the data in the file associated with the open file descriptor, *fd*, starting at *offset* and continuing for *len* bytes. The specified range need not currently exist in the file. If *len* is zero, all data following *offset* is specified. The implementation may use this information to optimize handling of the specified data. The *posix_fadvise*( ) function shall have no effect on the semantics of other operations on the specified data, although it may affect the performance of other operations.

The advice to be applied to the data is specified by the *advice* parameter and may be one of the following values:

POSIX_FADV_NORMAL
: Specifies that the application has no advice to give on its behavior with respect to the specified data. It is the default characteristic if no advice is given for an open file.

POSIX_FADV_SEQUENTIAL
: Specifies that the application expects to access the specified data sequentially from lower offsets to higher offsets.

POSIX_FADV_RANDOM
: Specifies that the application expects to access the specified data in a random order.

POSIX_FADV_WILLNEED
: Specifies that the application expects to access the specified data in the near future.

POSIX_FADV_DONTNEED
: Specifies that the application expects that it will not access the specified data in the near future.

POSIX_FADV_NOREUSE
: Specifies that the application expects to access the specified data once and then not reuse it thereafter.

These values are defined in **<fcntl.h>**.

RETURN VALUE

Upon successful completion, *posix_fadvise*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *posix_fadvise*( ) function shall fail if:

[EBADF] The *fd* argument is not a valid file descriptor.

[EINVAL] The value of *advice* is invalid, or the value of *len* is less than zero.

[ESPIPE] The *fd* argument is associated with a pipe or FIFO.

EXAMPLES

None.

APPLICATION USAGE

The *posix_fadvise*( ) function is part of the Advisory Information option and need not be provided on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/68 is applied, changing the function prototype in the SYNOPSIS section. The previous prototype was not large file-aware, and the standard developers felt it acceptable to make this change before implementations of this function become widespread.

Issue 7

Austin Group Interpretation 1003.1-2001 #024 is applied, changing the definition of the [EINVAL] error.

NAME

posix_fallocate — file space control (**ADVANCED REALTIME**)

SYNOPSIS

ADV

```
#include <fcntl.h>

int posix_fallocate(int fd, off_t offset, off_t len);
```

DESCRIPTION

The *posix_fallocate*( ) function shall ensure that any required storage for regular file data starting at *offset* and continuing for *len* bytes is allocated on the file system storage media. If *posix_fallocate*( ) returns successfully, subsequent writes to the specified file data shall not fail due to the lack of free space on the file system storage media.

If the *offset*+*len* is beyond the current file size, then *posix_fallocate*( ) shall adjust the file size to *offset*+*len*. Otherwise, the file size shall not be changed.

It is implementation-defined whether a previous *posix_fadvise*( ) call influences allocation strategy.

Space allocated via *posix_fallocate*( ) shall be freed by a successful call to *creat*( ) or *open*( ) that truncates the size of the file. Space allocated via *posix_fallocate*( ) may be freed by a successful call to *ftruncate*( ) that reduces the file size to a size smaller than *offset*+*len*.

RETURN VALUE

Upon successful completion, *posix_fallocate*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *posix_fallocate*( ) function shall fail if:

[EBADF] The *fd* argument is not a valid file descriptor.

[EBADF] The *fd* argument references a file that was opened without write permission.

[EFBIG] The value of *offset*+*len* is greater than the maximum file size.

[EINTR] A signal was caught during execution.

[EINVAL] The *len* argument is less than zero, or the *offset* argument is less than zero, or the underlying file system does not support this operation.

[EIO] An I/O error occurred while reading from or writing to a file system.

[ENODEV] The *fd* argument does not refer to a regular file.

[ENOSPC] There is insufficient free space remaining on the file system storage media.

[ESPIPE] The *fd* argument is associated with a pipe or FIFO.

The *posix_fallocate*( ) function may fail if:

[EINVAL] The *len* argument is zero.

EXAMPLES

None.

APPLICATION USAGE

The *posix_fallocate*( ) function is part of the Advisory Information option and need not be provided on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 7

Austin Group Interpretations 1003.1-2001 #022, #024, and #162 are applied, changing the definition of the [EINVAL] error.

NAME

posix_madvise — memory advisory information and alignment control (**ADVANCED REALTIME**)

SYNOPSIS

ADV
```
#include <sys/mman.h>

int posix_madvise(void *addr, size_t len, int advice);
```

DESCRIPTION

The *posix_madvise*( ) function shall advise the implementation on the expected behavior of the application with respect to the data in the memory starting at address *addr*, and continuing for *len* bytes. The implementation may use this information to optimize handling of the specified data. The *posix_madvise*( ) function shall have no effect on the semantics of access to memory in the specified range, although it may affect the performance of access.

The implementation may require that *addr* be a multiple of the page size, which is the value returned by *sysconf*( ) when the name value _SC_PAGESIZE is used.

The advice to be applied to the memory range is specified by the *advice* parameter and may be one of the following values:

POSIX_MADV_NORMAL
: Specifies that the application has no advice to give on its behavior with respect to the specified range. It is the default characteristic if no advice is given for a range of memory.

POSIX_MADV_SEQUENTIAL
: Specifies that the application expects to access the specified range sequentially from lower addresses to higher addresses.

POSIX_MADV_RANDOM
: Specifies that the application expects to access the specified range in a random order.

POSIX_MADV_WILLNEED
: Specifies that the application expects to access the specified range in the near future.

POSIX_MADV_DONTNEED
: Specifies that the application expects that it will not access the specified range in the near future.

These values are defined in the **<sys/mman.h>** header.

RETURN VALUE

Upon successful completion, *posix_madvise*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *posix_madvise*( ) function shall fail if:

[EINVAL] The value of *advice* is invalid.

[ENOMEM] Addresses in the range starting at *addr* and continuing for *len* bytes are partly or completely outside the range allowed for the address space of the calling process.

The *posix_madvise*( ) function may fail if:

[EINVAL] The value of *addr* is not a multiple of the value returned by *sysconf*( ) when the name value _SC_PAGESIZE is used.

[EINVAL] The value of *len* is zero.

EXAMPLES

None.

APPLICATION USAGE

The *posix_madvise*( ) function is part of the Advisory Information option and need not be provided on all implementations.

IEEE PASC Interpretation 1003.1 #102 is applied.

NAME

posix_mem_offset — find offset and length of a mapped typed memory block (**ADVANCED REALTIME**)

SYNOPSIS

TYM
```
#include <sys/mman.h>

int posix_mem_offset(const void *restrict addr, size_t len,
    off_t *restrict off, size_t *restrict contig_len,
    int *restrict fildes);
```

DESCRIPTION

The *posix_mem_offset*( ) function shall return in the variable pointed to by *off* a value that identifies the offset (or location), within a memory object, of the memory block currently mapped at *addr*. The function shall return in the variable pointed to by *fildes*, the descriptor used (via *mmap*( )) to establish the mapping which contains *addr*. If that descriptor was closed since the mapping was established, the returned value of *fildes* shall be –1. The *len* argument specifies the length of the block of the memory object the user wishes the offset for; upon return, the value pointed to by *contig_len* shall equal either *len*, or the length of the largest contiguous block of the memory object that is currently mapped to the calling process starting at *addr*, whichever is smaller.

If the memory object mapped at *addr* is a typed memory object, then if the *off* and *contig_len* values obtained by calling *posix_mem_offset*( ) are used in a call to *mmap*( ) with a file descriptor that refers to the same memory pool as *fildes* (either through the same port or through a different port), and that was opened with neither the POSIX_TYPED_MEM_ALLOCATE nor the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, the typed memory area that is mapped shall be exactly the same area that was mapped at *addr* in the address space of the process that called *posix_mem_offset*( ).

If the memory object specified by *fildes* is not a typed memory object, then the behavior of this function is implementation-defined.

RETURN VALUE

Upon successful completion, the *posix_mem_offset*( ) function shall return zero; otherwise, the corresponding error status value shall be returned.

ERRORS

The *posix_mem_offset*( ) function shall fail if:

[EACCES] The process has not mapped a memory object supported by this function at the given address *addr*.

This function shall not return an error code of [EINTR].

NAME

posix_memalign — aligned memory allocation (**ADVANCED REALTIME**)

SYNOPSIS

ADV

```
#include <stdlib.h>

int posix_memalign(void **memptr, size_t alignment, size_t size);
```

DESCRIPTION

The *posix_memalign*( ) function shall allocate *size* bytes aligned on a boundary specified by *alignment*, and shall return a pointer to the allocated memory in *memptr*. The value of *alignment* shall be a power of two multiple of *sizeof* (**void** *).

Upon successful completion, the value pointed to by *memptr* shall be a multiple of *alignment*.

If the size of the space requested is 0, the behavior is implementation-defined; the value returned in *memptr* shall be either a null pointer or a unique pointer.

CX The *free*( ) function shall deallocate memory that has previously been allocated by *posix_memalign*( ).

RETURN VALUE

Upon successful completion, *posix_memalign*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *posix_memalign*( ) function shall fail if:

[EINVAL] The value of the alignment parameter is not a power of two multiple of *sizeof* (**void** *).

[ENOMEM] There is insufficient memory available with the requested alignment.

EXAMPLES

None.

APPLICATION USAGE

The *posix_memalign*( ) function is part of the Advisory Information option and need not be provided on all implementations.

NAME

posix_openpt — open a pseudo-terminal device

SYNOPSIS

XSI
```
#include <stdlib.h>
#include <fcntl.h>

int posix_openpt(int oflag);
```

DESCRIPTION

The *posix_openpt*( ) function shall establish a connection between a master device for a pseudo-terminal and a file descriptor. The file descriptor is used by other I/O functions that refer to that pseudo-terminal.

The file status flags and file access modes of the open file description shall be set according to the value of *oflag*.

Values for *oflag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in **<fcntl.h>**:

O_RDWR Open for reading and writing.

O_NOCTTY If set *posix_openpt*( ) shall not cause the terminal device to become the controlling terminal for the process.

The behavior of other values for the *oflag* argument is unspecified.

RETURN VALUE

Upon successful completion, the *posix_openpt*( ) function shall open a master pseudo-terminal device and return a non-negative integer representing the lowest numbered unused file descriptor. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *posix_openpt*( ) function shall fail if:

[EMFILE] All file descriptors available to the process are currently open.

[ENFILE] The maximum allowable number of files is currently open in the system.

The *posix_openpt*( ) function may fail if:

[EINVAL] The value of *oflag* is not valid.

[EAGAIN] Out of pseudo-terminal resources.

OB XSR [ENOSR] Out of STREAMS resources.

EXAMPLES

Opening a Pseudo-Terminal and Returning the Name of the Slave Device and a File Descriptor

```
#include <fcntl.h>
#include <stdio.h>

int masterfd, slavefd;
char *slavedevice;

masterfd = posix_openpt(O_RDWR|O_NOCTTY);

if (masterfd == -1
    || grantpt (masterfd) == -1
```

```
        || unlockpt (masterfd) == -1
        || (slavedevice = ptsname (masterfd)) == NULL)
        return -1;
    printf("slave device is: %s\n", slavedevice);
    slavefd = open(slavedevice, O_RDWR|O_NOCTTY);
    if (slavefd < 0)
        return -1;
```

APPLICATION USAGE

This function is a method for portably obtaining a file descriptor of a master terminal device for a pseudo-terminal. The *grantpt*( ) and *ptsname*( ) functions can be used to manipulate mode and ownership permissions, and to obtain the name of the slave device, respectively.

RATIONALE

The standard developers considered the matter of adding a special device for cloning master pseudo-terminals: the **/dev/ptmx** device. However, consensus could not be reached, and it was felt that adding a new function would permit other implementations. The *posix_openpt*( ) function is designed to complement the *grantpt*( ), *ptsname*( ), and *unlockpt*( ) functions.

On implementations supporting the **/dev/ptmx** clone device, opening the master device of a pseudo-terminal is simply:

```
mfdp = open("/dev/ptmx", oflag );
if (mfdp < 0)
    return -1;
```

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6.

Issue 7

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

SD5-XSH-ERN-51 is applied, correcting an error in the EXAMPLES section.

NAME

posix_spawn, posix_spawnp — spawn a process (**ADVANCED REALTIME**)

SYNOPSIS

SPN

```
#include <spawn.h>

int posix_spawn(pid_t *restrict pid, const char *restrict path,
    const posix_spawn_file_actions_t *file_actions,
    const posix_spawnattr_t *restrict attrp,
    char *const argv[restrict], char *const envp[restrict]);
int posix_spawnp(pid_t *restrict pid, const char *restrict file,
    const posix_spawn_file_actions_t *file_actions,
    const posix_spawnattr_t *restrict attrp,
    char *const argv[restrict], char *const envp[restrict]);
```

DESCRIPTION

The *posix_spawn*( ) and *posix_spawnp*( ) functions shall create a new process (child process) from the specified process image. The new process image shall be constructed from a regular executable file called the new process image file.

When a C program is executed as the result of this call, it shall be entered as a C-language function call as follows:

```
int main(int argc, char *argv[]);
```

where *argc* is the argument count and *argv* is an array of character pointers to the arguments themselves. In addition, the following variable:

```
extern char **environ;
```

shall be initialized as a pointer to an array of character pointers to the environment strings.

The argument *argv* is an array of character pointers to null-terminated strings. The last member of this array shall be a null pointer and is not counted in *argc*. These strings constitute the argument list available to the new process image. The value in *argv*[0] should point to a filename that is associated with the process image being started by the *posix_spawn*( ) or *posix_spawnp*( ) function.

The argument *envp* is an array of character pointers to null-terminated strings. These strings constitute the environment for the new process image. The environment array is terminated by a null pointer.

The number of bytes available for the combined argument and environment lists of the child process is {ARG_MAX}. The implementation shall specify in the system documentation (see XBD Chapter 2, on page 15) whether any list overhead, such as length words, null terminators, pointers, or alignment bytes, is included in this total.

The *path* argument to *posix_spawn*( ) is a pathname that identifies the new process image file to execute.

The *file* parameter to *posix_spawnp*( ) shall be used to construct a pathname that identifies the new process image file. If the *file* parameter contains a <slash> character, the *file* parameter shall be used as the pathname for the new process image file. Otherwise, the path prefix for this file shall be obtained by a search of the directories passed as the environment variable *PATH* (see XBD Chapter 8, on page 173). If this environment variable is not defined, the results of the search are implementation-defined.

If *file_actions* is a null pointer, then file descriptors open in the calling process shall remain open

in the child process, except for those whose close-on-*exec* flag FD_CLOEXEC is set (see *fcntl( )*). For those file descriptors that remain open, all attributes of the corresponding open file descriptions, including file locks (see *fcntl( )*), shall remain unchanged.

If *file_actions* is not NULL, then the file descriptors open in the child process shall be those open in the calling process as modified by the spawn file actions object pointed to by *file_actions* and the FD_CLOEXEC flag of each remaining open file descriptor after the spawn file actions have been processed. The effective order of processing the spawn file actions shall be:

1. The set of open file descriptors for the child process shall initially be the same set as is open for the calling process. All attributes of the corresponding open file descriptions, including file locks (see *fcntl( )*), shall remain unchanged.
2. The signal mask, signal default actions, and the effective user and group IDs for the child process shall be changed as specified in the attributes object referenced by *attrp*.
3. The file actions specified by the spawn file actions object shall be performed in the order in which they were added to the spawn file actions object.
4. Any file descriptor that has its FD_CLOEXEC flag set (see *fcntl( )*) shall be closed.

The **posix_spawnattr_t** spawn attributes object type is defined in **<spawn.h>**. It shall contain at least the attributes defined below.

If the POSIX_SPAWN_SETPGROUP flag is set in the *spawn-flags* attribute of the object referenced by *attrp*, and the *spawn-pgroup* attribute of the same object is non-zero, then the child's process group shall be as specified in the *spawn-pgroup* attribute of the object referenced by *attrp*.

As a special case, if the POSIX_SPAWN_SETPGROUP flag is set in the *spawn-flags* attribute of the object referenced by *attrp*, and the *spawn-pgroup* attribute of the same object is set to zero, then the child shall be in a new process group with a process group ID equal to its process ID.

If the POSIX_SPAWN_SETPGROUP flag is not set in the *spawn-flags* attribute of the object referenced by *attrp*, the new child process shall inherit the parent's process group.

PS If the POSIX_SPAWN_SETSCHEDPARAM flag is set in the *spawn-flags* attribute of the object referenced by *attrp*, but POSIX_SPAWN_SETSCHEDULER is not set, the new process image shall initially have the scheduling policy of the calling process with the scheduling parameters specified in the *spawn-schedparam* attribute of the object referenced by *attrp*.

If the POSIX_SPAWN_SETSCHEDULER flag is set in the *spawn-flags* attribute of the object referenced by *attrp* (regardless of the setting of the POSIX_SPAWN_SETSCHEDPARAM flag), the new process image shall initially have the scheduling policy specified in the *spawn-schedpolicy* attribute of the object referenced by *attrp* and the scheduling parameters specified in the *spawn-schedparam* attribute of the same object.

The POSIX_SPAWN_RESETIDS flag in the *spawn-flags* attribute of the object referenced by *attrp* governs the effective user ID of the child process. If this flag is not set, the child process shall inherit the effective user ID of the parent process. If this flag is set, the effective user ID of the child process shall be reset to the parent's real user ID. In either case, if the set-user-ID mode bit of the new process image file is set, the effective user ID of the child process shall become that file's owner ID before the new process image begins execution.

The POSIX_SPAWN_RESETIDS flag in the *spawn-flags* attribute of the object referenced by *attrp* also governs the effective group ID of the child process. If this flag is not set, the child process shall inherit the effective group ID of the parent process. If this flag is set, the effective group ID of the child process shall be reset to the parent's real group ID. In either case, if the set-group-ID mode bit of the new process image file is set, the effective group ID of the child process shall

become that file's group ID before the new process image begins execution.

If the POSIX_SPAWN_SETSIGMASK flag is set in the *spawn-flags* attribute of the object referenced by *attrp*, the child process shall initially have the signal mask specified in the *spawn-sigmask* attribute of the object referenced by *attrp*.

If the POSIX_SPAWN_SETSIGDEF flag is set in the *spawn-flags* attribute of the object referenced by *attrp*, the signals specified in the *spawn-sigdefault* attribute of the same object shall be set to their default actions in the child process. Signals set to the default action in the parent process shall be set to the default action in the child process.

Signals set to be caught by the calling process shall be set to the default action in the child process.

Except for SIGCHLD, signals set to be ignored by the calling process image shall be set to be ignored by the child process, unless otherwise specified by the POSIX_SPAWN_SETSIGDEF flag being set in the *spawn-flags* attribute of the object referenced by *attrp* and the signals being indicated in the *spawn-sigdefault* attribute of the object referenced by *attrp*.

If the SIGCHLD signal is set to be ignored by the calling process, it is unspecified whether the SIGCHLD signal is set to be ignored or to the default action in the child process, unless otherwise specified by the POSIX_SPAWN_SETSIGDEF flag being set in the *spawn_flags* attribute of the object referenced by *attrp* and the SIGCHLD signal being indicated in the *spawn_sigdefault* attribute of the object referenced by *attrp*.

If the value of the *attrp* pointer is NULL, then the default values are used.

All process attributes, other than those influenced by the attributes set in the object referenced by *attrp* as specified above or by the file descriptor manipulations specified in *file_actions*, shall appear in the new process image as though *fork*( ) had been called to create a child process and then a member of the *exec* family of functions had been called by the child process to execute the new process image.

It is implementation-defined whether the fork handlers are run when *posix_spawn*( ) or *posix_spawnp*( ) is called.

RETURN VALUE

Upon successful completion, *posix_spawn*( ) and *posix_spawnp*( ) shall return the process ID of the child process to the parent process, in the variable pointed to by a non-NULL *pid* argument, and shall return zero as the function return value. Otherwise, no child process shall be created, the value stored into the variable pointed to by a non-NULL *pid* is unspecified, and an error number shall be returned as the function return value to indicate the error. If the *pid* argument is a null pointer, the process ID of the child is not returned to the caller.

ERRORS

These functions may fail if:

[EINVAL] The value specified by *file_actions* or *attrp* is invalid.

If this error occurs after the calling process successfully returns from the *posix_spawn*( ) or *posix_spawnp*( ) function, the child process may exit with exit status 127.

If *posix_spawn*( ) or *posix_spawnp*( ) fail for any of the reasons that would cause *fork*( ) or one of the *exec* family of functions to fail, an error value shall be returned as described by *fork*( ) and *exec*, respectively (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

If POSIX_SPAWN_SETPGROUP is set in the *spawn-flags* attribute of the object referenced by *attrp*, and *posix_spawn*( ) or *posix_spawnp*( ) fails while changing the child's process group, an

error value shall be returned as described by *setpgid*( ) (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

PS If POSIX_SPAWN_SETSCHEDPARAM is set and POSIX_SPAWN_SETSCHEDULER is not set in the *spawn-flags* attribute of the object referenced by *attrp*, then if *posix_spawn*( ) or *posix_spawnp*( ) fails for any of the reasons that would cause *sched_setparam*( ) to fail, an error value shall be returned as described by *sched_setparam*( ) (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

If POSIX_SPAWN_SETSCHEDULER is set in the *spawn-flags* attribute of the object referenced by *attrp*, and if *posix_spawn*( ) or *posix_spawnp*( ) fails for any of the reasons that would cause *sched_setscheduler*( ) to fail, an error value shall be returned as described by *sched_setscheduler*( ) (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

If the *file_actions* argument is not NULL, and specifies any *close*, *dup2*, or *open* actions to be performed, and if *posix_spawn*( ) or *posix_spawnp*( ) fails for any of the reasons that would cause *close*( ), *dup2*( ), or *open*( ) to fail, an error value shall be returned as described by *close*( ), *dup2*( ), and *open*( ), respectively (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127). An open file action may, by itself, result in any of the errors described by *close*( ) or *dup2*( ), in addition to those described by *open*( ).

EXAMPLES

None.

APPLICATION USAGE

These functions are part of the Spawn option and need not be provided on all implementations.

RATIONALE

The *posix_spawn*( ) function and its close relation *posix_spawnp*( ) have been introduced to overcome the following perceived difficulties with *fork*( ): the *fork*( ) function is difficult or impossible to implement without swapping or dynamic address translation.

- Swapping is generally too slow for a realtime environment.
- Dynamic address translation is not available everywhere that POSIX might be useful.
- Processes are too useful to simply option out of POSIX whenever it must run without address translation or other MMU services.

Thus, POSIX needs process creation and file execution primitives that can be efficiently implemented without address translation or other MMU services.

The *posix_spawn*( ) function is implementable as a library routine, but both *posix_spawn*( ) and *posix_spawnp*( ) are designed as kernel operations. Also, although they may be an efficient replacement for many *fork*( )/*exec* pairs, their goal is to provide useful process creation primitives for systems that have difficulty with *fork*( ), not to provide drop-in replacements for *fork*( )/*exec*.

This view of the role of *posix_spawn*( ) and *posix_spawnp*( ) influenced the design of their API. It does not attempt to provide the full functionality of *fork*( )/*exec* in which arbitrary user-specified operations of any sort are permitted between the creation of the child process and the execution of the new process image; any attempt to reach that level would need to provide a programming language as parameters. Instead, *posix_spawn*( ) and *posix_spawnp*( ) are process creation primitives like the *Start_Process* and *Start_Process_Search* Ada language bindings package *POSIX_Process_Primitives* and also like those in many operating systems that are not UNIX systems, but with some POSIX-specific additions.

To achieve its coverage goals, *posix_spawn*( ) and *posix_spawnp*( ) have control of six types of inheritance: file descriptors, process group ID, user and group ID, signal mask, scheduling, and whether each signal ignored in the parent will remain ignored in the child, or be reset to its default action in the child.

Control of file descriptors is required to allow an independently written child process image to access data streams opened by and even generated or read by the parent process without being specifically coded to know which parent files and file descriptors are to be used. Control of the process group ID is required to control how the job control of the child process relates to that of the parent.

Control of the signal mask and signal defaulting is sufficient to support the implementation of *system*( ). Although support for *system*( ) is not explicitly one of the goals for *posix_spawn*( ) and *posix_spawnp*( ), it is covered under the "at least 50%" coverage goal.

The intention is that the normal file descriptor inheritance across *fork*( ), the subsequent effect of the specified spawn file actions, and the normal file descriptor inheritance across one of the *exec* family of functions should fully specify open file inheritance. The implementation need make no decisions regarding the set of open file descriptors when the child process image begins execution, those decisions having already been made by the caller and expressed as the set of open file descriptors and their FD_CLOEXEC flags at the time of the call and the spawn file actions object specified in the call. We have been assured that in cases where the POSIX *Start_Process* Ada primitives have been implemented in a library, this method of controlling file descriptor inheritance may be implemented very easily.

We can identify several problems with *posix_spawn*( ) and *posix_spawnp*( ), but there does not appear to be a solution that introduces fewer problems. Environment modification for child process attributes not specifiable via the *attrp* or *file_actions* arguments must be done in the parent process, and since the parent generally wants to save its context, it is more costly than similar functionality with *fork*( )/*exec*. It is also complicated to modify the environment of a multi-threaded process temporarily, since all threads must agree when it is safe for the environment to be changed. However, this cost is only borne by those invocations of *posix_spawn*( ) and *posix_spawnp*( ) that use the additional functionality. Since extensive modifications are not the usual case, and are particularly unlikely in time-critical code, keeping much of the environment control out of *posix_spawn*( ) and *posix_spawnp*( ) is appropriate design.

The *posix_spawn*( ) and *posix_spawnp*( ) functions do not have all the power of *fork*( )/*exec*. This is to be expected. The *fork*( ) function is a wonderfully powerful operation. We do not expect to duplicate its functionality in a simple, fast function with no special hardware requirements. It is worth noting that *posix_spawn*( ) and *posix_spawnp*( ) are very similar to the process creation operations on many operating systems that are not UNIX systems.

Requirements

The requirements for *posix_spawn*( ) and *posix_spawnp*( ) are:

- They must be implementable without an MMU or unusual hardware.
- They must be compatible with existing POSIX standards.

Additional goals are:

- They should be efficiently implementable.
- They should be able to replace at least 50% of typical executions of *fork*( ).

- A system with *posix_spawn*() and *posix_spawnp*() and without *fork*() should be useful, at least for realtime applications.
- A system with *fork*() and the *exec* family should be able to implement *posix_spawn*() and *posix_spawnp*() as library routines.

Two-Syntax

POSIX *exec* has several calling sequences with approximately the same functionality. These appear to be required for compatibility with existing practice. Since the existing practice for the *posix_spawn**() functions is otherwise substantially unlike POSIX, we feel that simplicity outweighs compatibility. There are, therefore, only two names for the *posix_spawn**() functions.

The parameter list does not differ between *posix_spawn*() and *posix_spawnp*(); *posix_spawnp*() interprets the second parameter more elaborately than *posix_spawn*().

Compatibility with POSIX.5 (Ada)

The *Start_Process* and *Start_Process_Search* procedures from the *POSIX_Process_Primitives* package from the Ada language binding to POSIX.1 encapsulate *fork*() and *exec* functionality in a manner similar to that of *posix_spawn*() and *posix_spawnp*(). Originally, in keeping with our simplicity goal, the standard developers had limited the capabilities of *posix_spawn*() and *posix_spawnp*() to a subset of the capabilities of *Start_Process* and *Start_Process_Search*; certain non-default capabilities were not supported. However, based on suggestions by the ballot group to improve file descriptor mapping or drop it, and on the advice of an Ada Language Bindings working group member, the standard developers decided that *posix_spawn*() and *posix_spawnp*() should be sufficiently powerful to implement *Start_Process* and *Start_Process_Search*. The rationale is that if the Ada language binding to such a primitive had already been approved as an IEEE standard, there can be little justification for not approving the functionally-equivalent parts of a C binding. The only three capabilities provided by *posix_spawn*() and *posix_spawnp*() that are not provided by *Start_Process* and *Start_Process_Search* are optionally specifying the child's process group ID, the set of signals to be reset to default signal handling in the child process, and the child's scheduling policy and parameters.

For the Ada language binding for *Start_Process* to be implemented with *posix_spawn*(), that binding would need to explicitly pass an empty signal mask and the parent's environment to *posix_spawn*() whenever the caller of *Start_Process* allowed these arguments to default, since *posix_spawn*() does not provide such defaults. The ability of *Start_Process* to mask user-specified signals during its execution is functionally unique to the Ada language binding and must be dealt with in the binding separately from the call to *posix_spawn*().

Process Group

The process group inheritance field can be used to join the child process with an existing process group. By assigning a value of zero to the *spawn-pgroup* attribute of the object referenced by *attrp*, the *setpgid*() mechanism will place the child process in a new process group.

Threads

Without the *posix_spawn*( ) and *posix_spawnp*( ) functions, systems without address translation can still use threads to give an abstraction of concurrency. In many cases, thread creation suffices, but it is not always a good substitute. The *posix_spawn*( ) and *posix_spawnp*( ) functions are considerably "heavier" than thread creation. Processes have several important attributes that threads do not. Even without address translation, a process may have base-and-bound memory protection. Each process has a process environment including security attributes and file capabilities, and powerful scheduling attributes. Processes abstract the behavior of non-uniform-memory-architecture multi-processors better than threads, and they are more convenient to use for activities that are not closely linked.

The *posix_spawn*( ) and *posix_spawnp*( ) functions may not bring support for multiple processes to every configuration. Process creation is not the only piece of operating system support required to support multiple processes. The total cost of support for multiple processes may be quite high in some circumstances. Existing practice shows that support for multiple processes is uncommon and threads are common among "tiny kernels". There should, therefore, probably continue to be AEPs for operating systems with only one process.

Asynchronous Error Notification

A library implementation of *posix_spawn*( ) or *posix_spawnp*( ) may not be able to detect all possible errors before it forks the child process. POSIX.1-200x provides for an error indication returned from a child process which could not successfully complete the spawn operation via a special exit status which may be detected using the status value returned by *wait*( ), *waitid*( ), and *waitpid*( ).

The *stat_val* interface and the macros used to interpret it are not well suited to the purpose of returning API errors, but they are the only path available to a library implementation. Thus, an implementation may cause the child process to exit with exit status 127 for any error detected during the spawn process after the *posix_spawn*( ) or *posix_spawnp*( ) function has successfully returned.

The standard developers had proposed using two additional macros to interpret *stat_val*. The first, WIFSPAWNFAIL, would have detected a status that indicated that the child exited because of an error detected during the *posix_spawn*( ) or *posix_spawnp*( ) operations rather than during actual execution of the child process image; the second, WSPAWNERRNO, would have extracted the error value if WIFSPAWNFAIL indicated a failure. Unfortunately, the ballot group strongly opposed this because it would make a library implementation of *posix_spawn*( ) or *posix_spawnp*( ) dependent on kernel modifications to *waitpid*( ) to be able to embed special information in *stat_val* to indicate a spawn failure.

The 8 bits of child process exit status that are guaranteed by POSIX.1-200x to be accessible to the waiting parent process are insufficient to disambiguate a spawn error from any other kind of error that may be returned by an arbitrary process image. No other bits of the exit status are required to be visible in *stat_val*, so these macros could not be strictly implemented at the library level. Reserving an exit status of 127 for such spawn errors is consistent with the use of this value by *system*( ) and *popen*( ) to signal failures in these operations that occur after the function has returned but before a shell is able to execute. The exit status of 127 does not uniquely identify this class of error, nor does it provide any detailed information on the nature of the failure. Note that a kernel implementation of *posix_spawn*( ) or *posix_spawnp*( ) is permitted (and encouraged) to return any possible error as the function value, thus providing more detailed failure information to the parent process.

Thus, no special macros are available to isolate asynchronous *posix_spawn*( ) or *posix_spawnp*( )

errors. Instead, errors detected by the *posix_spawn*( ) or *posix_spawnp*( ) operations in the context of the child process before the new process image executes are reported by setting the child's exit status to 127. The calling process may use the WIFEXITED and WEXITSTATUS macros on the *stat_val* stored by the *wait*( ) or *waitpid*( ) functions to detect spawn failures to the extent that other status values with which the child process image may exit (before the parent can conclusively determine that the child process image has begun execution) are distinct from exit status 127.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #103 is applied, noting that the signal default actions are changed as well as the signal mask in step 2.

IEEE PASC Interpretation 1003.1 #132 is applied.

Issue 7

Functionality relating to the Threads option is moved to the Base.

posix_spawn_file_actions_addclose( )

NAME

posix_spawn_file_actions_addclose, posix_spawn_file_actions_addopen — add close or open action to spawn file actions object (**ADVANCED REALTIME**)

SYNOPSIS

SPN

```
#include <spawn.h>

int posix_spawn_file_actions_addclose(posix_spawn_file_actions_t
    *file_actions, int fildes);
int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t
    *restrict file_actions, int fildes,
    const char *restrict path, int oflag, mode_t mode);
```

DESCRIPTION

These functions shall add or delete a close or open action to a spawn file actions object.

A spawn file actions object is of type **posix_spawn_file_actions_t** (defined in **<spawn.h>**) and is used to specify a series of actions to be performed by a *posix_spawn*( ) or *posix_spawnp*( ) operation in order to arrive at the set of open file descriptors for the child process given the set of open file descriptors of the parent. POSIX.1-200x does not define comparison or assignment operators for the type **posix_spawn_file_actions_t**.

A spawn file actions object, when passed to *posix_spawn*( ) or *posix_spawnp*( ), shall specify how the set of open file descriptors in the calling process is transformed into a set of potentially open file descriptors for the spawned process. This transformation shall be as if the specified sequence of actions was performed exactly once, in the context of the spawned process (prior to execution of the new process image), in the order in which the actions were added to the object; additionally, when the new process image is executed, any file descriptor (from this new set) which has its FD_CLOEXEC flag set shall be closed (see *posix_spawn*( )).

The *posix_spawn_file_actions_addclose*( ) function shall add a *close* action to the object referenced by *file_actions* that shall cause the file descriptor *fildes* to be closed (as if *close*(*fildes*) had been called) when a new process is spawned using this file actions object.

The *posix_spawn_file_actions_addopen*( ) function shall add an *open* action to the object referenced by *file_actions* that shall cause the file named by *path* to be opened (as if *open*(*path*, *oflag*, *mode*) had been called, and the returned file descriptor, if not *fildes*, had been changed to *fildes*) when a new process is spawned using this file actions object. If *fildes* was already an open file descriptor, it shall be closed before the new file is opened.

The string described by *path* shall be copied by the *posix_spawn_file_actions_addopen*( ) function.

RETURN VALUE

Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions shall fail if:

[EBADF] The value specified by *fildes* is negative or greater than or equal to {OPEN_MAX}.

These functions may fail if:

[EINVAL] The value specified by *file_actions* is invalid.

[ENOMEM] Insufficient memory exists to add to the spawn file actions object.

It shall not be considered an error for the *fildes* argument passed to these functions to specify a file descriptor for which the specified operation could not be performed at the time of the call. Any such error will be detected when the associated file actions object is later used during a *posix_spawn*( ) or *posix_spawnp*( ) operation.

EXAMPLES

None.

APPLICATION USAGE

These functions are part of the Spawn option and need not be provided on all implementations.

RATIONALE

A spawn file actions object may be initialized to contain an ordered sequence of *close*( ), *dup2*( ), and *open*( ) operations to be used by *posix_spawn*( ) or *posix_spawnp*( ) to arrive at the set of open file descriptors inherited by the spawned process from the set of open file descriptors in the parent at the time of the *posix_spawn*( ) or *posix_spawnp*( ) call. It had been suggested that the *close*( ) and *dup2*( ) operations alone are sufficient to rearrange file descriptors, and that files which need to be opened for use by the spawned process can be handled either by having the calling process open them before the *posix_spawn*( ) or *posix_spawnp*( ) call (and close them after), or by passing filenames to the spawned process (in *argv*) so that it may open them itself. The standard developers recommend that applications use one of these two methods when practical, since detailed error status on a failed open operation is always available to the application this way. However, the standard developers feel that allowing a spawn file actions object to specify open operations is still appropriate because:

1. It is consistent with equivalent POSIX.5 (Ada) functionality.
2. It supports the I/O redirection paradigm commonly employed by POSIX programs designed to be invoked from a shell. When such a program is the child process, it may not be designed to open files on its own.
3. It allows file opens that might otherwise fail or violate file ownership/access rights if executed by the parent process.

Regarding 2. above, note that the spawn open file action provides to *posix_spawn*( ) and *posix_spawnp*( ) the same capability that the shell redirection operators provide to *system*( ), only without the intervening execution of a shell; for example:

```
system ("myprog <file1 3<file2");
```

Regarding 3. above, note that if the calling process needs to open one or more files for access by the spawned process, but has insufficient spare file descriptors, then the open action is necessary to allow the *open*( ) to occur in the context of the child process after other file descriptors have been closed (that must remain open in the parent).

Additionally, if a parent is executed from a file having a "set-user-id" mode bit set and the POSIX_SPAWN_RESETIDS flag is set in the spawn attributes, a file created within the parent process will (possibly incorrectly) have the parent's effective user ID as its owner, whereas a file created via an *open*( ) action during *posix_spawn*( ) or *posix_spawnp*( ) will have the parent's real ID as its owner; and an open by the parent process may successfully open a file to which the real user should not have access or fail to open a file to which the real user should have access.

File Descriptor Mapping

The standard developers had originally proposed using an array which specified the mapping of child file descriptors back to those of the parent. It was pointed out by the ballot group that it is not possible to reshuffle file descriptors arbitrarily in a library implementation of *posix_spawn*( ) or *posix_spawnp*( ) without provision for one or more spare file descriptor entries (which simply may not be available). Such an array requires that an implementation develop a complex strategy to achieve the desired mapping without inadvertently closing the wrong file descriptor at the wrong time.

It was noted by a member of the Ada Language Bindings working group that the approved Ada Language *Start_Process* family of POSIX process primitives use a caller-specified set of file actions to alter the normal *fork*( )/*exec* semantics for inheritance of file descriptors in a very flexible way, yet no such problems exist because the burden of determining how to achieve the final file descriptor mapping is completely on the application. Furthermore, although the file actions interface appears frightening at first glance, it is actually quite simple to implement in either a library or the kernel.

FUTURE DIRECTIONS

None.

XBD **<spawn.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #105 is applied, adding a note to the DESCRIPTION that the string pointed to by *path* is copied by the *posix_spawn_file_actions_addopen*( ) function.

NAME

posix_spawn_file_actions_adddup2 — add dup2 action to spawn file actions object (**ADVANCED REALTIME**)

SYNOPSIS

SPN

```
#include <spawn.h>

int posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t
    *file_actions, int fildes, int newfildes);
```

DESCRIPTION

The *posix_spawn_file_actions_adddup2*() function shall add a *dup2*() action to the object referenced by *file_actions* that shall cause the file descriptor *fildes* to be duplicated as *newfildes* (as if *dup2*(*fildes*, *newfildes*) had been called) when a new process is spawned using this file actions object.

A spawn file actions object is as defined in *posix_spawn_file_actions_addclose*().

RETURN VALUE

Upon successful completion, the *posix_spawn_file_actions_adddup2*() function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *posix_spawn_file_actions_adddup2*() function shall fail if:

[EBADF] The value specified by *fildes* or *newfildes* is negative or greater than or equal to {OPEN_MAX}.

[ENOMEM] Insufficient memory exists to add to the spawn file actions object.

The *posix_spawn_file_actions_adddup2*() function may fail if:

[EINVAL] The value specified by *file_actions* is invalid.

It shall not be considered an error for the *fildes* argument passed to the *posix_spawn_file_actions_adddup2*() function to specify a file descriptor for which the specified operation could not be performed at the time of the call. Any such error will be detected when the associated file actions object is later used during a *posix_spawn*() or *posix_spawnp*() operation.

EXAMPLES

None.

APPLICATION USAGE

The *posix_spawn_file_actions_adddup2*() function is part of the Spawn option and need not be provided on all implementations.

RATIONALE

Refer to the RATIONALE in *posix_spawn_file_actions_addclose*().

FUTURE DIRECTIONS

None.

47009 **CHANGE HISTORY**

47010 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

47011 IEEE PASC Interpretation 1003.1 #104 is applied, noting that the [EBADF] error can apply to the
47012 *newfildes* argument in addition to *fildes*.

47013 **NAME**

47014 posix_spawn_file_actions_addopen — add open action to spawn file actions object
47015 (**ADVANCED REALTIME**)

47016 **SYNOPSIS**

47017 SPN
```
#include <spawn.h>

int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t
    *restrict file_actions, int fildes,
    const char *restrict path, int oflag, mode_t mode);
```

47021 **DESCRIPTION**

47022 Refer to *posix_spawn_file_actions_addclose( )*.

47023 **NAME**

47024 posix_spawn_file_actions_destroy, posix_spawn_file_actions_init — destroy and initialize
47025 spawn file actions object (**ADVANCED REALTIME**)

47026 **SYNOPSIS**

47027 SPN
```
#include <spawn.h>

int posix_spawn_file_actions_destroy(posix_spawn_file_actions_t
    *file_actions);
int posix_spawn_file_actions_init(posix_spawn_file_actions_t
    *file_actions);
```

47032 **DESCRIPTION**

47033 The *posix_spawn_file_actions_destroy*( ) function shall destroy the object referenced by *file_actions*;
47034 the object becomes, in effect, uninitialized. An implementation may cause
47035 *posix_spawn_file_actions_destroy*( ) to set the object referenced by *file_actions* to an invalid value. A
47036 destroyed spawn file actions object can be reinitialized using *posix_spawn_file_actions_init*( ); the
47037 results of otherwise referencing the object after it has been destroyed are undefined.

47038 The *posix_spawn_file_actions_init*( ) function shall initialize the object referenced by *file_actions* to
47039 contain no file actions for *posix_spawn*( ) or *posix_spawnp*( ) to perform.

47040 A spawn file actions object is as defined in *posix_spawn_file_actions_addclose*( ).

47041 The effect of initializing an already initialized spawn file actions object is undefined.

47042 **RETURN VALUE**

47043 Upon successful completion, these functions shall return zero; otherwise, an error number shall
47044 be returned to indicate the error.

47045 **ERRORS**

47046 The *posix_spawn_file_actions_init*( ) function shall fail if:

47047 [ENOMEM] Insufficient memory exists to initialize the spawn file actions object.

47048 The *posix_spawn_file_actions_destroy*( ) function may fail if:

47049 [EINVAL] The value specified by *file_actions* is invalid.

47050 **EXAMPLES**

47051 None.

47052 **APPLICATION USAGE**

47053 These functions are part of the Spawn option and need not be provided on all implementations.

47054 **RATIONALE**

47055 Refer to the RATIONALE in *posix_spawn_file_actions_addclose*( ).

47056 **FUTURE DIRECTIONS**

47057 None.

47058 **SEE ALSO**

47059 *posix_spawn*( )

47060 XBD **<spawn.h>**

47061 **CHANGE HISTORY**

47062 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

47063 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

47064 **NAME**

47065 posix_spawnattr_destroy, posix_spawnattr_init — destroy and initialize spawn attributes object
47066 (**ADVANCED REALTIME**)

47067 **SYNOPSIS**

47068 SPN
```
#include <spawn.h>

int posix_spawnattr_destroy(posix_spawnattr_t *attr);
int posix_spawnattr_init(posix_spawnattr_t *attr);
```

47071 **DESCRIPTION**

47072 The *posix_spawnattr_destroy*( ) function shall destroy a spawn attributes object. A destroyed *attr*
47073 attributes object can be reinitialized using *posix_spawnattr_init*( ); the results of otherwise
47074 referencing the object after it has been destroyed are undefined. An implementation may cause
47075 *posix_spawnattr_destroy*( ) to set the object referenced by *attr* to an invalid value.

47076 The *posix_spawnattr_init*( ) function shall initialize a spawn attributes object *attr* with the default
47077 value for all of the individual attributes used by the implementation. Results are undefined if
47078 *posix_spawnattr_init*( ) is called specifying an already initialized *attr* attributes object.

47079 A spawn attributes object is of type **posix_spawnattr_t** (defined in **<spawn.h>**) and is used to
47080 specify the inheritance of process attributes across a spawn operation. POSIX.1-200x does not
47081 define comparison or assignment operators for the type **posix_spawnattr_t**.

47082 Each implementation shall document the individual attributes it uses and their default values
47083 unless these values are defined by POSIX.1-200x. Attributes not defined by POSIX.1-200x, their
47084 default values, and the names of the associated functions to get and set those attribute values are
47085 implementation-defined.

47086 The resulting spawn attributes object (possibly modified by setting individual attribute values),
47087 is used to modify the behavior of *posix_spawn*( ) or *posix_spawnp*( ). After a spawn attributes
47088 object has been used to spawn a process by a call to a *posix_spawn*( ) or *posix_spawnp*( ), any
47089 function affecting the attributes object (including destruction) shall not affect any process that
47090 has been spawned in this way.

47091 **RETURN VALUE**

47092 Upon successful completion, *posix_spawnattr_destroy*( ) and *posix_spawnattr_init*( ) shall return
47093 zero; otherwise, an error number shall be returned to indicate the error.

47094 **ERRORS**

47095 The *posix_spawnattr_init*( ) function shall fail if:

47096 [ENOMEM] Insufficient memory exists to initialize the spawn attributes object.

47097 The *posix_spawnattr_destroy*( ) function may fail if:

47098 [EINVAL] The value specified by attr is invalid.

47099 **EXAMPLES**

47100 None.

47101 **APPLICATION USAGE**

47102 These functions are part of the Spawn option and need not be provided on all implementations.

47103 **RATIONALE**

47104 The original spawn interface proposed in POSIX.1-200x defined the attributes that specify the
47105 inheritance of process attributes across a spawn operation as a structure. In order to be able to
47106 separate optional individual attributes under their appropriate options (that is, the *spawn-*
47107 *schedparam* and *spawn-schedpolicy* attributes depending upon the Process Scheduling option), and

also for extensibility and consistency with the newer POSIX interfaces, the attributes interface has been changed to an opaque data type. This interface now consists of the type **posix_spawnattr_t**, representing a spawn attributes object, together with associated functions to initialize or destroy the attributes object, and to set or get each individual attribute. Although the new object-oriented interface is more verbose than the original structure, it is simple to use, more extensible, and easy to implement.

FUTURE DIRECTIONS

None.

posix_spawn( ), *posix_spawnattr_getsigdefault*( ), *posix_spawnattr_getflags*( ), *posix_spawnattr_getpgroup*( ), *posix_spawnattr_getschedparam*( ), *posix_spawnattr_getschedpolicy*( ), *posix_spawnattr_getsigmask*( )

XBD **<spawn.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #106 is applied, noting that the effect of initializing an already initialized spawn attributes option is undefined.

NAME

posix_spawnattr_getflags, posix_spawnattr_setflags — get and set the spawn-flags attribute of a spawn attributes object (**ADVANCED REALTIME**)

SYNOPSIS

SPN
```
#include <spawn.h>

int posix_spawnattr_getflags(const posix_spawnattr_t *restrict attr,
    short *restrict flags);
int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
```

DESCRIPTION

The *posix_spawnattr_getflags*( ) function shall obtain the value of the *spawn-flags* attribute from the attributes object referenced by *attr*.

The *posix_spawnattr_setflags*( ) function shall set the *spawn-flags* attribute in an initialized attributes object referenced by *attr*.

The *spawn-flags* attribute is used to indicate which process attributes are to be changed in the new process image when invoking *posix_spawn*( ) or *posix_spawnp*( ). It is the bitwise-inclusive OR of zero or more of the following flags:

POSIX_SPAWN_RESETIDS
POSIX_SPAWN_SETPGROUP
POSIX_SPAWN_SETSIGDEF
POSIX_SPAWN_SETSIGMASK
PS POSIX_SPAWN_SETSCHEDPARAM
POSIX_SPAWN_SETSCHEDULER

These flags are defined in **<spawn.h>**. The default value of this attribute shall be as if no flags were set.

RETURN VALUE

Upon successful completion, *posix_spawnattr_getflags*( ) shall return zero and store the value of the *spawn-flags* attribute of *attr* into the object referenced by the *flags* parameter; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, *posix_spawnattr_setflags*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EINVAL] The value specified by *attr* is invalid.

The *posix_spawnattr_setflags*( ) function may fail if:

[EINVAL] The value of the attribute being set is not valid.

47160 **EXAMPLES**

47161 None.

47162 **APPLICATION USAGE**

47163 These functions are part of the Spawn option and need not be provided on all implementations.

47164 **RATIONALE**

47165 None.

47166 **FUTURE DIRECTIONS**

47167 None.

47173 **CHANGE HISTORY**

47174 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

47175 **NAME**

47176 posix_spawnattr_getpgroup, posix_spawnattr_setpgroup — get and set the spawn-pgroup
47177 attribute of a spawn attributes object (**ADVANCED REALTIME**)

47178 **SYNOPSIS**

47179 SPN
```
#include <spawn.h>

int posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict attr,
    pid_t *restrict pgroup);
int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);
```

47183 **DESCRIPTION**

47184 The *posix_spawnattr_getpgroup*( ) function shall obtain the value of the *spawn-pgroup* attribute
47185 from the attributes object referenced by *attr*.

47186 The *posix_spawnattr_setpgroup*( ) function shall set the *spawn-pgroup* attribute in an initialized
47187 attributes object referenced by *attr*.

47188 The *spawn-pgroup* attribute represents the process group to be joined by the new process image
47189 in a spawn operation (if POSIX_SPAWN_SETPGROUP is set in the *spawn-flags* attribute). The
47190 default value of this attribute shall be zero.

47191 **RETURN VALUE**

47192 Upon successful completion, *posix_spawnattr_getpgroup*( ) shall return zero and store the value of
47193 the *spawn-pgroup* attribute of *attr* into the object referenced by the *pgroup* parameter; otherwise,
47194 an error number shall be returned to indicate the error.

47195 Upon successful completion, *posix_spawnattr_setpgroup*( ) shall return zero; otherwise, an error
47196 number shall be returned to indicate the error.

47197 **ERRORS**

47198 These functions may fail if:

47199 [EINVAL] The value specified by *attr* is invalid.

47200 The *posix_spawnattr_setpgroup*( ) function may fail if:

47201 [EINVAL] The value of the attribute being set is not valid.

47202 **EXAMPLES**

47203 None.

NAME

posix_spawnattr_getschedparam, posix_spawnattr_setschedparam — get and set the spawn-schedparam attribute of a spawn attributes object (**ADVANCED REALTIME**)

SYNOPSIS

SPN PS

```
#include <spawn.h>
#include <sched.h>

int posix_spawnattr_getschedparam(const posix_spawnattr_t
    *restrict attr, struct sched_param *restrict schedparam);
int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,
    const struct sched_param *restrict schedparam);
```

DESCRIPTION

The *posix_spawnattr_getschedparam*( ) function shall obtain the value of the *spawn-schedparam* attribute from the attributes object referenced by *attr*.

The *posix_spawnattr_setschedparam*( ) function shall set the *spawn-schedparam* attribute in an initialized attributes object referenced by *attr*.

The *spawn-schedparam* attribute represents the scheduling parameters to be assigned to the new process image in a spawn operation (if POSIX_SPAWN_SETSCHEDULER or POSIX_SPAWN_SETSCHEDPARAM is set in the *spawn-flags* attribute). The default value of this attribute is unspecified.

RETURN VALUE

Upon successful completion, *posix_spawnattr_getschedparam*( ) shall return zero and store the value of the *spawn-schedparam* attribute of *attr* into the object referenced by the *schedparam* parameter; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, *posix_spawnattr_setschedparam*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EINVAL] The value specified by *attr* is invalid.

The *posix_spawnattr_setschedparam*( ) function may fail if:

[EINVAL] The value of the attribute being set is not valid.

EXAMPLES

None.

APPLICATION USAGE

These functions are part of the Spawn and Process Scheduling options and need not be provided on all implementations.

RATIONALE

47307 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

47308 **NAME**

47309 posix_spawnattr_getsigdefault, posix_spawnattr_setsigdefault — get and set the spawn-
47310 sigdefault attribute of a spawn attributes object (**ADVANCED REALTIME**)

47311 **SYNOPSIS**

47312 SPN
```
#include <signal.h>
#include <spawn.h>

int posix_spawnattr_getsigdefault(const posix_spawnattr_t
    *restrict attr, sigset_t *restrict sigdefault);
int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,
    const sigset_t *restrict sigdefault);
```

47318 **DESCRIPTION**

47319 The *posix_spawnattr_getsigdefault*( ) function shall obtain the value of the *spawn-sigdefault*
47320 attribute from the attributes object referenced by *attr*.

47321 The *posix_spawnattr_setsigdefault*( ) function shall set the *spawn-sigdefault* attribute in an
47322 initialized attributes object referenced by *attr*.

47323 The *spawn-sigdefault* attribute represents the set of signals to be forced to default signal handling
47324 in the new process image (if POSIX_SPAWN_SETSIGDEF is set in the *spawn-flags* attribute) by a
47325 spawn operation. The default value of this attribute shall be an empty signal set.

47326 **RETURN VALUE**

47327 Upon successful completion, *posix_spawnattr_getsigdefault*( ) shall return zero and store the value
47328 of the *spawn-sigdefault* attribute of *attr* into the object referenced by the *sigdefault* parameter;
47329 otherwise, an error number shall be returned to indicate the error.

47330 Upon successful completion, *posix_spawnattr_setsigdefault*( ) shall return zero; otherwise, an error
47331 number shall be returned to indicate the error.

47332 **ERRORS**

47333 These functions may fail if:

47334 [EINVAL] The value specified by *attr* is invalid.

47335 The *posix_spawnattr_setsigdefault*( ) function may fail if:

47336 [EINVAL] The value of the attribute being set is not valid.

47337 **EXAMPLES**

47338 None.

47347 *posix_spawnattr_getschedparam*( ), *posix_spawnattr_getschedpolicy*( ), *posix_spawnattr_getsigmask*( )

47348 XBD **<signal.h>**, **<spawn.h>**

47349 **CHANGE HISTORY**
47350 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

47351 **NAME**

47352 posix_spawnattr_getsigmask, posix_spawnattr_setsigmask — get and set the spawn-sigmask
47353 attribute of a spawn attributes object (**ADVANCED REALTIME**)

47354 **SYNOPSIS**

47355 SPN
```
#include <signal.h>
#include <spawn.h>

int posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict attr,
    sigset_t *restrict sigmask);
int posix_spawnattr_setsigmask(posix_spawnattr_t *restrict attr,
    const sigset_t *restrict sigmask);
```

47361 **DESCRIPTION**

47362 The *posix_spawnattr_getsigmask*( ) function shall obtain the value of the *spawn-sigmask* attribute
47363 from the attributes object referenced by *attr*.

47364 The *posix_spawnattr_setsigmask*( ) function shall set the *spawn-sigmask* attribute in an initialized
47365 attributes object referenced by *attr*.

47366 The *spawn-sigmask* attribute represents the signal mask in effect in the new process image of a
47367 spawn operation (if POSIX_SPAWN_SETSIGMASK is set in the *spawn-flags* attribute). The
47368 default value of this attribute is unspecified.

47369 **RETURN VALUE**

47370 Upon successful completion, *posix_spawnattr_getsigmask*( ) shall return zero and store the value
47371 of the *spawn-sigmask* attribute of *attr* into the object referenced by the *sigmask* parameter;
47372 otherwise, an error number shall be returned to indicate the error.

47373 Upon successful completion, *posix_spawnattr_setsigmask*( ) shall return zero; otherwise, an error
47374 number shall be returned to indicate the error.

47375 **ERRORS**

47376 These functions may fail if:

47377 [EINVAL] The value specified by *attr* is invalid.

47378 The *posix_spawnattr_setsigmask*( ) function may fail if:

47379 [EINVAL] The value of the attribute being set is not valid.

47380 **EXAMPLES**

47381 None.

47382 **APPLICATION USAGE**

47383 These functions are part of the Spawn option and need not be provided on all implementations.

47384 **RATIONALE**

47385 None.

47386 **FUTURE DIRECTIONS**

47387 None.

47388 **SEE ALSO**

47389 *posix_spawn*( ), *posix_spawnattr_destroy*( ), *posix_spawnattr_getsigdefault*( ),
47390 *posix_spawnattr_getflags*( ), *posix_spawnattr_getpgroup*( ), *posix_spawnattr_getschedparam*( ),
47391 *posix_spawnattr_getschedpolicy*( )

47392 XBD **<signal.h>**, **<spawn.h>**

47393 **CHANGE HISTORY**
47394 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

posix_spawnattr_init( )

47395 **NAME**

47396 posix_spawnattr_init — initialize the spawn attributes object (**ADVANCED REALTIME**)

47397 **SYNOPSIS**

47398 SPN
```
#include <spawn.h>

int posix_spawnattr_init(posix_spawnattr_t *attr);
```

47399

47400 **DESCRIPTION**

47401 Refer to *posix_spawnattr_destroy( )*.

47402 **NAME**

47403 posix_spawnattr_setflags — set the spawn-flags attribute of a spawn attributes object
47404 (**ADVANCED REALTIME**)

47405 **SYNOPSIS**

47406 SPN
```
#include <spawn.h>
```
47407
```
int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
```

47408 **DESCRIPTION**

47409 Refer to *posix_spawnattr_getflags( )*.

posix_spawnattr_setpgroup( )

NAME

posix_spawnattr_setpgroup — set the spawn-pgroup attribute of a spawn attributes object (**ADVANCED REALTIME**)

SYNOPSIS

SPN

```
#include <spawn.h>

int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);
```

DESCRIPTION

Refer to *posix_spawnattr_getpgroup( )*.

NAME

posix_spawnattr_setschedparam — set the spawn-schedparam attribute of a spawn attributes object (**ADVANCED REALTIME**)

SYNOPSIS

SPN PS

```
#include <sched.h>
#include <spawn.h>

int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,
    const struct sched_param *restrict schedparam);
```

DESCRIPTION

Refer to *posix_spawnattr_getschedparam( )*.

posix_spawnattr_setschedpolicy( )

NAME

posix_spawnattr_setschedpolicy — set the spawn-schedpolicy attribute of a spawn attributes object (**ADVANCED REALTIME**)

SYNOPSIS

SPN PS

```
#include <sched.h>
#include <spawn.h>

int posix_spawnattr_setschedpolicy(posix_spawnattr_t *attr,
    int schedpolicy);
```

DESCRIPTION

Refer to *posix_spawnattr_getschedpolicy( )*.

47438 **NAME**

47439 posix_spawnattr_setsigdefault — set the spawn-sigdefault attribute of a spawn attributes object
47440 (**ADVANCED REALTIME**)

47441 **SYNOPSIS**

47442 SPN
```
#include <signal.h>
#include <spawn.h>

int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,
    const sigset_t *restrict sigdefault);
```

47446 **DESCRIPTION**

47447 Refer to *posix_spawnattr_getsigdefault( )*.

posix_spawnattr_setsigmask( )

47448 **NAME**

47449 posix_spawnattr_setsigmask — set the spawn-sigmask attribute of a spawn attributes object
47450 (**ADVANCED REALTIME**)

47451 **SYNOPSIS**

47452 SPN
```
#include <signal.h>
#include <spawn.h>

int posix_spawnattr_setsigmask(posix_spawnattr_t *restrict attr,
    const sigset_t *restrict sigmask);
```

47456 **DESCRIPTION**

47457 Refer to *posix_spawnattr_getsigmask( )*.

47458 **NAME**

47459 posix_spawnp — spawn a process (**ADVANCED REALTIME**)

47460 **SYNOPSIS**

47461 SPN
```
#include <spawn.h>

int posix_spawnp(pid_t *restrict pid, const char *restrict file,
    const posix_spawn_file_actions_t *file_actions,
    const posix_spawnattr_t *restrict attrp,
    char *const argv[restrict], char *const envp[restrict]);
```

47466 **DESCRIPTION**

47467 Refer to *posix_spawn( )*.

47468 **NAME**

47469 posix_trace_attr_destroy, posix_trace_attr_init — destroy and initialize the trace stream
47470 attributes object (**TRACING**)

47471 **SYNOPSIS**

47472 OB TRC
```
#include <trace.h>

int posix_trace_attr_destroy(trace_attr_t *attr);
int posix_trace_attr_init(trace_attr_t *attr);
```

47475 **DESCRIPTION**

47476 The *posix_trace_attr_destroy*( ) function shall destroy an initialized trace attributes object. A
47477 destroyed *attr* attributes object can be reinitialized using *posix_trace_attr_init*( ); the results of
47478 otherwise referencing the object after it has been destroyed are undefined.

47479 The *posix_trace_attr_init*( ) function shall initialize a trace attributes object *attr* with the default
47480 value for all of the individual attributes used by a given implementation. The read-only
47481 *generation-version* and *clock-resolution* attributes of the newly initialized trace attributes object
47482 shall be set to their appropriate values (see Section 2.11.1.2, on page 535).

47483 Results are undefined if *posix_trace_attr_init*( ) is called specifying an already initialized *attr*
47484 attributes object.

47485 Implementations may add extensions to the trace attributes object structure as permitted in XBD
47486 Chapter 2 (on page 15).

47487 The resulting attributes object (possibly modified by setting individual attributes values), when
47488 used by *posix_trace_create*( ), defines the attributes of the trace stream created. A single attributes
47489 object can be used in multiple calls to *posix_trace_create*( ). After one or more trace streams have
47490 been created using an attributes object, any function affecting that attributes object, including
47491 destruction, shall not affect any trace stream previously created. An initialized attributes object
47492 also serves to receive the attributes of an existing trace stream or trace log when calling the
47493 *posix_trace_get_attr*( ) function.

47494 **RETURN VALUE**

47495 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
47496 return the corresponding error number.

47497 **ERRORS**

47498 The *posix_trace_attr_destroy*( ) function may fail if:

47499 [EINVAL] The value of *attr* is invalid.

47500 The *posix_trace_attr_init*( ) function shall fail if:

47501 [ENOMEM] Insufficient memory exists to initialize the trace attributes object.

47502 **EXAMPLES**

47503 None.

47504 **APPLICATION USAGE**

47505 None.

47506 **RATIONALE**

47507 None.

47508 **FUTURE DIRECTIONS**

47509 The *posix_trace_attr_destroy*( ) and *posix_trace_attr_init*( ) functions may be removed in a future
47510 version.

47511 **SEE ALSO**

47512 *posix_trace_create*( ), *posix_trace_get_attr*( ), *uname*( )

47513 XBD **<trace.h>**

47514 **CHANGE HISTORY**

47515 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

47516 IEEE PASC Interpretation 1003.1 #123 is applied.

47517 **Issue 7**

47518 The *posix_trace_attr_destroy*( ) and *posix_trace_attr_init*( ) functions are marked obsolescent.

NAME

posix_trace_attr_getclockres, posix_trace_attr_getcreatetime, posix_trace_attr_getgenversion, posix_trace_attr_getname, posix_trace_attr_setname — retrieve and set information about a trace stream (**TRACING**)

SYNOPSIS

OB TRC

```
#include <time.h>
#include <trace.h>

int posix_trace_attr_getclockres(const trace_attr_t *attr,
    struct timespec *resolution);
int posix_trace_attr_getcreatetime(const trace_attr_t *attr,
    struct timespec *createtime);

#include <trace.h>

int posix_trace_attr_getgenversion(const trace_attr_t *attr,
    char *genversion);
int posix_trace_attr_getname(const trace_attr_t *attr,
    char *tracename);
int posix_trace_attr_setname(trace_attr_t *attr,
    const char *tracename);
```

DESCRIPTION

The *posix_trace_attr_getclockres*( ) function shall copy the clock resolution of the clock used to generate timestamps from the *clock-resolution* attribute of the attributes object pointed to by the *attr* argument into the structure pointed to by the *resolution* argument.

The *posix_trace_attr_getcreatetime*( ) function shall copy the trace stream creation time from the *creation-time* attribute of the attributes object pointed to by the *attr* argument into the structure pointed to by the *createtime* argument. The *creation-time* attribute shall represent the time of creation of the trace stream.

The *posix_trace_attr_getgenversion*( ) function shall copy the string containing version information from the *generation-version* attribute of the attributes object pointed to by the *attr* argument into the string pointed to by the *genversion* argument. The *genversion* argument shall be the address of a character array which can store at least {TRACE_NAME_MAX} characters.

The *posix_trace_attr_getname*( ) function shall copy the string containing the trace name from the *trace-name* attribute of the attributes object pointed to by the *attr* argument into the string pointed to by the *tracename* argument. The *tracename* argument shall be the address of a character array which can store at least {TRACE_NAME_MAX} characters.

The *posix_trace_attr_setname*( ) function shall set the name in the *trace-name* attribute of the attributes object pointed to by the *attr* argument, using the trace name string supplied by the *tracename* argument. If the supplied string contains more than {TRACE_NAME_MAX} characters, the name copied into the *trace-name* attribute may be truncated to one less than the length of {TRACE_NAME_MAX} characters. The default value is a null string.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

If successful, the *posix_trace_attr_getclockres*( ) function stores the *clock-resolution* attribute value in the object pointed to by *resolution*. Otherwise, the content of this object is unspecified.

If successful, the *posix_trace_attr_getcreatetime*( ) function stores the trace stream creation time in

the object pointed to by *createtime*. Otherwise, the content of this object is unspecified.

If successful, the *posix_trace_attr_getgenversion*( ) function stores the trace version information in the string pointed to by *genversion*. Otherwise, the content of this string is unspecified.

If successful, the *posix_trace_attr_getname*( ) function stores the trace name in the string pointed to by *tracename*. Otherwise, the content of this string is unspecified.

ERRORS

The *posix_trace_attr_getclockres*( ), *posix_trace_attr_getcreatetime*( ), *posix_trace_attr_getgenversion*( ), and *posix_trace_attr_getname*( ) functions may fail if:

[EINVAL] The value specified by one of the arguments is invalid.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_attr_getclockres*( ), *posix_trace_attr_getcreatetime*( ), *posix_trace_attr_getgenversion*( ), *posix_trace_attr_getname*( ), and *posix_trace_attr_setname*( ) functions may be removed in a future version.

Issue 7

The *posix_trace_attr_getclockres*( ), *posix_trace_attr_getcreatetime*( ), *posix_trace_attr_getgenversion*( ), *posix_trace_attr_getname*( ), and *posix_trace_attr_setname*( ) functions are marked obsolescent.

NAME

posix_trace_attr_getinherited, posix_trace_attr_getlogfullpolicy, posix_trace_attr_getstreamfullpolicy, posix_trace_attr_setinherited, posix_trace_attr_setlogfullpolicy, posix_trace_attr_setstreamfullpolicy — retrieve and set the behavior of a trace stream (**TRACING**)

SYNOPSIS

OB TRC
```
#include <trace.h>

int posix_trace_attr_getinherited(const trace_attr_t *restrict attr,
    int *restrict inheritancepolicy);
int posix_trace_attr_getlogfullpolicy(const trace_attr_t *restrict attr,
    int *restrict logpolicy);
int posix_trace_attr_getstreamfullpolicy(const trace_attr_t *restrict
    attr, int *restrict streampolicy);
int posix_trace_attr_setinherited(trace_attr_t *attr,
    int inheritancepolicy);
int posix_trace_attr_setlogfullpolicy(trace_attr_t *attr,
    int logpolicy);
int posix_trace_attr_setstreamfullpolicy(trace_attr_t *attr,
    int streampolicy);
```

DESCRIPTION

TRI The *posix_trace_attr_getinherited*( ) and *posix_trace_attr_setinherited*( ) functions, respectively, shall get and set the inheritance policy stored in the *inheritance* attribute for traced processes across the *fork*( ) and *spawn*( ) operations. The *inheritance* attribute of the attributes object pointed to by the *attr* argument shall be set to one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_CLOSE_FOR_CHILD
: After a *fork*( ) or *spawn*( ) operation, the child shall not be traced, and tracing of the parent shall continue.

POSIX_TRACE_INHERITED
: After a *fork*( ) or *spawn*( ) operation, if the parent is being traced, its child shall be concurrently traced using the same trace stream.

The default value for the *inheritance* attribute is POSIX_TRACE_CLOSE_FOR_CHILD.

TRL The *posix_trace_attr_getlogfullpolicy*( ) and *posix_trace_attr_setlogfullpolicy*( ) functions, respectively, shall get and set the trace log full policy stored in the *log-full-policy* attribute of the attributes object pointed to by the *attr* argument.

The *log-full-policy* attribute shall be set to one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_LOOP
: The trace log shall loop until the associated trace stream is stopped. This policy means that when the trace log gets full, the file system shall reuse the resources allocated to the oldest trace events that were recorded. In this way, the trace log will always contain the most recent trace events flushed.

POSIX_TRACE_UNTIL_FULL
: The trace stream shall be flushed to the trace log until the trace log is full. This condition can be deduced from the *posix_log_full_status* member status (see the **posix_trace_status_info** structure defined in **<trace.h>**). The last recorded trace event shall be the POSIX_TRACE_STOP trace event.

POSIX_TRACE_APPEND
: The associated trace stream shall be flushed to the trace log without log size limitation. If the application specifies POSIX_TRACE_APPEND, the implementation shall ignore the *log-max-size* attribute.

The default value for the *log-full-policy* attribute is POSIX_TRACE_LOOP.

The *posix_trace_attr_getstreamfullpolicy*( ) and *posix_trace_attr_setstreamfullpolicy*( ) functions, respectively, shall get and set the trace stream full policy stored in the *stream-full-policy* attribute of the attributes object pointed to by the *attr* argument.

The *stream-full-policy* attribute shall be set to one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_LOOP
: The trace stream shall loop until explicitly stopped by the *posix_trace_stop*( ) function. This policy means that when the trace stream is full, the trace system shall reuse the resources allocated to the oldest trace events recorded. In this way, the trace stream will always contain the most recent trace events recorded.

POSIX_TRACE_UNTIL_FULL
: The trace stream will run until the trace stream resources are exhausted. Then the trace stream will stop. This condition can be deduced from *posix_stream_status* and *posix_stream_full_status* (see the **posix_trace_status_info** structure defined in **<trace.h>**). When this trace stream is read, a POSIX_TRACE_STOP trace event shall be reported after reporting the last recorded trace event. The trace system shall reuse the resources allocated to any trace events already reported—see the *posix_trace_getnext_event*( ), *posix_trace_trygetnext_event*( ), and *posix_trace_timedgetnext_event*( ) functions—or already flushed for an active trace stream with log if the Trace Log option is supported; see the *posix_trace_flush*( ) function. The trace system shall restart the trace stream when it is empty and may restart it sooner. A POSIX_TRACE_START trace event shall be reported before reporting the next recorded trace event.

TRL POSIX_TRACE_FLUSH
: If the Trace Log option is supported, this policy is identical to the POSIX_TRACE_UNTIL_FULL trace stream full policy except that the trace stream shall be flushed regularly as if *posix_trace_flush*( ) had been explicitly called. Defining this policy for an active trace stream without log shall be invalid.

The default value for the *stream-full-policy* attribute shall be POSIX_TRACE_LOOP for an active trace stream without log.

TRL If the Trace Log option is supported, the default value for the *stream-full-policy* attribute shall be POSIX_TRACE_FLUSH for an active trace stream with log.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

TRI If successful, the *posix_trace_attr_getinherited*( ) function shall store the *inheritance* attribute value in the object pointed to by *inheritancepolicy*. Otherwise, the content of this object is undefined.

TRL If successful, the *posix_trace_attr_getlogfullpolicy*( ) function shall store the *log-full-policy* attribute value in the object pointed to by *logpolicy*. Otherwise, the content of this object is undefined.

If successful, the *posix_trace_attr_getstreamfullpolicy*( ) function shall store the *stream-full-policy* attribute value in the object pointed to by *streampolicy*. Otherwise, the content of this object is undefined.

47684 **ERRORS**

47685 These functions may fail if:

47686 [EINVAL] The value specified by at least one of the arguments is invalid.

        const trace_attr_t *restrict attr,
        size_t data_len, size_t *restrict eventsize);
int posix_trace_attr_getstreamsize(const trace_attr_t *restrict attr,
        size_t *restrict streamsize);
TRL int posix_trace_attr_setlogsize(trace_attr_t *attr,
        size_t logsize);
int posix_trace_attr_setmaxdatasize(trace_attr_t *attr,
        size_t maxdatasize);
int posix_trace_attr_setstreamsize(trace_attr_t *attr,
        size_t streamsize);
```

DESCRIPTION

TRL The *posix_trace_attr_getlogsize*( ) function shall copy the log size, in bytes, from the *log-max-size* attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by the *logsize* argument. This log size is the maximum total of bytes that shall be allocated for system and user trace events in the trace log. The default value for the *log-max-size* attribute is implementation-defined.

The *posix_trace_attr_setlogsize*( ) function shall set the maximum allowed size, in bytes, in the *log-max-size* attribute of the attributes object pointed to by the *attr* argument, using the size value supplied by the *logsize* argument.

The trace log size shall be used if the *log-full-policy* attribute is set to POSIX_TRACE_LOOP or POSIX_TRACE_UNTIL_FULL. If the *log-full-policy* attribute is set to POSIX_TRACE_APPEND, the implementation shall ignore the *log-max-size* attribute.

The *posix_trace_attr_getmaxdatasize*( ) function shall copy the maximum user trace event data size, in bytes, from the *max-data-size* attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by the *maxdatasize* argument. The default value for the *max-data-size* attribute is implementation-defined.

The *posix_trace_attr_getmaxsystemeventsize*( ) function shall calculate the maximum memory size, in bytes, required to store a single system trace event. This value is calculated for the trace stream attributes object pointed to by the *attr* argument and is returned in the variable pointed to by the *eventsize* argument.

The values returned as the maximum memory sizes of the user and system trace events shall be such that if the sum of the maximum memory sizes of a set of the trace events that may be

recorded in a trace stream is less than or equal to the *stream-min-size* attribute of that trace stream, the system provides the necessary resources for recording all those trace events, without loss.

The *posix_trace_attr_getmaxusereventsize*( ) function shall calculate the maximum memory size, in bytes, required to store a single user trace event generated by a call to *posix_trace_event*( ) with a *data_len* parameter equal to the *data_len* value specified in this call. This value is calculated for the trace stream attributes object pointed to by the *attr* argument and is returned in the variable pointed to by the *eventsize* argument.

The *posix_trace_attr_getstreamsize*( ) function shall copy the stream size, in bytes, from the *stream-min-size* attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by the *streamsize* argument.

This stream size is the current total memory size reserved for system and user trace events in the trace stream. The default value for the *stream-min-size* attribute is implementation-defined. The stream size refers to memory used to store trace event records. Other stream data (for example, trace attribute values) shall not be included in this size.

The *posix_trace_attr_setmaxdatasize*( ) function shall set the maximum allowed size, in bytes, in the *max-data-size* attribute of the attributes object pointed to by the *attr* argument, using the size value supplied by the *maxdatasize* argument. This maximum size is the maximum allowed size for the user data argument which may be passed to *posix_trace_event*( ). The implementation shall be allowed to truncate data passed to *trace_user_event* which is longer than *maxdatasize*.

The *posix_trace_attr_setstreamsize*( ) function shall set the minimum allowed size, in bytes, in the *stream-min-size* attribute of the attributes object pointed to by the *attr* argument, using the size value supplied by the *streamsize* argument.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

TRL The *posix_trace_attr_getlogsize*( ) function stores the maximum trace log allowed size in the object pointed to by *logsize*, if successful.

The *posix_trace_attr_getmaxdatasize*( ) function stores the maximum trace event record memory size in the object pointed to by *maxdatasize*, if successful.

The *posix_trace_attr_getmaxsystemeventsize*( ) function stores the maximum memory size to store a single system trace event in the object pointed to by *eventsize*, if successful.

The *posix_trace_attr_getmaxusereventsize*( ) function stores the maximum memory size to store a single user trace event in the object pointed to by *eventsize*, if successful.

The *posix_trace_attr_getstreamsize*( ) function stores the maximum trace stream allowed size in the object pointed to by *streamsize*, if successful.

ERRORS

These functions may fail if:

[EINVAL] The value specified by one of the arguments is invalid.

47907 **NAME**

47908 posix_trace_clear — clear trace stream and trace log (**TRACING**)

47909 **SYNOPSIS**

47910 OB TRC
```
#include <sys/types.h>
#include <trace.h>

int posix_trace_clear(trace_id_t trid);
```

47913 **DESCRIPTION**

47914 The *posix_trace_clear*( ) function shall reinitialize the trace stream identified by the argument *trid*
47915 as if it were returning from the *posix_trace_create*( ) function, except that the same allocated
47916 resources shall be reused, the mapping of trace event type identifiers to trace event names shall
47917 be unchanged, and the trace stream status shall remain unchanged (that is, if it was running, it
47918 remains running and if it was suspended, it remains suspended).

47919 All trace events in the trace stream recorded before the call to *posix_trace_clear*( ) shall be lost. The
47920 *posix_stream_full_status* status shall be set to POSIX_TRACE_NOT_FULL. There is no guarantee
47921 that all trace events that occurred during the *posix_trace_clear*( ) call are recorded; the behavior
47922 with respect to trace points that may occur during this call is unspecified.

47923 OB TRL If the Trace Log option is supported and the trace stream has been created with a log, the
47924 *posix_trace_clear*( ) function shall reinitialize the trace stream with the same behavior as if the
47925 trace stream was created without the log, plus it shall reinitialize the trace log associated with
47926 the trace stream identified by the argument *trid* as if it were returning from the
47927 *posix_trace_create_withlog*( ) function, except that the same allocated resources, for the trace log,
47928 may be reused and the associated trace stream status remains unchanged. The first trace event
47929 recorded in the trace log after the call to *posix_trace_clear*( ) shall be the same as the first trace
47930 event recorded in the active trace stream after the call to *posix_trace_clear*( ). The
47931 *posix_log_full_status* status shall be set to POSIX_TRACE_NOT_FULL. There is no guarantee that
47932 all trace events that occurred during the *posix_trace_clear*( ) call are recorded in the trace log; the
47933 behavior with respect to trace points that may occur during this call is unspecified. If the log full
47934 policy is POSIX_TRACE_APPEND, the effect of a call to this function is unspecified for the trace
47935 log associated with the trace stream identified by the *trid* argument.

47936 **RETURN VALUE**

47937 Upon successful completion, the *posix_trace_clear*( ) function shall return a value of zero.
47938 Otherwise, it shall return the corresponding error number.

47939 **ERRORS**

47940 The *posix_trace_clear*( ) function shall fail if:

47941 [EINVAL] The value of the *trid* argument does not correspond to an active trace stream.

47942 **EXAMPLES**

47943 None.

47944 **APPLICATION USAGE**

47945 None.

47946 **RATIONALE**

47947 None.

47948 **FUTURE DIRECTIONS**

47949 The *posix_trace_clear*( ) function may be removed in a future version.

47950 **SEE ALSO**

47951 *posix_trace_attr_destroy( )*, *posix_trace_create( )*, *posix_trace_get_attr( )*

47952 XBD **<sys/types.h>**, **<trace.h>**

47953 **CHANGE HISTORY**

47954 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

47955 IEEE PASC Interpretation 1003.1 #123 is applied.

47956 **Issue 7**

47957 The *posix_trace_clear( )* function is marked obsolescent.

NAME

posix_trace_close, posix_trace_open, posix_trace_rewind — trace log management (**TRACING**)

SYNOPSIS

OB TRC
```
#include <trace.h>
```

TRL
```
int posix_trace_close(trace_id_t trid);
int posix_trace_open(int file_desc, trace_id_t *trid);
int posix_trace_rewind(trace_id_t trid);
```

DESCRIPTION

The *posix_trace_close*( ) function shall deallocate the trace log identifier indicated by *trid*, and all of its associated resources. If there is no valid trace log pointed to by the *trid*, this function shall fail.

The *posix_trace_open*( ) function shall allocate the necessary resources and establish the connection between a trace log identified by the *file_desc* argument and a trace stream identifier identified by the object pointed to by the *trid* argument. The *file_desc* argument should be a valid open file descriptor that corresponds to a trace log. The *file_desc* argument shall be open for reading. The current trace event timestamp, which specifies the timestamp of the trace event that will be read by the next call to *posix_trace_getnext_event*( ), shall be set to the timestamp of the oldest trace event recorded in the trace log identified by *trid*.

The *posix_trace_open*( ) function shall return a trace stream identifier in the variable pointed to by the *trid* argument, that may only be used by the following functions:

posix_trace_close( )	*posix_trace_get_attr*( )
posix_trace_eventid_equal( )	*posix_trace_get_status*( )
posix_trace_eventid_get_name( )	*posix_trace_getnext_event*( )
posix_trace_eventtypelist_getnext_id( )	*posix_trace_rewind*( )
posix_trace_eventtypelist_rewind( )	

In particular, notice that the operations normally used by a trace controller process, such as *posix_trace_start*( ), *posix_trace_stop*( ), or *posix_trace_shutdown*( ), cannot be invoked using the trace stream identifier returned by the *posix_trace_open*( ) function.

The *posix_trace_rewind*( ) function shall reset the current trace event timestamp, which specifies the timestamp of the trace event that will be read by the next call to *posix_trace_getnext_event*( ), to the timestamp of the oldest trace event recorded in the trace log identified by *trid*.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

If successful, the *posix_trace_open*( ) function stores the trace stream identifier value in the object pointed to by *trid*.

ERRORS

The *posix_trace_open*( ) function shall fail if:

[EINTR] The operation was interrupted by a signal and thus no trace log was opened.

[EINVAL] The object pointed to by *file_desc* does not correspond to a valid trace log.

The *posix_trace_close*( ) and *posix_trace_rewind*( ) functions may fail if:

[EINVAL] The object pointed to by *trid* does not correspond to a valid trace log.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_close*( ), *posix_trace_open*( ), and *posix_trace_rewind*( ) functions may be removed in a future version.

Issue 7

The *posix_trace_close*( ), *posix_trace_open*( ), and *posix_trace_rewind*( ) functions are marked obsolescent.

NAME

posix_trace_create, posix_trace_create_withlog, posix_trace_flush, posix_trace_shutdown — trace stream initialization, flush, and shutdown from a process (**TRACING**)

SYNOPSIS

OB TRC
```
#include <sys/types.h>
#include <trace.h>

int posix_trace_create(pid_t pid,
    const trace_attr_t *restrict attr,
    trace_id_t *restrict trid);
```
TRL
```
int posix_trace_create_withlog(pid_t pid,
    const trace_attr_t *restrict attr, int file_desc,
    trace_id_t *restrict trid);
int posix_trace_flush(trace_id_t trid);
int posix_trace_shutdown(trace_id_t trid);
```

DESCRIPTION

The *posix_trace_create*( ) function shall create an active trace stream. It allocates all the resources needed by the trace stream being created for tracing the process specified by *pid* in accordance with the *attr* argument. The *attr* argument represents the initial attributes of the trace stream and shall have been initialized by the function *posix_trace_attr_init*( ) prior to the *posix_trace_create*( ) call. If the argument *attr* is NULL, the default attributes shall be used. The *attr* attributes object shall be manipulated through a set of functions described in the *posix_trace_attr* family of functions. If the attributes of the object pointed to by *attr* are modified later, the attributes of the trace stream shall not be affected. The *creation-time* attribute of the newly created trace stream shall be set to the value of the system clock, if the Timers option is not supported, or to the value of the CLOCK_REALTIME clock, if the Timers option is supported.

The *pid* argument represents the target process to be traced. If the process executing this function does not have appropriate privileges to trace the process identified by *pid*, an error shall be returned. If the *pid* argument is zero, the calling process shall be traced.

The *posix_trace_create*( ) function shall store the trace stream identifier of the new trace stream in the object pointed to by the *trid* argument. This trace stream identifier shall be used in subsequent calls to control tracing. The *trid* argument may only be used by the following functions:

posix_trace_clear( )	*posix_trace_getnext_event*( )
posix_trace_eventid_equal( )	*posix_trace_shutdown*( )
posix_trace_eventid_get_name( )	*posix_trace_start*( )
posix_trace_eventtypelist_getnext_id( )	*posix_trace_stop*( )
posix_trace_eventtypelist_rewind( )	*posix_trace_timedgetnext_event*( )
posix_trace_get_attr( )	*posix_trace_trid_eventid_open*( )
posix_trace_get_status( )	*posix_trace_trygetnext_event*( )

TEF If the Trace Event Filter option is supported, the following additional functions may use the *trid* argument:

posix_trace_get_filter( ) *posix_trace_set_filter*( )

In particular, notice that the operations normally used by a trace analyzer process, such as *posix_trace_rewind*( ) or *posix_trace_close*( ), cannot be invoked using the trace stream identifier returned by the *posix_trace_create*( ) function.

48063 TEF A trace stream shall be created in a suspended state. If the Trace Event Filter option is
48064 supported, its trace event type filter shall be empty.

48065 The *posix_trace_create*( ) function may be called multiple times from the same or different
48066 processes, with the system-wide limit indicated by the runtime invariant value
48067 {TRACE_SYS_MAX}, which has the minimum value {_POSIX_TRACE_SYS_MAX}.

48068 The trace stream identifier returned by the *posix_trace_create*( ) function in the argument pointed
48069 to by *trid* is valid only in the process that made the function call. If it is used from another
48070 process, that is a child process, in functions defined in POSIX.1-200x, these functions shall return
48071 with the error [EINVAL].

48072 TRL The *posix_trace_create_withlog*( ) function shall be equivalent to *posix_trace_create*( ), except that it
48073 associates a trace log with this stream. The *file_desc* argument shall be the file descriptor
48074 designating the trace log destination. The function shall fail if this file descriptor refers to a file
48075 with a file type that is not compatible with the log policy associated with the trace log. The list of
48076 the appropriate file types that are compatible with each log policy is implementation-defined.

48077 The *posix_trace_create_withlog*( ) function shall return in the parameter pointed to by *trid* the trace
48078 stream identifier, which uniquely identifies the newly created trace stream, and shall be used in
48079 subsequent calls to control tracing. The *trid* argument may only be used by the following
48080 functions:

48081 *posix_trace_clear*( ) *posix_trace_get_status*( )
48082 *posix_trace_eventid_equal*( ) *posix_trace_getnext_event*( )
48083 *posix_trace_eventid_get_name*( ) *posix_trace_shutdown*( )
48084 *posix_trace_eventtypelist_getnext_id*( ) *posix_trace_start*( )
48085 *posix_trace_eventtypelist_rewind*( ) *posix_trace_stop*( )
48086 *posix_trace_flush*( ) *posix_trace_timedgetnext_event*( )
48087 *posix_trace_get_attr*( ) *posix_trace_trid_eventid_open*( )

48088 TEF TRL If the Trace Event Filter option is supported, the following additional functions may use the *trid*
48089 argument:

48090 *posix_trace_get_filter*( ) *posix_trace_set_filter*( )

48091 TRL In particular, notice that the operations normally used by a trace analyzer process, such as
48092 *posix_trace_rewind*( ) or *posix_trace_close*( ), cannot be invoked using the trace stream identifier
48093 returned by the *posix_trace_create_withlog*( ) function.

48094 The *posix_trace_flush*( ) function shall initiate a flush operation which copies the contents of the
48095 trace stream identified by the argument *trid* into the trace log associated with the trace stream at
48096 the creation time. If no trace log has been associated with the trace stream pointed to by *trid*, this
48097 function shall return an error. The termination of the flush operation can be polled by the
48098 *posix_trace_get_status*( ) function. During the flush operation, it shall be possible to trace new
48099 trace events up to the point when the trace stream becomes full. After flushing is completed, the
48100 space used by the flushed trace events shall be available for tracing new trace events.

48101 If flushing the trace stream causes the resulting trace log to become full, the trace log full policy
48102 shall be applied. If the trace *log-full-policy* attribute is set, the following occurs:

48103 POSIX_TRACE_UNTIL_FULL
48104 The trace events that have not yet been flushed shall be discarded.

POSIX_TRACE_LOOP
The trace events that have not yet been flushed shall be written to the beginning of the trace log, overwriting previous trace events stored there.

POSIX_TRACE_APPEND
The trace events that have not yet been flushed shall be appended to the trace log.

The *posix_trace_shutdown*( ) function shall stop the tracing of trace events in the trace stream identified by *trid*, as if *posix_trace_stop*( ) had been invoked. The *posix_trace_shutdown*( ) function shall free all the resources associated with the trace stream.

The *posix_trace_shutdown*( ) function shall not return until all the resources associated with the trace stream have been freed. When the *posix_trace_shutdown*( ) function returns, the *trid* argument becomes an invalid trace stream identifier. A call to this function shall unconditionally deallocate the resources regardless of whether all trace events have been retrieved by the analyzer process. Any thread blocked on one of the *trace_getnext_event*( ) functions (which specified this *trid*) before this call is unblocked with the error [EINVAL].

If the process exits, invokes a member of the *exec* family of functions, or is terminated, the trace streams that the process had created and that have not yet been shut down, shall be automatically shut down as if an explicit call were made to the *posix_trace_shutdown*( ) function.

TRL For an active trace stream with log, when the *posix_trace_shutdown*( ) function is called, all trace events that have not yet been flushed to the trace log shall be flushed, as in the *posix_trace_flush*( ) function, and the trace log shall be closed.

When a trace log is closed, all the information that may be retrieved later from the trace log through the trace interface shall have been written to the trace log. This information includes the trace attributes, the list of trace event types (with the mapping between trace event names and trace event type identifiers), and the trace status.

In addition, unspecified information shall be written to the trace log to allow detection of a valid trace log during the *posix_trace_open*( ) operation.

The *posix_trace_shutdown*( ) function shall not return until all trace events have been flushed.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

TRL The *posix_trace_create*( ) and *posix_trace_create_withlog*( ) functions store the trace stream identifier value in the object pointed to by *trid*, if successful.

ERRORS

TRL The *posix_trace_create*( ) and *posix_trace_create_withlog*( ) functions shall fail if:

[EAGAIN] No more trace streams can be started now. {TRACE_SYS_MAX} has been exceeded.

[EINTR] The operation was interrupted by a signal. No trace stream was created.

[EINVAL] One or more of the trace parameters specified by the *attr* parameter is invalid.

[ENOMEM] The implementation does not currently have sufficient memory to create the trace stream with the specified parameters.

[EPERM] The caller does not have appropriate privileges to trace the process specified by *pid*.

[ESRCH] The *pid* argument does not refer to an existing process.

TRL The *posix_trace_create_withlog*( ) function shall fail if:

[EBADF] The *file_desc* argument is not a valid file descriptor open for writing.

[EINVAL] The *file_desc* argument refers to a file with a file type that does not support the log policy associated with the trace log.

[ENOSPC] No space left on device. The device corresponding to the argument *file_desc* does not contain the space required to create this trace log.

TRL The *posix_trace_flush*( ) and *posix_trace_shutdown*( ) functions shall fail if:

[EINVAL] The value of the *trid* argument does not correspond to an active trace stream with log.

[EFBIG] The trace log file has attempted to exceed an implementation-defined maximum file size.

[ENOSPC] No space left on device.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_create*( ), *posix_trace_create_withlog*( ), *posix_trace_flush*( ), and *posix_trace_shutdown*( ) functions may be removed in a future version.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

Issue 7

These functions are marked obsolescent.

SD5-XSH-ERN-154 is applied, updating the DESCRIPTION to remove the *posix_trace_trygetnext_event*( ) function from the list of functions that use the *trid* argument.

NAME

posix_trace_event, posix_trace_eventid_open — trace functions for instrumenting application code (**TRACING**)

SYNOPSIS

OB TRC
```
#include <sys/types.h>
#include <trace.h>

void posix_trace_event(trace_event_id_t event_id,
    const void *restrict data_ptr, size_t data_len);
int posix_trace_eventid_open(const char *restrict event_name,
    trace_event_id_t *restrict event_id);
```

DESCRIPTION

The *posix_trace_event*( ) function shall record the *event_id* and the user data pointed to by *data_ptr* in the trace stream into which the calling process is being traced and in which *event_id* is not filtered out. If the total size of the user trace event data represented by *data_len* is not greater than the declared maximum size for user trace event data, then the *truncation-status* attribute of the trace event recorded is POSIX_TRACE_NOT_TRUNCATED. Otherwise, the user trace event data is truncated to this declared maximum size and the *truncation-status* attribute of the trace event recorded is POSIX_TRACE_TRUNCATED_RECORD.

If there is no trace stream created for the process or if the created trace stream is not running, or if the trace event specified by *event_id* is filtered out in the trace stream, the *posix_trace_event*( ) function shall have no effect.

The *posix_trace_eventid_open*( ) function shall associate a user trace event name with a trace event type identifier for the calling process. The trace event name is the string pointed to by the argument *event_name*. It shall have a maximum of {TRACE_EVENT_NAME_MAX} characters (which has the minimum value {_POSIX_TRACE_EVENT_NAME_MAX}). The number of user trace event type identifiers that can be defined for any given process is limited by the maximum value {TRACE_USER_EVENT_MAX}, which has the minimum value {POSIX_TRACE_USER_EVENT_MAX}.

If the Trace Inherit option is not supported, the *posix_trace_eventid_open*( ) function shall associate the user trace event name pointed to by the *event_name* argument with a trace event type identifier that is unique for the traced process, and is returned in the variable pointed to by the *event_id* argument. If the user trace event name has already been mapped for the traced process, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined POSIX_TRACE_UNNAMED_USEREVENT (see Table 2-7, on page 539) user trace event shall be returned.

TRI If the Trace Inherit option is supported, the *posix_trace_eventid_open*( ) function shall associate the user trace event name pointed to by the *event_name* argument with a trace event type identifier that is unique for all the processes being traced in this same trace stream, and is returned in the variable pointed to by the *event_id* argument. If the user trace event name has already been mapped for the traced processes, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined POSIX_TRACE_UNNAMED_USEREVENT (Table 2-7, on page 539) user trace event shall be returned.

Note: The above procedure, together with the fact that multiple processes can only be traced into the same trace stream by inheritance, ensure that all the processes that are traced into a trace stream have the same mapping of trace event names to trace event type identifiers.

If there is no trace stream created, the *posix_trace_eventid_open*( ) function shall store this information for future trace streams created for this process.

RETURN VALUE

No return value is defined for the *posix_trace_event*( ) function.

Upon successful completion, the *posix_trace_eventid_open*( ) function shall return a value of zero. Otherwise, it shall return the corresponding error number. The *posix_trace_eventid_open*( ) function stores the trace event type identifier value in the object pointed to by *event_id*, if successful.

ERRORS

The *posix_trace_eventid_open*( ) function shall fail if:

[ENAMETOOLONG]
The size of the name pointed to by the *event_name* argument was longer than the implementation-defined value {TRACE_EVENT_NAME_MAX}.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_event*( ) and *posix_trace_eventid_open*( ) functions may be removed in a future version.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

IEEE PASC Interpretation 1003.1 #123 is applied.

IEEE PASC Interpretation 1003.1 #127 is applied, correcting some editorial errors in the names of the *posix_trace_eventid_open*( ) function and the *event_id* argument.

Issue 7

The *posix_trace_event*( ) and *posix_trace_eventid_open*( ) functions are marked obsolescent.

NAME

posix_trace_eventid_equal, posix_trace_eventid_get_name, posix_trace_trid_eventid_open — manipulate the trace event type identifier (**TRACING**)

SYNOPSIS

OB TRC
```
#include <trace.h>

int posix_trace_eventid_equal(trace_id_t trid, trace_event_id_t event1,
    trace_event_id_t event2);
int posix_trace_eventid_get_name(trace_id_t trid,
    trace_event_id_t event, char *event_name);
```
TEF
```
int posix_trace_trid_eventid_open(trace_id_t trid,
    const char *restrict event_name,
    trace_event_id_t *restrict event);
```

DESCRIPTION

The *posix_trace_eventid_equal*( ) function shall compare the trace event type identifiers *event1* and *event2* from the same trace stream or the same trace log identified by the *trid* argument. If the trace event type identifiers *event1* and *event2* are from different trace streams, the return value shall be unspecified.

The *posix_trace_eventid_get_name*( ) function shall return, in the argument pointed to by *event_name*, the trace event name associated with the trace event type identifier identified by the argument *event*, for the trace stream or for the trace log identified by the *trid* argument. The name of the trace event shall have a maximum of {TRACE_EVENT_NAME_MAX} characters (which has the minimum value {_POSIX_TRACE_EVENT_NAME_MAX}). Successive calls to this function with the same trace event type identifier and the same trace stream identifier shall return the same event name.

TEF The *posix_trace_trid_eventid_open*( ) function shall associate a user trace event name with a trace event type identifier for a given trace stream. The trace stream is identified by the *trid* argument, and it shall be an active trace stream. The trace event name is the string pointed to by the argument *event_name*. It shall have a maximum of {TRACE_EVENT_NAME_MAX} characters (which has the minimum value {_POSIX_TRACE_EVENT_NAME_MAX}). The number of user trace event type identifiers that can be defined for any given process is limited by the maximum value {TRACE_USER_EVENT_MAX}, which has the minimum value {_POSIX_TRACE_USER_EVENT_MAX}.

If the Trace Inherit option is not supported, the *posix_trace_trid_eventid_open*( ) function shall associate the user trace event name pointed to by the *event_name* argument with a trace event type identifier that is unique for the process being traced in the trace stream identified by the *trid* argument, and is returned in the variable pointed to by the *event* argument. If the user trace event name has already been mapped for the traced process, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined POSIX_TRACE_UNNAMED_USEREVENT (see Table 2-7, on page 539) user trace event shall be returned.

TEF TRI If the Trace Inherit option is supported, the *posix_trace_trid_eventid_open*( ) function shall associate the user trace event name pointed to by the *event_name* argument with a trace event type identifier that is unique for all the processes being traced in the trace stream identified by the *trid* argument, and is returned in the variable pointed to by the *event* argument. If the user trace event name has already been mapped for the traced processes, then the previously assigned trace event type identifier shall be returned. If the per-process user trace event name limit represented by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined

48308 POSIX_TRACE_UNNAMED_USEREVENT (see Table 2-7, on page 539) user trace event shall be
48309 returned.

48310 **RETURN VALUE**

48311 TEF Upon successful completion, the *posix_trace_eventid_get_name*( ) and
48312 *posix_trace_trid_eventid_open*( ) functions shall return a value of zero. Otherwise, they shall return
48313 the corresponding error number.

48314 The *posix_trace_eventid_equal*( ) function shall return a non-zero value if *event1* and *event2* are
48315 equal; otherwise, a value of zero shall be returned. No errors are defined. If either *event1* or
48316 *event2* are not valid trace event type identifiers for the trace stream specified by *trid* or if the *trid*
48317 is invalid, the behavior shall be unspecified.

48318 The *posix_trace_eventid_get_name*( ) function stores the trace event name value in the object
48319 pointed to by *event_name*, if successful.

48320 TEF The *posix_trace_trid_eventid_open*( ) function stores the trace event type identifier value in the
48321 object pointed to by *event*, if successful.

48322 **ERRORS**

48323 TEF The *posix_trace_eventid_get_name*( ) and *posix_trace_trid_eventid_open*( ) functions shall fail if:

48324 [EINVAL] The *trid* argument was not a valid trace stream identifier.

48325 TEF The *posix_trace_trid_eventid_open*( ) function shall fail if:

48326 TEF [ENAMETOOLONG]
48327 The size of the name pointed to by the *event_name* argument was longer than
48328 the implementation-defined value {TRACE_EVENT_NAME_MAX}.

48329 The *posix_trace_eventid_get_name*( ) function shall fail if:

48330 [EINVAL] The trace event type identifier *event* was not associated with any name.

48331 **EXAMPLES**

48332 None.

48333 **APPLICATION USAGE**

48334 None.

NAME

posix_trace_eventid_open — trace functions for instrumenting application code (**TRACING**)

SYNOPSIS

OB TRC

```
#include <sys/types.h>
#include <trace.h>

int posix_trace_eventid_open(const char *restrict event_name,
    trace_event_id_t *restrict event_id);
```

DESCRIPTION

Refer to *posix_trace_event( )*.

posix_trace_eventset_add( )

NAME

posix_trace_eventset_add, posix_trace_eventset_del, posix_trace_eventset_empty, posix_trace_eventset_fill, posix_trace_eventset_ismember — manipulate trace event type sets (**TRACING**)

SYNOPSIS

OB TRC TEF

```
#include <trace.h>

int posix_trace_eventset_add(trace_event_id_t event_id,
    trace_event_set_t *set);
int posix_trace_eventset_del(trace_event_id_t event_id,
    trace_event_set_t *set);
int posix_trace_eventset_empty(trace_event_set_t *set);
int posix_trace_eventset_fill(trace_event_set_t *set, int what);
int posix_trace_eventset_ismember(trace_event_id_t event_id,
    const trace_event_set_t *restrict set, int *restrict ismember);
```

DESCRIPTION

These primitives manipulate sets of trace event types. They operate on data objects addressable by the application, not on the current trace event filter of any trace stream.

The *posix_trace_eventset_add*( ) and *posix_trace_eventset_del*( ) functions, respectively, shall add or delete the individual trace event type specified by the value of the argument *event_id* to or from the trace event type set pointed to by the argument *set*. Adding a trace event type already in the set or deleting a trace event type not in the set shall not be considered an error.

The *posix_trace_eventset_empty*( ) function shall initialize the trace event type set pointed to by the *set* argument such that all trace event types defined, both system and user, shall be excluded from the set.

The *posix_trace_eventset_fill*( ) function shall initialize the trace event type set pointed to by the argument *set*, such that the set of trace event types defined by the argument *what* shall be included in the set. The value of the argument *what* shall consist of one of the following values, as defined in the **<trace.h>** header:

POSIX_TRACE_WOPID_EVENTS
: All the process-independent implementation-defined system trace event types are included in the set.

POSIX_TRACE_SYSTEM_EVENTS
: All the implementation-defined system trace event types are included in the set, as are those defined in POSIX.1-200x.

POSIX_TRACE_ALL_EVENTS
: All trace event types defined, both system and user, are included in the set.

Applications shall call either *posix_trace_eventset_empty*( ) or *posix_trace_eventset_fill*( ) at least once for each object of type **trace_event_set_t** prior to any other use of that object. If such an object is not initialized in this way, but is nonetheless supplied as an argument to any of the *posix_trace_eventset_add*( ), *posix_trace_eventset_del*( ), or *posix_trace_eventset_ismember*( ) functions, the results are undefined.

The *posix_trace_eventset_ismember*( ) function shall test whether the trace event type specified by the value of the argument *event_id* is a member of the set pointed to by the argument *set*. The value returned in the object pointed to by *ismember* argument is zero if the trace event type identifier is not a member of the set and a value different from zero if it is a member of the set.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

ERRORS

These functions may fail if:

[EINVAL] The value of one of the arguments is invalid.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_eventset_add*( ), *posix_trace_eventset_del*( ), *posix_trace_eventset_empty*( ), *posix_trace_eventset_fill*( ), and *posix_trace_eventset_ismember*( ) functions may be removed in a future version.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

Issue 7

The *posix_trace_eventset_add*( ), *posix_trace_eventset_del*( ), *posix_trace_eventset_empty*( ), *posix_trace_eventset_fill*( ), and *posix_trace_eventset_ismember*( ) functions are marked obsolescent.

NAME

posix_trace_eventtypelist_getnext_id, posix_trace_eventtypelist_rewind — iterate over a mapping of trace event types (**TRACING**)

SYNOPSIS

OB TRC

```
#include <trace.h>

int posix_trace_eventtypelist_getnext_id(trace_id_t trid,
    trace_event_id_t *restrict event, int *restrict unavailable);
int posix_trace_eventtypelist_rewind(trace_id_t trid);
```

DESCRIPTION

The first time *posix_trace_eventtypelist_getnext_id*( ) is called, the function shall return in the variable pointed to by *event* the first trace event type identifier of the list of trace events of the trace stream identified by the *trid* argument. Successive calls to *posix_trace_eventtypelist_getnext_id*( ) return in the variable pointed to by *event* the next trace event type identifier in that same list. Each time a trace event type identifier is successfully written into the variable pointed to by the *event* argument, the variable pointed to by the *unavailable* argument shall be set to zero. When no more trace event type identifiers are available, and so none is returned, the variable pointed to by the *unavailable* argument shall be set to a value different from zero.

The *posix_trace_eventtypelist_rewind*( ) function shall reset the next trace event type identifier to be read to the first trace event type identifier from the list of trace events used in the trace stream identified by *trid*.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

The *posix_trace_eventtypelist_getnext_id*( ) function stores the trace event type identifier value in the object pointed to by *event*, if successful.

ERRORS

These functions shall fail if:

[EINVAL] The *trid* argument was not a valid trace stream identifier.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_eventtypelist_getnext_id*( ) and *posix_trace_eventtypelist_rewind*( ) functions may be removed in a future version.

XBD **<trace.h>**

48467 **CHANGE HISTORY**

48468 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

48469 IEEE PASC Interpretations 1003.1 #123 and #129 are applied.

48470 **Issue 7**

48471 The *posix_trace_eventtypelist_getnext_id*( ) and *posix_trace_eventtypelist_rewind*( ) functions are
48472 marked obsolescent.

posix_trace_flush( )

NAME

posix_trace_flush — trace stream flush from a process (**TRACING**)

SYNOPSIS

OB TRC
```
#include <sys/types.h>
#include <trace.h>
```

TRL
```
int posix_trace_flush(trace_id_t trid);
```

DESCRIPTION

Refer to *posix_trace_create( )*.

NAME

posix_trace_get_attr, posix_trace_get_status — retrieve the trace attributes or trace status (**TRACING**)

SYNOPSIS

OB TRC
```
#include <trace.h>

int posix_trace_get_attr(trace_id_t trid, trace_attr_t *attr);
int posix_trace_get_status(trace_id_t trid,
    struct posix_trace_status_info *statusinfo);
```

DESCRIPTION

The *posix_trace_get_attr*( ) function shall copy the attributes of the active trace stream identified by *trid* into the object pointed to by the *attr* argument. TRL If the Trace Log option is supported, *trid* may represent a pre-recorded trace log.

The *posix_trace_get_status*( ) function shall return, in the structure pointed to by the *statusinfo* argument, the current trace status for the trace stream identified by the *trid* argument. These status values returned in the structure pointed to by *statusinfo* shall have been appropriately read to ensure that the returned values are consistent. TRL If the Trace Log option is supported and the *trid* argument refers to a pre-recorded trace stream, the status shall be the status of the completed trace stream.

Each time the *posix_trace_get_status*( ) function is used, the overrun status of the trace stream shall be reset to POSIX_TRACE_NO_OVERRUN immediately after the call completes. TRL If the Trace Log option is supported, the *posix_trace_get_status*( ) function shall behave the same as when the option is not supported except for the following differences:

- If the *trid* argument refers to a trace stream with log, each time the *posix_trace_get_status*( ) function is used, the log overrun status of the trace stream shall be reset to POSIX_TRACE_NO_OVERRUN and the *flush_error* status shall be reset to zero immediately after the call completes.
- If the *trid* argument refers to a pre-recorded trace stream, the status returned shall be the status of the completed trace stream and the status values of the trace stream shall not be reset.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

The *posix_trace_get_attr*( ) function stores the trace attributes in the object pointed to by *attr*, if successful.

The *posix_trace_get_status*( ) function stores the trace status in the object pointed to by *statusinfo*, if successful.

ERRORS

These functions shall fail if:

[EINVAL] The trace stream argument *trid* does not correspond to a valid active trace stream or a valid trace log.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_get_attr*( ) and *posix_trace_get_status*( ) functions may be removed in a future version.

posix_trace_attr_destroy( ), *posix_trace_close*( ), *posix_trace_create*( )

XBD **<trace.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

IEEE PASC Interpretation 1003.1 #123 is applied.

Issue 7

The *posix_trace_get_attr*( ) and *posix_trace_get_status*( ) functions are marked obsolescent.

NAME

posix_trace_get_filter, posix_trace_set_filter — retrieve and set the filter of an initialized trace stream (**TRACING**)

SYNOPSIS

OB TRC
```
#include <trace.h>
```

TEF
```
int posix_trace_get_filter(trace_id_t trid, trace_event_set_t *set);
int posix_trace_set_filter(trace_id_t trid,
    const trace_event_set_t *set, int how);
```

DESCRIPTION

The *posix_trace_get_filter*( ) function shall retrieve, into the argument pointed to by *set*, the actual trace event filter from the trace stream specified by *trid*.

The *posix_trace_set_filter*( ) function shall change the set of filtered trace event types after a trace stream identified by the *trid* argument is created. This function may be called prior to starting the trace stream, or while the trace stream is active. By default, if no call is made to *posix_trace_set_filter*( ), all trace events shall be recorded (that is, none of the trace event types are filtered out).

If this function is called while the trace is in progress, a special system trace event, POSIX_TRACE_FILTER, shall be recorded in the trace indicating both the old and the new sets of filtered trace event types (see Table 2-4 (on page 537) and Table 2-6, on page 538).

If the *posix_trace_set_filter*( ) function is interrupted by a signal, an error shall be returned and the filter shall not be changed. In this case, the state of the trace stream shall not be changed.

The value of the argument *how* indicates the manner in which the set is to be changed and shall have one of the following values, as defined in the **<trace.h>** header:

POSIX_TRACE_SET_EVENTSET
: The resulting set of trace event types to be filtered shall be the trace event type set pointed to by the argument *set*.

POSIX_TRACE_ADD_EVENTSET
: The resulting set of trace event types to be filtered shall be the union of the current set and the trace event type set pointed to by the argument *set*.

POSIX_TRACE_SUB_EVENTSET
: The resulting set of trace event types to be filtered shall be all trace event types in the current set that are not in the set pointed to by the argument *set*; that is, remove each element of the specified set from the current filter.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

The *posix_trace_get_filter*( ) function stores the set of filtered trace event types in *set*, if successful.

ERRORS

These functions shall fail if:

[EINVAL] The value of the *trid* argument does not correspond to an active trace stream or the value of the argument pointed to by *set* is invalid.

[EINTR] The operation was interrupted by a signal.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_get_filter*( ) and *posix_trace_set_filter*( ) functions may be removed in a future version.

NAME

posix_trace_get_status — retrieve the trace status (**TRACING**)

SYNOPSIS

OB TRC

```
#include <trace.h>

int posix_trace_get_status(trace_id_t trid,
    struct posix_trace_status_info *statusinfo);
```

DESCRIPTION

Refer to *posix_trace_get_attr( )*.

NAME

posix_trace_getnext_event, posix_trace_timedgetnext_event, posix_trace_trygetnext_event — retrieve a trace event (**TRACING**)

SYNOPSIS

OB TRC

```
#include <sys/types.h>
#include <trace.h>

int posix_trace_getnext_event(trace_id_t trid,
    struct posix_trace_event_info *restrict event,
    void *restrict data, size_t num_bytes,
    size_t *restrict data_len, int *restrict unavailable);
int posix_trace_timedgetnext_event(trace_id_t trid,
    struct posix_trace_event_info *restrict event,
    void *restrict data, size_t num_bytes,
    size_t *restrict data_len, int *restrict unavailable,
    const struct timespec *restrict abstime);
int posix_trace_trygetnext_event(trace_id_t trid,
    struct posix_trace_event_info *restrict event,
    void *restrict data, size_t num_bytes,
    size_t *restrict data_len, int *restrict unavailable);
```

DESCRIPTION

The *posix_trace_getnext_event*( ) function shall report a recorded trace event either from an active trace stream without log TRL or a pre-recorded trace stream identified by the *trid* argument. The *posix_trace_trygetnext_event*( ) function shall report a recorded trace event from an active trace stream without log identified by the *trid* argument.

The trace event information associated with the recorded trace event shall be copied by the function into the structure pointed to by the argument *event* and the data associated with the trace event shall be copied into the buffer pointed to by the *data* argument.

The *posix_trace_getnext_event*( ) function shall block if the *trid* argument identifies an active trace stream and there is currently no trace event ready to be retrieved. When returning, if a recorded trace event was reported, the variable pointed to by the *unavailable* argument shall be set to zero. Otherwise, the variable pointed to by the *unavailable* argument shall be set to a value different from zero.

The *posix_trace_timedgetnext_event*( ) function shall attempt to get another trace event from an active trace stream without log, as in the *posix_trace_getnext_event*( ) function. However, if no trace event is available from the trace stream, the implied wait shall be terminated when the timeout specified by the argument *abstime* expires, and the function shall return the error [ETIMEDOUT].

The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the clock upon which timeouts are based (that is, when the value of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already passed at the time of the call.

The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall be the resolution of the clock on which it is based. The **timespec** data type is defined in the **<time.h>** header.

Under no circumstance shall the function fail with a timeout if a trace event is immediately available from the trace stream. The validity of the *abstime* argument need not be checked if a trace event is immediately available from the trace stream.

The behavior of this function for a pre-recorded trace stream is unspecified.

TRL The *posix_trace_trygetnext_event*( ) function shall not block. This function shall return an error if the *trid* argument identifies a pre-recorded trace stream. If a recorded trace event was reported, the variable pointed to by the *unavailable* argument shall be set to zero. Otherwise, if no trace event was reported, the variable pointed to by the *unavailable* argument shall be set to a value different from zero.

The argument *num_bytes* shall be the size of the buffer pointed to by the *data* argument. The argument *data_len* reports to the application the length in bytes of the data record just transferred. If *num_bytes* is greater than or equal to the size of the data associated with the trace event pointed to by the *event* argument, all the recorded data shall be transferred. In this case, the *truncation-status* member of the trace event structure shall be either POSIX_TRACE_NOT_TRUNCATED, if the trace event data was recorded without truncation while tracing, or POSIX_TRACE_TRUNCATED_RECORD, if the trace event data was truncated when it was recorded. If the *num_bytes* argument is less than the length of recorded trace event data, the data transferred shall be truncated to a length of *num_bytes*, the value stored in the variable pointed to by *data_len* shall be equal to *num_bytes*, and the *truncation-status* member of the *event* structure argument shall be set to POSIX_TRACE_TRUNCATED_READ (see the **posix_trace_event_info** structure defined in **<trace.h>**).

The report of a trace event shall be sequential starting from the oldest recorded trace event. Trace events shall be reported in the order in which they were generated, up to an implementation-defined time resolution that causes the ordering of trace events occurring very close to each other to be unknown. Once reported, a trace event cannot be reported again from an active trace stream. Once a trace event is reported from an active trace stream without log, the trace stream shall make the resources associated with that trace event available to record future generated trace events.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

If successful, these functions store:

- The recorded trace event in the object pointed to by *event*
- The trace event information associated with the recorded trace event in the object pointed to by *data*
- The length of this trace event information in the object pointed to by *data_len*
- The value of zero in the object pointed to by *unavailable*

ERRORS

These functions shall fail if:

[EINVAL] The trace stream identifier argument *trid* is invalid.

The *posix_trace_getnext_event*( ) and *posix_trace_timedgetnext_event*( ) functions shall fail if:

[EINTR] The operation was interrupted by a signal, and so the call had no effect.

The *posix_trace_trygetnext_event*( ) function shall fail if:

[EINVAL] The trace stream identifier argument *trid* does not correspond to an active trace stream.

The *posix_trace_timedgetnext_event*( ) function shall fail if:

[EINVAL] There is no trace event immediately available from the trace stream, and the *timeout* argument is invalid.

[ETIMEDOUT] No trace event was available from the trace stream before the specified timeout *timeout* expired.

NAME

posix_trace_open, posix_trace_rewind — trace log management (**TRACING**)

SYNOPSIS

OB TRC
```
#include <trace.h>
```

TRL
```
int posix_trace_open(int file_desc, trace_id_t *trid);
int posix_trace_rewind(trace_id_t trid);
```

DESCRIPTION

Refer to *posix_trace_close( )*.

posix_trace_set_filter( )

NAME

posix_trace_set_filter — set filter of an initialized trace stream (**TRACING**)

SYNOPSIS

OB TRC

```
#include <trace.h>
```

TEF

```
int posix_trace_set_filter(trace_id_t trid,
    const trace_event_set_t *set, int how);
```

DESCRIPTION

Refer to *posix_trace_get_filter( )*.

NAME

posix_trace_shutdown — trace stream shutdown from a process (**TRACING**)

SYNOPSIS

OB TRC

```
#include <sys/types.h>
#include <trace.h>

int posix_trace_shutdown(trace_id_t trid);
```

DESCRIPTION

Refer to *posix_trace_create( )*.

NAME

posix_trace_start, posix_trace_stop — trace start and stop (**TRACING**)

SYNOPSIS

OB TRC

```
#include <trace.h>

int posix_trace_start(trace_id_t trid);
int posix_trace_stop (trace_id_t trid);
```

DESCRIPTION

The *posix_trace_start*( ) and *posix_trace_stop*( ) functions, respectively, shall start and stop the trace stream identified by the argument *trid*.

The effect of calling the *posix_trace_start*( ) function shall be recorded in the trace stream as the POSIX_TRACE_START system trace event and the status of the trace stream shall become POSIX_TRACE_RUNNING. If the trace stream is in progress when this function is called, the POSIX_TRACE_START system trace event shall not be recorded and the trace stream shall continue to run. If the trace stream is full, the POSIX_TRACE_START system trace event shall not be recorded and the status of the trace stream shall not be changed.

The effect of calling the *posix_trace_stop*( ) function shall be recorded in the trace stream as the POSIX_TRACE_STOP system trace event and the status of the trace stream shall become POSIX_TRACE_SUSPENDED. If the trace stream is suspended when this function is called, the POSIX_TRACE_STOP system trace event shall not be recorded and the trace stream shall remain suspended. If the trace stream is full, the POSIX_TRACE_STOP system trace event shall not be recorded and the status of the trace stream shall not be changed.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

ERRORS

These functions shall fail if:

[EINVAL] The value of the argument *trid* does not correspond to an active trace stream and thus no trace stream was started or stopped.

[EINTR] The operation was interrupted by a signal and thus the trace stream was not necessarily started or stopped.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *posix_trace_start*( ) and *posix_trace_stop*( ) functions may be removed in a future version.

posix_trace_timedgetnext_event( )

NAME

posix_trace_timedgetnext_event — retrieve a trace event (**TRACING**)

SYNOPSIS

OB TRC

```
#include <sys/types.h>
#include <trace.h>

int posix_trace_timedgetnext_event(trace_id_t trid,
    struct posix_trace_event_info *restrict event,
    void *restrict data, size_t num_bytes,
    size_t *restrict data_len, int *restrict unavailable,
    const struct timespec *restrict abstime);
```

DESCRIPTION

Refer to *posix_trace_getnext_event( )*.

NAME

posix_trace_trid_eventid_open — open a trace event type identifier (**TRACING**)

SYNOPSIS

OB TRC
```
#include <trace.h>
```

TEF
```
int posix_trace_trid_eventid_open(trace_id_t trid,
    const char *restrict event_name,
    trace_event_id_t *restrict event);
```

DESCRIPTION

Refer to *posix_trace_eventid_equal( )*.

posix_trace_trygetnext_event( )

NAME

posix_trace_trygetnext_event — retrieve a trace event (**TRACING**)

SYNOPSIS

OB TRC

```
#include <sys/types.h>
#include <trace.h>

int posix_trace_trygetnext_event(trace_id_t trid,
    struct posix_trace_event_info *restrict event,
    void *restrict data, size_t num_bytes,
    size_t *restrict data_len, int *restrict unavailable);
```

DESCRIPTION

Refer to *posix_trace_getnext_event( )*.

NAME

posix_typed_mem_get_info — query typed memory information (**ADVANCED REALTIME**)

SYNOPSIS

TYM
```
#include <sys/mman.h>

int posix_typed_mem_get_info(int fildes,
    struct posix_typed_mem_info *info);
```

DESCRIPTION

The *posix_typed_mem_get_info*( ) function shall return, in the *posix_tmi_length* field of the **posix_typed_mem_info** structure pointed to by *info*, the maximum length which may be successfully allocated by the typed memory object designated by *fildes*. This maximum length shall take into account the flag POSIX_TYPED_MEM_ALLOCATE or POSIX_TYPED_MEM_ALLOCATE_CONTIG specified when the typed memory object represented by *fildes* was opened. The maximum length is dynamic; therefore, the value returned is valid only while the current mapping of the corresponding typed memory pool remains unchanged.

If *fildes* represents a typed memory object opened with neither the POSIX_TYPED_MEM_ALLOCATE flag nor the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag specified, the returned value of *info->posix_tmi_length* is unspecified.

The *posix_typed_mem_get_info*( ) function may return additional implementation-defined information in other fields of the **posix_typed_mem_info** structure pointed to by *info*.

If the memory object specified by *fildes* is not a typed memory object, then the behavior of this function is undefined.

RETURN VALUE

Upon successful completion, the *posix_typed_mem_get_info*( ) function shall return zero; otherwise, the corresponding error status value shall be returned.

ERRORS

The *posix_typed_mem_get_info*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid open file descriptor.

[ENODEV] The *fildes* argument is not connected to a memory object supported by this function.

This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

An application that needs to allocate a block of typed memory with length dependent upon the amount of memory currently available must either query the typed memory object to obtain the amount available, or repeatedly invoke *mmap*( ) attempting to guess an appropriate length. While the latter method is existing practice with *malloc*( ), it is awkward and imprecise. The *posix_typed_mem_get_info*( ) function allows an application to immediately determine available memory. This is particularly important for typed memory objects that may in some cases be scarce resources. Note that when a typed memory pool is a shared resource, some form of mutual-exclusion or synchronization may be required while typed memory is being queried and

allocated to prevent race conditions.

The existing *fstat*( ) function is not suitable for this purpose. We realize that implementations may wish to provide other attributes of typed memory objects (for example, alignment requirements, page size, and so on). The *fstat*( ) function returns a structure which is not extensible and, furthermore, contains substantial information that is inappropriate for typed memory objects.

FUTURE DIRECTIONS

None.

fstat( ), *mmap*( ), *posix_typed_mem_open*( )

XBD **<sys/mman.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

NAME

posix_typed_mem_open — open a typed memory object (**ADVANCED REALTIME**)

SYNOPSIS

TYM
```
#include <sys/mman.h>

int posix_typed_mem_open(const char *name, int oflag, int tflag);
```

DESCRIPTION

The *posix_typed_mem_open*( ) function shall establish a connection between the typed memory object specified by the string pointed to by *name* and a file descriptor. It shall create an open file description that refers to the typed memory object and a file descriptor that refers to that open file description. The file descriptor is used by other functions to refer to that typed memory object. It is unspecified whether the name appears in the file system and is visible to other functions that take pathnames as arguments. The *name* argument conforms to the construction rules for a pathname, except that the interpretation of <slash> characters other than the leading <slash> character in *name* is implementation-defined, and that the length limits for the *name* argument are implementation-defined and need not be the same as the pathname limits {PATH_MAX} and {NAME_MAX}. If *name* begins with the <slash> character, then processes calling *posix_typed_mem_open*( ) with the same value of *name* shall refer to the same typed memory object. If *name* does not begin with the <slash> character, the effect is implementation-defined.

Each typed memory object supported in a system shall be identified by a name which specifies not only its associated typed memory pool, but also the path or port by which it is accessed. That is, the same typed memory pool accessed via several different ports shall have several different corresponding names. The binding between names and typed memory objects is established in an implementation-defined manner. Unlike shared memory objects, there is no way within POSIX.1-200x for a program to create a typed memory object.

The value of *tflag* shall determine how the typed memory object behaves when subsequently mapped by calls to *mmap*( ). At most, one of the following flags defined in **<sys/mman.h>** may be specified:

POSIX_TYPED_MEM_ALLOCATE
: Allocate on *mmap*( ).

POSIX_TYPED_MEM_ALLOCATE_CONTIG
: Allocate contiguously on *mmap*( ).

POSIX_TYPED_MEM_MAP_ALLOCATABLE
: Map on *mmap*( ), without affecting allocatability.

If *tflag* has the flag POSIX_TYPED_MEM_ALLOCATE specified, any subsequent call to *mmap*( ) using the returned file descriptor shall result in allocation and mapping of typed memory from the specified typed memory pool. The allocated memory may be a contiguous previously unallocated area of the typed memory pool or several non-contiguous previously unallocated areas (mapped to a contiguous portion of the process address space). If *tflag* has the flag POSIX_TYPED_MEM_ALLOCATE_CONTIG specified, any subsequent call to *mmap*( ) using the returned file descriptor shall result in allocation and mapping of a single contiguous previously unallocated area of the typed memory pool (also mapped to a contiguous portion of the process address space). If *tflag* has none of the flags POSIX_TYPED_MEM_ALLOCATE or POSIX_TYPED_MEM_ALLOCATE_CONTIG specified, any subsequent call to *mmap*( ) using the returned file descriptor shall map an application-chosen area from the specified typed memory pool such that this mapped area becomes unavailable for allocation until unmapped by all processes. If *tflag* has the flag POSIX_TYPED_MEM_MAP_ALLOCATABLE specified, any

subsequent call to *mmap*( ) using the returned file descriptor shall map an application-chosen area from the specified typed memory pool without an effect on the availability of that area for allocation; that is, mapping such an object leaves each byte of the mapped area unallocated if it was unallocated prior to the mapping or allocated if it was allocated prior to the mapping. Appropriate privileges to specify the POSIX_TYPED_MEM_MAP_ALLOCATABLE flag are implementation-defined.

If successful, *posix_typed_mem_open*( ) shall return a file descriptor for the typed memory object that is the lowest numbered file descriptor not currently open for that process. The open file description is new, and therefore the file descriptor shall not share it with any other processes. It is unspecified whether the file offset is set. The FD_CLOEXEC file descriptor flag associated with the new file descriptor shall be cleared.

The behavior of *msync*( ), *ftruncate*( ), and all file operations other than *mmap*( ), *posix_mem_offset*( ), *posix_typed_mem_get_info*( ), *fstat*( ), *dup*( ), *dup2*( ), and *close*( ), is unspecified when passed a file descriptor connected to a typed memory object by this function.

The file status flags of the open file description shall be set according to the value of *oflag*. Applications shall specify exactly one of the three access mode values described below and defined in the **<fcntl.h>** header, as the value of *oflag*.

O_RDONLY Open for read access only.

O_WRONLY Open for write access only.

O_RDWR Open for read or write access.

RETURN VALUE

Upon successful completion, the *posix_typed_mem_open*( ) function shall return a non-negative integer representing the lowest numbered unused file descriptor. Otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *posix_typed_mem_open*( ) function shall fail if:

[EACCES] The typed memory object exists and the permissions specified by *oflag* are denied.

[EINTR] The *posix_typed_mem_open*( ) operation was interrupted by a signal.

[EINVAL] The flags specified in *tflag* are invalid (more than one of POSIX_TYPED_MEM_ALLOCATE, POSIX_TYPED_MEM_ALLOCATE_CONTIG, or POSIX_TYPED_MEM_MAP_ALLOCATABLE is specified).

[EMFILE] All file descriptors available to the process are currently open.

[ENAMETOOLONG]
The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems XSI that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI systems, or has a pathname component that is longer than XSI {_POSIX_NAME_MAX} on systems that do not support the XSI option or longer than {_XOPEN_NAME_MAX} on XSI systems.

[ENFILE] Too many file descriptors are currently open in the system.

[ENOENT] The named typed memory object does not exist.

[EPERM] The caller lacks appropriate privileges to specify the POSIX_TYPED_MEM_MAP_ALLOCATABLE flag in the *tflag* argument.

EXAMPLES

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

NAME

pow, powf, powl — power function

SYNOPSIS

```
#include <math.h>

double pow(double x, double y);
float powf(float x, float y);
long double powl(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the value of x raised to the power y, x^y. If x is negative, the application shall ensure that y is an integer value.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the value of x raised to the power y.

MX For finite values of $x < 0$, and finite non-integer values of y, a domain error shall occur and either a NaN (if representable), or an implementation-defined value shall be returned.

If the correct value would cause overflow, a range error shall occur and *pow*( ), *powf*( ), and *powl*( ) shall return ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL, respectively, with the same sign as the correct value of the function.

If the correct value would cause underflow, and is not representable, a range error may occur, and MX either 0.0 (if supported), or an implementation-defined value shall be returned.

CX For $y < 0$, if x is zero, a pole error may occur and *pow*( ), *powf*( ), and *powl*( ) shall return MX ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL, respectively. On systems that support the IEC 60559 Floating-Point option, a pole error shall occur and *pow*( ), *powf*( ), and *powl*( ) shall return ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL, respectively if y is an odd integer, or HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively if y is not an odd integer.

MX If x or y is a NaN, a NaN shall be returned (unless specified elsewhere in this description).

For any value of y (including NaN), if x is +1, 1.0 shall be returned.

For any value of x (including NaN), if y is ±0, 1.0 shall be returned.

For any odd integer value of $y > 0$, if x is ±0, ±0 shall be returned.

For $y > 0$ and not an odd integer, if x is ±0, +0 shall be returned.

If x is –1, and y is ±Inf, 1.0 shall be returned.

For $|x| < 1$, if y is –Inf, +Inf shall be returned.

For $|x| > 1$, if y is –Inf, +0 shall be returned.

For $|x| < 1$, if y is +Inf, +0 shall be returned.

For $|x| > 1$, if y is +Inf, +Inf shall be returned.

For y an odd integer < 0, if x is –Inf, –0 shall be returned.

For $y < 0$ and not an odd integer, if x is –Inf, +0 shall be returned.

For y an odd integer > 0, if x is –Inf, –Inf shall be returned.

For $y > 0$ and not an odd integer, if x is –Inf, +Inf shall be returned.

For $y < 0$, if x is +Inf, +0 shall be returned.

For $y > 0$, if x is +Inf, +Inf shall be returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

ERRORS

These functions shall fail if:

Domain Error — The value of x is negative and y is a finite non-integer.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

MX Pole Error — The value of x is zero and y is negative.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero floating-point exception shall be raised.

Range Error — The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

Pole Error — The value of x is zero and y is negative.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero floating-point exception shall be raised.

Range Error — The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.19 (on page 116), **<math.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

The *powf*( ) and *powl*( ) functions are added for alignment with the ISO/IEC 9899: 1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899: 1999 standard.

IEC 60559: 1989 standard floating-point extensions over the ISO/IEC 9899: 1999 standard are marked.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/42 is applied, correcting the third paragraph in the RETURN VALUE section.

Issue 7

ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #51 (SD5-XSH-ERN-81) is applied.

NAME

pselect, select — synchronous I/O multiplexing

SYNOPSIS

```
#include <sys/select.h>

int pselect(int nfds, fd_set *restrict readfds,
    fd_set *restrict writefds, fd_set *restrict errorfds,
    const struct timespec *restrict timeout,
    const sigset_t *restrict sigmask);
int select(int nfds, fd_set *restrict readfds,
    fd_set *restrict writefds, fd_set *restrict errorfds,
    struct timeval *restrict timeout);
void FD_CLR(int fd, fd_set *fdset);
int FD_ISSET(int fd, fd_set *fdset);
void FD_SET(int fd, fd_set *fdset);
void FD_ZERO(fd_set *fdset);
```

DESCRIPTION

The *pselect*( ) function shall examine the file descriptor sets whose addresses are passed in the *readfds*, *writefds*, and *errorfds* parameters to see whether some of their descriptors are ready for reading, are ready for writing, or have an exceptional condition pending, respectively.

The *select*( ) function shall be equivalent to the *pselect*( ) function, except as follows:

- For the *select*( ) function, the timeout period is given in seconds and microseconds in an argument of type **struct timeval**, whereas for the *pselect*( ) function the timeout period is given in seconds and nanoseconds in an argument of type **struct timespec**.
- The *select*( ) function has no *sigmask* argument; it shall behave as *pselect*( ) does when *sigmask* is a null pointer.
- Upon successful completion, the *select*( ) function may modify the object pointed to by the *timeout* argument.

The *pselect*( ) and *select*( ) functions shall support regular files, terminal and pseudo-terminal devices, STREAMS-based files, FIFOs, pipes, and sockets. The behavior of *pselect*( ) and *select*( ) on file descriptors that refer to other types of file is unspecified.

OB XSR

The *nfds* argument specifies the range of descriptors to be tested. The first *nfds* descriptors shall be checked in each set; that is, the descriptors from zero through *nfds*–1 in the descriptor sets shall be examined.

If the *readfds* argument is not a null pointer, it points to an object of type **fd_set** that on input specifies the file descriptors to be checked for being ready to read, and on output indicates which file descriptors are ready to read.

If the *writefds* argument is not a null pointer, it points to an object of type **fd_set** that on input specifies the file descriptors to be checked for being ready to write, and on output indicates which file descriptors are ready to write.

If the *errorfds* argument is not a null pointer, it points to an object of type **fd_set** that on input specifies the file descriptors to be checked for error conditions pending, and on output indicates which file descriptors have error conditions pending.

Upon successful completion, the *pselect*( ) or *select*( ) function shall modify the objects pointed to by the *readfds*, *writefds*, and *errorfds* arguments to indicate which file descriptors are ready for reading, ready for writing, or have an error condition pending, respectively, and shall return the total number of ready descriptors in all the output sets. For each file descriptor less than *nfds*, the

corresponding bit shall be set upon successful completion if it was set on input and the associated condition is true for that file descriptor.

If none of the selected descriptors are ready for the requested operation, the *pselect*( ) or *select*( ) function shall block until at least one of the requested operations becomes ready, until the *timeout* occurs, or until interrupted by a signal. The *timeout* parameter controls how long the *pselect*( ) or *select*( ) function shall take before timing out. If the *timeout* parameter is not a null pointer, it specifies a maximum interval to wait for the selection to complete. If the specified time interval expires without any requested operation becoming ready, the function shall return. If the *timeout* parameter is a null pointer, then the call to *pselect*( ) or *select*( ) shall block indefinitely until at least one descriptor meets the specified criteria. To effect a poll, the *timeout* parameter should not be a null pointer, and should point to a zero-valued **timespec** structure.

The use of a timeout does not affect any pending timers set up by *alarm*( ) or *setitimer*( ).

Implementations may place limitations on the maximum timeout interval supported. All implementations shall support a maximum timeout interval of at least 31 days. If the *timeout* argument specifies a timeout interval greater than the implementation-defined maximum value, the maximum value shall be used as the actual timeout value. Implementations may also place limitations on the granularity of timeout intervals. If the requested timeout interval requires a finer granularity than the implementation supports, the actual timeout interval shall be rounded up to the next supported value.

If *sigmask* is not a null pointer, then the *pselect*( ) function shall replace the signal mask of the caller by the set of signals pointed to by *sigmask* before examining the descriptors, and shall restore the signal mask of the calling thread before returning.

A descriptor shall be considered ready for reading when a call to an input function with O_NONBLOCK clear would not block, whether or not the function would transfer data successfully. (The function might return data, an end-of-file indication, or an error other than one indicating that it is blocked, and in each of these cases the descriptor shall be considered ready for reading.)

A descriptor shall be considered ready for writing when a call to an output function with O_NONBLOCK clear would not block, whether or not the function would transfer data successfully.

If a socket has a pending error, it shall be considered to have an exceptional condition pending. Otherwise, what constitutes an exceptional condition is file type-specific. For a file descriptor for use with a socket, it is protocol-specific except as noted below. For other file types it is implementation-defined. If the operation is meaningless for a particular file type, *pselect*( ) or *select*( ) shall indicate that the descriptor is ready for read or write operations, and shall indicate that the descriptor has no exceptional condition pending.

If a descriptor refers to a socket, the implied input function is the *recvmsg*( ) function with parameters requesting normal and ancillary data, such that the presence of either type shall cause the socket to be marked as readable. The presence of out-of-band data shall be checked if the socket option SO_OOBINLINE has been enabled, as out-of-band data is enqueued with normal data. If the socket is currently listening, then it shall be marked as readable if an incoming connection request has been received, and a call to the *accept*( ) function shall complete without blocking.

If a descriptor refers to a socket, the implied output function is the *sendmsg*( ) function supplying an amount of normal data equal to the current value of the SO_SNDLOWAT option for the socket. If a non-blocking call to the *connect*( ) function has been made for a socket, and the connection attempt has either succeeded or failed leaving a pending error, the socket shall be

marked as writable.

A socket shall be considered to have an exceptional condition pending if a receive operation with O_NONBLOCK clear for the open file description and with the MSG_OOB flag set would return out-of-band data without blocking. (It is protocol-specific whether the MSG_OOB flag would be used to read out-of-band data.) A socket shall also be considered to have an exceptional condition pending if an out-of-band data mark is present in the receive queue. Other circumstances under which a socket may be considered to have an exceptional condition pending are protocol-specific and implementation-defined.

If the *readfds*, *writefds*, and *errorfds* arguments are all null pointers and the *timeout* argument is not a null pointer, the *pselect*( ) or *select*( ) function shall block for the time specified, or until interrupted by a signal. If the *readfds*, *writefds*, and *errorfds* arguments are all null pointers and the *timeout* argument is a null pointer, the *pselect*( ) or *select*( ) function shall block until interrupted by a signal.

File descriptors associated with regular files shall always select true for ready to read, ready to write, and error conditions.

On failure, the objects pointed to by the *readfds*, *writefds*, and *errorfds* arguments shall not be modified. If the timeout interval expires without the specified condition being true for any of the specified file descriptors, the objects pointed to by the *readfds*, *writefds*, and *errorfds* arguments shall have all bits set to 0.

File descriptor masks of type **fd_set** can be initialized and tested with *FD_CLR*( ), *FD_ISSET*( ), *FD_SET*( ), and *FD_ZERO*( ). It is unspecified whether each of these is a macro or a function. If a macro definition is suppressed in order to access an actual function, or a program defines an external identifier with any of these names, the behavior is undefined.

FD_CLR(*fd*, *fdsetp*) shall remove the file descriptor *fd* from the set pointed to by *fdsetp*. If *fd* is not a member of this set, there shall be no effect on the set, nor will an error be returned.

FD_ISSET(*fd*, *fdsetp*) shall evaluate to non-zero if the file descriptor *fd* is a member of the set pointed to by *fdsetp*, and shall evaluate to zero otherwise.

FD_SET(*fd*, *fdsetp*) shall add the file descriptor *fd* to the set pointed to by *fdsetp*. If the file descriptor *fd* is already in this set, there shall be no effect on the set, nor will an error be returned.

FD_ZERO(*fdsetp*) shall initialize the descriptor set pointed to by *fdsetp* to the null set. No error is returned if the set is not empty at the time *FD_ZERO*( ) is invoked.

The behavior of these macros is undefined if the *fd* argument is less than 0 or greater than or equal to FD_SETSIZE, or if *fd* is not a valid file descriptor, or if any of the arguments are expressions with side-effects.

If a thread gets canceled during a *pselect*( ) call, the signal mask in effect when executing the registered cleanup functions is either the original signal mask or the signal mask installed as part of the *pselect*( ) call.

RETURN VALUE

Upon successful completion, the *pselect*( ) and *select*( ) functions shall return the total number of bits set in the bit masks. Otherwise, –1 shall be returned, and *errno* shall be set to indicate the error.

FD_CLR( ), *FD_SET*( ), and *FD_ZERO*( ) do not return a value. *FD_ISSET*( ) shall return a non-zero value if the bit for the file descriptor *fd* is set in the file descriptor set pointed to by *fdset*, and 0 otherwise.

ERRORS

Under the following conditions, *pselect*( ) and *select*( ) shall fail and set *errno* to:

[EBADF] One or more of the file descriptor sets specified a file descriptor that is not a valid open file descriptor.

[EINTR] The function was interrupted before any of the selected events occurred and before the timeout interval expired.

XSI If SA_RESTART has been set for the interrupting signal, it is implementation-defined whether the function restarts or returns with [EINTR].

[EINVAL] An invalid timeout interval was specified.

[EINVAL] The *nfds* argument is less than 0 or greater than FD_SETSIZE.

OB XSR [EINVAL] One of the specified file descriptors refers to a STREAM or multiplexer that is linked (directly or indirectly) downstream from a multiplexer.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

In earlier versions of the Single UNIX Specification, the *select*( ) function was defined in the **<sys/time.h>** header. This is now changed to **<sys/select.h>**. The rationale for this change was as follows: the introduction of the *pselect*( ) function included the **<sys/select.h>** header and the **<sys/select.h>** header defines all the related definitions for the *pselect*( ) and *select*( ) functions. Backwards-compatibility to existing XSI implementations is handled by allowing **<sys/time.h>** to include **<sys/select.h>**.

Code which wants to avoid the ambiguity of the signal mask for thread cancellation handlers can install an additional cancellation handler which resets the signal mask to the expected value.

```
void cleanup(void *arg)
{
    sigset_t *ss = (sigset_t *) arg;
    pthread_sigmask(SIG_SETMASK, ss, NULL);
}

int call_pselect(int nfds, fd_set *readfds, fd_set *writefds,
    fd_set errorfds, const struct timespec *timeout,
    const sigset_t *sigmask)
{
    sigset_t oldmask;
    int result;
    pthread_sigmask(SIG_SETMASK, NULL, &oldmask);
    pthread_cleanup_push(cleanup, &oldmask);
    result = pselect(nfds, readfds, writefds, errorfds, timeout, sigmask);
    pthread_cleanup_pop(0);
    return result;
}
```

FUTURE DIRECTIONS

None.

accept( ), *alarm( )*, *connect( )*, *fcntl( )*, *getitimer( )*, *poll( )*, *read( )*, *recvmsg( )*, *sendmsg( )*, *write( )*

XBD **<sys/select.h>**, **<sys/time.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

In the ERRORS section, the text has been changed to indicate that [EINVAL] is returned when *nfds* is less than 0 or greater than FD_SETSIZE. It previously stated less than 0, or greater than or equal to FD_SETSIZE.

Text about *timeout* is moved from the APPLICATION USAGE section to the DESCRIPTION.

Issue 6

The Open Group Corrigendum U026/6 is applied, changing the occurrences of *readfs* and *writefs* in the *select( )* DESCRIPTION to be *readfds* and *writefds*.

Text referring to sockets is added to the DESCRIPTION.

The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are marked as part of the XSI STREAMS Option Group.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- These functions are now mandatory.

The *pselect( )* function is added for alignment with IEEE Std 1003.1g-2000 and additional detail related to sockets semantics is added to the DESCRIPTION.

The *select( )* function now requires inclusion of **<sys/select.h>**.

The **restrict** keyword is added to the *select( )* prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/70 is applied, updating the DESCRIPTION to reference the signal mask in terms of the calling thread rather than the process.

Issue 7

SD5-XSH-ERN-122 is applied, adding text to the DESCRIPTION for when a thread is canceled during a call to *pselect( )*, and adding example code to the RATIONALE.

Functionality relating to the XSI STREAMS option is marked obsolescent.

Functionality relating to the Threads option is moved to the Base.

NAME

psiginfo, psignal — print signal information to standard error

SYNOPSIS

CX
```
#include <signal.h>

void psiginfo(const siginfo_t *pinfo, const char *message);
void psignal(int signum, const char *message);
```

DESCRIPTION

The *psiginfo*( ) and *psignal*( ) functions shall print a message out on *stderr* associated with a signal number. If *message* is not null and is not the empty string, then the string pointed to by the *message* argument shall be printed first, followed by a <colon>, a <space>, and the signal description string indicated by *signum*, or by the signal associated with *pinfo*. If the *message* argument is null or points to an empty string, then only the signal description shall be printed. For *psiginfo*( ), the argument *pinfo* references a valid **siginfo_t** structure. For *psignal*( ), if *signum* is not a valid signal number, the behavior is implementation-defined.

The *psiginfo*( ) and *psignal*( ) functions shall not change the orientation of the standard error stream.

The *psiginfo*( ) and *psignal*( ) functions shall mark for update the last data modification and last file status change timestamps of the file associated with the standard error stream at some time between their successful completion and *exit*( ), *abort*( ), or the completion of *fflush*( ) or *fclose*( ) on *stderr*.

RETURN VALUE

These functions shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

System V historically has *psignal*( ) and *psiginfo*( ) in **<siginfo.h>**. However, the **<siginfo.h>** header is not specified in the Base Definitions volume of POSIX.1-200x, and the type **siginfo_t** is defined in **<signal.h>**.

FUTURE DIRECTIONS

None.

NAME

pthread_atfork — register fork handlers

SYNOPSIS

```
#include <pthread.h>

int pthread_atfork(void (*prepare)(void), void (*parent)(void),
    void (*child)(void));
```

DESCRIPTION

The *pthread_atfork*( ) function shall declare fork handlers to be called before and after *fork*( ), in the context of the thread that called *fork*( ). The *prepare* fork handler shall be called before *fork*( ) processing commences. The *parent* fork handle shall be called after *fork*( ) processing completes in the parent process. The *child* fork handler shall be called after *fork*( ) processing completes in the child process. If no handling is desired at one or more of these three points, the corresponding fork handler address(es) may be set to NULL.

The order of calls to *pthread_atfork*( ) is significant. The *parent* and *child* fork handlers shall be called in the order in which they were established by calls to *pthread_atfork*( ). The *prepare* fork handlers shall be called in the opposite order.

RETURN VALUE

Upon successful completion, *pthread_atfork*( ) shall return a value of zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_atfork*( ) function shall fail if:

[ENOMEM] Insufficient table space exists to record the fork handler addresses.

The *pthread_atfork*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

There are at least two serious problems with the semantics of *fork*( ) in a multi-threaded program. One problem has to do with state (for example, memory) covered by mutexes. Consider the case where one thread has a mutex locked and the state covered by that mutex is inconsistent while another thread calls *fork*( ). In the child, the mutex is in the locked state (locked by a nonexistent thread and thus can never be unlocked). Having the child simply reinitialize the mutex is unsatisfactory since this approach does not resolve the question about how to correct or otherwise deal with the inconsistent state in the child.

It is suggested that programs that use *fork*( ) call an *exec* function very soon afterwards in the child process, thus resetting all states. In the meantime, only a short list of async-signal-safe library routines are promised to be available.

Unfortunately, this solution does not address the needs of multi-threaded libraries. Application programs may not be aware that a multi-threaded library is in use, and they feel free to call any number of library routines between the *fork*( ) and *exec* calls, just as they always have. Indeed, they may be extant single-threaded programs and cannot, therefore, be expected to obey new restrictions imposed by the threads library.

On the other hand, the multi-threaded library needs a way to protect its internal state during *fork*( ) in case it is re-entered later in the child process. The problem arises especially in multi-

threaded I/O libraries, which are almost sure to be invoked between the *fork*( ) and *exec* calls to effect I/O redirection. The solution may require locking mutex variables during *fork*( ), or it may entail simply resetting the state in the child after the *fork*( ) processing completes.

The *pthread_atfork*( ) function was intended to provide multi-threaded libraries with a means to protect themselves from innocent application programs that call *fork*( ), and to provide multi-threaded application programs with a standard mechanism for protecting themselves from *fork*( ) calls in a library routine or the application itself.

The expected usage was that the prepare handler would acquire all mutex locks and the other two fork handlers would release them.

For example, an application could have supplied a prepare routine that acquires the necessary mutexes the library maintains and supplied child and parent routines that release those mutexes, thus ensuring that the child would have got a consistent snapshot of the state of the library (and that no mutexes would have been left stranded). This is good in theory, but in reality not practical. Each and every mutex and lock in the process must be located and locked. Every component of a program including third-party components must participate and they must agree who is responsible for which mutex or lock. This is especially problematic for mutexes and locks in dynamically allocated memory. All mutexes and locks internal to the implementation must be locked, too. This possibly delays the thread calling *fork*( ) for a long time or even indefinitely since uses of these synchronization objects may not be under control of the application. A final problem to mention here is the problem of locking streams. At least the streams under control of the system (like *stdin*, *stdout*, *stderr*) must be protected by locking the stream with *flockfile*( ). But the application itself could have done that, possibly in the same thread calling *fork*( ). In this case, the process will deadlock.

Alternatively, some libraries might have been able to supply just a *child* routine that reinitializes the mutexes in the library and all associated states to some known value (for example, what it was when the image was originally executed). This approach is not possible, though, because implementations are allowed to fail **_init*( ) and **_destroy*( ) calls for mutexes and locks if the mutex or lock is still locked. In this case, the *child* routine is not able to reinitialize the mutexes and locks.

When *fork*( ) is called, only the calling thread is duplicated in the child process. Synchronization variables remain in the same state in the child as they were in the parent at the time *fork*( ) was called. Thus, for example, mutex locks may be held by threads that no longer exist in the child process, and any associated states may be inconsistent. The intention was that the parent process could have avoided this by explicit code that acquires and releases locks critical to the child via *pthread_atfork*( ). In addition, any critical threads would have needed to be recreated and reinitialized to the proper state in the child (also via *pthread_atfork*( )).

A higher-level package may acquire locks on its own data structures before invoking lower-level packages. Under this scenario, the order specified for fork handler calls allows a simple rule of initialization for avoiding package deadlock: a package initializes all packages on which it depends before it calls the *pthread_atfork*( ) function for itself.

As explained, there is no suitable solution for functionality which requires non-atomic operations to be protected through mutexes and locks. This is why the POSIX.1 standard since the 1996 release requires that the child process after *fork*( ) in a multi-threaded process only calls async-signal-safe interfaces.

CHANGE HISTORY

First released in Issue 5. Derived from the POSIX Threads Extension.

IEEE PASC Interpretation 1003.1c #4 is applied.

Issue 6

The *pthread_atfork*( ) function is marked as part of the Threads option.

The **<pthread.h>** header is added to the SYNOPSIS.

Issue 7

The *pthread_atfork*( ) function is moved from the Threads option to the Base.

SD5-XSH-ERN-145 is applied, updating the RATIONALE.

NAME

pthread_attr_destroy, pthread_attr_init — destroy and initialize the thread attributes object

SYNOPSIS

```
#include <pthread.h>

int pthread_attr_destroy(pthread_attr_t *attr);
int pthread_attr_init(pthread_attr_t *attr);
```

DESCRIPTION

The *pthread_attr_destroy*( ) function shall destroy a thread attributes object. An implementation may cause *pthread_attr_destroy*( ) to set *attr* to an implementation-defined invalid value. A destroyed *attr* attributes object can be reinitialized using *pthread_attr_init*( ); the results of otherwise referencing the object after it has been destroyed are undefined.

The *pthread_attr_init*( ) function shall initialize a thread attributes object *attr* with the default value for all of the individual attributes used by a given implementation.

The resulting attributes object (possibly modified by setting individual attribute values) when used by *pthread_create*( ) defines the attributes of the thread created. A single attributes object can be used in multiple simultaneous calls to *pthread_create*( ). Results are undefined if *pthread_attr_init*( ) is called specifying an already initialized *attr* attributes object.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_destroy*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

Upon successful completion, *pthread_attr_destroy*( ) and *pthread_attr_init*( ) shall return a value of 0; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_attr_init*( ) function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the thread attributes object.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Attributes objects are provided for threads, mutexes, and condition variables as a mechanism to support probable future standardization in these areas without requiring that the function itself be changed.

Attributes objects provide clean isolation of the configurable aspects of threads. For example, "stack size" is an important attribute of a thread, but it cannot be expressed portably. When porting a threaded program, stack sizes often need to be adjusted. The use of attributes objects can help by allowing the changes to be isolated in a single place, rather than being spread across every instance of thread creation.

Attributes objects can be used to set up "classes' of threads with similar attributes; for example, "threads with large stacks and high priority" or "threads with minimal stacks". These classes can be defined in a single place and then referenced wherever threads need to be created. Changes to "class" decisions become straightforward, and detailed analysis of each *pthread_create*( ) call is not required.

The attributes objects are defined as opaque types as an aid to extensibility. If these objects had been specified as structures, adding new attributes would force recompilation of all multi-threaded programs when the attributes objects are extended; this might not be possible if different program components were supplied by different vendors.

Additionally, opaque attributes objects present opportunities for improving performance. Argument validity can be checked once when attributes are set, rather than each time a thread is created. Implementations often need to cache kernel objects that are expensive to create. Opaque attributes objects provide an efficient mechanism to detect when cached objects become invalid due to attribute changes.

Since assignment is not necessarily defined on a given opaque type, implementation-defined default values cannot be defined in a portable way. The solution to this problem is to allow attributes objects to be initialized dynamically by attributes object initialization functions, so that default values can be supplied automatically by the implementation.

The following proposal was provided as a suggested alternative to the supplied attributes:

1. Maintain the style of passing a parameter formed by the bitwise-inclusive OR of flags to the initialization routines (*pthread_create*( ), *pthread_mutex_init*( ), *pthread_cond_init*( )). The parameter containing the flags should be an opaque type for extensibility. If no flags are set in the parameter, then the objects are created with default characteristics. An implementation may specify implementation-defined flag values and associated behavior.

2. If further specialization of mutexes and condition variables is necessary, implementations may specify additional procedures that operate on the **pthread_mutex_t** and **pthread_cond_t** objects (instead of on attributes objects).

The difficulties with this solution are:

1. A bitmask is not opaque if bits have to be set into bitvector attributes objects using explicitly-coded bitwise-inclusive OR operations. If the set of options exceeds an **int**, application programmers need to know the location of each bit. If bits are set or read by encapsulation (that is, get and set functions), then the bitmask is merely an implementation of attributes objects as currently defined and should not be exposed to the programmer.

2. Many attributes are not Boolean or very small integral values. For example, scheduling policy may be placed in 3-bit or 4-bit, but priority requires 5-bit or more, thereby taking up at least 8 bits out of a possible 16 bits on machines with 16-bit integers. Because of this, the bitmask can only reasonably control whether particular attributes are set or not, and it cannot serve as the repository of the value itself. The value needs to be specified as a function parameter (which is non-extensible), or by setting a structure field (which is non-opaque), or by get and set functions (making the bitmask a redundant addition to the attributes objects).

Stack size is defined as an optional attribute because the very notion of a stack is inherently machine-dependent. Some implementations may not be able to change the size of the stack, for example, and others may not need to because stack pages may be discontiguous and can be allocated and released on demand.

The attribute mechanism has been designed in large measure for extensibility. Future extensions to the attribute mechanism or to any attributes object defined in this volume of POSIX.1-200x has to be done with care so as not to affect binary-compatibility.

Attributes objects, even if allocated by means of dynamic allocation functions such as *malloc*( ),

may have their size fixed at compile time. This means, for example, a *pthread_create*( ) in an implementation with extensions to **pthread_attr_t** cannot look beyond the area that the binary application assumes is valid. This suggests that implementations should maintain a size field in the attributes object, as well as possibly version information, if extensions in different directions (possibly by different vendors) are to be accommodated.

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_destroy*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_init*( ) refers to an already initialized thread attributes object, it is recommended that the function should fail and report an [EBUSY] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_attr_destroy*( ) and *pthread_attr_init*( ) functions are marked as part of the Threads option.

IEEE PASC Interpretation 1003.1 #107 is applied, noting that the effect of initializing an already initialized thread attributes object is undefined.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/71 is applied, updating the ERRORS section to add the optional [EINVAL] error for the *pthread_attr_destroy*( ) function, and the optional [EBUSY] error for the *pthread_attr_init*( ) function.

Issue 7

The *pthread_attr_destroy*( ) and *pthread_attr_init*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

The [EBUSY] error for an already initialized thread attributes object is removed; this condition results in undefined behavior.

NAME

pthread_attr_getdetachstate, pthread_attr_setdetachstate — get and set the detachstate attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_attr_getdetachstate(const pthread_attr_t *attr,
    int *detachstate);
int pthread_attr_setdetachstate(pthread_attr_t *attr, int detachstate);
```

DESCRIPTION

The *detachstate* attribute controls whether the thread is created in a detached state. If the thread is created detached, then use of the ID of the newly created thread by the *pthread_detach*( ) or *pthread_join*( ) function is an error.

The *pthread_attr_getdetachstate*( ) and *pthread_attr_setdetachstate*( ) functions, respectively, shall get and set the *detachstate* attribute in the *attr* object.

For *pthread_attr_getdetachstate*( ), *detachstate* shall be set to either PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE.

For *pthread_attr_setdetachstate*( ), the application shall set *detachstate* to either PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE.

A value of PTHREAD_CREATE_DETACHED shall cause all threads created with *attr* to be in the detached state, whereas using a value of PTHREAD_CREATE_JOINABLE shall cause all threads created with *attr* to be in the joinable state. The default value of the *detachstate* attribute shall be PTHREAD_CREATE_JOINABLE.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getdetachstate*( ) or *pthread_attr_setdetachstate*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

Upon successful completion, *pthread_attr_getdetachstate*( ) and *pthread_attr_setdetachstate*( ) shall return a value of 0; otherwise, an error number shall be returned to indicate the error.

The *pthread_attr_getdetachstate*( ) function stores the value of the *detachstate* attribute in *detachstate* if successful.

ERRORS

The *pthread_attr_setdetachstate*( ) function shall fail if:

[EINVAL] The value of *detachstate* was not valid

These functions shall not return an error code of [EINTR].

EXAMPLES

Retrieving the detachstate Attribute

This example shows how to obtain the *detachstate* attribute of a thread attribute object.

```
#include <pthread.h>

pthread_attr_t thread_attr;
int            detachstate;
int            rc;

/* code initializing thread_attr */
...
```

```
        rc = pthread_attr_getdetachstate (&thread_attr, &detachstate);
        if (rc!=0) {
            /* handle error */
            ...
        }
        else {
            /* legal values for detachstate are:
             * PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE
             */
             ...
        }
```

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getdetachstate*( ) or *pthread_attr_setdetachstate*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_attr_setdetachstate*( ) and *pthread_attr_getdetachstate*( ) functions are marked as part of the Threads option.

The normative text is updated to avoid use of the term "must" for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/72 is applied, adding the example to the EXAMPLES section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/73 is applied, updating the ERRORS section to include the optional [EINVAL] error.

Issue 7

The *pthread_attr_setdetachstate*( ) and *pthread_attr_getdetachstate*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

NAME

pthread_attr_getguardsize, pthread_attr_setguardsize — get and set the thread guardsize attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_attr_getguardsize(const pthread_attr_t *restrict attr,
    size_t *restrict guardsize);
int pthread_attr_setguardsize(pthread_attr_t *attr,
    size_t guardsize);
```

DESCRIPTION

The *pthread_attr_getguardsize*( ) function shall get the *guardsize* attribute in the *attr* object. This attribute shall be returned in the *guardsize* parameter.

The *pthread_attr_setguardsize*( ) function shall set the *guardsize* attribute in the *attr* object. The new value of this attribute shall be obtained from the *guardsize* parameter. If *guardsize* is zero, a guard area shall not be provided for threads created with *attr*. If *guardsize* is greater than zero, a guard area of at least size *guardsize* bytes shall be provided for each thread created with *attr*.

The *guardsize* attribute controls the size of the guard area for the created thread's stack. The *guardsize* attribute provides protection against overflow of the stack pointer. If a thread's stack is created with guard protection, the implementation allocates extra memory at the overflow end of the stack as a buffer against stack overflow of the stack pointer. If an application overflows into this buffer an error shall result (possibly in a SIGSEGV signal being delivered to the thread).

A conforming implementation may round up the value contained in *guardsize* to a multiple of the configurable system variable {PAGESIZE} (see **<sys/mman.h>**). If an implementation rounds up the value of *guardsize* to a multiple of {PAGESIZE}, a call to *pthread_attr_getguardsize*( ) specifying *attr* shall store in the *guardsize* parameter the guard size specified by the previous *pthread_attr_setguardsize*( ) function call.

The default value of the *guardsize* attribute is implementation-defined.

If the *stackaddr* attribute has been set (that is, the caller is allocating and managing its own thread stacks), the *guardsize* attribute shall be ignored and no protection shall be provided by the implementation. It is the responsibility of the application to manage stack overflow along with stack allocation and management in this case.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getguardsize*( ) or *pthread_attr_setguardsize*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

If successful, the *pthread_attr_getguardsize*( ) and *pthread_attr_setguardsize*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions shall fail if:

[EINVAL] The parameter *guardsize* is invalid.

These functions shall not return an error code of [EINTR].

EXAMPLES

Retrieving the guardsize Attribute

This example shows how to obtain the *guardsize* attribute of a thread attribute object.

```
#include <pthread.h>

pthread_attr_t thread_attr;
size_t  guardsize;
int     rc;

/* code initializing thread_attr */
...

rc = pthread_attr_getguardsize (&thread_attr, &guardsize);
if (rc != 0)  {
    /* handle error */
    ...
}
else {
    if (guardsize > 0) {
    /* a guard area of at least guardsize bytes is provided */
    ...
    }
    else {
    /* no guard area provided */
    ...
    }
}
```

APPLICATION USAGE

None.

RATIONALE

The *guardsize* attribute is provided to the application for two reasons:

1. Overflow protection can potentially result in wasted system resources. An application that creates a large number of threads, and which knows its threads never overflow their stack, can save system resources by turning off guard areas.
2. When threads allocate large data structures on the stack, large guard areas may be needed to detect stack overflow.

The default size of the guard area is left implementation-defined since on systems supporting very large page sizes, the overhead might be substantial if at least one guard page is required by default.

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getguardsize*( ) or *pthread_attr_setguardsize*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5.

Issue 6

In the ERRORS section, a third [EINVAL] error condition is removed as it is covered by the second error condition.

The **restrict** keyword is added to the *pthread_attr_getguardsize*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/74 is applied, updating the ERRORS section to remove the [EINVAL] error (“The attribute *attr* is invalid.”), and replacing it with the optional [EINVAL] error.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/76 is applied, adding the example to the EXAMPLES section.

Issue 7

SD5-XSH-ERN-111 is applied, removing the reference to the *stack* attribute in the DESCRIPTION.

SD5-XSH-ERN-175 is applied, updating the DESCRIPTION to note that the default size of the guard area is implementation-defined.

The *pthread_attr_getguardsize*( ) and *pthread_attr_setguardsize*( ) functions are moved from the XSI option to the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

NAME

pthread_attr_getinheritsched, pthread_attr_setinheritsched — get and set the inheritsched attribute (**REALTIME THREADS**)

SYNOPSIS

TPS

```
#include <pthread.h>

int pthread_attr_getinheritsched(const pthread_attr_t *restrict attr,
    int *restrict inheritsched);
int pthread_attr_setinheritsched(pthread_attr_t *attr,
    int inheritsched);
```

DESCRIPTION

The *pthread_attr_getinheritsched*( ) and *pthread_attr_setinheritsched*( ) functions, respectively, shall get and set the *inheritsched* attribute in the *attr* argument.

When the attributes objects are used by *pthread_create*( ), the *inheritsched* attribute determines how the other scheduling attributes of the created thread shall be set.

The supported values of *inheritsched* shall be:

PTHREAD_INHERIT_SCHED
: Specifies that the thread scheduling attributes shall be inherited from the creating thread, and the scheduling attributes in this *attr* argument shall be ignored.

PTHREAD_EXPLICIT_SCHED
: Specifies that the thread scheduling attributes shall be set to the corresponding values from this attributes object.

The symbols PTHREAD_INHERIT_SCHED and PTHREAD_EXPLICIT_SCHED are defined in the **<pthread.h>** header.

The following thread scheduling attributes defined by POSIX.1-200x are affected by the *inheritsched* attribute: scheduling policy (*schedpolicy*), scheduling parameters (*schedparam*), and scheduling contention scope (*contentionscope*).

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getinheritsched*( ) or *pthread_attr_setinheritsched*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

If successful, the *pthread_attr_getinheritsched*( ) and *pthread_attr_setinheritsched*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_attr_setinheritsched*( ) function may fail if:

[EINVAL] The value of *inheritsched* is not valid.

[ENOTSUP] An attempt was made to set the attribute to an unsupported value.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

After these attributes have been set, a thread can be created with the specified attributes using *pthread_create*( ). Using these routines does not affect the current running thread.

See Section 2.9.4 (on page 509) for further details on thread scheduling attributes and their default settings.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getinheritsched*( ) or *pthread_attr_setinheritsched*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_attr_destroy( ), *pthread_attr_getscope*( ), *pthread_attr_getschedpolicy*( ), *pthread_attr_getschedparam*( ), *pthread_create*( )

XBD **<pthread.h>**, **<sched.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Marked as part of the Realtime Threads Feature Group.

Issue 6

The *pthread_attr_getinheritsched*( ) and *pthread_attr_setinheritsched*( ) functions are marked as part of the Threads and Thread Execution Scheduling options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Execution Scheduling option.

The **restrict** keyword is added to the *pthread_attr_getinheritsched*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/75 is applied, clarifying the values of *inheritsched* in the DESCRIPTION and adding two optional [EINVAL] errors to the ERRORS section for checking when *attr* refers to an uninitialized thread attribute object.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/77 is applied, adding a reference to Section 2.9.4 (on page 509) in the APPLICATION USAGE section.

Issue 7

The *pthread_attr_getinheritsched*( ) and *pthread_attr_setinheritsched*( ) functions are moved from the Threads option.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

NAME

pthread_attr_getschedparam, pthread_attr_setschedparam — get and set the schedparam attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_attr_getschedparam(const pthread_attr_t *restrict attr,
    struct sched_param *restrict param);
int pthread_attr_setschedparam(pthread_attr_t *restrict attr,
    const struct sched_param *restrict param);
```

DESCRIPTION

The *pthread_attr_getschedparam*( ) and *pthread_attr_setschedparam*( ) functions, respectively, shall get and set the scheduling parameter attributes in the *attr* argument. The contents of the *param* structure are defined in the **<sched.h>** header. For the SCHED_FIFO and SCHED_RR policies, the only required member of *param* is *sched_priority*.

TSP For the SCHED_SPORADIC policy, the required members of the *param* structure are *sched_priority*, *sched_ss_low_priority*, *sched_ss_repl_period*, *sched_ss_init_budget*, and *sched_ss_max_repl*. The specified *sched_ss_repl_period* must be greater than or equal to the specified *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail. The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the function to succeed; if not, the function shall fail. It is unspecified whether the *sched_ss_repl_period* and *sched_ss_init_budget* values are stored as provided by this function or are rounded to align with the resolution of the clock being used.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getschedparam*( ) or *pthread_attr_setschedparam*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

If successful, the *pthread_attr_getschedparam*( ) and *pthread_attr_setschedparam*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_attr_setschedparam*( ) function may fail if:

[EINVAL] The value of *param* is not valid.

[ENOTSUP] An attempt was made to set the attribute to an unsupported value.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

After these attributes have been set, a thread can be created with the specified attributes using *pthread_create*( ). Using these routines does not affect the current running thread.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getschedparam*( ) or *pthread_attr_setschedparam*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_attr_getschedparam( )* and *pthread_attr_setschedparam( )* functions are marked as part of the Threads option.

The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *pthread_attr_getschedparam( )* and *pthread_attr_setschedparam( )* prototypes for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/78 is applied, updating the ERRORS section to include optional errors for the case when *attr* refers to an uninitialized thread attribute object.

Issue 7

The *pthread_attr_getschedparam( )* and *pthread_attr_setschedparam( )* functions are moved from the Threads option to the Base.

Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements for the *sched_ss_repl_period* and *sched_ss_init_budget* values.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

NAME

pthread_attr_getschedpolicy, pthread_attr_setschedpolicy — get and set the schedpolicy attribute (**REALTIME THREADS**)

SYNOPSIS

TPS
```
#include <pthread.h>

int pthread_attr_getschedpolicy(const pthread_attr_t *restrict attr,
    int *restrict policy);
int pthread_attr_setschedpolicy(pthread_attr_t *attr, int policy);
```

DESCRIPTION

The *pthread_attr_getschedpolicy*( ) and *pthread_attr_setschedpolicy*( ) functions, respectively, shall get and set the *schedpolicy* attribute in the *attr* argument.

The supported values of *policy* shall include SCHED_FIFO, SCHED_RR, and SCHED_OTHER, which are defined in the **<sched.h>** header. When threads executing with the scheduling policy TSP SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC are waiting on a mutex, they shall acquire the mutex in priority order when the mutex is unlocked.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getschedpolicy*( ) or *pthread_attr_setschedpolicy*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

If successful, the *pthread_attr_getschedpolicy*( ) and *pthread_attr_setschedpolicy*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_attr_setschedpolicy*( ) function may fail if:

[EINVAL] The value of *policy* is not valid.

[ENOTSUP] An attempt was made to set the attribute to an unsupported value.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

After these attributes have been set, a thread can be created with the specified attributes using *pthread_create*( ). Using these routines does not affect the current running thread.

See Section 2.9.4 (on page 509) for further details on thread scheduling attributes and their default settings.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getschedpolicy*( ) or *pthread_attr_setschedpolicy*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Execution Scheduling option.

The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *pthread_attr_getschedpolicy*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/79 is applied, adding a reference to Section 2.9.4 (on page 509) in the APPLICATION USAGE section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/80 is applied, updating the ERRORS section to include optional errors for the case when *attr* refers to an uninitialized thread attribute object.

Issue 7

The *pthread_attr_getschedpolicy*( ) and *pthread_attr_setschedpolicy*( ) functions are moved from the Threads option.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

NAME

pthread_attr_getscope, pthread_attr_setscope — get and set the contentionscope attribute (**REALTIME THREADS**)

SYNOPSIS

TPS

```
#include <pthread.h>

int pthread_attr_getscope(const pthread_attr_t *restrict attr,
    int *restrict contentionscope);
int pthread_attr_setscope(pthread_attr_t *attr, int contentionscope);
```

DESCRIPTION

The *pthread_attr_getscope*( ) and *pthread_attr_setscope*( ) functions, respectively, shall get and set the *contentionscope* attribute in the *attr* object.

The *contentionscope* attribute may have the values PTHREAD_SCOPE_SYSTEM, signifying system scheduling contention scope, or PTHREAD_SCOPE_PROCESS, signifying process scheduling contention scope. The symbols PTHREAD_SCOPE_SYSTEM and PTHREAD_SCOPE_PROCESS are defined in the **<pthread.h>** header.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getscope*( ) or *pthread_attr_setscope*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

If successful, the *pthread_attr_getscope*( ) and *pthread_attr_setscope*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_attr_setscope*( ) function may fail if:

[EINVAL] The value of *contentionscope* is not valid.

[ENOTSUP] An attempt was made to set the attribute to an unsupported value.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

After these attributes have been set, a thread can be created with the specified attributes using *pthread_create*( ). Using these routines does not affect the current running thread.

See Section 2.9.4 (on page 509) for further details on thread scheduling attributes and their default settings.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getscope*( ) or *pthread_attr_setscope*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

Issue 6

The *pthread_attr_getscope*( ) and *pthread_attr_setscope*( ) functions are marked as part of the Threads and Thread Execution Scheduling options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Execution Scheduling option.

The **restrict** keyword is added to the *pthread_attr_getscope*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/81 is applied, adding a reference to Section 2.9.4 (on page 509) in the APPLICATION USAGE section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/82 is applied, updating the ERRORS section to include optional errors for the case when *attr* refers to an uninitialized thread attribute object.

Issue 7

The *pthread_attr_getscope*( ) and *pthread_attr_setscope*( ) functions are moved from the Threads option.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

pthread_attr_getstack( )

NAME

pthread_attr_getstack, pthread_attr_setstack — get and set stack attributes

SYNOPSIS

TSA TSS

```
#include <pthread.h>

int pthread_attr_getstack(const pthread_attr_t *restrict attr,
    void **restrict stackaddr, size_t *restrict stacksize);
int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr,
    size_t stacksize);
```

DESCRIPTION

The *pthread_attr_getstack*( ) and *pthread_attr_setstack*( ) functions, respectively, shall get and set the thread creation stack attributes *stackaddr* and *stacksize* in the *attr* object.

The stack attributes specify the area of storage to be used for the created thread's stack. The base (lowest addressable byte) of the storage shall be *stackaddr*, and the size of the storage shall be *stacksize* bytes. The *stacksize* shall be at least {PTHREAD_STACK_MIN}. The *pthread_attr_setstack*( ) function may fail with [EINVAL] if *stackaddr* does not meet implementation-defined alignment requirements. All pages within the stack described by *stackaddr* and *stacksize* shall be both readable and writable by the thread.

If the *pthread_attr_getstack*( ) function is called before the *stackaddr* attribute has been set, the behavior is unspecified.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getstack*( ) or *pthread_attr_setstack*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

Upon successful completion, these functions shall return a value of 0; otherwise, an error number shall be returned to indicate the error.

The *pthread_attr_getstack*( ) function shall store the stack attribute values in *stackaddr* and *stacksize* if successful.

ERRORS

The *pthread_attr_setstack*( ) function shall fail if:

[EINVAL] The value of *stacksize* is less than {PTHREAD_STACK_MIN} or exceeds an implementation-defined limit.

The *pthread_attr_setstack*( ) function may fail if:

[EINVAL] The value of *stackaddr* does not have proper alignment to be used as a stack, or ((**char** *)*stackaddr* + *stacksize*) lacks proper alignment.

[EACCES] The stack page(s) described by *stackaddr* and *stacksize* are not both readable and writable by the thread.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

These functions are appropriate for use by applications in an environment where the stack for a thread must be placed in some particular region of memory.

While it might seem that an application could detect stack overflow by providing a protected page outside the specified stack region, this cannot be done portably. Implementations are free to place the thread's initial stack pointer anywhere within the specified region to accommodate the machine's stack pointer behavior and allocation requirements. Furthermore, on some architectures, such as the IA-64, "overflow" might mean that two separate stack pointers allocated within the region will overlap somewhere in the middle of the region.

After a successful call to *pthread_attr_setstack*( ), the storage area specified by the *stackaddr* parameter is under the control of the implementation, as described in Section 2.9.8 (on page 516).

The specification of the *stackaddr* attribute presents several ambiguities that make portable use of these functions impossible. For example, the standard allows implementations to impose arbitrary alignment requirements on *stackaddr*. Applications cannot assume that a buffer obtained from *malloc*( ) is suitably aligned. Note that although the *stacksize* value passed to *pthread_attr_setstack*( ) must satisfy alignment requirements, the same is not true for *pthread_attr_setstacksize*( ) where the implementation must increase the specified size if necessary to achieve the proper alignment.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getstack*( ) or *pthread_attr_setstack*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

XBD **<limits.h>**, **<pthread.h>**

CHANGE HISTORY

First released in Issue 6. Developed as part of the XSI option and brought into the BASE by IEEE PASC Interpretation 1003.1 #101.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/83 is applied, updating the APPLICATION USAGE section to refer to Section 2.9.8 (on page 516).

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC/D6/84 is applied, updating the ERRORS section to include optional errors for the case when *attr* refers to an uninitialized thread attribute object.

Issue 7

SD5-XSH-ERN-66 is applied, correcting the use of *attr* in the [EINVAL] error condition.

Austin Group Interpretation 1003.1-2001 #057 is applied, clarifying the behavior if the function is called before the *stackaddr* attribute is set.

SD5-XSH-ERN-157 is applied, updating the APPLICATION USAGE section.

The description of the *stackaddr* attribute is updated in the DESCRIPTION and APPLICATION USAGE sections.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

NAME

pthread_attr_getstacksize, pthread_attr_setstacksize — get and set the stacksize attribute

SYNOPSIS

TSS

```
#include <pthread.h>

int pthread_attr_getstacksize(const pthread_attr_t *restrict attr,
    size_t *restrict stacksize);
int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);
```

DESCRIPTION

The *pthread_attr_getstacksize*( ) and *pthread_attr_setstacksize*( ) functions, respectively, shall get and set the thread creation *stacksize* attribute in the *attr* object.

The *stacksize* attribute shall define the minimum stack size (in bytes) allocated for the created threads stack.

The behavior is undefined if the value specified by the *attr* argument to *pthread_attr_getstacksize*( ) or *pthread_attr_setstacksize*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

Upon successful completion, *pthread_attr_getstacksize*( ) and *pthread_attr_setstacksize*( ) shall return a value of 0; otherwise, an error number shall be returned to indicate the error.

The *pthread_attr_getstacksize*( ) function stores the *stacksize* attribute value in *stacksize* if successful.

ERRORS

The *pthread_attr_setstacksize*( ) function shall fail if:

[EINVAL] The value of *stacksize* is less than {PTHREAD_STACK_MIN} or exceeds a system-imposed limit.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_attr_getstacksize*( ) or *pthread_attr_setstacksize*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_attr_getstacksize*( ) and *pthread_attr_setstacksize*( ) functions are marked as part of the Threads and Thread Stack Size Attribute options.

The **restrict** keyword is added to the *pthread_attr_getstacksize*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/43 is applied, correcting the margin code in the SYNOPSIS from TSA to TSS and updating the CHANGE HISTORY from "Thread Stack Address Attribute" option to "Thread Stack Size Attribute" option.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/87 is applied, updating the ERRORS section to include optional errors for the case when *attr* refers to an uninitialized thread attribute object.

Issue 7

The *pthread_attr_getstacksize*( ) and *pthread_attr_setstacksize*( ) functions are moved from the Threads option.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

pthread_attr_setstack( )

NAME

pthread_attr_setstack — set the stack attribute

SYNOPSIS

TSA TSS

```
#include <pthread.h>

int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr,
    size_t stacksize);
```

DESCRIPTION

Refer to *pthread_attr_getstack( )*.

50229 **NAME**

50230 pthread_attr_setstacksize — set the stacksize attribute

50231 **SYNOPSIS**

50232 TSS
```
#include <pthread.h>

int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);
```

50234 **DESCRIPTION**

50235 Refer to *pthread_attr_getstacksize( )*.

NAME

pthread_barrier_destroy, pthread_barrier_init — destroy and initialize a barrier object

SYNOPSIS

```
#include <pthread.h>

int pthread_barrier_destroy(pthread_barrier_t *barrier);
int pthread_barrier_init(pthread_barrier_t *restrict barrier,
    const pthread_barrierattr_t *restrict attr, unsigned count);
```

DESCRIPTION

The *pthread_barrier_destroy*( ) function shall destroy the barrier referenced by *barrier* and release any resources used by the barrier. The effect of subsequent use of the barrier is undefined until the barrier is reinitialized by another call to *pthread_barrier_init*( ). An implementation may use this function to set *barrier* to an invalid value. The results are undefined if *pthread_barrier_destroy*( ) is called when any thread is blocked on the barrier, or if this function is called with an uninitialized barrier.

The *pthread_barrier_init*( ) function shall allocate any resources required to use the barrier referenced by *barrier* and shall initialize the barrier with attributes referenced by *attr*. If *attr* is NULL, the default barrier attributes shall be used; the effect is the same as passing the address of a default barrier attributes object. The results are undefined if *pthread_barrier_init*( ) is called when any thread is blocked on the barrier (that is, has not returned from the *pthread_barrier_wait*( ) call). The results are undefined if a barrier is used without first being initialized. The results are undefined if *pthread_barrier_init*( ) is called specifying an already initialized barrier.

The *count* argument specifies the number of threads that must call *pthread_barrier_wait*( ) before any of them successfully return from the call. The value specified by *count* must be greater than zero.

If the *pthread_barrier_init*( ) function fails, the barrier shall not be initialized and the contents of *barrier* are undefined.

Only the object referenced by *barrier* may be used for performing synchronization. The result of referring to copies of that object in calls to *pthread_barrier_destroy*( ) or *pthread_barrier_wait*( ) is undefined.

RETURN VALUE

Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_barrier_init*( ) function shall fail if:

[EAGAIN] The system lacks the necessary resources to initialize another barrier.

[EINVAL] The value specified by *count* is equal to zero.

[ENOMEM] Insufficient memory exists to initialize the barrier.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *barrier* argument to *pthread_barrier_destroy*( ) does not refer to an initialized barrier object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *attr* argument to *pthread_barrier_init*( ) does not refer to an initialized barrier attributes object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *barrier* argument to *pthread_barrier_destroy*( ) or *pthread_barrier_init*( ) refers to a barrier that is in use (for example, in a *pthread_barrier_wait*( ) call) by another thread, or detects that the value specified by the *barrier* argument to *pthread_barrier_init*( ) refers to an already initialized barrier object, it is recommended that the function should fail and report an [EBUSY] error.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_barrier_wait( )

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

Issue 7

The *pthread_barrier_destroy*( ) and *pthread_barrier_init*( ) functions are moved from the Barriers option to the Base.

The [EINVAL] error for an uninitialized barrier object and an uninitialized barrier attributes object is removed; this condition results in undefined behavior.

The [EBUSY] error for a barrier that is in use or an already initialized barrier object is removed; this condition results in undefined behavior.

NAME

pthread_barrier_wait — synchronize at a barrier

SYNOPSIS

```
#include <pthread.h>

int pthread_barrier_wait(pthread_barrier_t *barrier);
```

DESCRIPTION

The *pthread_barrier_wait*( ) function shall synchronize participating threads at the barrier referenced by *barrier*. The calling thread shall block until the required number of threads have called *pthread_barrier_wait*( ) specifying the barrier.

When the required number of threads have called *pthread_barrier_wait*( ) specifying the barrier, the constant PTHREAD_BARRIER_SERIAL_THREAD shall be returned to one unspecified thread and zero shall be returned to each of the remaining threads. At this point, the barrier shall be reset to the state it had as a result of the most recent *pthread_barrier_init*( ) function that referenced it.

The constant PTHREAD_BARRIER_SERIAL_THREAD is defined in **<pthread.h>** and its value shall be distinct from any other value returned by *pthread_barrier_wait*( ).

The results are undefined if this function is called with an uninitialized barrier.

If a signal is delivered to a thread blocked on a barrier, upon return from the signal handler the thread shall resume waiting at the barrier if the barrier wait has not completed (that is, if the required number of threads have not arrived at the barrier during the execution of the signal handler); otherwise, the thread shall continue as normal from the completed barrier wait. Until the thread in the signal handler returns from it, it is unspecified whether other threads may proceed past the barrier once they have all reached it.

A thread that has blocked on a barrier shall not prevent any unblocked thread that is eligible to use the same processing resources from eventually making forward progress in its execution. Eligibility for processing resources shall be determined by the scheduling policy.

RETURN VALUE

Upon successful completion, the *pthread_barrier_wait*( ) function shall return PTHREAD_BARRIER_SERIAL_THREAD for a single (arbitrary) thread synchronized at the barrier and zero for each of the other threads. Otherwise, an error number shall be returned to indicate the error.

ERRORS

This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using this function may be subject to priority inversion, as discussed in XBD Section 3.285 (on page 79).

RATIONALE

If an implementation detects that the value specified by the *barrier* argument to *pthread_barrier_wait*( ) does not refer to an initialized barrier object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

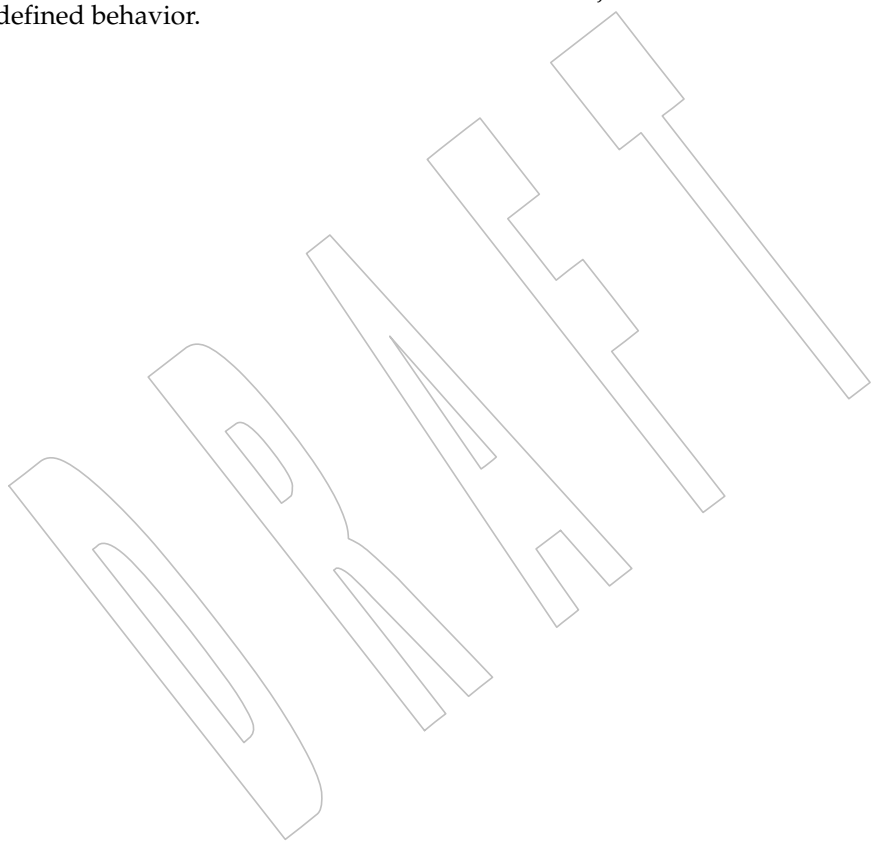
First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

Issue 7

The *pthread_barrier_wait( )* function is moved from the Barriers option to the Base.

The [EINVAL] error for an uninitialized barrier object is removed; this condition results in undefined behavior.



NAME

pthread_barrierattr_destroy, pthread_barrierattr_init — destroy and initialize the barrier attributes object

SYNOPSIS

```
#include <pthread.h>

int pthread_barrierattr_destroy(pthread_barrierattr_t *attr);
int pthread_barrierattr_init(pthread_barrierattr_t *attr);
```

DESCRIPTION

The *pthread_barrierattr_destroy*( ) function shall destroy a barrier attributes object. A destroyed *attr* attributes object can be reinitialized using *pthread_barrierattr_init*( ); the results of otherwise referencing the object after it has been destroyed are undefined. An implementation may cause *pthread_barrierattr_destroy*( ) to set the object referenced by *attr* to an invalid value.

The *pthread_barrierattr_init*( ) function shall initialize a barrier attributes object *attr* with the default value for all of the attributes defined by the implementation.

If *pthread_barrierattr_init*( ) is called specifying an already initialized *attr* attributes object, the results are undefined.

After a barrier attributes object has been used to initialize one or more barriers, any function affecting the attributes object (including destruction) shall not affect any previously initialized barrier.

The behavior is undefined if the value specified by the *attr* argument to *pthread_barrierattr_destroy*( ) does not refer to an initialized barrier attributes object.

RETURN VALUE

If successful, the *pthread_barrierattr_destroy*( ) and *pthread_barrierattr_init*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_barrierattr_init*( ) function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the barrier attributes object.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_barrierattr_destroy*( ) does not refer to an initialized barrier attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

pthread_barrierattr_getpshared( )

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

Issue 7

The *pthread_barrierattr_destroy*( ) and *pthread_barrierattr_init*( ) functions are moved from the Barriers option to the Base.

The [EINVAL] error for an uninitialized barrier attributes object is removed; this condition results in undefined behavior.

NAME

pthread_barrierattr_getpshared, pthread_barrierattr_setpshared — get and set the process-shared attribute of the barrier attributes object

SYNOPSIS

TSH

```
#include <pthread.h>

int pthread_barrierattr_getpshared(const pthread_barrierattr_t
    *restrict attr, int *restrict pshared);
int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,
    int pshared);
```

DESCRIPTION

The *pthread_barrierattr_getpshared*( ) function shall obtain the value of the *process-shared* attribute from the attributes object referenced by *attr*. The *pthread_barrierattr_setpshared*( ) function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

The *process-shared* attribute is set to PTHREAD_PROCESS_SHARED to permit a barrier to be operated upon by any thread that has access to the memory where the barrier is allocated. If the *process-shared* attribute is PTHREAD_PROCESS_PRIVATE, the barrier shall only be operated upon by threads created within the same process as the thread that initialized the barrier; if threads of different processes attempt to operate on such a barrier, the behavior is undefined. The default value of the attribute shall be PTHREAD_PROCESS_PRIVATE. Both constants PTHREAD_PROCESS_SHARED and PTHREAD_PROCESS_PRIVATE are defined in **<pthread.h>**.

Additional attributes, their default values, and the names of the associated functions to get and set those attribute values are implementation-defined.

The behavior is undefined if the value specified by the *attr* argument to *pthread_barrierattr_getpshared*( ) or *pthread_barrierattr_setpshared*( ) does not refer to an initialized barrier attributes object.

RETURN VALUE

If successful, the *pthread_barrierattr_getpshared*( ) function shall return zero and store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise, an error number shall be returned to indicate the error.

If successful, the *pthread_barrierattr_setpshared*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_barrierattr_setpshared*( ) function may fail if:

[EINVAL] The new value specified for the *process-shared* attribute is not one of the legal values PTHREAD_PROCESS_SHARED or PTHREAD_PROCESS_PRIVATE.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

The *pthread_barrierattr_getpshared*( ) and *pthread_barrierattr_setpshared*( ) functions are part of the Thread Process-Shared Synchronization option and need not be provided on all implementations.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_barrierattr_getpshared*( ) or *pthread_barrierattr_setpshared*( ) does not refer to an initialized barrier attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

NAME

pthread_cancel — cancel execution of a thread

SYNOPSIS

```
#include <pthread.h>

int pthread_cancel(pthread_t thread);
```

DESCRIPTION

The *pthread_cancel*( ) function shall request that *thread* be canceled. The target thread's cancelability state and type determines when the cancellation takes effect. When the cancellation is acted on, the cancellation cleanup handlers for *thread* shall be called. When the last cancellation cleanup handler returns, the thread-specific data destructor functions shall be called for *thread*. When the last destructor function returns, *thread* shall be terminated.

The cancellation processing in the target thread shall run asynchronously with respect to the calling thread returning from *pthread_cancel*( ).

RETURN VALUE

If successful, the *pthread_cancel*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_cancel*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Two alternative functions were considered for sending the cancellation notification to a thread. One would be to define a new SIGCANCEL signal that had the cancellation semantics when delivered; the other was to define the new *pthread_cancel*( ) function, which would trigger the cancellation semantics.

The advantage of a new signal was that so much of the delivery criteria were identical to that used when trying to deliver a signal that making cancellation notification a signal was seen as consistent. Indeed, many implementations implement cancellation using a special signal. On the other hand, there would be no signal functions that could be used with this signal except *pthread_kill*( ), and the behavior of the delivered cancellation signal would be unlike any previously existing defined signal.

The benefits of a special function include the recognition that this signal would be defined because of the similar delivery criteria and that this is the only common behavior between a cancellation request and a signal. In addition, the cancellation delivery mechanism does not have to be implemented as a signal. There are also strong, if not stronger, parallels with language exception mechanisms than with signals that are potentially obscured if the delivery mechanism is visibly closer to signals.

In the end, it was considered that as there were so many exceptions to the use of the new signal with existing signals functions it would be misleading. A special function has resolved this problem. This function was carefully defined so that an implementation wishing to provide the cancellation functions on top of signals could do so. The special function also means that implementations are not obliged to implement cancellation with signals.

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended that the function should fail and report an [ESRCH] error.

FUTURE DIRECTIONS

None.

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_cancel( )* function is marked as part of the Threads option.

Issue 7

The *pthread_cancel( )* function is moved from the Threads option to the Base.

Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

NAME

pthread_cleanup_pop, pthread_cleanup_push — establish cancellation handlers

SYNOPSIS

```
#include <pthread.h>

void pthread_cleanup_pop(int execute);
void pthread_cleanup_push(void (*routine)(void*), void *arg);
```

DESCRIPTION

The *pthread_cleanup_pop*( ) function shall remove the routine at the top of the calling thread's cancellation cleanup stack and optionally invoke it (if *execute* is non-zero).

The *pthread_cleanup_push*( ) function shall push the specified cancellation cleanup handler *routine* onto the calling thread's cancellation cleanup stack. The cancellation cleanup handler shall be popped from the cancellation cleanup stack and invoked with the argument *arg* when:

- The thread exits (that is, calls *pthread_exit*( )).
- The thread acts upon a cancellation request.
- The thread calls *pthread_cleanup_pop*( ) with a non-zero *execute* argument.

These functions may be implemented as macros. The application shall ensure that they appear as statements, and in pairs within the same lexical scope (that is, the *pthread_cleanup_push*( ) macro may be thought to expand to a token list whose first token is `'{'` with *pthread_cleanup_pop*( ) expanding to a token list whose last token is the corresponding `'}'`).

The effect of calling *longjmp*( ) or *siglongjmp*( ) is undefined if there have been any calls to *pthread_cleanup_push*( ) or *pthread_cleanup_pop*( ) made without the matching call since the jump buffer was filled. The effect of calling *longjmp*( ) or *siglongjmp*( ) from inside a cancellation cleanup handler is also undefined unless the jump buffer was also filled in the cancellation cleanup handler.

The effect of the use of **return**, **break**, **continue**, and **goto** to prematurely leave a code block described by a pair of *pthread_cleanup_push*( ) and *pthread_cleanup_pop*( ) functions calls is undefined.

RETURN VALUE

The *pthread_cleanup_push*( ) and *pthread_cleanup_pop*( ) functions shall not return a value.

ERRORS

No errors are defined.

These functions shall not return an error code of [EINTR].

EXAMPLES

The following is an example using thread primitives to implement a cancelable, writers-priority read-write lock:

```
typedef struct {
    pthread_mutex_t lock;
    pthread_cond_t rcond,
        wcond;
    int lock_count; /* < 0 .. Held by writer. */
                    /* > 0 .. Held by lock_count readers. */
                    /* = 0 .. Held by nobody. */
    int waiting_writers; /* Count of waiting writers. */
} rwlock;
```

```
50585       void
50586       waiting_reader_cleanup(void *arg)
50587       {
50588           rwlock *l;
50589           l = (rwlock *) arg;
50590           pthread_mutex_unlock(&l->lock);
50591       }
50592       void
50593       lock_for_read(rwlock *l)
50594       {
50595           pthread_mutex_lock(&l->lock);
50596           pthread_cleanup_push(waiting_reader_cleanup, l);
50597           while ((l->lock_count < 0) && (l->waiting_writers != 0))
50598               pthread_cond_wait(&l->rcond, &l->lock);
50599           l->lock_count++;
50600          /*
50601           * Note the pthread_cleanup_pop executes
50602           * waiting_reader_cleanup.
50603           */
50604           pthread_cleanup_pop(1);
50605       }
50606       void
50607       release_read_lock(rwlock *l)
50608       {
50609           pthread_mutex_lock(&l->lock);
50610           if (--l->lock_count == 0)
50611               pthread_cond_signal(&l->wcond);
50612           pthread_mutex_unlock(l);
50613       }
50614       void
50615       waiting_writer_cleanup(void *arg)
50616       {
50617           rwlock *l;
50618           l = (rwlock *) arg;
50619           if ((--l->waiting_writers == 0) && (l->lock_count >= 0)) {
50620              /*
50621               * This only happens if we have been canceled.
50622               */
50623               pthread_cond_broadcast(&l->wcond);
50624       }
50625           pthread_mutex_unlock(&l->lock);
50626       }
50627       void
50628       lock_for_write(rwlock *l)
50629       {
50630           pthread_mutex_lock(&l->lock);
50631           l->waiting_writers++;
50632           pthread_cleanup_push(waiting_writer_cleanup, l);
50633           while (l->lock_count != 0)
```

```
50634                pthread_cond_wait(&l->wcond, &l->lock);
50635            l->lock_count = –1;
50636           /*
50637            * Note the pthread_cleanup_pop executes
50638            * waiting_writer_cleanup.
50639            */
50640            pthread_cleanup_pop(1);
50641        }
50642        void
50643        release_write_lock(rwlock *l)
50644        {
50645            pthread_mutex_lock(&l->lock);
50646            l->lock_count = 0;
50647            if (l->waiting_writers == 0)
50648                pthread_cond_broadcast(&l->rcond)
50649            else
50650                pthread_cond_signal(&l->wcond);
50651            pthread_mutex_unlock(&l->lock);
50652        }
50653        /*
50654         * This function is called to initialize the read/write lock.
50655         */
50656        void
50657        initialize_rwlock(rwlock *l)
50658        {
50659            pthread_mutex_init(&l->lock, pthread_mutexattr_default);
50660            pthread_cond_init(&l->wcond, pthread_condattr_default);
50661            pthread_cond_init(&l->rcond, pthread_condattr_default);
50662            l->lock_count = 0;
50663            l->waiting_writers = 0;
50664        }
50665        reader_thread()
50666        {
50667            lock_for_read(&lock);
50668            pthread_cleanup_push(release_read_lock, &lock);
50669           /*
50670            * Thread has read lock.
50671            */
50672            pthread_cleanup_pop(1);
50673        }
50674        writer_thread()
50675        {
50676            lock_for_write(&lock);
50677            pthread_cleanup_push(release_write_lock, &lock);
50678           /*
50679            * Thread has write lock.
50680            */
50681        pthread_cleanup_pop(1);
50682        }
```

APPLICATION USAGE

The two routines that push and pop cancellation cleanup handlers, *pthread_cleanup_push*( ) and *pthread_cleanup_pop*( ), can be thought of as left and right-parentheses. They always need to be matched.

RATIONALE

The restriction that the two routines that push and pop cancellation cleanup handlers, *pthread_cleanup_push*( ) and *pthread_cleanup_pop*( ), have to appear in the same lexical scope allows for efficient macro or compiler implementations and efficient storage management. A sample implementation of these routines as macros might look like this:

```
#define pthread_cleanup_push(rtn,arg) { \
    struct _pthread_handler_rec __cleanup_handler, **__head; \
    __cleanup_handler.rtn = rtn; \
    __cleanup_handler.arg = arg; \
    (void) pthread_getspecific(_pthread_handler_key, &__head); \
    __cleanup_handler.next = *__head; \
    *__head = &__cleanup_handler;

#define pthread_cleanup_pop(ex) \
    *__head = __cleanup_handler.next; \
    if (ex) (*__cleanup_handler.rtn)(__cleanup_handler.arg); \
}
```

A more ambitious implementation of these routines might do even better by allowing the compiler to note that the cancellation cleanup handler is a constant and can be expanded inline.

This volume of POSIX.1-200x currently leaves unspecified the effect of calling *longjmp*( ) from a signal handler executing in a POSIX System Interfaces function. If an implementation wants to allow this and give the programmer reasonable behavior, the *longjmp*( ) function has to call all cancellation cleanup handlers that have been pushed but not popped since the time *setjmp*( ) was called.

Consider a multi-threaded function called by a thread that uses signals. If a signal were delivered to a signal handler during the operation of *qsort*( ) and that handler were to call *longjmp*( ) (which, in turn, did *not* call the cancellation cleanup handlers) the helper threads created by the *qsort*( ) function would not be canceled. Instead, they would continue to execute and write into the argument array even though the array might have been popped off the stack.

Note that the specified cleanup handling mechanism is especially tied to the C language and, while the requirement for a uniform mechanism for expressing cleanup is language-independent, the mechanism used in other languages may be quite different. In addition, this mechanism is really only necessary due to the lack of a real exception mechanism in the C language, which would be the ideal solution.

There is no notion of a cancellation cleanup-safe function. If an application has no cancellation points in its signal handlers, blocks any signal whose handler may have cancellation points while calling async-unsafe functions, or disables cancellation while calling async-unsafe functions, all functions may be safely called from cancellation cleanup routines.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_cleanup_pop*( ) and *pthread_cleanup_push*( ) functions are marked as part of the Threads option.

The APPLICATION USAGE section is added.

The normative text is updated to avoid use of the term "must" for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/88 is applied, updating the DESCRIPTION to describe the consequences of prematurely leaving a code block defined by the *pthread_cleanup_push*( ) and *pthread_cleanup_pop*( ) functions.

Issue 7

The *pthread_cleanup_pop*( ) and *pthread_cleanup_push*( ) functions are moved from the Threads option to the Base.

NAME

pthread_cond_broadcast, pthread_cond_signal — broadcast or signal a condition

SYNOPSIS

```
#include <pthread.h>

int pthread_cond_broadcast(pthread_cond_t *cond);
int pthread_cond_signal(pthread_cond_t *cond);
```

DESCRIPTION

These functions shall unblock threads blocked on a condition variable.

The *pthread_cond_broadcast*( ) function shall unblock all threads currently blocked on the specified condition variable *cond*.

The *pthread_cond_signal*( ) function shall unblock at least one of the threads that are blocked on the specified condition variable *cond* (if any threads are blocked on *cond*).

If more than one thread is blocked on a condition variable, the scheduling policy shall determine the order in which threads are unblocked. When each thread unblocked as a result of a *pthread_cond_broadcast*( ) or *pthread_cond_signal*( ) returns from its call to *pthread_cond_wait*( ) or *pthread_cond_timedwait*( ), the thread shall own the mutex with which it called *pthread_cond_wait*( ) or *pthread_cond_timedwait*( ). The thread(s) that are unblocked shall contend for the mutex according to the scheduling policy (if applicable), and as if each had called *pthread_mutex_lock*( ).

The *pthread_cond_broadcast*( ) or *pthread_cond_signal*( ) functions may be called by a thread whether or not it currently owns the mutex that threads calling *pthread_cond_wait*( ) or *pthread_cond_timedwait*( ) have associated with the condition variable during their waits; however, if predictable scheduling behavior is required, then that mutex shall be locked by the thread calling *pthread_cond_broadcast*( ) or *pthread_cond_signal*( ).

The *pthread_cond_broadcast*( ) and *pthread_cond_signal*( ) functions shall have no effect if there are no threads currently blocked on *cond*.

The behavior is undefined if the value specified by the *cond* argument to *pthread_cond_broadcast*( ) or *pthread_cond_signal*( ) does not refer to an initialized condition variable.

RETURN VALUE

If successful, the *pthread_cond_broadcast*( ) and *pthread_cond_signal*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

The *pthread_cond_broadcast*( ) function is used whenever the shared-variable state has been changed in a way that more than one thread can proceed with its task. Consider a single producer/multiple consumer problem, where the producer can insert multiple items on a list that is accessed one item at a time by the consumers. By calling the *pthread_cond_broadcast*( ) function, the producer would notify all consumers that might be waiting, and thereby the application would receive more throughput on a multi-processor. In addition, *pthread_cond_broadcast*( ) makes it easier to implement a read-write lock. The *pthread_cond_broadcast*( ) function is needed in order to wake up all waiting readers when a writer releases its lock. Finally, the two-phase commit algorithm can use this broadcast function to notify all clients of an impending transaction commit.

It is not safe to use the *pthread_cond_signal*( ) function in a signal handler that is invoked asynchronously. Even if it were safe, there would still be a race between the test of the Boolean *pthread_cond_wait*( ) that could not be efficiently eliminated.

Mutexes and condition variables are thus not suitable for releasing a waiting thread by signaling from code running in a signal handler.

RATIONALE

If an implementation detects that the value specified by the *cond* argument to *pthread_cond_broadcast*( ) or *pthread_cond_signal*( ) does not refer to an initialized condition variable, it is recommended that the function should fail and report an [EINVAL] error.

Multiple Awakenings by Condition Signal

On a multi-processor, it may be impossible for an implementation of *pthread_cond_signal*( ) to avoid the unblocking of more than one thread blocked on a condition variable. For example, consider the following partial implementation of *pthread_cond_wait*( ) and *pthread_cond_signal*( ), executed by two threads in the order given. One thread is trying to wait on the condition variable, another is concurrently executing *pthread_cond_signal*( ), while a third thread is already waiting.

```
pthread_cond_wait(mutex, cond):
    value = cond->value; /* 1 */
    pthread_mutex_unlock(mutex); /* 2 */
    pthread_mutex_lock(cond->mutex); /* 10 */
    if (value == cond->value) { /* 11 */
        me->next_cond = cond->waiter;
        cond->waiter = me;
        pthread_mutex_unlock(cond->mutex);
        unable_to_run(me);
    } else
        pthread_mutex_unlock(cond->mutex); /* 12 */
    pthread_mutex_lock(mutex); /* 13 */

pthread_cond_signal(cond):
    pthread_mutex_lock(cond->mutex); /* 3 */
    cond->value++; /* 4 */
    if (cond->waiter) { /* 5 */
        sleeper = cond->waiter; /* 6 */
        cond->waiter = sleeper->next_cond; /* 7 */
        able_to_run(sleeper); /* 8 */
    }
    pthread_mutex_unlock(cond->mutex); /* 9 */
```

The effect is that more than one thread can return from its call to *pthread_cond_wait*( ) or *pthread_cond_timedwait*( ) as a result of one call to *pthread_cond_signal*( ). This effect is called "spurious wakeup". Note that the situation is self-correcting in that the number of threads that are so awakened is finite; for example, the next thread to call *pthread_cond_wait*( ) after the sequence of events above blocks.

While this problem could be resolved, the loss of efficiency for a fringe condition that occurs only rarely is unacceptable, especially given that one has to check the predicate associated with a condition variable anyway. Correcting this problem would unnecessarily reduce the degree of concurrency in this basic building block for all higher-level synchronization operations.

An added benefit of allowing spurious wakeups is that applications are forced to code a

predicate-testing-loop around the condition wait. This also makes the application tolerate superfluous condition broadcasts or signals on the same condition variable that may be coded in some other part of the application. The resulting applications are thus more robust. Therefore, POSIX.1-200x explicitly documents that spurious wakeups may occur.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_cond_destroy( ), *pthread_cond_timedwait( )*

XBD Section 4.11 (on page 110), **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_cond_broadcast( )* and *pthread_cond_signal( )* functions are marked as part of the Threads option.

The APPLICATION USAGE section is added.

Issue 7

The *pthread_cond_broadcast( )* and *pthread_cond_signal( )* functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized condition variable is removed; this condition results in undefined behavior.

NAME

pthread_cond_destroy, pthread_cond_init — destroy and initialize condition variables

SYNOPSIS

```
#include <pthread.h>

int pthread_cond_destroy(pthread_cond_t *cond);
int pthread_cond_init(pthread_cond_t *restrict cond,
    const pthread_condattr_t *restrict attr);
pthread_cond_t cond = PTHREAD_COND_INITIALIZER;
```

DESCRIPTION

The *pthread_cond_destroy*( ) function shall destroy the given condition variable specified by *cond*; the object becomes, in effect, uninitialized. An implementation may cause *pthread_cond_destroy*( ) to set the object referenced by *cond* to an invalid value. A destroyed condition variable object can be reinitialized using *pthread_cond_init*( ); the results of otherwise referencing the object after it has been destroyed are undefined.

It shall be safe to destroy an initialized condition variable upon which no threads are currently blocked. Attempting to destroy a condition variable upon which other threads are currently blocked results in undefined behavior.

The *pthread_cond_init*( ) function shall initialize the condition variable referenced by *cond* with attributes referenced by *attr*. If *attr* is NULL, the default condition variable attributes shall be used; the effect is the same as passing the address of a default condition variable attributes object. Upon successful initialization, the state of the condition variable shall become initialized.

Only *cond* itself may be used for performing synchronization. The result of referring to copies of *cond* in calls to *pthread_cond_wait*( ), *pthread_cond_timedwait*( ), *pthread_cond_signal*( ), *pthread_cond_broadcast*( ), and *pthread_cond_destroy*( ) is undefined.

Attempting to initialize an already initialized condition variable results in undefined behavior.

In cases where default condition variable attributes are appropriate, the macro PTHREAD_COND_INITIALIZER can be used to initialize condition variables that are statically allocated. The effect shall be equivalent to dynamic initialization by a call to *pthread_cond_init*( ) with parameter *attr* specified as NULL, except that no error checks are performed.

The behavior is undefined if the value specified by the *cond* argument to *pthread_cond_destroy*( ) does not refer to an initialized condition variable.

The behavior is undefined if the value specified by the *attr* argument to *pthread_cond_init*( ) does not refer to an initialized condition variable attributes object.

RETURN VALUE

If successful, the *pthread_cond_destroy*( ) and *pthread_cond_init*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_cond_init*( ) function shall fail if:

[EAGAIN] The system lacked the necessary resources (other than memory) to initialize another condition variable.

[ENOMEM] Insufficient memory exists to initialize the condition variable.

These functions shall not return an error code of [EINTR].

EXAMPLES

A condition variable can be destroyed immediately after all the threads that are blocked on it are awakened. For example, consider the following code:

```
struct list {
    pthread_mutex_t lm;
    ...
}

struct elt {
    key k;
    int busy;
    pthread_cond_t notbusy;
    ...
}

/* Find a list element and reserve it. */
struct elt *
list_find(struct list *lp, key k)
{
    struct elt *ep;

    pthread_mutex_lock(&lp->lm);
    while ((ep = find_elt(l, k) != NULL) && ep->busy)
        pthread_cond_wait(&ep->notbusy, &lp->lm);
    if (ep != NULL)
        ep->busy = 1;
    pthread_mutex_unlock(&lp->lm);
    return(ep);
}

delete_elt(struct list *lp, struct elt *ep)
{
    pthread_mutex_lock(&lp->lm);
    assert(ep->busy);
    ... remove ep from list ...
    ep->busy = 0;  /* Paranoid. */
(A) pthread_cond_broadcast(&ep->notbusy);
    pthread_mutex_unlock(&lp->lm);
(B) pthread_cond_destroy(&rp->notbusy);
    free(ep);
}
```

In this example, the condition variable and its list element may be freed (line B) immediately after all threads waiting for it are awakened (line A), since the mutex and the code ensure that no other thread can touch the element to be deleted.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *cond* argument to *pthread_cond_destroy*( ) does not refer to an initialized condition variable, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *cond* argument to

pthread_cond_destroy( ) or *pthread_cond_init*( ) refers to a condition variable that is in use (for example, in a *pthread_cond_wait*( ) call) by another thread, or detects that the value specified by the *cond* argument to *pthread_cond_init*( ) refers to an already initialized condition variable, it is recommended that the function should fail and report an [EBUSY] error.

If an implementation detects that the value specified by the *attr* argument to *pthread_cond_init*( ) does not refer to an initialized condition variable attributes object, it is recommended that the function should fail and report an [EINVAL] error.

NAME

pthread_cond_timedwait, pthread_cond_wait — wait on a condition

SYNOPSIS

```
#include <pthread.h>

int pthread_cond_timedwait(pthread_cond_t *restrict cond,
    pthread_mutex_t *restrict mutex,
    const struct timespec *restrict abstime);
int pthread_cond_wait(pthread_cond_t *restrict cond,
    pthread_mutex_t *restrict mutex);
```

DESCRIPTION

The *pthread_cond_timedwait*( ) and *pthread_cond_wait*( ) functions shall block on a condition variable. The application shall ensure that these functions are called with *mutex* locked by the calling thread; otherwise, an error (for PTHREAD_MUTEX_ERRORCHECK and robust mutexes) or undefined behavior (for other mutexes) results.

These functions atomically release *mutex* and cause the calling thread to block on the condition variable *cond*; atomically here means "atomically with respect to access by another thread to the mutex and then the condition variable". That is, if another thread is able to acquire the mutex after the about-to-block thread has released it, then a subsequent call to *pthread_cond_broadcast*( ) or *pthread_cond_signal*( ) in that thread shall behave as if it were issued after the about-to-block thread has blocked.

Upon successful return, the mutex shall have been locked and shall be owned by the calling thread. If *mutex* is a robust mutex where an owner terminated while holding the lock and the state is recoverable, the mutex shall be acquired even though the function returns an error code.

When using condition variables there is always a Boolean predicate involving shared variables associated with each condition wait that is true if the thread should proceed. Spurious wakeups from the *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ) functions may occur. Since the return from *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ) does not imply anything about the value of this predicate, the predicate should be re-evaluated upon such return.

When a thread waits on a condition variable, having specified a particular mutex to either the *pthread_cond_timedwait*( ) or the *pthread_cond_wait*( ) operation, a dynamic binding is formed between that mutex and condition variable that remains in effect as long as at least one thread is blocked on the condition variable. During this time, the effect of an attempt by any thread to wait on that condition variable using a different mutex is undefined. Once all waiting threads have been unblocked (as by the *pthread_cond_broadcast*( ) operation), the next wait operation on that condition variable shall form a new dynamic binding with the mutex specified by that wait operation. Even though the dynamic binding between condition variable and mutex may be removed or replaced between the time a thread is unblocked from a wait on the condition variable and the time that it returns to the caller or begins cancellation cleanup, the unblocked thread shall always re-acquire the mutex specified in the condition wait operation call from which it is returning.

A condition wait (whether timed or not) is a cancellation point. When the cancelability type of a thread is set to PTHREAD_CANCEL_DEFERRED, a side-effect of acting upon a cancellation request while in a condition wait is that the mutex is (in effect) re-acquired before calling the first cancellation cleanup handler. The effect is as if the thread were unblocked, allowed to execute up to the point of returning from the call to *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ), but at that point notices the cancellation request and instead of returning to the caller of *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ), starts the thread cancellation activities, which includes calling cancellation cleanup handlers.

A thread that has been unblocked because it has been canceled while blocked in a call to *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ) shall not consume any condition signal that may be directed concurrently at the condition variable if there are other threads blocked on the condition variable.

The *pthread_cond_timedwait*( ) function shall be equivalent to *pthread_cond_wait*( ), except that an error is returned if the absolute time specified by *abstime* passes (that is, system time equals or exceeds *abstime*) before the condition *cond* is signaled or broadcasted, or if the absolute time specified by *abstime* has already been passed at the time of the call.

The condition variable shall have a clock attribute which specifies the clock that shall be used to measure the time specified by the *abstime* argument. When such timeouts occur, *pthread_cond_timedwait*( ) shall nonetheless release and re-acquire the mutex referenced by *mutex*. The *pthread_cond_timedwait*( ) function is also a cancellation point.

If a signal is delivered to a thread waiting for a condition variable, upon return from the signal handler the thread resumes waiting for the condition variable as if it was not interrupted, or it shall return zero due to spurious wakeup.

The behavior is undefined if the value specified by the *cond* or *mutex* argument to these functions does not refer to an initialized condition variable or an initialized mutex object, respectively.

RETURN VALUE

Except in the case of [ETIMEDOUT], all these error checks shall act as if they were performed immediately at the beginning of processing for the function and shall cause an error return, in effect, prior to modifying the state of the mutex specified by *mutex* or the condition variable specified by *cond*.

Upon successful completion, a value of zero shall be returned; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions shall fail if:

[ENOTRECOVERABLE]
: The state protected by the mutex is not recoverable.

[EOWNERDEAD]
: The mutex is a robust mutex and the process containing the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent.

[EPERM]
: The mutex type is PTHREAD_MUTEX_ERRORCHECK or the mutex is a robust mutex, and the current thread does not own the mutex.

The *pthread_cond_timedwait*( ) function shall fail if:

[ETIMEDOUT]
: The time specified by *abstime* to *pthread_cond_timedwait*( ) has passed.

[EINVAL]
: The *abstime* argument specified a nanosecond value less than zero or greater than or equal to 1000 million.

These functions may fail if:

[EOWNERDEAD]
: The mutex is a robust mutex and the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling

thread and it is up to the new owner to make the state consistent.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications that have assumed that non-zero return values are errors will need updating for use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If an application is supposed to work with normal and robust mutexes, it should check all return values for error conditions and if necessary take appropriate action.

RATIONALE

If an implementation detects that the value specified by the *cond* argument to *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ) does not refer to an initialized condition variable, or detects that the value specified by the *mutex* argument to *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ) does not refer to an initialized mutex object, it is recommended that the function should fail and report an [EINVAL] error.

Condition Wait Semantics

It is important to note that when *pthread_cond_wait*( ) and *pthread_cond_timedwait*( ) return without error, the associated predicate may still be false. Similarly, when *pthread_cond_timedwait*( ) returns with the timeout error, the associated predicate may be true due to an unavoidable race between the expiration of the timeout and the predicate state change.

The application needs to recheck the predicate on any return because it cannot be sure there is another thread waiting on the thread to handle the signal, and if there is not then the signal is lost. The burden is on the application to check the predicate.

Some implementations, particularly on a multi-processor, may sometimes cause multiple threads to wake up when the condition variable is signaled simultaneously on different processors.

In general, whenever a condition wait returns, the thread has to re-evaluate the predicate associated with the condition wait to determine whether it can safely proceed, should wait again, or should declare a timeout. A return from the wait does not imply that the associated predicate is either true or false.

It is thus recommended that a condition wait be enclosed in the equivalent of a "while loop" that checks the predicate.

Timed Wait Semantics

An absolute time measure was chosen for specifying the timeout parameter for two reasons. First, a relative time measure can be easily implemented on top of a function that specifies absolute time, but there is a race condition associated with specifying an absolute timeout on top of a function that specifies relative timeouts. For example, assume that *clock_gettime*( ) returns the current time and *cond_relative_timed_wait*( ) uses relative timeouts:

```
clock_gettime(CLOCK_REALTIME, &now)
reltime = sleep_til_this_absolute_time -now;
cond_relative_timed_wait(c, m, &reltime);
```

If the thread is preempted between the first statement and the last statement, the thread blocks

for too long. Blocking, however, is irrelevant if an absolute timeout is used. An absolute timeout also need not be recomputed if it is used multiple times in a loop, such as that enclosing a condition wait.

For cases when the system clock is advanced discontinuously by an operator, it is expected that implementations process any timed wait expiring at an intervening time as if that time had actually occurred.

Cancellation and Condition Wait

A condition wait, whether timed or not, is a cancellation point. That is, the functions *pthread_cond_wait*( ) or *pthread_cond_timedwait*( ) are points where a pending (or concurrent) cancellation request is noticed. The reason for this is that an indefinite wait is possible at these points—whatever event is being waited for, even if the program is totally correct, might never occur; for example, some input data being awaited might never be sent. By making condition wait a cancellation point, the thread can be canceled and perform its cancellation cleanup handler even though it may be stuck in some indefinite wait.

A side-effect of acting on a cancellation request while a thread is blocked on a condition variable is to re-acquire the mutex before calling any of the cancellation cleanup handlers. This is done in order to ensure that the cancellation cleanup handler is executed in the same state as the critical code that lies both before and after the call to the condition wait function. This rule is also required when interfacing to POSIX threads from languages, such as Ada or C++, which may choose to map cancellation onto a language exception; this rule ensures that each exception handler guarding a critical section can always safely depend upon the fact that the associated mutex has already been locked regardless of exactly where within the critical section the exception was raised. Without this rule, there would not be a uniform rule that exception handlers could follow regarding the lock, and so coding would become very cumbersome.

Therefore, since *some* statement has to be made regarding the state of the lock when a cancellation is delivered during a wait, a definition has been chosen that makes application coding most convenient and error free.

When acting on a cancellation request while a thread is blocked on a condition variable, the implementation is required to ensure that the thread does not consume any condition signals directed at that condition variable if there are any other threads waiting on that condition variable. This rule is specified in order to avoid deadlock conditions that could occur if these two independent requests (one acting on a thread and the other acting on the condition variable) were not processed independently.

Performance of Mutexes and Condition Variables

Mutexes are expected to be locked only for a few instructions. This practice is almost automatically enforced by the desire of programmers to avoid long serial regions of execution (which would reduce total effective parallelism).

When using mutexes and condition variables, one tries to ensure that the usual case is to lock the mutex, access shared data, and unlock the mutex. Waiting on a condition variable should be a relatively rare situation. For example, when implementing a read-write lock, code that acquires a read-lock typically needs only to increment the count of readers (under mutual-exclusion) and return. The calling thread would actually wait on the condition variable only when there is already an active writer. So the efficiency of a synchronization operation is bounded by the cost of mutex lock/unlock and not by condition wait. Note that in the usual case there is no context switch.

This is not to say that the efficiency of condition waiting is unimportant. Since there needs to be

at least one context switch per Ada rendezvous, the efficiency of waiting on a condition variable is important. The cost of waiting on a condition variable should be little more than the minimal cost for a context switch plus the time to unlock and lock the mutex.

Features of Mutexes and Condition Variables

It had been suggested that the mutex acquisition and release be decoupled from condition wait. This was rejected because it is the combined nature of the operation that, in fact, facilitates realtime implementations. Those implementations can atomically move a high-priority thread between the condition variable and the mutex in a manner that is transparent to the caller. This can prevent extra context switches and provide more deterministic acquisition of a mutex when the waiting thread is signaled. Thus, fairness and priority issues can be dealt with directly by the scheduling discipline. Furthermore, the current condition wait operation matches existing practice.

Scheduling Behavior of Mutexes and Condition Variables

Synchronization primitives that attempt to interfere with scheduling policy by specifying an ordering rule are considered undesirable. Threads waiting on mutexes and condition variables are selected to proceed in an order dependent upon the scheduling policy rather than in some fixed order (for example, FIFO or priority). Thus, the scheduling policy determines which thread(s) are awakened and allowed to proceed.

Timed Condition Wait

The *pthread_cond_timedwait*( ) function allows an application to give up waiting for a particular condition after a given amount of time. An example of its use follows:

```
(void) pthread_mutex_lock(&t.mn);
        t.waiters++;
    clock_gettime(CLOCK_REALTIME, &ts);
    ts.tv_sec += 5;
    rc = 0;
    while (! mypredicate(&t) && rc == 0)
        rc = pthread_cond_timedwait(&t.cond, &t.mn, &ts);
    t.waiters--;
    if (rc == 0) setmystate(&t);
(void) pthread_mutex_unlock(&t.mn);
```

By making the timeout parameter absolute, it does not need to be recomputed each time the program checks its blocking predicate. If the timeout was relative, it would have to be recomputed before each call. This would be especially difficult since such code would need to take into account the possibility of extra wakeups that result from extra broadcasts or signals on the condition variable that occur before either the predicate is true or the timeout is due.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_cond_timedwait*( ) and *pthread_cond_wait*( ) functions are marked as part of the Threads option.

The Open Group Corrigendum U021/9 is applied, correcting the prototype for the *pthread_cond_wait*( ) function.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for the Clock Selection option.

The ERRORS section has an additional case for [EPERM] in response to IEEE PASC Interpretation 1003.1c #28.

The **restrict** keyword is added to the *pthread_cond_timedwait*( ) and *pthread_cond_wait*( ) prototypes for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/89 is applied, updating the DESCRIPTION for consistency with the *pthread_cond_destroy*( ) function that states it is safe to destroy an initialized condition variable upon which no threads are currently blocked.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/90 is applied, updating words in the DESCRIPTION from "the cancelability enable state" to "the cancelability type".

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/91 is applied, updating the ERRORS section to remove the error case related to *abstime* from the *pthread_cond_wait*( ) function, and to make the error case related to *abstime* mandatory for *pthread_cond_timedwait*( ) for consistency with other functions.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/92 is applied, adding a new paragraph to the RATIONALE section stating that an application should check the predicate on any return from this function.

Issue 7

SD5-XSH-ERN-44 is applied, changing the definition of the "shall fail" case of the [EINVAL] error.

Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

The *pthread_cond_timedwait*( ) and *pthread_cond_wait*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized condition variable or uninitialized mutex object is removed; this condition results in undefined behavior"

The [EPERM] error is revised and moved to the "shall fail" list of error conditions for the *pthread_cond_timedwait*( ) function.

The DESCRIPTION is updated to clarify the behavior when *mutex* is a robust mutex.

The ERRORS section is updated to include "shall fail" cases for PTHREAD_MUTEX_ERRORCHECK mutexes.

The DESCRIPTION is rewritten to clarify that undefined behavior occurs only for mutexes where the [EPERM] error is not mandated. +

NAME

pthread_condattr_destroy, pthread_condattr_init — destroy and initialize the condition variable attributes object

SYNOPSIS

```
#include <pthread.h>

int pthread_condattr_destroy(pthread_condattr_t *attr);
int pthread_condattr_init(pthread_condattr_t *attr);
```

DESCRIPTION

The *pthread_condattr_destroy*( ) function shall destroy a condition variable attributes object; the object becomes, in effect, uninitialized. An implementation may cause *pthread_condattr_destroy*( ) to set the object referenced by *attr* to an invalid value. A destroyed *attr* attributes object can be reinitialized using *pthread_condattr_init*( ); the results of otherwise referencing the object after it has been destroyed are undefined.

The *pthread_condattr_init*( ) function shall initialize a condition variable attributes object *attr* with the default value for all of the attributes defined by the implementation.

Results are undefined if *pthread_condattr_init*( ) is called specifying an already initialized *attr* attributes object.

After a condition variable attributes object has been used to initialize one or more condition variables, any function affecting the attributes object (including destruction) shall not affect any previously initialized condition variables.

This volume of POSIX.1-200x requires two attributes, the *clock* attribute and the *process-shared* attribute.

Additional attributes, their default values, and the names of the associated functions to get and set those attribute values are implementation-defined.

The behavior is undefined if the value specified by the *attr* argument to *pthread_condattr_destroy*( ) does not refer to an initialized condition variable attributes object.

RETURN VALUE

If successful, the *pthread_condattr_destroy*( ) and *pthread_condattr_init*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_condattr_init*( ) function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the condition variable attributes object.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

A *process-shared* attribute has been defined for condition variables for the same reason it has been defined for mutexes.

If an implementation detects that the value specified by the *attr* argument to *pthread_condattr_destroy*( ) does not refer to an initialized condition variable attributes object, it is recommended that the function should fail and report an [EINVAL] error.

See also *pthread_attr_destroy( )* and *pthread_mutex_destroy( )*.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_condattr_destroy*( ) and *pthread_condattr_init*( ) functions are marked as part of the Threads option.

Issue 7

The *pthread_condattr_destroy*( ) and *pthread_condattr_init*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized condition variable attributes object is removed; this condition results in undefined behavior.

NAME

pthread_condattr_getclock, pthread_condattr_setclock — get and set the clock selection condition variable attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_condattr_getclock(const pthread_condattr_t *restrict attr,
    clockid_t *restrict clock_id);
int pthread_condattr_setclock(pthread_condattr_t *attr,
    clockid_t clock_id);
```

DESCRIPTION

The *pthread_condattr_getclock*( ) function shall obtain the value of the *clock* attribute from the attributes object referenced by *attr*.

The *pthread_condattr_setclock*( ) function shall set the *clock* attribute in an initialized attributes object referenced by *attr*. If *pthread_condattr_setclock*( ) is called with a *clock_id* argument that refers to a CPU-time clock, the call shall fail.

The *clock* attribute is the clock ID of the clock that shall be used to measure the timeout service of *pthread_cond_timedwait*( ). The default value of the *clock* attribute shall refer to the system clock.

The behavior is undefined if the value specified by the *attr* argument to *pthread_condattr_getclock*( ) or *pthread_condattr_setclock*( ) does not refer to an initialized condition variable attributes object.

RETURN VALUE

If successful, the *pthread_condattr_getclock*( ) function shall return zero and store the value of the clock attribute of *attr* into the object referenced by the *clock_id* argument. Otherwise, an error number shall be returned to indicate the error.

If successful, the *pthread_condattr_setclock*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_condattr_setclock*( ) function may fail if:

[EINVAL] The value specified by *clock_id* does not refer to a known clock, or is a CPU-time clock.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_condattr_getclock*( ) or *pthread_condattr_setclock*( ) does not refer to an initialized condition variable attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

Issue 7

The *pthread_condattr_getclock*( ) and *pthread_condattr_setclock*( ) functions are moved from the Clock Selection option to the Base.

The [EINVAL] error for an uninitialized condition variable attributes object is removed; this condition results in undefined behavior.

pthread_condattr_getpshared( )

NAME

pthread_condattr_getpshared, pthread_condattr_setpshared — get and set the process-shared condition variable attributes

SYNOPSIS

TSH

```
#include <pthread.h>

int pthread_condattr_getpshared(const pthread_condattr_t *restrict attr,
    int *restrict pshared);
int pthread_condattr_setpshared(pthread_condattr_t *attr,
    int pshared);
```

DESCRIPTION

The *pthread_condattr_getpshared*( ) function shall obtain the value of the *process-shared* attribute from the attributes object referenced by *attr*.

The *pthread_condattr_setpshared*( ) function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

The *process-shared* attribute is set to PTHREAD_PROCESS_SHARED to permit a condition variable to be operated upon by any thread that has access to the memory where the condition variable is allocated, even if the condition variable is allocated in memory that is shared by multiple processes. If the *process-shared* attribute is PTHREAD_PROCESS_PRIVATE, the condition variable shall only be operated upon by threads created within the same process as the thread that initialized the condition variable; if threads of differing processes attempt to operate on such a condition variable, the behavior is undefined. The default value of the attribute is PTHREAD_PROCESS_PRIVATE.

The behavior is undefined if the value specified by the *attr* argument to *pthread_condattr_getpshared*( ) or *pthread_condattr_setpshared*( ) does not refer to an initialized condition variable attributes object.

RETURN VALUE

If successful, the *pthread_condattr_setpshared*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

If successful, the *pthread_condattr_getpshared*( ) function shall return zero and store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_condattr_setpshared*( ) function may fail if:

[EINVAL] The new value specified for the attribute is outside the range of legal values for that attribute.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_condattr_getpshared*( ) or *pthread_condattr_setpshared*( ) does not refer to an initialized condition variable attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_condattr_getpshared*( ) and *pthread_condattr_setpshared*( ) functions are marked as part of the Threads and Thread Process-Shared Synchronization options.

The **restrict** keyword is added to the *pthread_condattr_getpshared*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

The *pthread_condattr_getpshared*( ) and *pthread_condattr_setpshared*( ) functions are moved from the Threads option.

The [EINVAL] error for an uninitialized condition variable attributes object is removed; this condition results in undefined behavior.

pthread_condattr_init( )

51417 **NAME**

51418 pthread_condattr_init — initialize the condition variable attributes object

51419 **SYNOPSIS**

51420 `#include <pthread.h>`

51421 `int pthread_condattr_init(pthread_condattr_t *attr);`

51422 **DESCRIPTION**

51423 Refer to *pthread_condattr_destroy( )*.

51424 **NAME**

51425 pthread_condattr_setclock — set the clock selection condition variable attribute

51426 **SYNOPSIS**

51427
```
#include <pthread.h>
```

51428
```
int pthread_condattr_setclock(pthread_condattr_t *attr,
```
51429
```
    clockid_t clock_id);
```

51430 **DESCRIPTION**

51431 Refer to *pthread_condattr_getclock( )*.

pthread_condattr_setpshared( )

NAME

pthread_condattr_setpshared — set the process-shared condition variable attribute

SYNOPSIS

TSH

```
#include <pthread.h>

int pthread_condattr_setpshared(pthread_condattr_t *attr,
    int pshared);
```

DESCRIPTION

Refer to *pthread_condattr_getpshared( )*.

NAME

pthread_create — thread creation

SYNOPSIS

```
#include <pthread.h>

int pthread_create(pthread_t *restrict thread,
    const pthread_attr_t *restrict attr,
    void *(*start_routine)(void*), void *restrict arg);
```

DESCRIPTION

The *pthread_create*( ) function shall create a new thread, with attributes specified by *attr*, within a process. If *attr* is NULL, the default attributes shall be used. If the attributes specified by *attr* are modified later, the thread's attributes shall not be affected. Upon successful completion, *pthread_create*( ) shall store the ID of the created thread in the location referenced by *thread*.

The thread is created executing *start_routine* with *arg* as its sole argument. If the *start_routine* returns, the effect shall be as if there was an implicit call to *pthread_exit*( ) using the return value of *start_routine* as the exit status. Note that the thread in which *main*( ) was originally invoked differs from this. When it returns from *main*( ), the effect shall be as if there was an implicit call to *exit*( ) using the return value of *main*( ) as the exit status.

The signal state of the new thread shall be initialized as follows:

- The signal mask shall be inherited from the creating thread.
- The set of signals pending for the new thread shall be empty.

XSI The alternate stack shall not be inherited.

The floating-point environment shall be inherited from the creating thread.

If *pthread_create*( ) fails, no new thread is created and the contents of the location referenced by *thread* are undefined.

TCT If _POSIX_THREAD_CPUTIME is defined, the new thread shall have a CPU-time clock accessible, and the initial value of this clock shall be set to zero.

The behavior is undefined if the value specified by the *attr* argument to *pthread_create*( ) does not refer to an initialized thread attributes object.

RETURN VALUE

If successful, the *pthread_create*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_create*( ) function shall fail if:

[EAGAIN] The system lacked the necessary resources to create another thread, or the system-imposed limit on the total number of threads in a process {PTHREAD_THREADS_MAX} would be exceeded.

[EPERM] The caller does not have appropriate privileges to set the required scheduling parameters or scheduling policy.

The *pthread_create*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

There is no requirement on the implementation that the ID of the created thread be available before the newly created thread starts executing. The calling thread can obtain the ID of the created thread through the return value of the *pthread_create*( ) function, and the newly created thread can obtain its ID by a call to *pthread_self*( ).

RATIONALE

A suggested alternative to *pthread_create*( ) would be to define two separate operations: create and start. Some applications would find such behavior more natural. Ada, in particular, separates the "creation" of a task from its "activation".

Splitting the operation was rejected by the standard developers for many reasons:

- The number of calls required to start a thread would increase from one to two and thus place an additional burden on applications that do not require the additional synchronization. The second call, however, could be avoided by the additional complication of a start-up state attribute.
- An extra state would be introduced: "created but not started". This would require the standard to specify the behavior of the thread operations when the target has not yet started executing.
- For those applications that require such behavior, it is possible to simulate the two separate steps with the facilities that are currently provided. The *start_routine*( ) can synchronize by waiting on a condition variable that is signaled by the start operation.

An Ada implementor can choose to create the thread at either of two points in the Ada program: when the task object is created, or when the task is activated (generally at a "begin"). If the first approach is adopted, the *start_routine*( ) needs to wait on a condition variable to receive the order to begin "activation". The second approach requires no such condition variable or extra synchronization. In either approach, a separate Ada task control block would need to be created when the task object is created to hold rendezvous queues, and so on.

An extension of the preceding model would be to allow the state of the thread to be modified between the create and start. This would allow the thread attributes object to be eliminated. This has been rejected because:

- All state in the thread attributes object has to be able to be set for the thread. This would require the definition of functions to modify thread attributes. There would be no reduction in the number of function calls required to set up the thread. In fact, for an application that creates all threads using identical attributes, the number of function calls required to set up the threads would be dramatically increased. Use of a thread attributes object permits the application to make one set of attribute setting function calls. Otherwise, the set of attribute setting function calls needs to be made for each thread creation.
- Depending on the implementation architecture, functions to set thread state would require kernel calls, or for other implementation reasons would not be able to be implemented as macros, thereby increasing the cost of thread creation.
- The ability for applications to segregate threads by class would be lost.

Another suggested alternative uses a model similar to that for process creation, such as "thread fork". The fork semantics would provide more flexibility and the "create" function can be implemented simply by doing a thread fork followed immediately by a call to the desired "start

routine'' for the thread. This alternative has these problems:

- For many implementations, the entire stack of the calling thread would need to be duplicated, since in many architectures there is no way to determine the size of the calling frame.
- Efficiency is reduced since at least some part of the stack has to be copied, even though in most cases the thread never needs the copied context, since it merely calls the desired start routine.

If an implementation detects that the value specified by the *attr* argument to *pthread_create*( ) does not refer to an initialized thread attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

fork( ), *pthread_exit*( ), *pthread_join*( )

XBD Section 4.11 (on page 110), **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_create*( ) function is marked as part of the Threads option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EPERM] mandatory error condition is added.

The thread CPU-time clock semantics are added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *pthread_create*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION is updated to make it explicit that the floating-point environment is inherited from the creating thread.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/44 is applied, adding text that the alternate stack is not inherited.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/93 is applied, updating the ERRORS section to remove the mandatory [EINVAL] error (''The value specified by *attr* is invalid''), and adding the optional [EINVAL] error (''The attributes specified by *attr* are invalid'').

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/94 is applied, adding the APPLICATION USAGE section.

Issue 7

The *pthread_create*( ) function is moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized thread attributes object is removed; this condition results in undefined behavior.

NAME

pthread_detach — detach a thread

SYNOPSIS

```
#include <pthread.h>

int pthread_detach(pthread_t thread);
```

DESCRIPTION

The *pthread_detach*( ) function shall indicate to the implementation that storage for the thread *thread* can be reclaimed when that thread terminates. If *thread* has not terminated, *pthread_detach*( ) shall not cause it to terminate.

The behavior is undefined if the value specified by the *thread* argument to *pthread_detach*( ) does not refer to a joinable thread.

RETURN VALUE

If the call succeeds, *pthread_detach*( ) shall return 0; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_detach*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *pthread_join*( ) or *pthread_detach*( ) functions should eventually be called for every thread that is created so that storage associated with the thread may be reclaimed.

It has been suggested that a "detach" function is not necessary; the *detachstate* thread creation attribute is sufficient, since a thread need never be dynamically detached. However, need arises in at least two cases:

1. In a cancellation handler for a *pthread_join*( ) it is nearly essential to have a *pthread_detach*( ) function in order to detach the thread on which *pthread_join*( ) was waiting. Without it, it would be necessary to have the handler do another *pthread_join*( ) to attempt to detach the thread, which would both delay the cancellation processing for an unbounded period and introduce a new call to *pthread_join*( ), which might itself need a cancellation handler. A dynamic detach is nearly essential in this case.
2. In order to detach the "initial thread" (as may be desirable in processes that set up server threads).

If an implementation detects that the value specified by the *thread* argument to *pthread_detach*( ) does not refer to a joinable thread, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended that the function should fail and report an [ESRCH] error.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_join( )

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_detach( )* function is marked as part of the Threads option.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/95 is applied, updating the ERRORS section so that the [EINVAL] and [ESRCH] error cases become optional.

Issue 7

The *pthread_detach( )* function is moved from the Threads option to the Base.

Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

The [EINVAL] error for a non-joinable thread is removed; this condition results in undefined behavior.

NAME

pthread_equal — compare thread IDs

SYNOPSIS

```
#include <pthread.h>

int pthread_equal(pthread_t t1, pthread_t t2);
```

DESCRIPTION

This function shall compare the thread IDs *t1* and *t2*.

RETURN VALUE

The *pthread_equal*( ) function shall return a non-zero value if *t1* and *t2* are equal; otherwise, zero shall be returned.

If either *t1* or *t2* are not valid thread IDs, the behavior is undefined.

ERRORS

No errors are defined.

The *pthread_equal*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Implementations may choose to define a thread ID as a structure. This allows additional flexibility and robustness over using an **int**. For example, a thread ID could include a sequence number that allows detection of "dangling IDs" (copies of a thread ID that has been detached). Since the C language does not support comparison on structure types, the *pthread_equal*( ) function is provided to compare thread IDs.

FUTURE DIRECTIONS

None.

Issue 7

The *pthread_equal*( ) function is moved from the Threads option to the Base.

NAME

pthread_exit — thread termination

SYNOPSIS

```
#include <pthread.h>

void pthread_exit(void *value_ptr);
```

DESCRIPTION

The *pthread_exit*( ) function shall terminate the calling thread and make the value *value_ptr* available to any successful join with the terminating thread. Any cancellation cleanup handlers that have been pushed and not yet popped shall be popped in the reverse order that they were pushed and then executed. After all cancellation cleanup handlers have been executed, if the thread has any thread-specific data, appropriate destructor functions shall be called in an unspecified order. Thread termination does not release any application visible process resources, including, but not limited to, mutexes and file descriptors, nor does it perform any process-level cleanup actions, including, but not limited to, calling any *atexit*( ) routines that may exist.

An implicit call to *pthread_exit*( ) is made when a thread other than the thread in which *main*( ) was first invoked returns from the start routine that was used to create it. The function's return value shall serve as the thread's exit status.

The behavior of *pthread_exit*( ) is undefined if called from a cancellation cleanup handler or destructor function that was invoked as a result of either an implicit or explicit call to *pthread_exit*( ).

After a thread has terminated, the result of access to local (auto) variables of the thread is undefined. Thus, references to local variables of the exiting thread should not be used for the *pthread_exit*( ) *value_ptr* parameter value.

The process shall exit with an exit status of 0 after the last thread has been terminated. The behavior shall be as if the implementation called *exit*( ) with a zero argument at thread termination time.

RETURN VALUE

The *pthread_exit*( ) function cannot return to its caller.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The normal mechanism by which a thread terminates is to return from the routine that was specified in the *pthread_create*( ) call that started it. The *pthread_exit*( ) function provides the capability for a thread to terminate without requiring a return from the start routine of that thread, thereby providing a function analogous to *exit*( ).

Regardless of the method of thread termination, any cancellation cleanup handlers that have been pushed and not yet popped are executed, and the destructors for any existing thread-specific data are executed. This volume of POSIX.1-200x requires that cancellation cleanup handlers be popped and called in order. After all cancellation cleanup handlers have been executed, thread-specific data destructors are called, in an unspecified order, for each item of thread-specific data that exists in the thread. This ordering is necessary because cancellation cleanup handlers may rely on thread-specific data.

As the meaning of the status is determined by the application (except when the thread has been canceled, in which case it is PTHREAD_CANCELED), the implementation has no idea what an illegal status value is, which is why no address error checking is done.

FUTURE DIRECTIONS

None.

Issue 7

The *pthread_exit*( ) function is moved from the Threads option to the Base.

NAME

pthread_getconcurrency, pthread_setconcurrency — get and set the level of concurrency

SYNOPSIS

OB XSI
```
#include <pthread.h>

int pthread_getconcurrency(void);
int pthread_setconcurrency(int new_level);
```

DESCRIPTION

Unbound threads in a process may or may not be required to be simultaneously active. By default, the threads implementation ensures that a sufficient number of threads are active so that the process can continue to make progress. While this conserves system resources, it may not produce the most effective level of concurrency.

The *pthread_setconcurrency*( ) function allows an application to inform the threads implementation of its desired concurrency level, *new_level*. The actual level of concurrency provided by the implementation as a result of this function call is unspecified.

If *new_level* is zero, it causes the implementation to maintain the concurrency level at its discretion as if *pthread_setconcurrency*( ) had never been called.

The *pthread_getconcurrency*( ) function shall return the value set by a previous call to the *pthread_setconcurrency*( ) function. If the *pthread_setconcurrency*( ) function was not previously called, this function shall return zero to indicate that the implementation is maintaining the concurrency level.

A call to *pthread_setconcurrency*( ) shall inform the implementation of its desired concurrency level. The implementation shall use this as a hint, not a requirement.

If an implementation does not support multiplexing of user threads on top of several kernel-scheduled entities, the *pthread_setconcurrency*( ) and *pthread_getconcurrency*( ) functions are provided for source code compatibility but they shall have no effect when called. To maintain the function semantics, the *new_level* parameter is saved when *pthread_setconcurrency*( ) is called so that a subsequent call to *pthread_getconcurrency*( ) shall return the same value.

RETURN VALUE

If successful, the *pthread_setconcurrency*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

The *pthread_getconcurrency*( ) function shall always return the concurrency level set by a previous call to *pthread_setconcurrency*( ). If the *pthread_setconcurrency*( ) function has never been called, *pthread_getconcurrency*( ) shall return zero.

ERRORS

The *pthread_setconcurrency*( ) function shall fail if:

[EINVAL] The value specified by *new_level* is negative.

[EAGAIN] The value specified by *new_level* would cause a system resource to be exceeded.

The *pthread_setconcurrency*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Application developers should note that an implementation can always ignore any calls to *pthread_setconcurrency*( ) and return a constant for *pthread_getconcurrency*( ). For this reason, it is not recommended that portable applications use this function.

RATIONALE

None.

FUTURE DIRECTIONS

These functions may be removed in a future version.

The *pthread_getconcurrency*( ) and *pthread_setconcurrency*( ) functions are marked obsolescent.

NAME

pthread_getcpuclockid — access a thread CPU-time clock (**ADVANCED REALTIME THREADS**)

SYNOPSIS

TCT
```
#include <pthread.h>
#include <time.h>

int pthread_getcpuclockid(pthread_t thread_id, clockid_t *clock_id);
```

DESCRIPTION

The *pthread_getcpuclockid*( ) function shall return in *clock_id* the clock ID of the CPU-time clock of the thread specified by *thread_id*, if the thread specified by *thread_id* exists.

RETURN VALUE

Upon successful completion, *pthread_getcpuclockid*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *pthread_getcpuclockid*( ) function is part of the Thread CPU-Time Clocks option and need not be provided on all implementations.

RATIONALE

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended that the function should fail and report an [ESRCH] error.

SYNOPSIS

TPS
```
#include <pthread.h>

int pthread_getschedparam(pthread_t thread, int *restrict policy,
    struct sched_param *restrict param);
int pthread_setschedparam(pthread_t thread, int policy,
    const struct sched_param *param);
```

DESCRIPTION

The *pthread_getschedparam*( ) and *pthread_setschedparam*( ) functions shall, respectively, get and set the scheduling policy and parameters of individual threads within a multi-threaded process to be retrieved and set. For SCHED_FIFO and SCHED_RR, the only required member of the **sched_param** structure is the priority *sched_priority*. For SCHED_OTHER, the affected scheduling parameters are implementation-defined.

The *pthread_getschedparam*( ) function shall retrieve the scheduling policy and scheduling parameters for the thread whose thread ID is given by *thread* and shall store those values in *policy* and *param*, respectively. The priority value returned from *pthread_getschedparam*( ) shall be the value specified by the most recent *pthread_setschedparam*( ), *pthread_setschedprio*( ), or *pthread_create*( ) call affecting the target thread. It shall not reflect any temporary adjustments to its priority as a result of any priority inheritance or ceiling functions. The *pthread_setschedparam*( ) function shall set the scheduling policy and associated scheduling parameters for the thread whose thread ID is given by *thread* to the policy and associated parameters provided in *policy* and *param*, respectively.

The *policy* parameter may have the value SCHED_OTHER, SCHED_FIFO, or SCHED_RR. The scheduling parameters for the SCHED_OTHER policy are implementation-defined. The SCHED_FIFO and SCHED_RR policies shall have a single scheduling parameter, *priority*.

TSP If _POSIX_THREAD_SPORADIC_SERVER is defined, then the *policy* argument may have the value SCHED_SPORADIC, with the exception for the *pthread_setschedparam*( ) function that if the scheduling policy was not SCHED_SPORADIC at the time of the call, it is implementation-defined whether the function is supported; in other words, the implementation need not allow the application to dynamically change the scheduling policy to SCHED_SPORADIC. The sporadic server scheduling policy has the associated parameters *sched_ss_low_priority*, *sched_ss_repl_period*, *sched_ss_init_budget*, *sched_priority*, and *sched_ss_max_repl*. The specified *sched_ss_repl_period* shall be greater than or equal to the specified *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail. The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the function to succeed; if not, the function shall fail. It is unspecified whether the *sched_ss_repl_period* and *sched_ss_init_budget* values are stored as provided by this function or are rounded to align with the resolution of the clock being used.

If the *pthread_setschedparam*( ) function fails, the scheduling parameters shall not be changed for the target thread.

RETURN VALUE

If successful, the *pthread_getschedparam*( ) and *pthread_setschedparam*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_setschedparam*( ) function may fail if:

[EINVAL] The value specified by *policy* or one of the scheduling parameters associated with the scheduling policy *policy* is invalid.

[ENOTSUP] An attempt was made to set the policy or scheduling parameters to an unsupported value.

TSP [ENOTSUP] An attempt was made to dynamically change the scheduling policy to SCHED_SPORADIC, and the implementation does not support this change.

[EPERM] The caller does not have appropriate privileges to set either the scheduling parameters or the scheduling policy of the specified thread.

[EPERM] The implementation does not allow the application to modify one of the parameters to the value specified.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended that the function should fail and report an [ESRCH] error.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_getschedparam*( ) and *pthread_setschedparam*( ) functions are marked as part of the Threads and Thread Execution Scheduling options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Execution Scheduling option.

The Open Group Corrigendum U026/2 is applied, correcting the prototype for the *pthread_setschedparam*( ) function so that its second argument is of type **int**.

The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *pthread_getschedparam*( ) prototype for alignment with the ISO/IEC 9899:1999 standard.

The Open Group Corrigendum U047/1 is applied.

IEEE PASC Interpretation 1003.1 #96 is applied, noting that priority values can also be set by a call to the *pthread_setschedprio*( ) function.

Issue 7

The *pthread_getschedparam*( ) and *pthread_setschedparam*( ) functions are moved from the Threads option.

Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements for the *sched_ss_repl_period* and *sched_ss_init_budget* values.

Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

NAME

pthread_getspecific, pthread_setspecific — thread-specific data management

SYNOPSIS

```
#include <pthread.h>

void *pthread_getspecific(pthread_key_t key);
int pthread_setspecific(pthread_key_t key, const void *value);
```

DESCRIPTION

The *pthread_getspecific*( ) function shall return the value currently bound to the specified *key* on behalf of the calling thread.

The *pthread_setspecific*( ) function shall associate a thread-specific *value* with a *key* obtained via a previous call to *pthread_key_create*( ). Different threads may bind different values to the same key. These values are typically pointers to blocks of dynamically allocated memory that have been reserved for use by the calling thread.

The effect of calling *pthread_getspecific*( ) or *pthread_setspecific*( ) with a *key* value not obtained from *pthread_key_create*( ) or after *key* has been deleted with *pthread_key_delete*( ) is undefined.

Both *pthread_getspecific*( ) and *pthread_setspecific*( ) may be called from a thread-specific data destructor function. A call to *pthread_getspecific*( ) for the thread-specific data key being destroyed shall return the value NULL, unless the value is changed (after the destructor starts) by a call to *pthread_setspecific*( ). Calling *pthread_setspecific*( ) from a thread-specific data destructor routine may result either in lost storage (after at least PTHREAD_DESTRUCTOR_ITERATIONS attempts at destruction) or in an infinite loop.

Both functions may be implemented as macros.

RETURN VALUE

The *pthread_getspecific*( ) function shall return the thread-specific data value associated with the given *key*. If no thread-specific data value is associated with *key*, then the value NULL shall be returned.

If successful, the *pthread_setspecific*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

No errors are returned from *pthread_getspecific*( ).

The *pthread_setspecific*( ) function shall fail if:

[ENOMEM] Insufficient memory exists to associate the non-NULL value with the key.

The *pthread_setspecific*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Performance and ease-of-use of *pthread_getspecific*( ) are critical for functions that rely on maintaining state in thread-specific data. Since no errors are required to be detected by it, and since the only error that could be detected is the use of an invalid key, the function to *pthread_getspecific*( ) has been designed to favor speed and simplicity over error reporting.

If an implementation detects that the value specified by the *key* argument to *pthread_setspecific*( ) does not refer to a a key value obtained from *pthread_key_create*( ) or refers to a key that has been

deleted with *pthread_key_delete*( ), it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_key_create( )

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_getspecific*( ) and *pthread_setspecific*( ) functions are marked as part of the Threads option.

IEEE PASC Interpretation 1003.1c #3 (Part 6) is applied, updating the DESCRIPTION.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/96 is applied, updating the ERRORS section so that the [ENOMEM] error case is changed from "to associate the value with the key" to "to associate the non-NULL value with the key".

Issue 7

Austin Group Interpretation 1003.1-2001 #063 is applied, updating the ERRORS section.

The *pthread_getspecific*( ) and *pthread_setspecific*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for a key value not obtained from *pthread_key_create*( ) or a key deleted with *pthread_key_delete*( ) is removed; this condition results in undefined behavior.

NAME

pthread_join — wait for thread termination

SYNOPSIS

```
#include <pthread.h>

int pthread_join(pthread_t thread, void **value_ptr);
```

DESCRIPTION

The *pthread_join*( ) function shall suspend execution of the calling thread until the target *thread* terminates, unless the target *thread* has already terminated. On return from a successful *pthread_join*( ) call with a non-NULL *value_ptr* argument, the value passed to *pthread_exit*( ) by the terminating thread shall be made available in the location referenced by *value_ptr*. When a *pthread_join*( ) returns successfully, the target thread has been terminated. The results of multiple simultaneous calls to *pthread_join*( ) specifying the same target thread are undefined. If the thread calling *pthread_join*( ) is canceled, then the target thread shall not be detached.

It is unspecified whether a thread that has exited but remains unjoined counts against {PTHREAD_THREADS_MAX}.

The behavior is undefined if the value specified by the *thread* argument to *pthread_join*( ) does not refer to a joinable thread.

The behavior is undefined if the value specified by the *thread* argument to *pthread_join*( ) refers to the calling thread.

RETURN VALUE

If successful, the *pthread_join*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_join*( ) function may fail if:

[EDEADLK] A deadlock was detected.

The *pthread_join*( ) function shall not return an error code of [EINTR].

EXAMPLES

An example of thread creation and deletion follows:

```
typedef struct {
    int *ar;
    long n;
} subarray;

void *
incer(void *arg)
{
    long i;

    for (i = 0; i < ((subarray *)arg)->n; i++)
        ((subarray *)arg)->ar[i]++;
}

int main(void)
{
    int        ar[1000000];
    pthread_t  th1, th2;
    subarray   sb1, sb2;
```

```
        sb1.ar = &ar[0];
        sb1.n  = 500000;
        (void) pthread_create(&th1, NULL, incer, &sb1);
        sb2.ar = &ar[500000];
        sb2.n  = 500000;
        (void) pthread_create(&th2, NULL, incer, &sb2);
        (void) pthread_join(th1, NULL);
        (void) pthread_join(th2, NULL);
        return 0;
    }
```

APPLICATION USAGE

None.

RATIONALE

The *pthread_join*( ) function is a convenience that has proven useful in multi-threaded applications. It is true that a programmer could simulate this function if it were not provided by passing extra state as part of the argument to the *start_routine*( ). The terminating thread would set a flag to indicate termination and broadcast a condition that is part of that state; a joining thread would wait on that condition variable. While such a technique would allow a thread to wait on more complex conditions (for example, waiting for multiple threads to terminate), waiting on individual thread termination is considered widely useful. Also, including the *pthread_join*( ) function in no way precludes a programmer from coding such complex waits. Thus, while not a primitive, including *pthread_join*( ) in this volume of POSIX.1-200x was considered valuable.

The *pthread_join*( ) function provides a simple mechanism allowing an application to wait for a thread to terminate. After the thread terminates, the application may then choose to clean up resources that were used by the thread. For instance, after *pthread_join*( ) returns, any application-provided stack storage could be reclaimed.

The *pthread_join*( ) or *pthread_detach*( ) function should eventually be called for every thread that is created with the *detachstate* attribute set to PTHREAD_CREATE_JOINABLE so that storage associated with the thread may be reclaimed.

The interaction between *pthread_join*( ) and cancellation is well-defined for the following reasons:

- The *pthread_join*( ) function, like all other non-async-cancel-safe functions, can only be called with deferred cancelability type.
- Cancellation cannot occur in the disabled cancelability state.

Thus, only the default cancelability state need be considered. As specified, either the *pthread_join*( ) call is canceled, or it succeeds, but not both. The difference is obvious to the application, since either a cancellation handler is run or *pthread_join*( ) returns. There are no race conditions since *pthread_join*( ) was called in the deferred cancelability state.

If an implementation detects that the value specified by the *thread* argument to *pthread_join*( ) does not refer to a joinable thread, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *thread* argument to *pthread_join*( ) refers to the calling thread, it is recommended that the function should fail and report an [EDEADLK] error.

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended

that the function should fail and report an [ESRCH] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_join( )* function is marked as part of the Threads option.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/97 is applied, updating the ERRORS section so that the [EINVAL] error is made optional and the words ''the implementation has detected'' are removed from it.

Issue 7

The *pthread_join( )* function is moved from the Threads option to the Base.

Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

The [EINVAL] error for a non-joinable thread is removed; this condition results in undefined behavior.

The [EDEADLK] error for the calling thread is removed; this condition results in undefined behavior.

NAME

pthread_key_create — thread-specific data key creation

SYNOPSIS

```
#include <pthread.h>

int pthread_key_create(pthread_key_t *key, void (*destructor)(void*));
```

DESCRIPTION

The *pthread_key_create*( ) function shall create a thread-specific data key visible to all threads in the process. Key values provided by *pthread_key_create*( ) are opaque objects used to locate thread-specific data. Although the same key value may be used by different threads, the values bound to the key by *pthread_setspecific*( ) are maintained on a per-thread basis and persist for the life of the calling thread.

Upon key creation, the value NULL shall be associated with the new key in all active threads. Upon thread creation, the value NULL shall be associated with all defined keys in the new thread.

An optional destructor function may be associated with each key value. At thread exit, if a key value has a non-NULL destructor pointer, and the thread has a non-NULL value associated with that key, the value of the key is set to NULL, and then the function pointed to is called with the previously associated value as its sole argument. The order of destructor calls is unspecified if more than one destructor exists for a thread when it exits.

If, after all the destructors have been called for all non-NULL values with associated destructors, there are still some non-NULL values with associated destructors, then the process is repeated. If, after at least {PTHREAD_DESTRUCTOR_ITERATIONS} iterations of destructor calls for outstanding non-NULL values, there are still some non-NULL values with associated destructors, implementations may stop calling destructors, or they may continue calling destructors until no non-NULL values with associated destructors exist, even though this might result in an infinite loop.

RETURN VALUE

If successful, the *pthread_key_create*( ) function shall store the newly created key value at **key* and shall return zero. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_key_create*( ) function shall fail if:

[EAGAIN] The system lacked the necessary resources to create another thread-specific data key, or the system-imposed limit on the total number of keys per process {PTHREAD_KEYS_MAX} has been exceeded.

[ENOMEM] Insufficient memory exists to create the key.

The *pthread_key_create*( ) function shall not return an error code of [EINTR].

EXAMPLES

The following example demonstrates a function that initializes a thread-specific data key when it is first called, and associates a thread-specific object with each calling thread, initializing this object when necessary.

```
static pthread_key_t key;
static pthread_once_t key_once = PTHREAD_ONCE_INIT;

static void
make_key()
{
```

```
        (void) pthread_key_create(&key, NULL);
    }

    func()
    {
        void *ptr;

        (void) pthread_once(&key_once, make_key);
        if ((ptr = pthread_getspecific(key)) == NULL) {
            ptr = malloc(OBJECT_SIZE);
            ...
            (void) pthread_setspecific(key, ptr);
        }
        ...
    }
```

Note that the key has to be initialized before *pthread_getspecific*( ) or *pthread_setspecific*( ) can be used. The *pthread_key_create*( ) call could either be explicitly made in a module initialization routine, or it can be done implicitly by the first call to a module as in this example. Any attempt to use the key before it is initialized is a programming error, making the code below incorrect.

```
    static pthread_key_t key;

    func()
    {
        void *ptr;

       /* KEY NOT INITIALIZED!!!  THIS WON'T WORK!!! */
        if ((ptr = pthread_getspecific(key)) == NULL &&
            pthread_setspecific(key, NULL) != 0) {
            pthread_key_create(&key, NULL);
            ...
        }
    }
```

APPLICATION USAGE

None.

RATIONALE

Destructor Functions

Normally, the value bound to a key on behalf of a particular thread is a pointer to storage allocated dynamically on behalf of the calling thread. The destructor functions specified with *pthread_key_create*( ) are intended to be used to free this storage when the thread exits. Thread cancellation cleanup handlers cannot be used for this purpose because thread-specific data may persist outside the lexical scope in which the cancellation cleanup handlers operate.

If the value associated with a key needs to be updated during the lifetime of the thread, it may be necessary to release the storage associated with the old value before the new value is bound. Although the *pthread_setspecific*( ) function could do this automatically, this feature is not needed often enough to justify the added complexity. Instead, the programmer is responsible for freeing the stale storage:

```
    pthread_getspecific(key, &old);
    new = allocate();
    destructor(old);
```

```
pthread_setspecific(key, new);
```

Note: The above example could leak storage if run with asynchronous cancellation enabled. No such problems occur in the default cancellation state if no cancellation points occur between the get and set.

There is no notion of a destructor-safe function. If an application does not call *pthread_exit*( ) from a signal handler, or if it blocks any signal whose handler may call *pthread_exit*( ) while calling async-unsafe functions, all functions may be safely called from destructors.

Non-Idempotent Data Key Creation

There were requests to make *pthread_key_create*( ) idempotent with respect to a given *key* address parameter. This would allow applications to call *pthread_key_create*( ) multiple times for a given *key* address and be guaranteed that only one key would be created. Doing so would require the key value to be previously initialized (possibly at compile time) to a known null value and would require that implicit mutual-exclusion be performed based on the address and contents of the *key* parameter in order to guarantee that exactly one key would be created.

Unfortunately, the implicit mutual-exclusion would not be limited to only *pthread_key_create*( ). On many implementations, implicit mutual-exclusion would also have to be performed by *pthread_getspecific*( ) and *pthread_setspecific*( ) in order to guard against using incompletely stored or not-yet-visible key values. This could significantly increase the cost of important operations, particularly *pthread_getspecific*( ).

Thus, this proposal was rejected. The *pthread_key_create*( ) function performs no implicit synchronization. It is the responsibility of the programmer to ensure that it is called exactly once per key before use of the key. Several straightforward mechanisms can already be used to accomplish this, including calling explicit module initialization functions, using mutexes, and using *pthread_once*( ). This places no significant burden on the programmer, introduces no possibly confusing *ad hoc* implicit synchronization mechanism, and potentially allows commonly used thread-specific data operations to be more efficient.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_key_create*( ) function is marked as part of the Threads option.

IEEE PASC Interpretation 1003.1c #8 is applied, updating the DESCRIPTION.

Issue 7

The *pthread_key_create*( ) function is moved from the Threads option to the Base.

NAME

pthread_key_delete — thread-specific data key deletion

SYNOPSIS

```
#include <pthread.h>

int pthread_key_delete(pthread_key_t key);
```

DESCRIPTION

The *pthread_key_delete*( ) function shall delete a thread-specific data key previously returned by *pthread_key_create*( ). The thread-specific data values associated with *key* need not be NULL at the time *pthread_key_delete*( ) is called. It is the responsibility of the application to free any application storage or perform any cleanup actions for data structures related to the deleted key or associated thread-specific data in any threads; this cleanup can be done either before or after *pthread_key_delete*( ) is called. Any attempt to use *key* following the call to *pthread_key_delete*( ) results in undefined behavior.

The *pthread_key_delete*( ) function shall be callable from within destructor functions. No destructor functions shall be invoked by *pthread_key_delete*( ). Any destructor function that may have been associated with *key* shall no longer be called upon thread exit.

RETURN VALUE

If successful, the *pthread_key_delete*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_key_delete*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

A thread-specific data key deletion function has been included in order to allow the resources associated with an unused thread-specific data key to be freed. Unused thread-specific data keys can arise, among other scenarios, when a dynamically loaded module that allocated a key is unloaded.

Conforming applications are responsible for performing any cleanup actions needed for data structures associated with the key to be deleted, including data referenced by thread-specific data values. No such cleanup is done by *pthread_key_delete*( ). In particular, destructor functions are not called. There are several reasons for this division of responsibility:

1. The associated destructor functions used to free thread-specific data at thread exit time are only guaranteed to work correctly when called in the thread that allocated the thread-specific data. (Destructors themselves may utilize thread-specific data.) Thus, they cannot be used to free thread-specific data in other threads at key deletion time. Attempting to have them called by other threads at key deletion time would require other threads to be asynchronously interrupted. But since interrupted threads could be in an arbitrary state, including holding locks necessary for the destructor to run, this approach would fail. In general, there is no safe mechanism whereby an implementation could free thread-specific data at key deletion time.

2. Even if there were a means of safely freeing thread-specific data associated with keys to be deleted, doing so would require that implementations be able to enumerate the threads with non-NULL data and potentially keep them from creating more thread-

specific data while the key deletion is occurring. This special case could cause extra synchronization in the normal case, which would otherwise be unnecessary.

For an application to know that it is safe to delete a key, it has to know that all the threads that might potentially ever use the key do not attempt to use it again. For example, it could know this if all the client threads have called a cleanup procedure declaring that they are through with the module that is being shut down, perhaps by setting a reference count to zero.

If an implementation detects that the value specified by the *key* argument to *pthread_key_delete*( ) does not refer to a a key value obtained from *pthread_key_create*( ) or refers to a key that has been deleted with *pthread_key_delete*( ), it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

Issue 6

The *pthread_key_delete*( ) function is marked as part of the Threads option.

Issue 7

The *pthread_key_delete*( ) function is moved from the Threads option to the Base.

The [EINVAL] error for a key value not obtained from *pthread_key_create*( ) or a key deleted with *pthread_key_delete*( ) is removed; this condition results in undefined behavior.

52266 **NAME**

52267 pthread_kill — send a signal to a thread

52268 **SYNOPSIS**

52269 CX
```
#include <signal.h>
```
52270
```
int pthread_kill(pthread_t thread, int sig);
```

52271 **DESCRIPTION**

52272 The *pthread_kill*( ) function shall request that a signal be delivered to the specified thread.

52273 As in *kill*( ), if *sig* is zero, error checking shall be performed but no signal shall actually be sent.

52274 **RETURN VALUE**

52275 Upon successful completion, the function shall return a value of zero. Otherwise, the function
52276 shall return an error number. If the *pthread_kill*( ) function fails, no signal shall be sent.

52277 **ERRORS**

52278 The *pthread_kill*( ) function shall fail if:

52279 [EINVAL] The value of the *sig* argument is an invalid or unsupported signal number.

52280 The *pthread_kill*( ) function shall not return an error code of [EINTR].

52281 **EXAMPLES**

52282 None.

52283 **APPLICATION USAGE**

52284 The *pthread_kill*( ) function provides a mechanism for asynchronously directing a signal at a
52285 thread in the calling process. This could be used, for example, by one thread to affect broadcast
52286 delivery of a signal to a set of threads.

52287 Note that *pthread_kill*( ) only causes the signal to be handled in the context of the given thread;
52288 the signal action (termination or stopping) affects the process as a whole.

52289 **RATIONALE**

52290 If an implementation detects use of a thread ID after the end of its lifetime, it is recommended
52291 that the function should fail and report an [ESRCH] error.

52292 **FUTURE DIRECTIONS**

52293 None.

52294 **SEE ALSO**

52295 *kill*( ), *pthread_self*( ), *raise*( )

52296 XBD **<signal.h>**

52297 **CHANGE HISTORY**

52298 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

52299 **Issue 6**

52300 The *pthread_kill*( ) function is marked as part of the Threads option.

52301 The APPLICATION USAGE section is added.

52302 **Issue 7**

52303 The *pthread_kill*( ) function is moved from the Threads option to the Base.

52304 Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

52305 **NAME**

52306 pthread_mutex_consistent — mark state protected by robust mutex as consistent

52307 **SYNOPSIS**

52308 ```
#include <pthread.h>
```

52309 ```
int pthread_mutex_consistent(pthread_mutex_t *mutex);
```

52310 **DESCRIPTION**

52311 If *mutex* is a robust mutex in an inconsistent state, the *pthread_mutex_consistent*( ) function can be
52312 used to mark the state protected by the mutex referenced by *mutex* as consistent again.

52313 If an owner of a robust mutex terminates while holding the mutex, the mutex becomes
52314 inconsistent and the next thread that acquires the mutex lock shall be notified of the state by the
52315 return value [EOWNERDEAD]. In this case, the mutex does not become normally usable again
52316 until the state is marked consistent.

52317 If the thread which acquired the mutex lock with the return value [EOWNERDEAD] terminates
52318 before calling either *pthread_mutex_consistent*( ) or *pthread_mutex_unlock*( ), the next thread that
52319 acquires the mutex lock shall be notified about the state of the mutex by the return value
52320 [EOWNERDEAD].

52321 The behavior is undefined if the value specified by the *mutex* argument to
52322 *pthread_mutex_consistent*( ) does not refer to an initialized mutex.

52323 **RETURN VALUE**

52324 Upon successful completion, the *pthread_mutex_consistent*( ) function shall return zero.
52325 Otherwise, an error value shall be returned to indicate the error.

52326 **ERRORS**

52327 The *pthread_mutex_consistent*( ) function shall fail if:

52328 [EINVAL] The mutex object referenced by *mutex* is not robust or does not protect an
52329 inconsistent state.

52330 These functions shall not return an error code of [EINTR].

52331 **EXAMPLES**

52332 None.

52333 **APPLICATION USAGE**

52334 The *pthread_mutex_consistent*( ) function is only responsible for notifying the implementation that
52335 the state protected by the mutex has been recovered and that normal operations with the mutex
52336 can be resumed. It is the responsibility of the application to recover the state so it can be reused.
52337 If the application is not able to perform the recovery, it can notify the implementation that the
52338 situation is unrecoverable by a call to *pthread_mutex_unlock*( ) without a prior call to
52339 *pthread_mutex_consistent*( ), in which case subsequent threads that attempt to lock the mutex will
52340 fail to acquire the lock and be returned [ENOTRECOVERABLE].

52341 **RATIONALE**

52342 If an implementation detects that the value specified by the *mutex* argument to
52343 *pthread_mutex_consistent*( ) does not refer to an initialized mutex, it is recommended that the
52344 function should fail and report an [EINVAL] error.

52345 **FUTURE DIRECTIONS**

52346 None.

52347 **SEE ALSO**

52348 *pthread_mutex_lock( )*, *pthread_mutexattr_getrobust( )*

pthread_mutex_destroy( )

NAME

pthread_mutex_destroy, pthread_mutex_init — destroy and initialize a mutex

SYNOPSIS

```
#include <pthread.h>

int pthread_mutex_destroy(pthread_mutex_t *mutex);
int pthread_mutex_init(pthread_mutex_t *restrict mutex,
    const pthread_mutexattr_t *restrict attr);
pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;
```

DESCRIPTION

The *pthread_mutex_destroy*( ) function shall destroy the mutex object referenced by *mutex*; the mutex object becomes, in effect, uninitialized. An implementation may cause *pthread_mutex_destroy*( ) to set the object referenced by *mutex* to an invalid value.

A destroyed mutex object can be reinitialized using *pthread_mutex_init*( ); the results of otherwise referencing the object after it has been destroyed are undefined.

It shall be safe to destroy an initialized mutex that is unlocked. Attempting to destroy a locked mutex or a mutex that is referenced (for example, while being used in a *pthread_cond_timedwait*( ) or *pthread_cond_wait*( )) by another thread results in undefined behavior.

The *pthread_mutex_init*( ) function shall initialize the mutex referenced by *mutex* with attributes specified by *attr*. If *attr* is NULL, the default mutex attributes are used; the effect shall be the same as passing the address of a default mutex attributes object. Upon successful initialization, the state of the mutex becomes initialized and unlocked.

Only *mutex* itself may be used for performing synchronization. The result of referring to copies of *mutex* in calls to *pthread_mutex_lock*( ), *pthread_mutex_trylock*( ), *pthread_mutex_unlock*( ), and *pthread_mutex_destroy*( ) is undefined.

Attempting to initialize an already initialized mutex results in undefined behavior.

In cases where default mutex attributes are appropriate, the macro PTHREAD_MUTEX_INITIALIZER can be used to initialize mutexes that are statically allocated. The effect shall be equivalent to dynamic initialization by a call to *pthread_mutex_init*( ) with parameter *attr* specified as NULL, except that no error checks are performed.

The behavior is undefined if the value specified by the *mutex* argument to *pthread_mutex_destroy*( ) does not refer to an initialized mutex.

The behavior is undefined if the value specified by the *attr* argument to *pthread_mutex_init*( ) does not refer to an initialized mutex attributes object.

RETURN VALUE

If successful, the *pthread_mutex_destroy*( ) and *pthread_mutex_init*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_mutex_init*( ) function shall fail if:

[EAGAIN] The system lacked the necessary resources (other than memory) to initialize another mutex.

[ENOMEM] Insufficient memory exists to initialize the mutex.

[EPERM] The caller does not have the privilege to perform the operation.

The *pthread_mutex_init*( ) function may fail if:

[EINVAL] The attributes object referenced by *attr* has the robust mutex attribute set without the process-shared attribute being set.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *mutex* argument to *pthread_mutex_destroy*( ) does not refer to an initialized mutex, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *mutex* argument to *pthread_mutex_destroy*( ) or *pthread_mutex_init*( ) refers to a locked mutex or a mutex that is referenced (for example, while being used in a *pthread_cond_timedwait*( ) or *pthread_cond_wait*( )) by another thread, or detects that the value specified by the *mutex* argument to *pthread_mutex_init*( ) refers to an already initialized mutex, it is recommended that the function should fail and report an [EBUSY] error.

If an implementation detects that the value specified by the *attr* argument to *pthread_mutex_init*( ) does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

Alternate Implementations Possible

This volume of POSIX.1-200x supports several alternative implementations of mutexes. An implementation may store the lock directly in the object of type **pthread_mutex_t**. Alternatively, an implementation may store the lock in the heap and merely store a pointer, handle, or unique ID in the mutex object. Either implementation has advantages or may be required on certain hardware configurations. So that portable code can be written that is invariant to this choice, this volume of POSIX.1-200x does not define assignment or equality for this type, and it uses the term "initialize" to reinforce the (more restrictive) notion that the lock may actually reside in the mutex object itself.

Note that this precludes an over-specification of the type of the mutex or condition variable and motivates the opaqueness of the type.

An implementation is permitted, but not required, to have *pthread_mutex_destroy*( ) store an illegal value into the mutex. This may help detect erroneous programs that try to lock (or otherwise reference) a mutex that has already been destroyed.

Tradeoff Between Error Checks and Performance Supported

Many error conditions that can occur are not required to be detected by the implementation in order to let implementations trade off performance *versus* degree of error checking according to the needs of their specific applications and execution environment. As a general rule, conditions caused by the system (such as insufficient memory) are required to be detected, but conditions caused by an erroneously coded application (such as failing to provide adequate synchronization to prevent a mutex from being deleted while in use) are specified to result in undefined behavior.

A wide range of implementations is thus made possible. For example, an implementation

intended for application debugging may implement all of the error checks, but an implementation running a single, provably correct application under very tight performance constraints in an embedded computer might implement minimal checks. An implementation might even be provided in two versions, similar to the options that compilers provide: a full-checking, but slower version; and a limited-checking, but faster version. To forbid this optionality would be a disservice to users.

By carefully limiting the use of "undefined behavior" only to things that an erroneous (badly coded) application might do, and by defining that resource-not-available errors are mandatory, this volume of POSIX.1-200x ensures that a fully-conforming application is portable across the full range of implementations, while not forcing all implementations to add overhead to check for numerous things that a correct program never does. When the behavior is undefined, no error number is specified to be returned on implementations that do detect the condition. This is because undefined behavior means *anything* can happen, which includes returning with any value (which might happen to be a valid, but different, error number). However, since the error number might be useful to application developers when diagnosing problems during application development, a recommendation is made in rationale that implementors should return a particular error number if their implementation does detect the condition.

Why No Limits are Defined

Defining symbols for the maximum number of mutexes and condition variables was considered but rejected because the number of these objects may change dynamically. Furthermore, many implementations place these objects into application memory; thus, there is no explicit maximum.

Static Initializers for Mutexes and Condition Variables

Providing for static initialization of statically allocated synchronization objects allows modules with private static synchronization variables to avoid runtime initialization tests and overhead. Furthermore, it simplifies the coding of self-initializing modules. Such modules are common in C libraries, where for various reasons the design calls for self-initialization instead of requiring an explicit module initialization function to be called. An example use of static initialization follows.

Without static initialization, a self-initializing routine *foo*( ) might look as follows:

```
static pthread_once_t foo_once = PTHREAD_ONCE_INIT;
static pthread_mutex_t foo_mutex;

void foo_init()
{
    pthread_mutex_init(&foo_mutex, NULL);
}

void foo()
{
    pthread_once(&foo_once, foo_init);
    pthread_mutex_lock(&foo_mutex);
   /* Do work. */
    pthread_mutex_unlock(&foo_mutex);
}
```

With static initialization, the same routine could be coded as follows:

```
static pthread_mutex_t foo_mutex = PTHREAD_MUTEX_INITIALIZER;
```

```
void foo()
{
    pthread_mutex_lock(&foo_mutex);
   /* Do work. */
    pthread_mutex_unlock(&foo_mutex);
}
```

Note that the static initialization both eliminates the need for the initialization test inside *pthread_once*( ) and the fetch of *&foo_mutex* to learn the address to be passed to *pthread_mutex_lock*( ) or *pthread_mutex_unlock*( ).

Thus, the C code written to initialize static objects is simpler on all systems and is also faster on a large class of systems; those where the (entire) synchronization object can be stored in application memory.

Yet the locking performance question is likely to be raised for machines that require mutexes to be allocated out of special memory. Such machines actually have to have mutexes and possibly condition variables contain pointers to the actual hardware locks. For static initialization to work on such machines, *pthread_mutex_lock*( ) also has to test whether or not the pointer to the actual lock has been allocated. If it has not, *pthread_mutex_lock*( ) has to initialize it before use. The reservation of such resources can be made when the program is loaded, and hence return codes have not been added to mutex locking and condition variable waiting to indicate failure to complete initialization.

This runtime test in *pthread_mutex_lock*( ) would at first seem to be extra work; an extra test is required to see whether the pointer has been initialized. On most machines this would actually be implemented as a fetch of the pointer, testing the pointer against zero, and then using the pointer if it has already been initialized. While the test might seem to add extra work, the extra effort of testing a register is usually negligible since no extra memory references are actually done. As more and more machines provide caches, the real expenses are memory references, not instructions executed.

Alternatively, depending on the machine architecture, there are often ways to eliminate *all* overhead in the most important case: on the lock operations that occur *after* the lock has been initialized. This can be done by shifting more overhead to the less frequent operation: initialization. Since out-of-line mutex allocation also means that an address has to be dereferenced to find the actual lock, one technique that is widely applicable is to have static initialization store a bogus value for that address; in particular, an address that causes a machine fault to occur. When such a fault occurs upon the first attempt to lock such a mutex, validity checks can be done, and then the correct address for the actual lock can be filled in. Subsequent lock operations incur no extra overhead since they do not "fault". This is merely one technique that can be used to support static initialization, while not adversely affecting the performance of lock acquisition. No doubt there are other techniques that are highly machine-dependent.

The locking overhead for machines doing out-of-line mutex allocation is thus similar for modules being implicitly initialized, where it is improved for those doing mutex allocation entirely inline. The inline case is thus made much faster, and the out-of-line case is not significantly worse.

Besides the issue of locking performance for such machines, a concern is raised that it is possible that threads would serialize contending for initialization locks when attempting to finish initializing statically allocated mutexes. (Such finishing would typically involve taking an internal lock, allocating a structure, storing a pointer to the structure in the mutex, and releasing the internal lock.) First, many implementations would reduce such serialization by hashing on the mutex address. Second, such serialization can only occur a bounded number of times. In

particular, it can happen at most as many times as there are statically allocated synchronization objects. Dynamically allocated objects would still be initialized via *pthread_mutex_init*( ) or *pthread_cond_init*( ).

Finally, if none of the above optimization techniques for out-of-line allocation yields sufficient performance for an application on some implementation, the application can avoid static initialization altogether by explicitly initializing all synchronization objects with the corresponding *pthread_*_init*( ) functions, which are supported by all implementations. An implementation can also document the tradeoffs and advise which initialization technique is more efficient for that particular implementation.

Destroying Mutexes

A mutex can be destroyed immediately after it is unlocked. For example, consider the following code:

```
struct obj {
pthread_mutex_t om;
    int refcnt;
    ...
};

obj_done(struct obj *op)
{
    pthread_mutex_lock(&op->om);
    if (--op->refcnt == 0) {
        pthread_mutex_unlock(&op->om);
(A)     pthread_mutex_destroy(&op->om);
(B)     free(op);
    } else
(C)     pthread_mutex_unlock(&op->om);
}
```

In this case *obj* is reference counted and *obj_done*( ) is called whenever a reference to the object is dropped. Implementations are required to allow an object to be destroyed and freed and potentially unmapped (for example, lines A and B) immediately after the object is unlocked (line C).

Robust Mutexes

Implementations are required to provide robust mutexes for mutexes with the process-shared attribute set to PTHREAD_PROCESS_SHARED. Implementations are allowed, but not required, to provide robust mutexes when the process-shared attribute is set to PTHREAD_PROCESS_PRIVATE.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_mutex_destroy*( ) and *pthread_mutex_init*( ) functions are marked as part of the Threads option.

The *pthread_mutex_timedlock*( ) function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1c #34 is applied, updating the DESCRIPTION.

The **restrict** keyword is added to the *pthread_mutex_init*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

The *pthread_mutex_destroy*( ) and *pthread_mutex_init*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized mutex or an uninitialized mutex attributes object is removed; this condition results in undefined behavior.

The [EBUSY] error for a locked mutex, a mutex that is referenced, or an already initialized mutex is removed; this condition results in undefined behavior.

NAME

pthread_mutex_getprioceiling, pthread_mutex_setprioceiling — get and set the priority ceiling of a mutex (**REALTIME THREADS**)

SYNOPSIS

RPP | TPP

```
#include <pthread.h>

int pthread_mutex_getprioceiling(const pthread_mutex_t *restrict mutex,
    int *restrict prioceiling);
int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,
    int prioceiling, int *restrict old_ceiling);
```

DESCRIPTION

The *pthread_mutex_getprioceiling*( ) function shall return the current priority ceiling of the mutex.

The *pthread_mutex_setprioceiling*( ) function shall attempt to lock the mutex as if by a call to *pthread_mutex_lock*( ), except that the process of locking the mutex need not adhere to the priority protect protocol. On acquiring the mutex it shall change the mutex's priority ceiling and then release the mutex as if by a call to *pthread_mutex_unlock*( ). When the change is successful, the previous value of the priority ceiling shall be returned in *old_ceiling*.

If the *pthread_mutex_setprioceiling*( ) function fails, the mutex priority ceiling shall not be changed.

RETURN VALUE

If successful, the *pthread_mutex_getprioceiling*( ) and *pthread_mutex_setprioceiling*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions shall fail if:

[EINVAL] The protocol attribute of *mutex* is PTHREAD_PRIO_NONE.

[EPERM] The implementation requires appropriate privileges to perform the operation and the caller does not have appropriate privileges.

The *pthread_mutex_setprioceiling*( ) function shall fail if:

[EAGAIN] The mutex could not be acquired because the maximum number of recursive locks for *mutex* has been exceeded.

[EDEADLK] The mutex type is PTHREAD_MUTEX_ERRORCHECK and the current thread already owns the mutex.

[EINVAL] The mutex was created with the protocol attribute having the value PTHREAD_PRIO_PROTECT and the calling thread's priority is higher than the mutex's current priority ceiling, and the implementation adheres to the priority protect protocol in the process of locking the mutex.

[ENOTRECOVERABLE] The mutex is a robust mutex and the state protected by the mutex is not recoverable.

[EOWNERDEAD] The mutex is a robust mutex and the process containing the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent (see *pthread_mutex_lock*( )).

The *pthread_mutex_setprioceiling*( ) function may fail if:

[EDEADLK] A deadlock condition was detected.

[EINVAL] The priority requested by *prioceiling* is out of range.

[EOWNERDEAD]
The mutex is a robust mutex and the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent (see *pthread_mutex_lock*( )).

These functions shall not return an error code of [EINTR].

```
52682
```
pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;
```

52683 **DESCRIPTION**

52684 Refer to *pthread_mutex_destroy( )*.

NAME

pthread_mutex_lock, pthread_mutex_trylock, pthread_mutex_unlock — lock and unlock a mutex

SYNOPSIS

```
#include <pthread.h>

int pthread_mutex_lock(pthread_mutex_t *mutex);
int pthread_mutex_trylock(pthread_mutex_t *mutex);
int pthread_mutex_unlock(pthread_mutex_t *mutex);
```

DESCRIPTION

The mutex object referenced by *mutex* shall be locked by calling *pthread_mutex_lock*( ). If the mutex is already locked, the calling thread shall block until the mutex becomes available. This operation shall return with the mutex object referenced by *mutex* in the locked state with the calling thread as its owner.

If the mutex type is PTHREAD_MUTEX_NORMAL, deadlock detection shall not be provided. Attempting to relock the mutex causes deadlock. If a thread attempts to unlock a mutex that it has not locked or a mutex which is unlocked, undefined behavior results.

If the mutex type is PTHREAD_MUTEX_ERRORCHECK, then error checking shall be provided. If a thread attempts to relock a mutex that it has already locked, an error shall be returned. If a thread attempts to unlock a mutex that it has not locked or a mutex which is unlocked, an error shall be returned.

If the mutex type is PTHREAD_MUTEX_RECURSIVE, then the mutex shall maintain the concept of a lock count. When a thread successfully acquires a mutex for the first time, the lock count shall be set to one. Every time a thread relocks this mutex, the lock count shall be incremented by one. Each time the thread unlocks the mutex, the lock count shall be decremented by one. When the lock count reaches zero, the mutex shall become available for other threads to acquire. If a thread attempts to unlock a mutex that it has not locked or a mutex which is unlocked, an error shall be returned.

If the mutex type is PTHREAD_MUTEX_DEFAULT, attempting to recursively lock the mutex results in undefined behavior. Attempting to unlock the mutex if it was not locked by the calling thread results in undefined behavior. Attempting to unlock the mutex if it is not locked results in undefined behavior.

The *pthread_mutex_trylock*( ) function shall be equivalent to *pthread_mutex_lock*( ), except that if the mutex object referenced by *mutex* is currently locked (by any thread, including the current thread), the call shall return immediately. If the mutex type is PTHREAD_MUTEX_RECURSIVE and the mutex is currently owned by the calling thread, the mutex lock count shall be incremented by one and the *pthread_mutex_trylock*( ) function shall immediately return success.

The *pthread_mutex_unlock*( ) function shall release the mutex object referenced by *mutex*. The manner in which a mutex is released is dependent upon the mutex's type attribute. If there are threads blocked on the mutex object referenced by *mutex* when *pthread_mutex_unlock*( ) is called, resulting in the mutex becoming available, the scheduling policy shall determine which thread shall acquire the mutex.

(In the case of PTHREAD_MUTEX_RECURSIVE mutexes, the mutex shall become available when the count reaches zero and the calling thread no longer has any locks on this mutex.)

If a signal is delivered to a thread waiting for a mutex, upon return from the signal handler the thread shall resume waiting for the mutex as if it was not interrupted.

If *mutex* is a robust mutex and the process containing the owning thread terminated while

holding the mutex lock, a call to *pthread_mutex_lock*( ) shall return the error value [EOWNERDEAD]. If *mutex* is a robust mutex and the owning thread terminated while holding the mutex lock, a call to *pthread_mutex_lock*( ) may return the error value [EOWNERDEAD] even if the process in which the owning thread resides has not terminated. In these cases, the mutex is locked by the thread but the state it protects is marked as inconsistent. The application should ensure that the state is made consistent for reuse and when that is complete call *pthread_mutex_consistent*( ). If the application is unable to recover the state, it should unlock the mutex without a prior call to *pthread_mutex_consistent*( ), after which the mutex is marked permanently unusable.

If *mutex* does not refer to an initialized mutex object, the behavior of *pthread_mutex_lock*( ), *pthread_mutex_trylock*( ), and *pthread_mutex_unlock*( ) is undefined.

RETURN VALUE

If successful, the *pthread_mutex_lock*( ) and *pthread_mutex_unlock*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

The *pthread_mutex_trylock*( ) function shall return zero if a lock on the mutex object referenced by *mutex* is acquired. Otherwise, an error number is returned to indicate the error.

ERRORS

The *pthread_mutex_lock*( ) and *pthread_mutex_trylock*( ) functions shall fail if:

[EAGAIN] The mutex could not be acquired because the maximum number of recursive locks for *mutex* has been exceeded.

RPP | TPP [EINVAL] The *mutex* was created with the protocol attribute having the value PTHREAD_PRIO_PROTECT and the calling thread's priority is higher than the mutex's current priority ceiling.

[ENOTRECOVERABLE]
The state protected by the mutex is not recoverable.

[EOWNERDEAD]
The mutex is a robust mutex and the process containing the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent.

The *pthread_mutex_lock*( ) function shall fail if:

[EDEADLK] The mutex type is PTHREAD_MUTEX_ERRORCHECK and the current thread already owns the mutex.

The *pthread_mutex_trylock*( ) function shall fail if:

[EBUSY] The *mutex* could not be acquired because it was already locked.

The *pthread_mutex_unlock*( ) function shall fail if:

[EPERM] The mutex type is PTHREAD_MUTEX_ERRORCHECK or the mutex is a robust mutex, and the current thread does not own the mutex.

The *pthread_mutex_lock*( ) and *pthread_mutex_trylock*( ) functions may fail if:

[EOWNERDEAD]
The mutex is a robust mutex and the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent.

The *pthread_mutex_lock*( ) function may fail if:

[EDEADLK] A deadlock condition was detected.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications that have assumed that non-zero return values are errors will need updating for use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If an application is supposed to work with normal and robust mutexes it should check all return values for error conditions and if necessary take appropriate action.

RATIONALE

Mutex objects are intended to serve as a low-level primitive from which other thread synchronization functions can be built. As such, the implementation of mutexes should be as efficient as possible, and this has ramifications on the features available at the interface.

The mutex functions and the particular default settings of the mutex attributes have been motivated by the desire to not preclude fast, inlined implementations of mutex locking and unlocking.

Since most attributes only need to be checked when a thread is going to be blocked, the use of attributes does not slow the (common) mutex-locking case.

Likewise, while being able to extract the thread ID of the owner of a mutex might be desirable, it would require storing the current thread ID when each mutex is locked, and this could incur unacceptable levels of overhead. Similar arguments apply to a *mutex_tryunlock* operation.

For further rationale on the extended mutex types, see XRAT Threads Extensions (on page 3573).

If an implementation detects that the value specified by the *mutex* argument does not refer to an initialized mutex object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

XBD Section 4.11 (on page 110), **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_mutex_lock*( ), *pthread_mutex_trylock*( ), and *pthread_mutex_unlock*( ) functions are marked as part of the Threads option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The behavior when attempting to relock a mutex is defined.

The *pthread_mutex_timedlock*( ) function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/98 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition. The RATIONALE section is also reworded to take into account non-XSI-conformant systems.

Issue 7

SD5-XSH-ERN-43 is applied, marking the "shall fail" case of the [EINVAL] error as dependent on the Thread Priority Protection option.

Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

The *pthread_mutex_lock*( ), *pthread_mutex_trylock*( ), and *pthread_mutex_unlock*( ) functions are moved from the Threads option to the Base.

The PTHREAD_MUTEX_NORMAL, PTHREAD_MUTEX_ERRORCHECK, PTHREAD_MUTEX_RECURSIVE, and PTHREAD_MUTEX_DEFAULT extended mutex types are moved from the XSI option to the Base.

The DESCRIPTION is updated to clarify the behavior when *mutex* does not refer to an initialized mutex.

The ERRORS section is updated to account properly for all of the various mutex types.

pthread_mutex_setprioceiling( )

52833 **NAME**

```
#include <pthread.h>

int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,
    int prioceiling, int *restrict old_ceiling);
```

52840 **DESCRIPTION**

52841 Refer to *pthread_mutex_getprioceiling( )*.

52842 **NAME**

52843 pthread_mutex_timedlock — lock a mutex

52844 **SYNOPSIS**

52845 ```
#include <pthread.h>
```
52846 ```
#include <time.h>
```

52847 ```
int pthread_mutex_timedlock(pthread_mutex_t *restrict mutex,
```
52848 ```
    const struct timespec *restrict abstime);
```

52849 **DESCRIPTION**

52850 The *pthread_mutex_timedlock*( ) function shall lock the mutex object referenced by *mutex*. If the
52851 mutex is already locked, the calling thread shall block until the mutex becomes available as in
52852 the *pthread_mutex_lock*( ) function. If the mutex cannot be locked without waiting for another
52853 thread to unlock the mutex, this wait shall be terminated when the specified timeout expires.

52854 The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the
52855 clock on which timeouts are based (that is, when the value of that clock equals or exceeds
52856 *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the
52857 call.

52858 The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall
52859 be the resolution of the clock on which it is based. The **timespec** data type is defined in the
52860 **<time.h>** header.

52861 Under no circumstance shall the function fail with a timeout if the mutex can be locked
52862 immediately. The validity of the *abstime* parameter need not be checked if the mutex can be
52863 locked immediately.

52864 RPI | TPI As a consequence of the priority inheritance rules (for mutexes initialized with the
52865 PRIO_INHERIT protocol), if a timed mutex wait is terminated because its timeout expires, the
52866 priority of the owner of the mutex shall be adjusted as necessary to reflect the fact that this
52867 thread is no longer among the threads waiting for the mutex.

52868 If *mutex* is a robust mutex and the process containing the owning thread terminated while
52869 holding the mutex lock, a call to *pthread_mutex_timedlock*( ) shall return the error value
52870 [EOWNERDEAD]. If *mutex* is a robust mutex and the owning thread terminated while holding
52871 the mutex lock, a call to *pthread_mutex_timedlock*( ) may return the error value [EOWNERDEAD]
52872 even if the process in which the owning thread resides has not terminated. In these cases, the
52873 mutex is locked by the thread but the state it protects is marked as inconsistent. The application
52874 should ensure that the state is made consistent for reuse and when that is complete call
52875 *pthread_mutex_consistent*( ). If the application is unable to recover the state, it should unlock the
52876 mutex without a prior call to *pthread_mutex_consistent*( ), after which the mutex is marked
52877 permanently unusable.

52878 If *mutex* does not refer to an initialized mutex object, the behavior is undefined.

52879 **RETURN VALUE**

52880 If successful, the *pthread_mutex_timedlock*( ) function shall return zero; otherwise, an error
52881 number shall be returned to indicate the error.

52882 **ERRORS**

52883 The *pthread_mutex_timedlock*( ) function shall fail if:

52884 [EAGAIN] The mutex could not be acquired because the maximum number of recursive
52885 locks for *mutex* has been exceeded.

[EDEADLK] The mutex type is PTHREAD_MUTEX_ERRORCHECK and the current thread already owns the mutex.

[EINVAL] The mutex was created with the protocol attribute having the value PTHREAD_PRIO_PROTECT and the calling thread's priority is higher than the mutex' current priority ceiling.

[EINVAL] The process or thread would have blocked, and the *abstime* parameter specified a nanoseconds field value less than zero or greater than or equal to 1 000 million.

[ENOTRECOVERABLE]
The state protected by the mutex is not recoverable.

[EOWNERDEAD]
The mutex is a robust mutex and the process containing the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent.

[ETIMEDOUT] The mutex could not be locked before the specified timeout expired.

The *pthread_mutex_timedlock*( ) function may fail if:

[EDEADLK] A deadlock condition was detected.

[EOWNERDEAD]
The mutex is a robust mutex and the previous owning thread terminated while holding the mutex lock. The mutex lock shall be acquired by the calling thread and it is up to the new owner to make the state consistent.

This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications that have assumed that non-zero return values are errors will need updating for use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If an application is supposed to work with normal and robust mutexes, it should check all return values for error conditions and if necessary take appropriate action.

RATIONALE

Refer to *pthread_mutex_lock*( ).

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/99 is applied, marking the last paragraph in the DESCRIPTION as part of the Thread Priority Inheritance option.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/100 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

The *pthread_mutex_timedlock*( ) function is moved from the Timeouts option to the Base.

Functionality relating to the Timers option is moved to the Base.

The DESCRIPTION is updated to clarify the behavior when *mutex* does not refer to an initialized mutex.

The ERRORS section is updated to account properly for all of the various mutex types.

pthread_mutex_trylock( )

52938 **NAME**

52939 pthread_mutex_trylock, pthread_mutex_unlock — lock and unlock a mutex

52940 **SYNOPSIS**

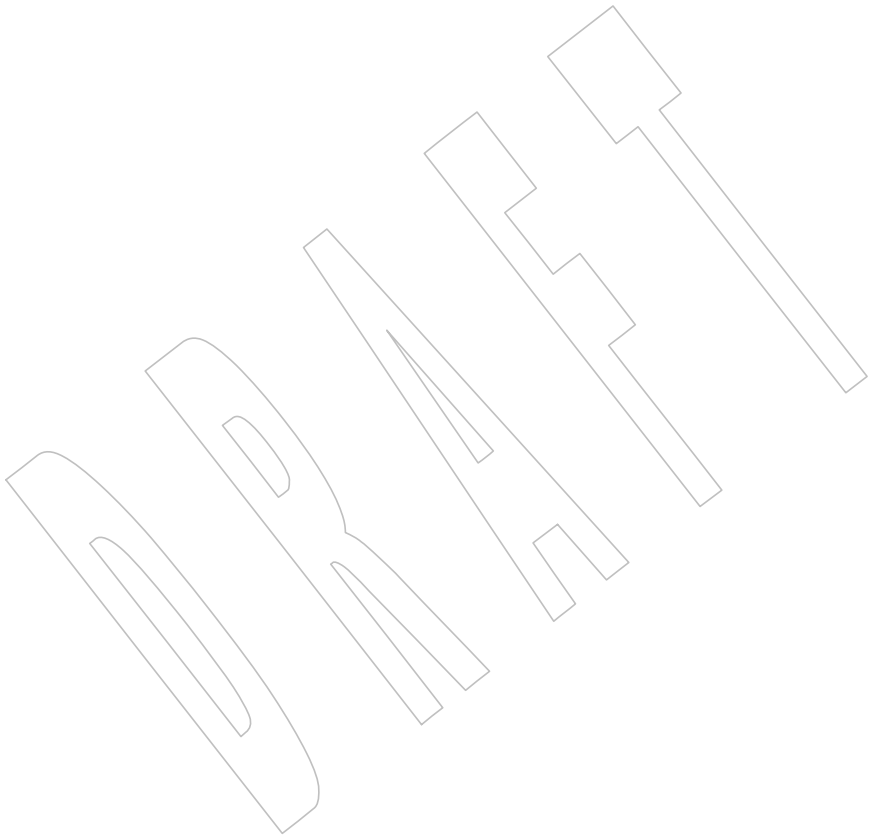
52941 `#include <pthread.h>`

52942 `int pthread_mutex_trylock(pthread_mutex_t *mutex);`

52943 `int pthread_mutex_unlock(pthread_mutex_t *mutex);`

52944 **DESCRIPTION**

52945 Refer to *pthread_mutex_lock( )*.



NAME

pthread_mutexattr_destroy, pthread_mutexattr_init — destroy and initialize the mutex attributes object

SYNOPSIS

```
#include <pthread.h>

int pthread_mutexattr_destroy(pthread_mutexattr_t *attr);
int pthread_mutexattr_init(pthread_mutexattr_t *attr);
```

DESCRIPTION

The *pthread_mutexattr_destroy*( ) function shall destroy a mutex attributes object; the object becomes, in effect, uninitialized. An implementation may cause *pthread_mutexattr_destroy*( ) to set the object referenced by *attr* to an invalid value.

A destroyed *attr* attributes object can be reinitialized using *pthread_mutexattr_init*( ); the results of otherwise referencing the object after it has been destroyed are undefined.

The *pthread_mutexattr_init*( ) function shall initialize a mutex attributes object *attr* with the default value for all of the attributes defined by the implementation.

Results are undefined if *pthread_mutexattr_init*( ) is called specifying an already initialized *attr* attributes object.

After a mutex attributes object has been used to initialize one or more mutexes, any function affecting the attributes object (including destruction) shall not affect any previously initialized mutexes.

The behavior is undefined if the value specified by the *attr* argument to *pthread_mutexattr_destroy*( ) does not refer to an initialized mutex attributes object.

RETURN VALUE

Upon successful completion, *pthread_mutexattr_destroy*( ) and *pthread_mutexattr_init*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_mutexattr_init*( ) function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the mutex attributes object.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_mutexattr_destroy*( ) does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

See *pthread_attr_destroy*( ) for a general explanation of attributes. Attributes objects allow implementations to experiment with useful extensions and permit extension of this volume of POSIX.1-200x without changing the existing functions. Thus, they provide for future extensibility of this volume of POSIX.1-200x and reduce the temptation to standardize prematurely on semantics that are not yet widely implemented or understood.

Examples of possible additional mutex attributes that have been discussed are *spin_only*, *limited_spin*, *no_spin*, *recursive*, and *metered*. (To explain what the latter attributes might mean:

recursive mutexes would allow for multiple re-locking by the current owner; metered mutexes would transparently keep records of queue length, wait time, and so on.) Since there is not yet wide agreement on the usefulness of these resulting from shared implementation and usage experience, they are not yet specified in this volume of POSIX.1-200x. Mutex attributes objects, however, make it possible to test out these concepts for possible standardization at a later time.

Mutex Attributes and Performance

Care has been taken to ensure that the default values of the mutex attributes have been defined such that mutexes initialized with the defaults have simple enough semantics so that the locking and unlocking can be done with the equivalent of a test-and-set instruction (plus possibly a few other basic instructions).

There is at least one implementation method that can be used to reduce the cost of testing at lock-time if a mutex has non-default attributes. One such method that an implementation can employ (and this can be made fully transparent to fully conforming POSIX applications) is to secretly pre-lock any mutexes that are initialized to non-default attributes. Any later attempt to lock such a mutex causes the implementation to branch to the "slow path" as if the mutex were unavailable; then, on the slow path, the implementation can do the "real work" to lock a non-default mutex. The underlying unlock operation is more complicated since the implementation never really wants to release the pre-lock on this kind of mutex. This illustrates that, depending on the hardware, there may be certain optimizations that can be used so that whatever mutex attributes are considered "most frequently used" can be processed most efficiently.

Process Shared Memory and Synchronization

The existence of memory mapping functions in this volume of POSIX.1-200x leads to the possibility that an application may allocate the synchronization objects from this section in memory that is accessed by multiple processes (and therefore, by threads of multiple processes).

In order to permit such usage, while at the same time keeping the usual case (that is, usage within a single process) efficient, a *process-shared* option has been defined.

If an implementation supports the _POSIX_THREAD_PROCESS_SHARED option, then the *process-shared* attribute can be used to indicate that mutexes or condition variables may be accessed by threads of multiple processes.

The default setting of PTHREAD_PROCESS_PRIVATE has been chosen for the *process-shared* attribute so that the most efficient forms of these synchronization objects are created by default.

Synchronization variables that are initialized with the PTHREAD_PROCESS_PRIVATE *process-shared* attribute may only be operated on by threads in the process that initialized them. Synchronization variables that are initialized with the PTHREAD_PROCESS_SHARED *process-shared* attribute may be operated on by any thread in any process that has access to it. In particular, these processes may exist beyond the lifetime of the initializing process. For example, the following code implements a simple counting semaphore in a mapped file that may be used by many processes.

```
/* sem.h */
struct semaphore {
    pthread_mutex_t lock;
    pthread_cond_t nonzero;
    unsigned count;
};
typedef struct semaphore semaphore_t;
```

```
53035        semaphore_t *semaphore_create(char *semaphore_name);
53036        semaphore_t *semaphore_open(char *semaphore_name);
53037        void semaphore_post(semaphore_t *semap);
53038        void semaphore_wait(semaphore_t *semap);
53039        void semaphore_close(semaphore_t *semap);

53040        /* sem.c */
53041        #include <sys/types.h>
53042        #include <sys/stat.h>
53043        #include <sys/mman.h>
53044        #include <fcntl.h>
53045        #include <pthread.h>
53046        #include "sem.h"

53047        semaphore_t *
53048        semaphore_create(char *semaphore_name)
53049        {
53050        int fd;
53051            semaphore_t *semap;
53052            pthread_mutexattr_t psharedm;
53053            pthread_condattr_t psharedc;

53054            fd = open(semaphore_name, O_RDWR | O_CREAT | O_EXCL, 0666);
53055            if (fd < 0)
53056                return (NULL);
53057            (void) ftruncate(fd, sizeof(semaphore_t));
53058            (void) pthread_mutexattr_init(&psharedm);
53059            (void) pthread_mutexattr_setpshared(&psharedm,
53060                PTHREAD_PROCESS_SHARED);
53061            (void) pthread_condattr_init(&psharedc);
53062            (void) pthread_condattr_setpshared(&psharedc,
53063                PTHREAD_PROCESS_SHARED);
53064            semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
53065                    PROT_READ | PROT_WRITE, MAP_SHARED,
53066                    fd, 0);
53067            close (fd);
53068            (void) pthread_mutex_init(&semap->lock, &psharedm);
53069            (void) pthread_cond_init(&semap->nonzero, &psharedc);
53070            semap->count = 0;
53071            return (semap);
53072        }

53073        semaphore_t *
53074        semaphore_open(char *semaphore_name)
53075        {
53076            int fd;
53077            semaphore_t *semap;

53078            fd = open(semaphore_name, O_RDWR, 0666);
53079            if (fd < 0)
53080                return (NULL);
53081            semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
53082                    PROT_READ | PROT_WRITE, MAP_SHARED,
53083                    fd, 0);
```

```
        close (fd);
        return (semap);
    }

    void
    semaphore_post(semaphore_t *semap)
    {
        pthread_mutex_lock(&semap->lock);
        if (semap->count == 0)
            pthread_cond_signal(&semapx->nonzero);
        semap->count++;
        pthread_mutex_unlock(&semap->lock);
    }

    void
    semaphore_wait(semaphore_t *semap)
    {
        pthread_mutex_lock(&semap->lock);
        while (semap->count == 0)
            pthread_cond_wait(&semap->nonzero, &semap->lock);
        semap->count--;
        pthread_mutex_unlock(&semap->lock);
    }

    void
    semaphore_close(semaphore_t *semap)
    {
        munmap((void *) semap, sizeof(semaphore_t));
    }
```

The following code is for three separate processes that create, post, and wait on a semaphore in the file **/tmp/semaphore**. Once the file is created, the post and wait programs increment and decrement the counting semaphore (waiting and waking as required) even though they did not initialize the semaphore.

```
    /* create.c */
    #include "pthread.h"
    #include "sem.h"

    int
    main()
    {
        semaphore_t *semap;

        semap = semaphore_create("/tmp/semaphore");
        if (semap == NULL)
            exit(1);
        semaphore_close(semap);
        return (0);
    }

    /* post */
    #include "pthread.h"
    #include "sem.h"

    int
```

```
53131       main()
53132       {
53133           semaphore_t *semap;
53134           semap = semaphore_open("/tmp/semaphore");
53135           if (semap == NULL)
53136               exit(1);
53137           semaphore_post(semap);
53138           semaphore_close(semap);
53139           return (0);
53140       }
53141       /* wait */
53142       #include "pthread.h"
53143       #include "sem.h"
53144       int
53145       main()
53146       {
53147           semaphore_t *semap;
53148           semap = semaphore_open("/tmp/semaphore");
53149           if (semap == NULL)
53150               exit(1);
53151           semaphore_wait(semap);
53152           semaphore_close(semap);
53153           return (0);
53154       }
```

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_mutexattr_destroy*( ) and *pthread_mutexattr_init*( ) functions are marked as part of the Threads option.

IEEE PASC Interpretation 1003.1c #27 is applied, updating the ERRORS section.

Issue 7

The *pthread_mutexattr_destroy*( ) and *pthread_mutexattr_init*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition results in undefined behavior.

NAME

pthread_mutexattr_getprioceiling, pthread_mutexattr_setprioceiling — get and set the prioceiling attribute of the mutex attributes object (**REALTIME THREADS**)

SYNOPSIS

RPP | TPP

```
#include <pthread.h>

int pthread_mutexattr_getprioceiling(const pthread_mutexattr_t
    *restrict attr, int *restrict prioceiling);
int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr,
    int prioceiling);
```

DESCRIPTION

The *pthread_mutexattr_getprioceiling*( ) and *pthread_mutexattr_setprioceiling*( ) functions, respectively, shall get and set the priority ceiling attribute of a mutex attributes object pointed to by *attr* which was previously created by the function *pthread_mutexattr_init*( ).

The *prioceiling* attribute contains the priority ceiling of initialized mutexes. The values of *prioceiling* are within the maximum range of priorities defined by SCHED_FIFO.

The *prioceiling* attribute defines the priority ceiling of initialized mutexes, which is the minimum priority level at which the critical section guarded by the mutex is executed. In order to avoid priority inversion, the priority ceiling of the mutex shall be set to a priority higher than or equal to the highest priority of all the threads that may lock that mutex. The values of *prioceiling* are within the maximum range of priorities defined under the SCHED_FIFO scheduling policy.

The behavior is undefined if the value specified by the *attr* argument to *pthread_mutexattr_getprioceiling*( ) or *pthread_mutexattr_setprioceiling*( ) does not refer to an initialized mutex attributes object.

RETURN VALUE

Upon successful completion, the *pthread_mutexattr_getprioceiling*( ) and *pthread_mutexattr_setprioceiling*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EINVAL] The value specified by *prioceiling* is invalid.

[EPERM] The caller does not have the privilege to perform the operation.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_mutexattr_getprioceiling*( ) or *pthread_mutexattr_setprioceiling*( ) does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Marked as part of the Realtime Threads Feature Group.

Issue 6

The *pthread_mutexattr_getprioceiling( )* and *pthread_mutexattr_setprioceiling( )* functions are marked as part of the Threads and Thread Priority Protection options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Priority Protection option.

The [ENOTSUP] error condition has been removed since these functions do not have a *protocol* argument.

The **restrict** keyword is added to the *pthread_mutexattr_getprioceiling( )* prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

The *pthread_mutexattr_getprioceiling( )* and *pthread_mutexattr_setprioceiling( )* functions are moved from the Threads option to require support of either the Robust Mutex Priority Protection option or the Non-Robust Mutex Priority Protection option.

The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition results in undefined behavior.

NAME

pthread_mutexattr_getprotocol, pthread_mutexattr_setprotocol — get and set the protocol attribute of the mutex attributes object (**REALTIME THREADS**)

SYNOPSIS

MC1
```
#include <pthread.h>

int pthread_mutexattr_getprotocol(const pthread_mutexattr_t
    *restrict attr, int *restrict protocol);
int pthread_mutexattr_setprotocol(pthread_mutexattr_t *attr,
    int protocol);
```

DESCRIPTION

The *pthread_mutexattr_getprotocol*( ) and *pthread_mutexattr_setprotocol*( ) functions, respectively, shall get and set the protocol attribute of a mutex attributes object pointed to by *attr* which was previously created by the function *pthread_mutexattr_init*( ).

The *protocol* attribute defines the protocol to be followed in utilizing mutexes. The value of *protocol* may be one of:

RPI | TPI PTHREAD_PRIO_INHERIT
MC1 PTHREAD_PRIO_NONE
RPP | TPP PTHREAD_PRIO_PROTECT

which are defined in the **<pthread.h>** header. The default value of the attribute shall be PTHREAD_PRIO_NONE.

When a thread owns a mutex with the PTHREAD_PRIO_NONE *protocol* attribute, its priority and scheduling shall not be affected by its mutex ownership.

RPI When a thread is blocking higher priority threads because of owning one or more robust mutexes with the PTHREAD_PRIO_INHERIT *protocol* attribute, it shall execute at the higher of its priority or the priority of the highest priority thread waiting on any of the robust mutexes owned by this thread and initialized with this protocol.

TPI When a thread is blocking higher priority threads because of owning one or more non-robust mutexes with the PTHREAD_PRIO_INHERIT *protocol* attribute, it shall execute at the higher of its priority or the priority of the highest priority thread waiting on any of the non-robust mutexes owned by this thread and initialized with this protocol.

RPP When a thread owns one or more robust mutexes initialized with the PTHREAD_PRIO_PROTECT protocol, it shall execute at the higher of its priority or the highest of the priority ceilings of all the robust mutexes owned by this thread and initialized with this attribute, regardless of whether other threads are blocked on any of these robust mutexes or not.

TPP When a thread owns one or more non-robust mutexes initialized with the PTHREAD_PRIO_PROTECT protocol, it shall execute at the higher of its priority or the highest of the priority ceilings of all the non-robust mutexes owned by this thread and initialized with this attribute, regardless of whether other threads are blocked on any of these non-robust mutexes or not.

While a thread is holding a mutex which has been initialized with the PTHREAD_PRIO_INHERIT or PTHREAD_PRIO_PROTECT protocol attributes, it shall not be subject to being moved to the tail of the scheduling queue at its priority in the event that its original priority is changed, such as by a call to *sched_setparam*( ). Likewise, when a thread

unlocks a mutex that has been initialized with the PTHREAD_PRIO_INHERIT or PTHREAD_PRIO_PROTECT protocol attributes, it shall not be subject to being moved to the tail of the scheduling queue at its priority in the event that its original priority is changed.

If a thread simultaneously owns several mutexes initialized with different protocols, it shall execute at the highest of the priorities that it would have obtained by each of these protocols.

RPI | TPI When a thread makes a call to *pthread_mutex_lock*( ), the mutex was initialized with the protocol attribute having the value PTHREAD_PRIO_INHERIT, when the calling thread is blocked because the mutex is owned by another thread, that owner thread shall inherit the priority level of the calling thread as long as it continues to own the mutex. The implementation shall update its execution priority to the maximum of its assigned priority and all its inherited priorities. Furthermore, if this owner thread itself becomes blocked on another mutex with the *protocol* attribute having the value PTHREAD_PRIO_INHERIT, the same priority inheritance effect shall be propagated to this other owner thread, in a recursive manner.

The behavior is undefined if the value specified by the *attr* argument to *pthread_mutexattr_getprotocol*( ) or *pthread_mutexattr_setprotocol*( ) does not refer to an initialized mutex attributes object.

RETURN VALUE

Upon successful completion, the *pthread_mutexattr_getprotocol*( ) and *pthread_mutexattr_setprotocol*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_mutexattr_setprotocol*( ) function shall fail if:

[ENOTSUP] The value specified by *protocol* is an unsupported value.

The *pthread_mutexattr_getprotocol*( ) and *pthread_mutexattr_setprotocol*( ) functions may fail if:

[EINVAL] The value specified by *protocol* is invalid.

[EPERM] The caller does not have the privilege to perform the operation.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_mutexattr_getprotocol*( ) or *pthread_mutexattr_setprotocol*( ) does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Marked as part of the Realtime Threads Feature Group.

Issue 6

The *pthread_mutexattr_getprotocol*( ) and *pthread_mutexattr_setprotocol*( ) functions are marked as part of the Threads option and either the Thread Priority Protection or Thread Priority Inheritance options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Priority Protection or Thread Priority Inheritance options.

The **restrict** keyword is added to the *pthread_mutexattr_getprotocol*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

SD5-XSH-ERN-135 is applied, updating the DESCRIPTION to define a default value for the *protocol* attribute.

SD5-XSH-ERN-188 is applied, updating the DESCRIPTION.

The *pthread_mutexattr_getprotocol*( ) and *pthread_mutexattr_setprotocol*( ) functions are moved from the Threads option to require support of either the Non-Robust Mutex Priority Protection option or the Non-Robust Mutex Priority Inheritance option or the Robust Mutex Priority Protection option or the Robust Mutex Priority Inheritance option.

The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition results in undefined behavior.

NAME

pthread_mutexattr_getpshared, pthread_mutexattr_setpshared — get and set the process-shared attribute

SYNOPSIS

TSH

```
#include <pthread.h>

int pthread_mutexattr_getpshared(const pthread_mutexattr_t
    *restrict attr, int *restrict pshared);
int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr,
    int pshared);
```

DESCRIPTION

The *pthread_mutexattr_getpshared*( ) function shall obtain the value of the *process-shared* attribute from the attributes object referenced by *attr*.

The *pthread_mutexattr_setpshared*( ) function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

The *process-shared* attribute is set to PTHREAD_PROCESS_SHARED to permit a mutex to be operated upon by any thread that has access to the memory where the mutex is allocated, even if the mutex is allocated in memory that is shared by multiple processes. If the *process-shared* attribute is PTHREAD_PROCESS_PRIVATE, the mutex shall only be operated upon by threads created within the same process as the thread that initialized the mutex; if threads of differing processes attempt to operate on such a mutex, the behavior is undefined. The default value of the attribute shall be PTHREAD_PROCESS_PRIVATE.

The behavior is undefined if the value specified by the *attr* argument to *pthread_mutexattr_getpshared*( ) or *pthread_mutexattr_setpshared*( ) does not refer to an initialized mutex attributes object.

RETURN VALUE

Upon successful completion, *pthread_mutexattr_setpshared*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, *pthread_mutexattr_getpshared*( ) shall return zero and store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_mutexattr_setpshared*( ) function may fail if:

[EINVAL] The new value specified for the attribute is outside the range of legal values for that attribute.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_mutexattr_getpshared*( ) or *pthread_mutexattr_setpshared*( ) does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

The [EINVAL] error for an uninitialized mutex attributes object is removed; this condition results in undefined behavior.

NAME

pthread_mutexattr_getrobust, pthread_mutexattr_setrobust — get and set the mutex robust attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_mutexattr_getrobust(const pthread_mutexattr_t *restrict
    attr, int *restrict robust);
int pthread_mutexattr_setrobust(pthread_mutexattr_t *attr,
    int robust);
```

DESCRIPTION

The *pthread_mutexattr_getrobust*( ) and *pthread_mutexattr_setrobust*( ) functions, respectively, shall get and set the mutex *robust* attribute. This attribute is set in the *robust* parameter. Valid values for *robust* include:

PTHREAD_MUTEX_STALLED
: No special actions are taken if the owner of the mutex is terminated while holding the mutex lock. This can lead to deadlocks if no other thread can unlock the mutex.
This is the default value.

PTHREAD_MUTEX_ROBUST
: If the process containing the owning thread of a robust mutex terminates while holding the mutex lock, the next thread that acquires the mutex shall be notified about the termination by the return value [EOWNERDEAD] from the locking function. If the owning thread of a robust mutex terminates while holding the mutex lock, the next thread that acquires the mutex may be notified about the termination by the return value [EOWNERDEAD]. The notified thread can then attempt to mark the state protected by the mutex as consistent again by a call to *pthread_mutex_consistent*( ). After a subsequent successful call to *pthread_mutex_unlock*( ), the mutex lock shall be released and can be used normally by other threads. If the mutex is unlocked without a call to *pthread_mutex_consistent*( ), it shall be in a permanently unusable state and all attempts to lock the mutex shall fail with the error [ENOTRECOVERABLE]. The only permissible operation on such a mutex is *pthread_mutex_destroy*( ).

The behavior is undefined if the value specified by the *attr* argument to *pthread_mutexattr_getrobust*( ) or *pthread_mutexattr_setrobust*( ) does not refer to an initialized mutex attributes object.

RETURN VALUE

Upon successful completion, the *pthread_mutexattr_getrobust*( ) function shall return zero and store the value of the *robust* attribute of *attr* into the object referenced by the *robust* parameter. Otherwise, an error value shall be returned to indicate the error. If successful, the *pthread_mutexattr_setrobust*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_mutexattr_setrobust*( ) function shall fail if:

[EINVAL] The value of *robust* is invalid.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

The actions required to make the state protected by the mutex consistent again are solely dependent on the application. If it is not possible to make the state of a mutex consistent, robust mutexes can be used to notify this situation by calling *pthread_mutex_unlock*( ) without a prior call to *pthread_mutex_consistent*( ).

If the state is declared inconsistent by calling *pthread_mutex_unlock*( ) without a prior call to *pthread_mutex_consistent*( ), a possible approach could be to destroy the mutex and then reinitialize it. However, it should be noted that this is possible only in certain situations where the state protected by the mutex has to be reinitialized and coordination achieved with other threads blocked on the mutex, because otherwise a call to a locking function with a reference to a mutex object invalidated by a call to *pthread_mutex_destroy*( ) results in undefined behavior.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_mutexattr_getrobust*( ) or *pthread_mutexattr_setrobust*( ) does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 7.

NAME

pthread_mutexattr_gettype, pthread_mutexattr_settype — get and set the mutex type attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_mutexattr_gettype(const pthread_mutexattr_t *restrict attr,
    int *restrict type);
int pthread_mutexattr_settype(pthread_mutexattr_t *attr, int type);
```

DESCRIPTION

The *pthread_mutexattr_gettype*( ) and *pthread_mutexattr_settype*( ) functions, respectively, shall get and set the mutex *type* attribute. This attribute is set in the *type* parameter to these functions. The default value of the *type* attribute is PTHREAD_MUTEX_DEFAULT.

The type of mutex is contained in the *type* attribute of the mutex attributes. Valid mutex types include:

PTHREAD_MUTEX_NORMAL
: This type of mutex does not detect deadlock. A thread attempting to relock this mutex without first unlocking it shall deadlock. Attempting to unlock a mutex locked by a different thread results in undefined behavior. Attempting to unlock an unlocked mutex results in undefined behavior.

PTHREAD_MUTEX_ERRORCHECK
: This type of mutex provides error checking. A thread attempting to relock this mutex without first unlocking it shall return with an error. A thread attempting to unlock a mutex which another thread has locked shall return with an error. A thread attempting to unlock an unlocked mutex shall return with an error.

PTHREAD_MUTEX_RECURSIVE
: A thread attempting to relock this mutex without first unlocking it shall succeed in locking the mutex. The relocking deadlock which can occur with mutexes of type PTHREAD_MUTEX_NORMAL cannot occur with this type of mutex. Multiple locks of this mutex shall require the same number of unlocks to release the mutex before another thread can acquire the mutex. A thread attempting to unlock a mutex which another thread has locked shall return with an error. A thread attempting to unlock an unlocked mutex shall return with an error.

PTHREAD_MUTEX_DEFAULT
: Attempting to recursively lock a mutex of this type results in undefined behavior. Attempting to unlock a mutex of this type which was not locked by the calling thread results in undefined behavior. Attempting to unlock a mutex of this type which is not locked results in undefined behavior. An implementation may map this mutex to one of the other mutex types.

The behavior is undefined if the value specified by the *attr* argument to *pthread_mutexattr_gettype*( ) or *pthread_mutexattr_settype*( ) does not refer to an initialized mutex attributes object.

RETURN VALUE

Upon successful completion, the *pthread_mutexattr_gettype*( ) function shall return zero and store the value of the *type* attribute of *attr* into the object referenced by the *type* parameter. Otherwise, an error shall be returned to indicate the error.

If successful, the *pthread_mutexattr_settype*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_mutexattr_settype*( ) function shall fail if:

[EINVAL] The value *type* is invalid.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

It is advised that an application should not use a PTHREAD_MUTEX_RECURSIVE mutex with condition variables because the implicit unlock performed for a *pthread_cond_timedwait*( ) or *pthread_cond_wait*( ) may not actually release the mutex (if it had been locked multiple times). If this happens, no other thread can satisfy the condition of the predicate.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_mutexattr_gettype*( ) or *pthread_mutexattr_settype*( ) does not refer to an initialized mutex attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

NAME

pthread_once — dynamic package initialization

SYNOPSIS

```
#include <pthread.h>

int pthread_once(pthread_once_t *once_control,
    void (*init_routine)(void));
pthread_once_t once_control = PTHREAD_ONCE_INIT;
```

DESCRIPTION

The first call to *pthread_once*( ) by any thread in a process, with a given *once_control*, shall call the *init_routine* with no arguments. Subsequent calls of *pthread_once*( ) with the same *once_control* shall not call the *init_routine*. On return from *pthread_once*( ), *init_routine* shall have completed. The *once_control* parameter shall determine whether the associated initialization routine has been called.

The *pthread_once*( ) function is not a cancellation point. However, if *init_routine* is a cancellation point and is canceled, the effect on *once_control* shall be as if *pthread_once*( ) was never called.

The constant PTHREAD_ONCE_INIT is defined in the **<pthread.h>** header.

The behavior of *pthread_once*( ) is undefined if *once_control* has automatic storage duration or is not initialized by PTHREAD_ONCE_INIT.

RETURN VALUE

Upon successful completion, *pthread_once*( ) shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_once*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Some C libraries are designed for dynamic initialization. That is, the global initialization for the library is performed when the first procedure in the library is called. In a single-threaded program, this is normally implemented using a static variable whose value is checked on entry to a routine, as follows:

```
static int random_is_initialized = 0;
extern int initialize_random();

int random_function()
{
    if (random_is_initialized == 0) {
        initialize_random();
        random_is_initialized = 1;
    }
    ... /* Operations performed after initialization. */
}
```

To keep the same structure in a multi-threaded program, a new primitive is needed. Otherwise, library initialization has to be accomplished by an explicit call to a library-exported initialization function prior to any use of the library.

For dynamic library initialization in a multi-threaded process, a simple initialization flag is not sufficient; the flag needs to be protected against modification by multiple threads simultaneously calling into the library. Protecting the flag requires the use of a mutex; however, mutexes have to be initialized before they are used. Ensuring that the mutex is only initialized once requires a recursive solution to this problem.

The use of *pthread_once*( ) not only supplies an implementation-guaranteed means of dynamic initialization, it provides an aid to the reliable construction of multi-threaded and realtime systems. The preceding example then becomes:

```
#include <pthread.h>
static pthread_once_t random_is_initialized = PTHREAD_ONCE_INIT;
extern int initialize_random();

int random_function()
{
    (void) pthread_once(&random_is_initialized, initialize_random);
    ... /* Operations performed after initialization. */
}
```

Note that a **pthread_once_t** cannot be an array because some compilers do not accept the construct **&<array_name>**.

If an implementation detects that the value specified by the *once_control* argument to *pthread_once*( ) does not refer to a **pthread_once_t** object initialized by PTHREAD_ONCE_INIT, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

SEE ALSO

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_once*( ) function is marked as part of the Threads option.

The [EINVAL] error is added as a “may fail” case for if either argument is invalid.

Issue 7

The *pthread_once*( ) function is moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized **pthread_once_t** object is removed; this condition results in undefined behavior.

NAME

pthread_rwlock_destroy, pthread_rwlock_init — destroy and initialize a read-write lock object

SYNOPSIS

```
#include <pthread.h>

int pthread_rwlock_destroy(pthread_rwlock_t *rwlock,
int pthread_rwlock_init(pthread_rwlock_t *restrict rwlock,
    const pthread_rwlockattr_t *restrict attr);
XSI pthread_rwlock_t rwlock = PTHREAD_RWLOCK_INITIALIZER;
```

DESCRIPTION

The *pthread_rwlock_destroy*( ) function shall destroy the read-write lock object referenced by *rwlock* and release any resources used by the lock. The effect of subsequent use of the lock is undefined until the lock is reinitialized by another call to *pthread_rwlock_init*( ). An implementation may cause *pthread_rwlock_destroy*( ) to set the object referenced by *rwlock* to an invalid value. Results are undefined if *pthread_rwlock_destroy*( ) is called when any thread holds *rwlock*. Attempting to destroy an uninitialized read-write lock results in undefined behavior.

The *pthread_rwlock_init*( ) function shall allocate any resources required to use the read-write lock referenced by *rwlock* and initializes the lock to an unlocked state with attributes referenced by *attr*. If *attr* is NULL, the default read-write lock attributes shall be used; the effect is the same as passing the address of a default read-write lock attributes object. Once initialized, the lock can be used any number of times without being reinitialized. Results are undefined if *pthread_rwlock_init*( ) is called specifying an already initialized read-write lock. Results are undefined if a read-write lock is used without first being initialized.

If the *pthread_rwlock_init*( ) function fails, *rwlock* shall not be initialized and the contents of *rwlock* are undefined.

Only the object referenced by *rwlock* may be used for performing synchronization. The result of referring to copies of that object in calls to *pthread_rwlock_destroy*( ), *pthread_rwlock_rdlock*( ), *pthread_rwlock_timedrdlock*( ), *pthread_rwlock_timedwrlock*( ), *pthread_rwlock_tryrdlock*( ), *pthread_rwlock_trywrlock*( ), *pthread_rwlock_unlock*( ), or *pthread_rwlock_wrlock*( ) is undefined.

XSI In cases where default read-write lock attributes are appropriate, the macro PTHREAD_RWLOCK_INITIALIZER can be used to initialize read-write locks that are statically allocated. The effect shall be equivalent to dynamic initialization by a call to *pthread_rwlock_init*( ) with the *attr* parameter specified as NULL, except that no error checks are performed.

The behavior is undefined if the value specified by the *attr* argument to *pthread_rwlock_init*( ) does not refer to an initialized read-write lock attributes object.

RETURN VALUE

If successful, the *pthread_rwlock_destroy*( ) and *pthread_rwlock_init*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_rwlock_init*( ) function shall fail if:

[EAGAIN] The system lacked the necessary resources (other than memory) to initialize another read-write lock.

[ENOMEM] Insufficient memory exists to initialize the read-write lock.

[EPERM] The caller does not have the privilege to perform the operation.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using these and related read-write lock functions may be subject to priority inversion, as discussed in XBD Section 3.285 (on page 79).

RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_destroy*( ) does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *attr* argument to *pthread_rwlockr_init*( ) does not refer to an initialized read-write lock attributes object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_destroy*( ) or *pthread_rwlock_init*( ) refers to a locked read-write lock object, or detects that the value specified by the *rwlock* argument to *pthread_rwlock_init*( ) refers to an already initialized read-write lock object, it is recommended that the function should fail and report an [EBUSY] error.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_rwlock_rdlock( ), *pthread_rwlock_timedrdlock*( ), *pthread_rwlock_timedwrlock*( ), *pthread_rwlock_trywrlock*( ), *pthread_rwlock_unlock*( )

XBD Section 3.285 (on page 79), **<pthread.h>**

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension). The initializer macro is also deleted from the SYNOPSIS.
- The DESCRIPTION is updated as follows:
  - — It explicitly notes allocation of resources upon initialization of a read-write lock object.
  - — A paragraph is added specifying that copies of read-write lock objects may not be used.
- An [EINVAL] error is added to the ERRORS section for *pthread_rwlock_init*( ), indicating that the *rwlock* value is invalid.
- The SEE ALSO section is updated.

The **restrict** keyword is added to the *pthread_rwlock_init*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/45 is applied, adding APPLICATION USAGE relating to priority inversion.

Issue 7

Austin Group Interpretation 1003.1-2001 #048 is applied, adding the PTHREAD_RWLOCK_INITIALIZER macro.

The *pthread_rwlock_destroy*( ) and *pthread_rwlock_init*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized read-write lock object or read-write lock attributes object is removed; this condition results in undefined behavior.

The [EBUSY] error for a locked read-write lock object or an already initialized read-write lock object is removed; this condition results in undefined behavior.

NAME

pthread_rwlock_rdlock, pthread_rwlock_tryrdlock — lock a read-write lock object for reading

SYNOPSIS

```
#include <pthread.h>

int pthread_rwlock_rdlock(pthread_rwlock_t *rwlock);
int pthread_rwlock_tryrdlock(pthread_rwlock_t *rwlock);
```

DESCRIPTION

The *pthread_rwlock_rdlock*( ) function shall apply a read lock to the read-write lock referenced by *rwlock*. The calling thread acquires the read lock if a writer does not hold the lock and there are no writers blocked on the lock.

TPS If the Thread Execution Scheduling option is supported, and the threads involved in the lock are executing with the scheduling policies SCHED_FIFO or SCHED_RR, the calling thread shall not acquire the lock if a writer holds the lock or if writers of higher or equal priority are blocked on the lock; otherwise, the calling thread shall acquire the lock.

TPS TSP If the Thread Execution Scheduling option is supported, and the threads involved in the lock are executing with the SCHED_SPORADIC scheduling policy, the calling thread shall not acquire the lock if a writer holds the lock or if writers of higher or equal priority are blocked on the lock; otherwise, the calling thread shall acquire the lock.

If the Thread Execution Scheduling option is not supported, it is implementation-defined whether the calling thread acquires the lock when a writer does not hold the lock and there are writers blocked on the lock. If a writer holds the lock, the calling thread shall not acquire the read lock. If the read lock is not acquired, the calling thread shall block until it can acquire the lock. The calling thread may deadlock if at the time the call is made it holds a write lock.

A thread may hold multiple concurrent read locks on *rwlock* (that is, successfully call the *pthread_rwlock_rdlock*( ) function *n* times). If so, the application shall ensure that the thread performs matching unlocks (that is, it calls the *pthread_rwlock_unlock*( ) function *n* times).

The maximum number of simultaneous read locks that an implementation guarantees can be applied to a read-write lock shall be implementation-defined. The *pthread_rwlock_rdlock*( ) function may fail if this maximum would be exceeded.

The *pthread_rwlock_tryrdlock*( ) function shall apply a read lock as in the *pthread_rwlock_rdlock*( ) function, with the exception that the function shall fail if the equivalent *pthread_rwlock_rdlock*( ) call would have blocked the calling thread. In no case shall the *pthread_rwlock_tryrdlock*( ) function ever block; it always either acquires the lock or fails and returns immediately.

Results are undefined if any of these functions are called with an uninitialized read-write lock.

If a signal is delivered to a thread waiting for a read-write lock for reading, upon return from the signal handler the thread resumes waiting for the read-write lock for reading as if it was not interrupted.

RETURN VALUE

If successful, the *pthread_rwlock_rdlock*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

The *pthread_rwlock_tryrdlock*( ) function shall return zero if the lock for reading on the read-write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to indicate the error.

53815 **ERRORS**

53816 The *pthread_rwlock_tryrdlock*( ) function shall fail if:

53817 [EBUSY] The read-write lock could not be acquired for reading because a writer holds
53818 the lock or a writer with the appropriate priority was blocked on it.

53819 The *pthread_rwlock_rdlock*( ) and *pthread_rwlock_tryrdlock*( ) functions may fail if:

53820 [EAGAIN] The read lock could not be acquired because the maximum number of read
53821 locks for *rwlock* has been exceeded.

53822 The *pthread_rwlock_rdlock*( ) function may fail if:

53823 [EDEADLK] A deadlock condition was detected or the current thread already owns the
53824 read-write lock for writing.

53825 These functions shall not return an error code of [EINTR].

53826 **EXAMPLES**

53827 None.

53828 **APPLICATION USAGE**

53829 Applications using these functions may be subject to priority inversion, as discussed in XBD
53830 Section 3.285 (on page 79).

53831 **RATIONALE**

53832 If an implementation detects that the value specified by the *rwlock* argument to
53833 *pthread_rwlock_rdlock*( ) or *pthread_rwlock_tryrdlock*( ) does not refer to an initialized read-write
53834 lock object, it is recommended that the function should fail and report an [EINVAL] error.

53835 **FUTURE DIRECTIONS**

53836 None.

53837 **SEE ALSO**

53838 *pthread_rwlock_destroy*( ), *pthread_rwlock_timedrdlock*( ), *pthread_rwlock_timedwrlock*( ),
53839 *pthread_rwlock_trywrlock*( ), *pthread_rwlock_unlock*( )

53840 XBD Section 3.285 (on page 79), Section 4.11 (on page 110), **<pthread.h>**

53841 **CHANGE HISTORY**

53842 First released in Issue 5.

53843 **Issue 6**

53844 The following changes are made for alignment with IEEE Std 1003.1j-2000:

53845 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is
53846 now part of the Threads option (previously it was part of the Read-Write Locks option in
53847 IEEE Std 1003.1j-2000 and also part of the XSI extension).

53848 • The DESCRIPTION is updated as follows:

53849 — Conditions under which writers have precedence over readers are specified.

53850 — Failure of *pthread_rwlock_tryrdlock*( ) is clarified.

53851 — A paragraph on the maximum number of read locks is added.

53852 • In the ERRORS sections, [EBUSY] is modified to take into account write priority, and
53853 [EDEADLK] is deleted as a *pthread_rwlock_tryrdlock*( ) error.

- The SEE ALSO section is updated.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/101 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

The *pthread_rwlock_rdlock*( ) and *pthread_rwlock_tryrdlock*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

53862 **NAME**

53863 pthread_rwlock_timedrdlock — lock a read-write lock for reading

53864 **SYNOPSIS**

53865 ```
#include <pthread.h>
```
53866 ```
#include <time.h>
```

53867 ```
int pthread_rwlock_timedrdlock(pthread_rwlock_t *restrict rwlock,
```
53868 ```
    const struct timespec *restrict abstime);
```

53869 **DESCRIPTION**

53870 The *pthread_rwlock_timedrdlock*( ) function shall apply a read lock to the read-write lock
53871 referenced by *rwlock* as in the *pthread_rwlock_rdlock*( ) function. However, if the lock cannot be
53872 acquired without waiting for other threads to unlock the lock, this wait shall be terminated
53873 when the specified timeout expires. The timeout shall expire when the absolute time specified
53874 by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value
53875 of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already
53876 been passed at the time of the call.

53877 The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall
53878 be the resolution of the CLOCK_REALTIME clock. The **timespec** data type is defined in the
53879 **<time.h>** header. Under no circumstances shall the function fail with a timeout if the lock can be
53880 acquired immediately. The validity of the *abstime* parameter need not be checked if the lock can
53881 be immediately acquired.

53882 If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-
53883 write lock via a call to *pthread_rwlock_timedrdlock*( ), upon return from the signal handler the
53884 thread shall resume waiting for the lock as if it was not interrupted.

53885 The calling thread may deadlock if at the time the call is made it holds a write lock on *rwlock*.
53886 The results are undefined if this function is called with an uninitialized read-write lock.

53887 **RETURN VALUE**

53888 The *pthread_rwlock_timedrdlock*( ) function shall return zero if the lock for reading on the read-
53889 write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned
53890 to indicate the error.

53891 **ERRORS**

53892 The *pthread_rwlock_timedrdlock*( ) function shall fail if:

53893 [ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

53894 The *pthread_rwlock_timedrdlock*( ) function may fail if:

53895 [EAGAIN] The read lock could not be acquired because the maximum number of read
53896 locks for lock would be exceeded.

53897 [EDEADLK] A deadlock condition was detected or the calling thread already holds a write
53898 lock on *rwlock*.

53899 [EINVAL] The *abstime* nanosecond value is less than zero or greater than or equal to 1 000
53900 million.

53901 This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using this function may be subject to priority inversion, as discussed in XBD Section 3.285 (on page 79).

RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_timedrdlock*( ) does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/102 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

The *pthread_rwlock_timedrdlock*( ) function is moved from the Timeouts option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

53925 **NAME**

53926 pthread_rwlock_timedwrlock — lock a read-write lock for writing

53927 **SYNOPSIS**

53928 ```
#include <pthread.h>
```
53929 ```
#include <time.h>
```

53930 ```
int pthread_rwlock_timedwrlock(pthread_rwlock_t *restrict rwlock,
```
53931 ```
    const struct timespec *restrict abstime);
```

53932 **DESCRIPTION**

53933 The *pthread_rwlock_timedwrlock*( ) function shall apply a write lock to the read-write lock
53934 referenced by *rwlock* as in the *pthread_rwlock_wrlock*( ) function. However, if the lock cannot be
53935 acquired without waiting for other threads to unlock the lock, this wait shall be terminated
53936 when the specified timeout expires. The timeout shall expire when the absolute time specified
53937 by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value
53938 of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already
53939 been passed at the time of the call.

53940 The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall
53941 be the resolution of the CLOCK_REALTIME clock. The **timespec** data type is defined in the
53942 **<time.h>** header. Under no circumstances shall the function fail with a timeout if the lock can be
53943 acquired immediately. The validity of the *abstime* parameter need not be checked if the lock can
53944 be immediately acquired.

53945 If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-
53946 write lock via a call to *pthread_rwlock_timedwrlock*( ), upon return from the signal handler the
53947 thread shall resume waiting for the lock as if it was not interrupted.

53948 The calling thread may deadlock if at the time the call is made it holds the read-write lock. The
53949 results are undefined if this function is called with an uninitialized read-write lock.

53950 **RETURN VALUE**

53951 The *pthread_rwlock_timedwrlock*( ) function shall return zero if the lock for writing on the read-
53952 write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned
53953 to indicate the error.

53954 **ERRORS**

53955 The *pthread_rwlock_timedwrlock*( ) function shall fail if:

53956 [ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

53957 The *pthread_rwlock_timedwrlock*( ) function may fail if:

53958 [EDEADLK] A deadlock condition was detected or the calling thread already holds the
53959 *rwlock*.

53960 [EINVAL] The *abstime* nanosecond value is less than zero or greater than or equal to 1 000
53961 million.

53962 This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using this function may be subject to priority inversion, as discussed in XBD Section 3.285 (on page 79).

RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_timedwrlock*( ) does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/103 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

The *pthread_rwlock_timedwrlock*( ) function is moved from the Timeouts option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

53986 **NAME**

53987 pthread_rwlock_tryrdlock — lock a read-write lock object for reading

53988 **SYNOPSIS**

53989 `#include <pthread.h>`

53990 `int pthread_rwlock_tryrdlock(pthread_rwlock_t *rwlock);`

53991 **DESCRIPTION**

53992 Refer to *pthread_rwlock_rdlock( )*.

NAME

pthread_rwlock_trywrlock, pthread_rwlock_wrlock — lock a read-write lock object for writing

SYNOPSIS

```
#include <pthread.h>

int pthread_rwlock_trywrlock(pthread_rwlock_t *rwlock);
int pthread_rwlock_wrlock(pthread_rwlock_t *rwlock);
```

DESCRIPTION

The *pthread_rwlock_trywrlock*( ) function shall apply a write lock like the *pthread_rwlock_wrlock*( ) function, with the exception that the function shall fail if any thread currently holds *rwlock* (for reading or writing).

The *pthread_rwlock_wrlock*( ) function shall apply a write lock to the read-write lock referenced by *rwlock*. The calling thread acquires the write lock if no other thread (reader or writer) holds the read-write lock *rwlock*. Otherwise, the thread shall block until it can acquire the lock. The calling thread may deadlock if at the time the call is made it holds the read-write lock (whether a read or write lock).

Implementations may favor writers over readers to avoid writer starvation.

Results are undefined if any of these functions are called with an uninitialized read-write lock.

If a signal is delivered to a thread waiting for a read-write lock for writing, upon return from the signal handler the thread resumes waiting for the read-write lock for writing as if it was not interrupted.

RETURN VALUE

The *pthread_rwlock_trywrlock*( ) function shall return zero if the lock for writing on the read-write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to indicate the error.

If successful, the *pthread_rwlock_wrlock*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_rwlock_trywrlock*( ) function shall fail if:

[EBUSY] The read-write lock could not be acquired for writing because it was already locked for reading or writing.

The *pthread_rwlock_wrlock*( ) function may fail if:

[EDEADLK] A deadlock condition was detected or the current thread already owns the read-write lock for writing or reading.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using these functions may be subject to priority inversion, as discussed in XBD Section 3.285 (on page 79).

RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_trywrlock*( ) or *pthread_rwlock_wrlock*( ) does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- The [EDEADLK] error is deleted as a *pthread_rwlock_trywrlock( )* error.
- The SEE ALSO section is updated.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/104 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

The *pthread_rwlock_trywrlock( )* and *pthread_rwlock_wrlock( )* functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

NAME

pthread_rwlock_unlock — unlock a read-write lock object

SYNOPSIS

```
#include <pthread.h>

int pthread_rwlock_unlock(pthread_rwlock_t *rwlock);
```

DESCRIPTION

The *pthread_rwlock_unlock*( ) function shall release a lock held on the read-write lock object referenced by *rwlock*. Results are undefined if the read-write lock *rwlock* is not held by the calling thread.

If this function is called to release a read lock from the read-write lock object and there are other read locks currently held on this read-write lock object, the read-write lock object remains in the read locked state. If this function releases the last read lock for this read-write lock object, the read-write lock object shall be put in the unlocked state with no owners.

If this function is called to release a write lock for this read-write lock object, the read-write lock object shall be put in the unlocked state.

If there are threads blocked on the lock when it becomes available, the scheduling policy shall TPS determine which thread(s) shall acquire the lock. If the Thread Execution Scheduling option is supported, when threads executing with the scheduling policies SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC are waiting on the lock, they shall acquire the lock in priority order when the lock becomes available. For equal priority threads, write locks shall take precedence over read locks. If the Thread Execution Scheduling option is not supported, it is implementation-defined whether write locks take precedence over read locks.

Results are undefined if this function is called with an uninitialized read-write lock.

RETURN VALUE

If successful, the *pthread_rwlock_unlock*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_rwlock_unlock*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_unlock*( ) does not refer to an initialized read-write lock object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *rwlock* argument to *pthread_rwlock_unlock*( ) refers to a read-write lock object for which the current thread does not hold a lock, it is recommended that the function should fail and report an [EPERM] error.

FUTURE DIRECTIONS

None.

XBD Section 4.11 (on page 110), **<pthread.h>**

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- The DESCRIPTION is updated as follows:
  - — The conditions under which writers have precedence over readers are specified.
  - — The concept of read-write lock owner is deleted.
- The SEE ALSO section is updated.

Issue 7

SD5-XSH-ERN-183 is applied.

The *pthread_rwlock_unlock( )* function is moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized read-write lock object is removed; this condition results in undefined behavior.

The [EPERM] error for a read-write lock object for which the current thread does not hold a lock is removed; this condition results in undefined behavior.

pthread_rwlock_wrlock( )

54121 **NAME**

54122 pthread_rwlock_wrlock — lock a read-write lock object for writing

54123 **SYNOPSIS**

54124 ```
#include <pthread.h>
```

54125 ```
int pthread_rwlock_wrlock(pthread_rwlock_t *rwlock);
```

54126 **DESCRIPTION**

54127 Refer to *pthread_rwlock_trywrlock( )*.

NAME

pthread_rwlockattr_destroy, pthread_rwlockattr_init — destroy and initialize the read-write lock attributes object

SYNOPSIS

```
#include <pthread.h>

int pthread_rwlockattr_destroy(pthread_rwlockattr_t *attr);
int pthread_rwlockattr_init(pthread_rwlockattr_t *attr);
```

DESCRIPTION

The *pthread_rwlockattr_destroy*( ) function shall destroy a read-write lock attributes object. A destroyed *attr* attributes object can be reinitialized using *pthread_rwlockattr_init*( ); the results of otherwise referencing the object after it has been destroyed are undefined. An implementation may cause *pthread_rwlockattr_destroy*( ) to set the object referenced by *attr* to an invalid value.

The *pthread_rwlockattr_init*( ) function shall initialize a read-write lock attributes object *attr* with the default value for all of the attributes defined by the implementation.

Results are undefined if *pthread_rwlockattr_init*( ) is called specifying an already initialized *attr* attributes object.

After a read-write lock attributes object has been used to initialize one or more read-write locks, any function affecting the attributes object (including destruction) shall not affect any previously initialized read-write locks.

The behavior is undefined if the value specified by the *attr* argument to *pthread_rwlockattr_destroy*( ) does not refer to an initialized read-write lock attributes object.

RETURN VALUE

If successful, the *pthread_rwlockattr_destroy*( ) and *pthread_rwlockattr_init*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_rwlockattr_init*( ) function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the read-write lock attributes object.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *attr* argument to *pthread_rwlockattr_destroy*( ) does not refer to an initialized read-write lock attributes object, it is recommended that the function should fail and report an [EINVAL] error.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_rwlock_destroy( ), *pthread_rwlockattr_getpshared*( )

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 5.

Issue 6

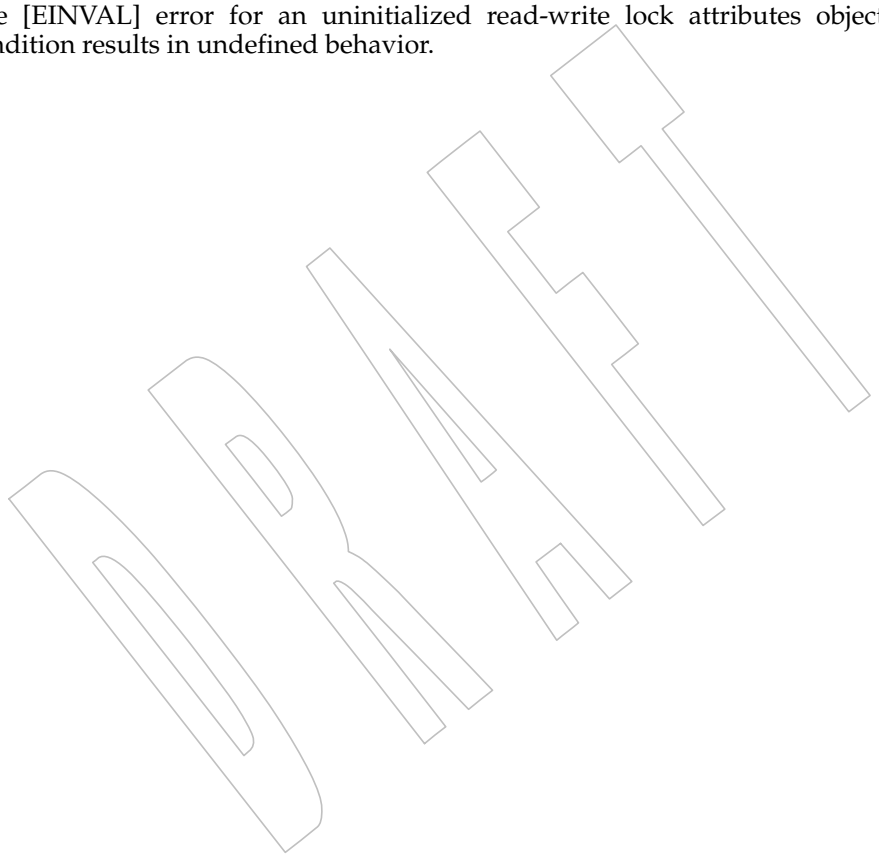
The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- The SEE ALSO section is updated.

Issue 7

The *pthread_rwlockattr_destroy*( ) and *pthread_rwlockattr_init*( ) functions are moved from the Threads option to the Base.

The [EINVAL] error for an uninitialized read-write lock attributes object is removed; this condition results in undefined behavior.



NAME

pthread_rwlockattr_getpshared, pthread_rwlockattr_setpshared — get and set the process-shared attribute of the read-write lock attributes object

SYNOPSIS

TSH
```
#include <pthread.h>

int pthread_rwlockattr_getpshared(const pthread_rwlockattr_t
    *restrict attr, int *restrict pshared);
int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,
    int pshared);
```

DESCRIPTION

The *pthread_rwlockattr_getpshared*( ) function shall obtain the value of the *process-shared* attribute from the initialized attributes object referenced by *attr*. The *pthread_rwlockattr_setpshared*( ) function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

The *process-shared* attribute shall be set to PTHREAD_PROCESS_SHARED to permit a read-write lock to be operated upon by any thread that has access to the memory where the read-write lock is allocated, even if the read-write lock is allocated in memory that is shared by multiple processes. If the *process-shared* attribute is PTHREAD_PROCESS_PRIVATE, the read-write lock shall only be operated upon by threads created within the same process as the thread that initialized the read-write lock; if threads of differing processes attempt to operate on such a read-write lock, the behavior is undefined. The default value of the *process-shared* attribute shall be PTHREAD_PROCESS_PRIVATE.

Additional attributes, their default values, and the names of the associated functions to get and set those attribute values are implementation-defined.

The behavior is undefined if the value specified by the *attr* argument to *pthread_rwlockattr_getpshared*( ) or *pthread_rwlockattr_setpshared*( ) does not refer to an initialized read-write lock attributes object.

RETURN VALUE

Upon successful completion, the *pthread_rwlockattr_getpshared*( ) function shall return zero and store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise, an error number shall be returned to indicate the error.

If successful, the *pthread_rwlockattr_setpshared*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_rwlockattr_setpshared*( ) function may fail if:

[EINVAL] The new value specified for the attribute is outside the range of legal values for that attribute.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR TSH to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- The DESCRIPTION notes that additional attributes are implementation-defined.
- The SEE ALSO section is updated.

The **restrict** keyword is added to the *pthread_rwlockattr_getpshared*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

The *pthread_rwlockattr_getpshared*( ) and *pthread_rwlockattr_setpshared*( ) functions are moved from the Threads option.

The [EINVAL] error for an uninitialized read-write lock attributes object is removed; this condition results in undefined behavior.

54246 **NAME**

54247 pthread_rwlockattr_init — initialize the read-write lock attributes object

54248 **SYNOPSIS**

54249
```
#include <pthread.h>
```

54250
```
int pthread_rwlockattr_init(pthread_rwlockattr_t *attr);
```

54251 **DESCRIPTION**

54252 Refer to *pthread_rwlockattr_destroy( )*.

pthread_rwlockattr_setpshared( )

NAME

pthread_rwlockattr_setpshared — set the process-shared attribute of the read-write lock attributes object

SYNOPSIS

TSH

```
#include <pthread.h>

int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,
    int pshared);
```

DESCRIPTION

Refer to *pthread_rwlockattr_getpshared( )*.

54262 **NAME**

54263 pthread_self — get the calling thread ID

54264 **SYNOPSIS**

54265
```
#include <pthread.h>
```

54266
```
pthread_t pthread_self(void);
```

54267 **DESCRIPTION**

54268 The *pthread_self*( ) function shall return the thread ID of the calling thread.

54269 **RETURN VALUE**

54270 The *pthread_self*( ) function shall always be successful and no return value is reserved to indicate
54271 an error.

54272 **ERRORS**

54273 No errors are defined.

54274 **EXAMPLES**

54275 None.

54276 **APPLICATION USAGE**

54277 None.

54278 **RATIONALE**

54279 The *pthread_self*( ) function provides a capability similar to the *getpid*( ) function for processes
54280 and the rationale is the same: the creation call does not provide the thread ID to the created
54281 thread.

54282 **FUTURE DIRECTIONS**

54283 None.

54284 **SEE ALSO**

54285 *pthread_create*( ), *pthread_equal*( )

54286 XBD **<pthread.h>**

54287 **CHANGE HISTORY**

54288 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

54289 **Issue 6**

54290 The *pthread_self*( ) function is marked as part of the Threads option.

54291 **Issue 7**

54292 Austin Group Interpretation 1003.1-2001 #063 is applied, updating the RETURN VALUE section.

54293 The *pthread_self*( ) function is moved from the Threads option to the Base.

NAME

pthread_setcancelstate, pthread_setcanceltype, pthread_testcancel — set cancelability state

SYNOPSIS

```
#include <pthread.h>

int pthread_setcancelstate(int state, int *oldstate);
int pthread_setcanceltype(int type, int *oldtype);
void pthread_testcancel(void);
```

DESCRIPTION

The *pthread_setcancelstate*( ) function shall atomically both set the calling thread's cancelability state to the indicated *state* and return the previous cancelability state at the location referenced by *oldstate*. Legal values for *state* are PTHREAD_CANCEL_ENABLE and PTHREAD_CANCEL_DISABLE.

The *pthread_setcanceltype*( ) function shall atomically both set the calling thread's cancelability type to the indicated *type* and return the previous cancelability type at the location referenced by *oldtype*. Legal values for *type* are PTHREAD_CANCEL_DEFERRED and PTHREAD_CANCEL_ASYNCHRONOUS.

The cancelability state and type of any newly created threads, including the thread in which *main*( ) was first invoked, shall be PTHREAD_CANCEL_ENABLE and PTHREAD_CANCEL_DEFERRED respectively.

The *pthread_testcancel*( ) function shall create a cancellation point in the calling thread. The *pthread_testcancel*( ) function shall have no effect if cancelability is disabled.

RETURN VALUE

If successful, the *pthread_setcancelstate*( ) and *pthread_setcanceltype*( ) functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_setcancelstate*( ) function may fail if:

[EINVAL] The specified state is not PTHREAD_CANCEL_ENABLE or PTHREAD_CANCEL_DISABLE.

The *pthread_setcanceltype*( ) function may fail if:

[EINVAL] The specified type is not PTHREAD_CANCEL_DEFERRED or PTHREAD_CANCEL_ASYNCHRONOUS.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *pthread_setcancelstate*( ) and *pthread_setcanceltype*( ) functions control the points at which a thread may be asynchronously canceled. For cancellation control to be usable in modular fashion, some rules need to be followed.

An object can be considered to be a generalization of a procedure. It is a set of procedures and global variables written as a unit and called by clients not known by the object. Objects may depend on other objects.

First, cancelability should only be disabled on entry to an object, never explicitly enabled. On

exit from an object, the cancelability state should always be restored to its value on entry to the object.

This follows from a modularity argument: if the client of an object (or the client of an object that uses that object) has disabled cancelability, it is because the client does not want to be concerned about cleaning up if the thread is canceled while executing some sequence of actions. If an object is called in such a state and it enables cancelability and a cancellation request is pending for that thread, then the thread is canceled, contrary to the wish of the client that disabled.

Second, the cancelability type may be explicitly set to either *deferred* or *asynchronous* upon entry to an object. But as with the cancelability state, on exit from an object the cancelability type should always be restored to its value on entry to the object.

Finally, only functions that are cancel-safe may be called from a thread that is asynchronously cancelable.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_setcancelstate*( ), *pthread_setcanceltype*( ), and *pthread_testcancel*( ) functions are marked as part of the Threads option.

Issue 7

The *pthread_setcancelstate*( ), *pthread_setcanceltype*( ), and *pthread_testcancel*( ) functions are moved from the Threads option to the Base.

pthread_setconcurrency( )

NAME

pthread_setconcurrency — set the level of concurrency

SYNOPSIS

OB XSI

```
#include <pthread.h>

int pthread_setconcurrency(int new_level);
```

DESCRIPTION

Refer to *pthread_getconcurrency( )*.

NAME

pthread_setschedparam — dynamic thread scheduling parameters access (**REALTIME THREADS**)

SYNOPSIS

TPS

```
#include <pthread.h>

int pthread_setschedparam(pthread_t thread, int policy,
    const struct sched_param *param);
```

DESCRIPTION

Refer to *pthread_getschedparam( )*.

NAME

pthread_setschedprio — dynamic thread scheduling parameters access (**REALTIME THREADS**)

SYNOPSIS

TPS
```
#include <pthread.h>

int pthread_setschedprio(pthread_t thread, int prio);
```

DESCRIPTION

The *pthread_setschedprio*( ) function shall set the scheduling priority for the thread whose thread ID is given by *thread* to the value given by *prio*. See Scheduling Policies (on page 501) for a description on how this function call affects the ordering of the thread in the thread list for its new priority.

If the *pthread_setschedprio*( ) function fails, the scheduling priority of the target thread shall not be changed.

RETURN VALUE

If successful, the *pthread_setschedprio*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_setschedprio*( ) function may fail if:

[EINVAL] The value of *prio* is invalid for the scheduling policy of the specified thread.

[ENOTSUP] An attempt was made to set the priority to an unsupported value.

[EPERM] The caller does not have appropriate privileges to set the scheduling priority of the specified thread.

The *pthread_setschedprio*( ) function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *pthread_setschedprio*( ) function provides a way for an application to temporarily raise its priority and then lower it again, without having the undesired side-effect of yielding to other threads of the same priority. This is necessary if the application is to implement its own strategies for bounding priority inversion, such as priority inheritance or priority ceilings. This capability is especially important if the implementation does not support the Thread Priority Protection or Thread Priority Inheritance options, but even if those options are supported it is needed if the application is to bound priority inheritance for other resources, such as semaphores.

The standard developers considered that while it might be preferable conceptually to solve this problem by modifying the specification of *pthread_setschedparam*( ), it was too late to make such a change, as there may be implementations that would need to be changed. Therefore, this new function was introduced.

If an implementation detects use of a thread ID after the end of its lifetime, it is recommended that the function should fail and report an [ESRCH] error.

FUTURE DIRECTIONS

None.

Scheduling Policies (on page 501), *pthread_getschedparam( )*

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 6. Included as a response to IEEE PASC Interpretation 1003.1 #96.

Issue 7

The *pthread_setschedprio( )* function is moved from the Threads option.

Austin Group Interpretation 1003.1-2001 #069 is applied, updating the [EPERM] error.

Austin Group Interpretation 1003.1-2001 #142 is applied, removing the [ESRCH] error condition.

pthread_setspecific( )

54432 **NAME**

54433 pthread_setspecific — thread-specific data management

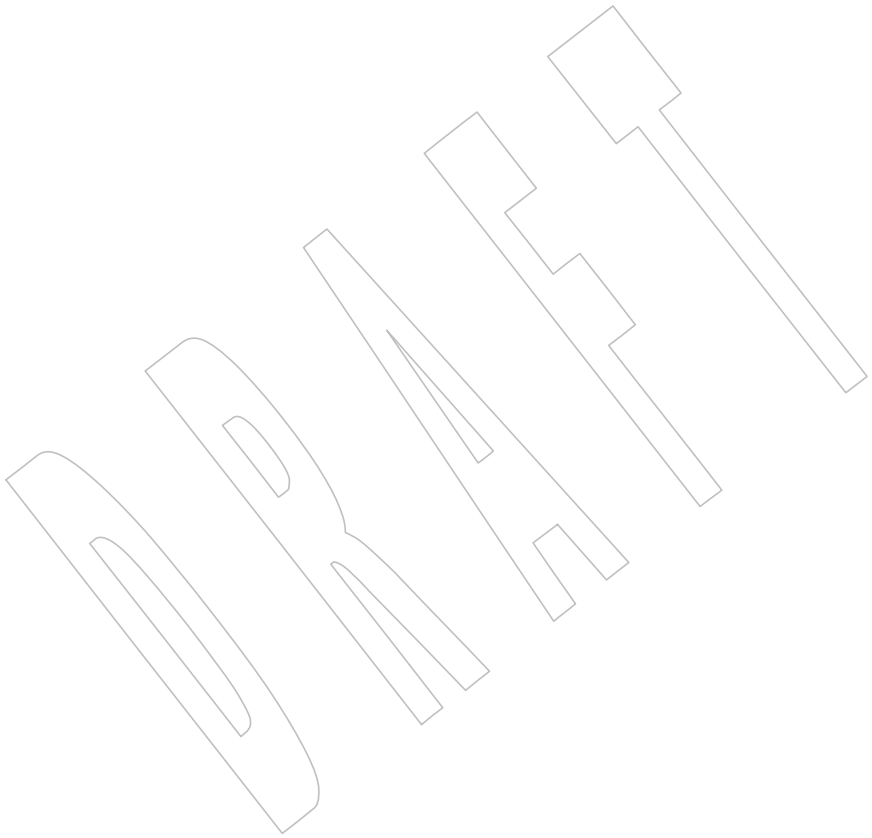
54434 **SYNOPSIS**

54435 `#include <pthread.h>`

54436 `int pthread_setspecific(pthread_key_t key, const void *value);`

54437 **DESCRIPTION**

54438 Refer to *pthread_getspecific( )*.



NAME

pthread_sigmask, sigprocmask — examine and change blocked signals

SYNOPSIS

CX
```
#include <signal.h>

int pthread_sigmask(int how, const sigset_t *restrict set,
    sigset_t *restrict oset);
int sigprocmask(int how, const sigset_t *restrict set,
    sigset_t *restrict oset);
```

DESCRIPTION

The *pthread_sigmask*( ) function shall examine or change (or both) the calling thread's signal mask, regardless of the number of threads in the process. The function shall be equivalent to *sigprocmask*( ), without the restriction that the call be made in a single-threaded process.

In a single-threaded process, the *sigprocmask*( ) function shall examine or change (or both) the signal mask of the calling thread.

If the argument *set* is not a null pointer, it points to a set of signals to be used to change the currently blocked set.

The argument *how* indicates the way in which the set is changed, and the application shall ensure it consists of one of the following values:

SIG_BLOCK The resulting set shall be the union of the current set and the signal set pointed to by *set*.

SIG_SETMASK The resulting set shall be the signal set pointed to by *set*.

SIG_UNBLOCK The resulting set shall be the intersection of the current set and the complement of the signal set pointed to by *set*.

If the argument *oset* is not a null pointer, the previous mask shall be stored in the location pointed to by *oset*. If *set* is a null pointer, the value of the argument *how* is not significant and the thread's signal mask shall be unchanged; thus the call can be used to enquire about currently blocked signals.

If there are any pending unblocked signals after the call to *sigprocmask*( ), at least one of those signals shall be delivered before the call to *sigprocmask*( ) returns.

It is not possible to block those signals which cannot be ignored. This shall be enforced by the system without causing an error to be indicated.

If any of the SIGFPE, SIGILL, SIGSEGV, or SIGBUS signals are generated while they are blocked, the result is undefined, unless the signal was generated by the *kill*( ) function, the *sigqueue*( ) function, or the *raise*( ) function.

If *sigprocmask*( ) fails, the thread's signal mask shall not be changed.

The use of the *sigprocmask*( ) function is unspecified in a multi-threaded process.

RETURN VALUE

Upon successful completion *pthread_sigmask*( ) shall return 0; otherwise, it shall return the corresponding error number.

Upon successful completion, *sigprocmask*( ) shall return 0; otherwise, –1 shall be returned, *errno* shall be set to indicate the error, and the signal mask of the process shall be unchanged.

ERRORS

The *pthread_sigmask*( ) and *sigprocmask*( ) functions shall fail if:

[EINVAL] The value of the *how* argument is not equal to one of the defined values.

The *pthread_sigmask*( ) function shall not return an error code of [EINTR].

EXAMPLES

Signaling in a Multi-Threaded Process

This example shows the use of *pthread_sigmask*( ) in order to deal with signals in a multi-threaded process. It provides a fairly general framework that could be easily adapted/extended.

```
#include <stdio.h>
#include <stdlib.h>
#include <pthread.h>
#include <signal.h>
#include <string.h>
#include <errno.h>
...

static sigset_t   signal_mask;  /* signals to block         */

int main (int argc, char *argv[])
{
    pthread_t  sig_thr_id;      /* signal handler thread ID */
    int        rc;              /* return code              */

    sigemptyset (&signal_mask);
    sigaddset (&signal_mask, SIGINT);
    sigaddset (&signal_mask, SIGTERM);
    rc = pthread_sigmask (SIG_BLOCK, &signal_mask, NULL);
    if (rc != 0) {
        /* handle error */
        ...
    }
    /* any newly created threads inherit the signal mask */

    rc = pthread_create (&sig_thr_id, NULL, signal_thread, NULL);
    if (rc != 0) {
        /* handle error */
        ...
    }

    /* APPLICATION CODE */
    ...
}

void *signal_thread (void *arg)
{
    int       sig_caught;    /* signal caught       */
    int       rc;            /* returned code       */

    rc = sigwait (&signal_mask, &sig_caught);
    if (rc != 0) {
        /* handle error */
    }
```

```
        switch (sig_caught)
        {
        case SIGINT:     /* process SIGINT  */
            ...
            break;
        case SIGTERM:    /* process SIGTERM */
            ...
            break;
        default:         /* should normally not happen */
            fprintf (stderr, "\nUnexpected signal %d\n", sig_caught);
            break;
        }
    }
```

APPLICATION USAGE

None.

RATIONALE

When a thread's signal mask is changed in a signal-catching function that is installed by *sigaction*( ), the restoration of the signal mask on return from the signal-catching function overrides that change (see *sigaction*( )). If the signal-catching function was installed with *signal*( ), it is unspecified whether this occurs.

See *kill*( ) for a discussion of the requirement on delivery of signals.

FUTURE DIRECTIONS

None.

SEE ALSO

exec, *kill*( ), *sigaction*( ), *sigaddset*( ), *sigdelset*( ), *sigemptyset*( ), *sigfillset*( ), *sigismember*( ), *sigpending*( ), *sigqueue*( ), *sigsuspend*( )

XBD **<signal.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

The *pthread_sigmask*( ) function is added for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_sigmask*( ) function is marked as part of the Threads option.

The SYNOPSIS for *sigprocmask*( ) is marked as a CX extension to note that the presence of this function in the **<signal.h>** header is an extension to the ISO C standard.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The DESCRIPTION is updated to explicitly state the functions which may generate the signal.

The normative text is updated to avoid use of the term "must" for application requirements.

The **restrict** keyword is added to the *pthread_sigmask*( ) and *sigprocmask*( ) prototypes for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/105 is applied, updating "process' signal mask" to "thread's signal mask" in the DESCRIPTION and RATIONALE sections.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/106 is applied, adding the example to the EXAMPLES section.

Issue 7

The *pthread_sigmask*( ) function is moved from the Threads option to the Base.

NAME

pthread_spin_destroy, pthread_spin_init — destroy or initialize a spin lock object

SYNOPSIS

```
#include <pthread.h>

int pthread_spin_destroy(pthread_spinlock_t *lock);
int pthread_spin_init(pthread_spinlock_t *lock, int pshared);
```

DESCRIPTION

The *pthread_spin_destroy*( ) function shall destroy the spin lock referenced by *lock* and release any resources used by the lock. The effect of subsequent use of the lock is undefined until the lock is reinitialized by another call to *pthread_spin_init*( ). The results are undefined if *pthread_spin_destroy*( ) is called when a thread holds the lock, or if this function is called with an uninitialized thread spin lock.

The *pthread_spin_init*( ) function shall allocate any resources required to use the spin lock referenced by *lock* and initialize the lock to an unlocked state.

TSH If the Thread Process-Shared Synchronization option is supported and the value of *pshared* is PTHREAD_PROCESS_SHARED, the implementation shall permit the spin lock to be operated upon by any thread that has access to the memory where the spin lock is allocated, even if it is allocated in memory that is shared by multiple processes.

If the Thread Process-Shared Synchronization option is supported and the value of *pshared* is PTHREAD_PROCESS_PRIVATE, or if the option is not supported, the spin lock shall only be operated upon by threads created within the same process as the thread that initialized the spin lock. If threads of differing processes attempt to operate on such a spin lock, the behavior is undefined.

The results are undefined if *pthread_spin_init*( ) is called specifying an already initialized spin lock. The results are undefined if a spin lock is used without first being initialized.

If the *pthread_spin_init*( ) function fails, the lock is not initialized and the contents of *lock* are undefined.

Only the object referenced by *lock* may be used for performing synchronization.

The result of referring to copies of that object in calls to *pthread_spin_destroy*( ), *pthread_spin_lock*( ), *pthread_spin_trylock*( ), or *pthread_spin_unlock*( ) is undefined.

RETURN VALUE

Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_spin_init*( ) function shall fail if:

[EAGAIN] The system lacks the necessary resources to initialize another spin lock.

[ENOMEM] Insufficient memory exists to initialize the lock.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *lock* argument to *pthread_spin_destroy*( ) does not refer to an initialized spin lock object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *lock* argument to *pthread_spin_destroy*( ) or *pthread_spin_init*( ) refers to a locked spin lock object, or detects that the value specified by the *lock* argument to *pthread_spin_init*( ) refers to an already initialized spin lock object, it is recommended that the function should fail and report an [EBUSY] error.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_spin_lock( ), *pthread_spin_unlock*( )

XBD **<pthread.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

Issue 7

The *pthread_spin_destroy*( ) and *pthread_spin_init*( ) functions are moved from the Spin Locks option to the Base.

The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in undefined behavior.

The [EBUSY] error for a locked spin lock object or an already initialized spin lock object is removed; this condition results in undefined behavior.

NAME

pthread_spin_lock, pthread_spin_trylock — lock a spin lock object

SYNOPSIS

```
#include <pthread.h>

int pthread_spin_lock(pthread_spinlock_t *lock);
int pthread_spin_trylock(pthread_spinlock_t *lock);
```

DESCRIPTION

The *pthread_spin_lock*( ) function shall lock the spin lock referenced by *lock*. The calling thread shall acquire the lock if it is not held by another thread. Otherwise, the thread shall spin (that is, shall not return from the *pthread_spin_lock*( ) call) until the lock becomes available. The results are undefined if the calling thread holds the lock at the time the call is made. The *pthread_spin_trylock*( ) function shall lock the spin lock referenced by *lock* if it is not held by any thread. Otherwise, the function shall fail.

The results are undefined if any of these functions is called with an uninitialized spin lock.

RETURN VALUE

Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The *pthread_spin_lock*( ) function may fail if:

[EDEADLK] A deadlock condition was detected.

The *pthread_spin_trylock*( ) function shall fail if:

[EBUSY] A thread currently holds the lock.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using this function may be subject to priority inversion, as discussed in XBD Section 3.285 (on page 79).

RATIONALE

If an implementation detects that the value specified by the *lock* argument to *pthread_spin_lock*( ) or *pthread_spin_trylock*( ) does not refer to an initialized spin lock object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *lock* argument to *pthread_spin_lock*( ) refers to a spin lock object for which the calling thread already holds the lock, it is recommended that the function should fail and report an [EDEADLK] error.

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_spin_destroy( ), *pthread_spin_unlock*( )

XBD Section 3.285 (on page 79), Section 4.11 (on page 110), **<pthread.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/107 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

The *pthread_spin_lock*( ) and *pthread_spin_trylock*( ) functions are moved from the Spin Locks option to the Base.

The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in undefined behavior.

The [EDEADLK] error for a spin lock object for which the calling thread already holds the lock is removed; this condition results in undefined behavior.

NAME

pthread_spin_unlock — unlock a spin lock object

SYNOPSIS

```
#include <pthread.h>

int pthread_spin_unlock(pthread_spinlock_t *lock);
```

DESCRIPTION

The *pthread_spin_unlock*( ) function shall release the spin lock referenced by *lock* which was locked via the *pthread_spin_lock*( ) or *pthread_spin_trylock*( ) functions.

The results are undefined if the lock is not held by the calling thread.

If there are threads spinning on the lock when *pthread_spin_unlock*( ) is called, the lock becomes available and an unspecified spinning thread shall acquire the lock.

The results are undefined if this function is called with an uninitialized thread spin lock.

RETURN VALUE

Upon successful completion, the *pthread_spin_unlock*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

If an implementation detects that the value specified by the *lock* argument to *pthread_spin_unlock*( ) does not refer to an initialized spin lock object, it is recommended that the function should fail and report an [EINVAL] error.

If an implementation detects that the value specified by the *lock* argument to *pthread_spin_unlock*( ) refers to a spin lock object for which the current thread does not hold the lock, it is recommended that the function should fail and report an [EPERM] error.

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

Issue 7

The *pthread_spin_unlock*( ) function is moved from the Spin Locks option to the Base.

The [EINVAL] error for an uninitialized spin lock object is removed; this condition results in undefined behavior.

54730 The [EPERM] error for a spin lock object for which the current thread does not hold the lock is
54731 removed; this condition results in undefined behavior.

54732 **NAME**

54733 pthread_testcancel — set cancelability state

54734 **SYNOPSIS**

54735
```
#include <pthread.h>
```

54736
```
void pthread_testcancel(void);
```

54737 **DESCRIPTION**

54738 Refer to *pthread_setcancelstate( )*.

NAME

ptsname — get name of the slave pseudo-terminal device

SYNOPSIS

XSI
```
#include <stdlib.h>

char *ptsname(int fildes);
```

DESCRIPTION

The *ptsname*( ) function shall return the name of the slave pseudo-terminal device associated with a master pseudo-terminal device. The *fildes* argument is a file descriptor that refers to the master device. The *ptsname*( ) function shall return a pointer to a string containing the pathname of the corresponding slave device.

The *ptsname*( ) function need not be thread-safe.

RETURN VALUE

Upon successful completion, *ptsname*( ) shall return a pointer to a string which is the name of the pseudo-terminal slave device. Upon failure, *ptsname*( ) shall return a null pointer. This could occur if *fildes* is an invalid file descriptor or if the slave device name does not exist in the file system.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The value returned may point to a static data area that is overwritten by each call to *ptsname*( ).

RATIONALE

None.

FUTURE DIRECTIONS

None.

Moved from X/OPEN UNIX extension to BASE.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

54775 **NAME**

54776 putc — put a byte on a stream

54777 **SYNOPSIS**

54778
```
#include <stdio.h>
```

54779
```
int putc(int c, FILE *stream);
```

54780 **DESCRIPTION**

54781 CX The functionality described on this reference page is aligned with the ISO C standard. Any
54782 conflict between the requirements described here and the ISO C standard is unintentional. This
54783 volume of POSIX.1-200x defers to the ISO C standard.

54784 The *putc*( ) function shall be equivalent to *fputc*( ), except that if it is implemented as a macro it
54785 may evaluate *stream* more than once, so the argument should never be an expression with side-
54786 effects.

54787 **RETURN VALUE**

54788 Refer to *fputc*( ).

54789 **ERRORS**

54790 Refer to *fputc*( ).

54791 **EXAMPLES**

54792 None.

54793 **APPLICATION USAGE**

54794 Since it may be implemented as a macro, *putc*( ) may treat a *stream* argument with side-effects
54795 incorrectly. In particular, *putc*(*c*,*f*++) does not necessarily work correctly. Therefore, use of this
54796 function is not recommended in such situations; *fputc*( ) should be used instead.

54797 **RATIONALE**

54798 None.

54799 **FUTURE DIRECTIONS**

54800 None.

54801 **SEE ALSO**

54802 *fputc*( )

putchar_unlocked( )

NAME

putchar_unlocked — stdio with explicit client locking

SYNOPSIS

CX

```
#include <stdio.h>

int putchar_unlocked(int c);
```

DESCRIPTION

Refer to *getc_unlocked( )*.

NAME

putenv — change or add a value to an environment

SYNOPSIS

XSI

```
#include <stdlib.h>

int putenv(char *string);
```

DESCRIPTION

The *putenv*( ) function shall use the *string* argument to set environment variable values. The *string* argument should point to a string of the form "*name=value*". The *putenv*( ) function shall make the value of the environment variable *name* equal to *value* by altering an existing variable or creating a new one. In either case, the string pointed to by *string* shall become part of the environment, so altering the string shall change the environment. The space used by *string* is no longer used once a new string which defines *name* is passed to *putenv*( ).

The *putenv*( ) function need not be thread-safe.

RETURN VALUE

Upon successful completion, *putenv*( ) shall return 0; otherwise, it shall return a non-zero value and set *errno* to indicate the error.

ERRORS

The *putenv*( ) function may fail if:

[ENOMEM] Insufficient memory was available.

EXAMPLES

Changing the Value of an Environment Variable

The following example changes the value of the *HOME* environment variable to the value **/usr/home**.

```
#include <stdlib.h>
...
static char *var = "HOME=/usr/home";
int ret;

ret = putenv(var);
```

APPLICATION USAGE

The *putenv*( ) function manipulates the environment pointed to by *environ*, and can be used in conjunction with *getenv*( ).

See *exec*( ) for restrictions on changing the environment in multi-threaded applications.

This routine may use *malloc*( ) to enlarge the environment.

A potential error is to call *putenv*( ) with an automatic variable as the argument, then return from the calling function while *string* is still part of the environment.

The *setenv*( ) function is preferred over this function.

RATIONALE

The standard developers noted that *putenv*( ) is the only function available to add to the environment without permitting memory leaks.

FUTURE DIRECTIONS

None.

SEE ALSO

exec, *getenv*( ), *malloc*( ), *setenv*( )

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The type of the argument to this function is changed from **const char** * to **char** *. This was indicated as a FUTURE DIRECTION in previous issues.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/48 is applied, clarifying wording in the DESCRIPTION and adding a new paragraph into APPLICATION USAGE referring readers to *exec*.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

NAME

putmsg, putpmsg — send a message on a STREAM (**STREAMS**)

SYNOPSIS

OB XSR

```
#include <stropts.h>

int putmsg(int fildes, const struct strbuf *ctlptr,
    const struct strbuf *dataptr, int flags);
int putpmsg(int fildes, const struct strbuf *ctlptr,
    const struct strbuf *dataptr, int band, int flags);
```

DESCRIPTION

The *putmsg*( ) function shall create a message from a process buffer(s) and send the message to a STREAMS file. The message may contain either a data part, a control part, or both. The data and control parts are distinguished by placement in separate buffers, as described below. The semantics of each part are defined by the STREAMS module that receives the message.

The *putpmsg*( ) function is equivalent to *putmsg*( ), except that the process can send messages in different priority bands. Except where noted, all requirements on *putmsg*( ) also pertain to *putpmsg*( ).

The *fildes* argument specifies a file descriptor referencing an open STREAM. The *ctlptr* and *dataptr* arguments each point to a **strbuf** structure.

The *ctlptr* argument points to the structure describing the control part, if any, to be included in the message. The *buf* member in the **strbuf** structure points to the buffer where the control information resides, and the *len* member indicates the number of bytes to be sent. The *maxlen* member is not used by *putmsg*( ). In a similar manner, the argument *dataptr* specifies the data, if any, to be included in the message. The *flags* argument indicates what type of message should be sent and is described further below.

To send the data part of a message, the application shall ensure that *dataptr* is not a null pointer and the *len* member of *dataptr* is 0 or greater. To send the control part of a message, the application shall ensure that the corresponding values are set for *ctlptr*. No data (control) part shall be sent if either *dataptr*(*ctlptr*) is a null pointer or the *len* member of *dataptr*(*ctlptr*) is set to –1.

For *putmsg*( ), if a control part is specified and *flags* is set to RS_HIPRI, a high priority message shall be sent. If no control part is specified, and *flags* is set to RS_HIPRI, *putmsg*( ) shall fail and set *errno* to [EINVAL]. If *flags* is set to 0, a normal message (priority band equal to 0) shall be sent. If a control part and data part are not specified and *flags* is set to 0, no message shall be sent and 0 shall be returned.

For *putpmsg*( ), the flags are different. The *flags* argument is a bitmask with the following mutually-exclusive flags defined: MSG_HIPRI and MSG_BAND. If *flags* is set to 0, *putpmsg*( ) shall fail and set *errno* to [EINVAL]. If a control part is specified and *flags* is set to MSG_HIPRI and *band* is set to 0, a high-priority message shall be sent. If *flags* is set to MSG_HIPRI and either no control part is specified or *band* is set to a non-zero value, *putpmsg*( ) shall fail and set *errno* to [EINVAL]. If *flags* is set to MSG_BAND, then a message shall be sent in the priority band specified by *band*. If a control part and data part are not specified and *flags* is set to MSG_BAND, no message shall be sent and 0 shall be returned.

The *putmsg*( ) function shall block if the STREAM write queue is full due to internal flow control conditions, with the following exceptions:

- For high-priority messages, *putmsg*( ) shall not block on this condition and continues processing the message.
- For other messages, *putmsg*( ) shall not block but shall fail when the write queue is full and O_NONBLOCK is set.

The *putmsg*( ) function shall also block, unless prevented by lack of internal resources, while waiting for the availability of message blocks in the STREAM, regardless of priority or whether O_NONBLOCK has been specified. No partial message shall be sent.

RETURN VALUE

Upon successful completion, *putmsg*( ) and *putpmsg*( ) shall return 0; otherwise, they shall return –1 and set *errno* to indicate the error.

ERRORS

The *putmsg*( ) and *putpmsg*( ) functions shall fail if:

[EAGAIN] A non-priority message was specified, the O_NONBLOCK flag is set, and the STREAM write queue is full due to internal flow control conditions; or buffers could not be allocated for the message that was to be created.

[EBADF] *fildes* is not a valid file descriptor open for writing.

[EINTR] A signal was caught during *putmsg*( ).

[EINVAL] An undefined value is specified in *flags*, or *flags* is set to RS_HIPRI or MSG_HIPRI and no control part is supplied, or the STREAM or multiplexer referenced by *fildes* is linked (directly or indirectly) downstream from a multiplexer, or *flags* is set to MSG_HIPRI and *band* is non-zero (for *putpmsg*( ) only).

[ENOSR] Buffers could not be allocated for the message that was to be created due to insufficient STREAMS memory resources.

[ENOSTR] A STREAM is not associated with *fildes*.

[ENXIO] A hangup condition was generated downstream for the specified STREAM.

[EPIPE] or [EIO] The *fildes* argument refers to a STREAMS-based pipe and the other end of the pipe is closed. A SIGPIPE signal is generated for the calling thread.

[ERANGE] The size of the data part of the message does not fall within the range specified by the maximum and minimum packet sizes of the topmost STREAM module. This value is also returned if the control part of the message is larger than the maximum configured size of the control part of a message, or if the data part of a message is larger than the maximum configured size of the data part of a message.

In addition, *putmsg*( ) and *putpmsg*( ) shall fail if the STREAM head had processed an asynchronous error before the call. In this case, the value of *errno* does not reflect the result of *putmsg*( ) or *putpmsg*( ), but reflects the prior error.

EXAMPLES

Sending a High-Priority Message

The value of *fd* is assumed to refer to an open STREAMS file. This call to *putmsg*( ) does the following:

1. Creates a high-priority message with a control part and a data part, using the buffers pointed to by *ctrlbuf* and *databuf* , respectively.
2. Sends the message to the STREAMS file identified by *fd*.

```
#include <stropts.h>
#include <string.h>
...
int fd;
char *ctrlbuf = "This is the control part";
char *databuf = "This is the data part";
struct strbuf ctrl;
struct strbuf data;
int ret;

ctrl.buf = ctrlbuf;
ctrl.len = strlen(ctrlbuf);

data.buf = databuf;
data.len = strlen(databuf);

ret = putmsg(fd, &ctrl, &data, MSG_HIPRI);
```

Using putpmsg( )

This example has the same effect as the previous example. In this example, however, the *putpmsg*( ) function creates and sends the message to the STREAMS file.

```
#include <stropts.h>
#include <string.h>
...
int fd;
char *ctrlbuf = "This is the control part";
char *databuf = "This is the data part";
struct strbuf ctrl;
struct strbuf data;
int ret;

ctrl.buf = ctrlbuf;
ctrl.len = strlen(ctrlbuf);

data.buf = databuf;
data.len = strlen(databuf);

ret = putpmsg(fd, &ctrl, &data, 0, MSG_HIPRI);
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The *putmsg*( ) and *putpmsg*( ) functions may be removed in a future version.

SEE ALSO

Section 2.6 (on page 494), *getmsg*( ), *poll*( ), *read*( ), *write*( )

XBD **<stropts.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The following text is removed from the DESCRIPTION: "The STREAM head guarantees that the control part of a message generated by *putmsg*( ) is at least 64 bytes in length".

Issue 6

This function is marked as part of the XSI STREAMS Option Group.

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

The *putmsg*( ) and *putpmsg*( ) functions are marked obsolescent.

NAME

puts — put a string on standard output

SYNOPSIS

```
#include <stdio.h>

int puts(const char *s);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *puts*( ) function shall write the string pointed to by *s*, followed by a <newline>, to the standard output stream *stdout*. The terminating null byte shall not be written.

CX The last data modification and last file status change timestamps of the file shall be marked for update between the successful execution of *puts*( ) and the next successful completion of a call to *fflush*( ) or *fclose*( ) on the same stream or a call to *exit*( ) or *abort*( ).

RETURN VALUE

Upon successful completion, *puts*( ) shall return a non-negative number. Otherwise, it shall return EOF, CX shall set an error indicator for the stream, and *errno* shall be set to indicate the error.

ERRORS

Refer to *fputc*( ).

EXAMPLES

Printing to Standard Output

The following example gets the current time, converts it to a string using *localtime*( ) and *asctime*( ), and prints it to standard output using *puts*( ). It then prints the number of minutes to an event for which it is waiting.

```
#include <time.h>
#include <stdio.h>
...
time_t now;
int minutes_to_event;
...
time(&now);
printf("The time is ");
puts(asctime(localtime(&now)));
printf("There are %d minutes to the event.\n",
    minutes_to_event);
...
```

APPLICATION USAGE

The *puts*( ) function appends a <newline>, while *fputs*( ) does not.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

fopen( ), *fputs*( ), *putc*( )

XBD **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

Issue 7

Changes are made related to support for finegrained timestamps.

NAME

pututxline — put an entry into the user accounting database

SYNOPSIS

XSI

```
#include <utmpx.h>

struct utmpx *pututxline(const struct utmpx *utmpx);
```

DESCRIPTION

Refer to *endutxent( )*.

55100 **NAME**

55101 putwc — put a wide character on a stream

55102 **SYNOPSIS**

55103 ```
#include <stdio.h>
```

55104 ```
#include <wchar.h>
```

55105 ```
wint_t putwc(wchar_t wc, FILE *stream);
```

55106 **DESCRIPTION**

55107 CX The functionality described on this reference page is aligned with the ISO C standard. Any
55108 conflict between the requirements described here and the ISO C standard is unintentional. This
55109 volume of POSIX.1-200x defers to the ISO C standard.

55110 The *putwc*( ) function shall be equivalent to *fputwc*( ), except that if it is implemented as a macro
55111 it may evaluate *stream* more than once, so the argument should never be an expression with
55112 side-effects.

55113 **RETURN VALUE**

55114 Refer to *fputwc*( ).

55115 **ERRORS**

55116 Refer to *fputwc*( ).

55117 **EXAMPLES**

55118 None.

55119 **APPLICATION USAGE**

55120 Since it may be implemented as a macro, *putwc*( ) may treat a *stream* argument with side-effects
55121 incorrectly. In particular, *putwc*(*wc*,*f*++) need not work correctly. Therefore, use of this function
55122 is not recommended; *fputwc*( ) should be used instead.

55123 **RATIONALE**

55124 None.

55125 **FUTURE DIRECTIONS**

55126 None.

CHANGE HISTORY

First released in Issue 4.

Issue 5

Aligned with ISO/IEC 9899: 1990/Amendment 1: 1995 (E). Specifically, the type of argument *wc* is changed from **wint_t** to **wchar_t**.

NAME

pwrite — write on a file

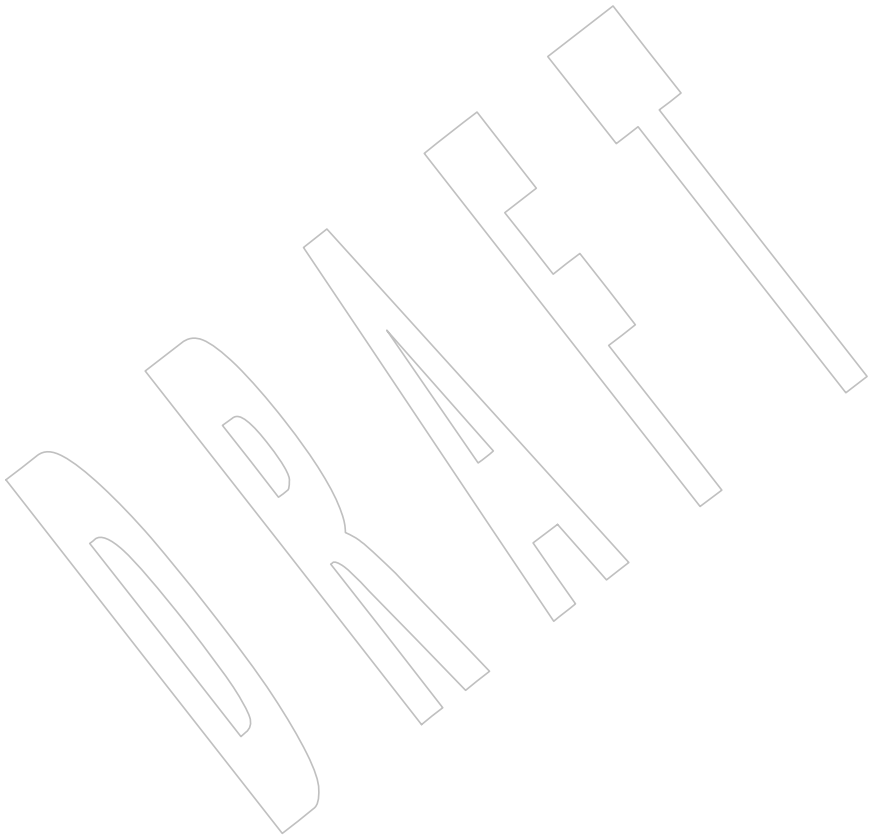
SYNOPSIS

```
#include <unistd.h>

ssize_t pwrite(int fildes, const void *buf, size_t nbyte,
    off_t offset);
```

DESCRIPTION

Refer to *write( )*.



NAME

qsort — sort a table of data

SYNOPSIS

```
#include <stdlib.h>

void qsort(void *base, size_t nel, size_t width,
    int (*compar)(const void *, const void *));
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *qsort*( ) function shall sort an array of *nel* objects, the initial element of which is pointed to by *base*. The size of each object, in bytes, is specified by the *width* argument. If the *nel* argument has the value zero, the comparison function pointed to by *compar* shall not be called and no rearrangement shall take place.

The application shall ensure that the comparison function pointed to by *compar* does not alter the contents of the array. The implementation may reorder elements of the array between calls to the comparison function, but shall not alter the contents of any individual element.

When the same objects (consisting of width bytes, irrespective of their current positions in the array) are passed more than once to the comparison function, the results shall be consistent with one another. That is, they shall define a total ordering on the array.

The contents of the array shall be sorted in ascending order according to a comparison function. The *compar* argument is a pointer to the comparison function, which is called with two arguments that point to the elements being compared. The application shall ensure that the function returns an integer less than, equal to, or greater than 0, if the first argument is considered respectively less than, equal to, or greater than the second. If two members compare as equal, their order in the sorted array is unspecified.

RETURN VALUE

The *qsort*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

RATIONALE

The requirement that each argument (hereafter referred to as *p)* to the comparison function is a pointer to elements of the array implies that for every call, for each argument separately, all of the following expressions are non-zero:

```
((char *)p – (char *)base) % width == 0
(char *)p >= (char *)base
(char *)p < (char *)base + nel * width
```

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/49 is applied, adding the last sentence to the first non-shaded paragraph in the DESCRIPTION, and the following two paragraphs. The RATIONALE is also updated. These changes are for alignment with the ISO C standard.

55228 **NAME**

55229 raise — send a signal to the executing process

55230 **SYNOPSIS**

55231
```
#include <signal.h>
```

55232
```
int raise(int sig);
```

55233 **DESCRIPTION**

55234 CX The functionality described on this reference page is aligned with the ISO C standard. Any
55235 conflict between the requirements described here and the ISO C standard is unintentional. This
55236 volume of POSIX.1-200x defers to the ISO C standard.

55237 CX The *raise*( ) function shall send the signal *sig* to the executing thread or process. If a signal
55238 handler is called, the *raise*( ) function shall not return until after the signal handler does.

55239 CX The effect of the *raise*( ) function shall be equivalent to calling:

55240
```
pthread_kill(pthread_self(), sig);
```

55241 **RETURN VALUE**

55242 CX Upon successful completion, 0 shall be returned. Otherwise, a non-zero value shall be returned
55243 and *errno* shall be set to indicate the error.

55244 **ERRORS**

55245 The *raise*( ) function shall fail if:

55246 CX [EINVAL] The value of the *sig* argument is an invalid signal number.

55247 **EXAMPLES**

55248 None.

55249 **APPLICATION USAGE**

55250 None.

55251 **RATIONALE**

55252 The term "thread" is an extension to the ISO C standard.

55253 **FUTURE DIRECTIONS**

55254 None.

55255 **SEE ALSO**

55256 *kill*( ), *sigaction*( )

55257 XBD **<signal.h>**, **<sys/types.h>**

55258 **CHANGE HISTORY**

55259 First released in Issue 4. Derived from the ANSI C standard.

55260 **Issue 5**

55261 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

55262 **Issue 6**

55263 Extensions beyond the ISO C standard are marked.

55264 The following new requirements on POSIX implementations derive from alignment with the
55265 Single UNIX Specification:

55266 • In the RETURN VALUE section, the requirement to set *errno* on error is added.

- The [EINVAL] error condition is added.

Issue 7

Functionality relating to the Threads option is moved to the Base.

NAME

rand, rand_r, srand — pseudo-random number generator

SYNOPSIS

```
#include <stdlib.h>

int rand(void);
int rand_r(unsigned *seed);
void srand(unsigned seed);
```

DESCRIPTION

CX For *rand*( ) and *srand*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *rand*( ) function shall compute a sequence of pseudo-random integers in the range [0,{RAND_MAX}] XSI with a period of at least 2^{32}.

CX The *rand*( ) function need not be thread-safe.

OB CX The *rand_r*( ) function shall compute a sequence of pseudo-random integers in the range [0,{RAND_MAX}]. (The value of the {RAND_MAX} macro shall be at least 32 767.)

If *rand_r*( ) is called with the same initial value for the object pointed to by *seed* and that object is not modified between successive returns and calls to *rand_r*( ), the same sequence shall be generated.

The *srand*( ) function uses the argument as a seed for a new sequence of pseudo-random numbers to be returned by subsequent calls to *rand*( ). If *srand*( ) is then called with the same seed value, the sequence of pseudo-random numbers shall be repeated. If *rand*( ) is called before any calls to *srand*( ) are made, the same sequence shall be generated as when *srand*( ) is first called with a seed value of 1.

The implementation shall behave as if no function defined in this volume of POSIX.1-200x calls *rand*( ) or *srand*( ).

RETURN VALUE

The *rand*( ) function shall return the next pseudo-random number in the sequence.

OB CX The *rand_r*( ) function shall return a pseudo-random integer.

The *srand*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

Generating a Pseudo-Random Number Sequence

The following example demonstrates how to generate a sequence of pseudo-random numbers.

```
#include <stdio.h>
#include <stdlib.h>
...
    long count, i;
    char *keystr;
    int elementlen, len;
    char c;
...
```

```
55313       /* Initial random number generator. */
55314           srand(1);
55315           /* Create keys using only lowercase characters */
55316           len = 0;
55317           for (i=0; i<count; i++) {
55318               while (len < elementlen) {
55319                   c = (char) (rand() % 128);
55320                   if (islower(c))
55321                       keystr[len++] = c;
55322               }
55323               keystr[len] = '\0';
55324               printf("%s Element%0*ld\n", keystr, elementlen, i);
55325               len = 0;
55326           }
```

Generating the Same Sequence on Different Machines

The following code defines a pair of functions that could be incorporated into applications wishing to ensure that the same sequence of numbers is generated across different machines.

```
55330       static unsigned long next = 1;
55331       int myrand(void)  /* RAND_MAX assumed to be 32767. */
55332       {
55333           next = next * 1103515245 + 12345;
55334           return((unsigned)(next/65536) % 32768);
55335       }
55336       void mysrand(unsigned seed)
55337       {
55338           next = seed;
55339       }
```

APPLICATION USAGE

The *drand48*( ) function provides a much more elaborate random number generator.

The limitations on the amount of state that can be carried between one function call and another mean the *rand_r*( ) function can never be implemented in a way which satisfies all of the requirements on a pseudo-random number generator. Therefore this function should be avoided whenever non-trivial requirements (including safety) have to be fulfilled.

RATIONALE

The ISO C standard *rand*( ) and *srand*( ) functions allow per-process pseudo-random streams shared by all threads. Those two functions need not change, but there has to be mutual-exclusion that prevents interference between two threads concurrently accessing the random number generator.

With regard to *rand*( ), there are two different behaviors that may be wanted in a multi-threaded program:

1. A single per-process sequence of pseudo-random numbers that is shared by all threads that call *rand*( )
2. A different sequence of pseudo-random numbers for each thread that calls *rand*( )

This is provided by the modified thread-safe function based on whether the seed value is global

to the entire process or local to each thread.

This does not address the known deficiencies of the *rand*( ) function implementations, which have been approached by maintaining more state. In effect, this specifies new thread-safe forms of a deficient function.

FUTURE DIRECTIONS

The *rand_r*( ) function may be removed in a future version.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The *rand_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *rand*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

Extensions beyond the ISO C standard are marked.

The *rand_r*( ) function is marked as part of the Thread-Safe Functions option.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

The *rand_r*( ) function is marked obsolescent.

NAME

random — generate pseudo-random number

SYNOPSIS

XSI

```
#include <stdlib.h>

long random(void);
```

DESCRIPTION

Refer to *initstate( )*.

55384 **NAME**

55385 pread, read — read from a file

55386 **SYNOPSIS**

55387 ```
#include <unistd.h>
```

55388 ```
ssize_t pread(int fildes, void *buf, size_t nbyte, off_t offset);
```

55389 ```
ssize_t read(int fildes, void *buf, size_t nbyte);
```

55390 **DESCRIPTION**

55391 The *read*( ) function shall attempt to read *nbyte* bytes from the file associated with the open file
55392 descriptor, *fildes*, into the buffer pointed to by *buf*. The behavior of multiple concurrent reads on
55393 the same pipe, FIFO, or terminal device is unspecified.

55394 Before any action described below is taken, and if *nbyte* is zero, the *read*( ) function may detect
55395 and return errors as described below. In the absence of errors, or if error detection is not
55396 performed, the *read*( ) function shall return zero and have no other results.

55397 On files that support seeking (for example, a regular file), the *read*( ) shall start at a position in
55398 the file given by the file offset associated with *fildes*. The file offset shall be incremented by the
55399 number of bytes actually read.

55400 Files that do not support seeking—for example, terminals—always read from the current
55401 position. The value of a file offset associated with such a file is undefined.

55402 No data transfer shall occur past the current end-of-file. If the starting position is at or after the
55403 end-of-file, 0 shall be returned. If the file refers to a device special file, the result of subsequent
55404 *read*( ) requests is implementation-defined.

55405 If the value of *nbyte* is greater than {SSIZE_MAX}, the result is implementation-defined.

55406 When attempting to read from an empty pipe or FIFO:

55407 • If no process has the pipe open for writing, *read*( ) shall return 0 to indicate end-of-file.

55408 • If some process has the pipe open for writing and O_NONBLOCK is set, *read*( ) shall return
55409 –1 and set *errno* to [EAGAIN].

55410 • If some process has the pipe open for writing and O_NONBLOCK is clear, *read*( ) shall
55411 block the calling thread until some data is written or the pipe is closed by all processes that
55412 had the pipe open for writing.

55413 When attempting to read a file (other than a pipe or FIFO) that supports non-blocking reads and
55414 has no data currently available:

55415 • If O_NONBLOCK is set, *read*( ) shall return –1 and set *errno* to [EAGAIN].

55416 • If O_NONBLOCK is clear, *read*( ) shall block the calling thread until some data becomes
55417 available.

55418 • The use of the O_NONBLOCK flag has no effect if there is some data available.

55419 The *read*( ) function reads data previously written to a file. If any portion of a regular file prior to
55420 the end-of-file has not been written, *read*( ) shall return bytes with value 0. For example, *lseek*( )
55421 allows the file offset to be set beyond the end of existing data in the file. If data is later written at
55422 this point, subsequent reads in the gap between the previous end of data and the newly written
55423 data shall return bytes with value 0 until data is written into the gap.

55424 Upon successful completion, where *nbyte* is greater than 0, *read*( ) shall mark for update the last
55425 data access timestamp of the file, and shall return the number of bytes read. This number shall
55426 never be greater than *nbyte*. The value returned may be less than *nbyte* if the number of bytes
```

left in the file is less than *nbyte*, if the *read*( ) request was interrupted by a signal, or if the file is a pipe or FIFO or special file and has fewer than *nbyte* bytes immediately available for reading. For example, a *read*( ) from a file associated with a terminal may return one typed line of data.

If a *read*( ) is interrupted by a signal before it reads any data, it shall return –1 with *errno* set to [EINTR].

If a *read*( ) is interrupted by a signal after it has successfully read some data, it shall return the number of bytes read.

For regular files, no data transfer shall occur past the offset maximum established in the open file description associated with *fildes*.

If *fildes* refers to a socket, *read*( ) shall be equivalent to *recv*( ) with no flags set.

SIO If the O_DSYNC and O_RSYNC bits have been set, read I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion. If the O_SYNC and O_RSYNC bits have been set, read I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.

SHM If *fildes* refers to a shared memory object, the result of the *read*( ) function is unspecified.

TYM If *fildes* refers to a typed memory object, the result of the *read*( ) function is unspecified.

OB XSR A *read*( ) from a STREAMS file can read data in three different modes: *byte-stream* mode, *message-nondiscard* mode, and *message-discard* mode. The default shall be byte-stream mode. This can be changed using the I_SRDOPT *ioctl*( ) request, and can be tested with I_GRDOPT *ioctl*( ). In byte-stream mode, *read*( ) shall retrieve data from the STREAM until as many bytes as were requested are transferred, or until there is no more data to be retrieved. Byte-stream mode ignores message boundaries.

In STREAMS message-nondiscard mode, *read*( ) shall retrieve data until as many bytes as were requested are transferred, or until a message boundary is reached. If *read*( ) does not retrieve all the data in a message, the remaining data shall be left on the STREAM, and can be retrieved by the next *read*( ) call. Message-discard mode also retrieves data until as many bytes as were requested are transferred, or a message boundary is reached. However, unread data remaining in a message after the *read*( ) returns shall be discarded, and shall not be available for a subsequent *read*( ), *getmsg*( ), or *getpmsg*( ) call.

How *read*( ) handles zero-byte STREAMS messages is determined by the current read mode setting. In byte-stream mode, *read*( ) shall accept data until it has read *nbyte* bytes, or until there is no more data to read, or until a zero-byte message block is encountered. The *read*( ) function shall then return the number of bytes read, and place the zero-byte message back on the STREAM to be retrieved by the next *read*( ), *getmsg*( ), or *getpmsg*( ). In message-nondiscard mode or message-discard mode, a zero-byte message shall return 0 and the message shall be removed from the STREAM. When a zero-byte message is read as the first message on a STREAM, the message shall be removed from the STREAM and 0 shall be returned, regardless of the read mode.

A *read*( ) from a STREAMS file shall return the data in the message at the front of the STREAM head read queue, regardless of the priority band of the message.

By default, STREAMs are in control-normal mode, in which a *read*( ) from a STREAMS file can only process messages that contain a data part but do not contain a control part. The *read*( ) shall fail if a message containing a control part is encountered at the STREAM head. This default action can be changed by placing the STREAM in either control-data mode or control-discard mode with the I_SRDOPT *ioctl*( ) command. In control-data mode, *read*( ) shall convert any control part to data and pass it to the application before passing any data part originally present

in the same message. In control-discard mode, *read*( ) shall discard message control parts but return to the process any data part in the message.

In addition, *read*( ) shall fail if the STREAM head had processed an asynchronous error before the call. In this case, the value of *errno* shall not reflect the result of *read*( ), but reflect the prior error. If a hangup occurs on the STREAM being read, *read*( ) shall continue to operate normally until the STREAM head read queue is empty. Thereafter, it shall return 0.

The *pread*( ) function shall be equivalent to *read*( ), except that it shall read from a given position in the file without changing the file pointer. The first three arguments to *pread*( ) are the same as *read*( ) with the addition of a fourth argument *offset* for the desired position inside the file. An attempt to perform a *pread*( ) on a file that is incapable of seeking shall result in an error.

RETURN VALUE

Upon successful completion, these functions shall return a non-negative integer indicating the number of bytes actually read. Otherwise, the functions shall return −1 and set *errno* to indicate the error.

ERRORS

These functions shall fail if:

[EAGAIN] The O_NONBLOCK flag is set for the file descriptor and the thread would be delayed.

[EBADF] The *fildes* argument is not a valid file descriptor open for reading.

OB XSR [EBADMSG] The file is a STREAM file that is set to control-normal mode and the message waiting to be read includes a control part.

[EINTR] The read operation was terminated due to the receipt of a signal, and no data was transferred.

OB XSR [EINVAL] The STREAM or multiplexer referenced by *fildes* is linked (directly or indirectly) downstream from a multiplexer.

[EIO] The process is a member of a background process group attempting to read from its controlling terminal, the process is ignoring or blocking the SIGTTIN signal, or the process group is orphaned. This error may also be generated for implementation-defined reasons.

XSI [EISDIR] The *fildes* argument refers to a directory and the implementation does not allow the directory to be read using *read*( ) or *pread*( ). The *readdir*( ) function should be used instead.

[EOVERFLOW] The file is a regular file, *nbyte* is greater than 0, the starting position is before the end-of-file, and the starting position is greater than or equal to the offset maximum established in the open file description associated with *fildes*.

The *read*( ) function shall fail if:

[EAGAIN] or [EWOULDBLOCK]
The file descriptor is for a socket, is marked O_NONBLOCK, and no data is waiting to be received.

[ECONNRESET] A read was attempted on a socket and the connection was forcibly closed by its peer.

[ENOTCONN] A read was attempted on a socket that is not connected.

55515 [ETIMEDOUT] A read was attempted on a socket and a transmission timeout occurred.

55516 These functions may fail if:

55517 [EIO] A physical I/O error has occurred.

55518 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

55519 [ENOMEM] Insufficient memory was available to fulfill the request.

55520 [ENXIO] A request was made of a nonexistent device, or the request was outside the
55521 capabilities of the device.

55522 The *pread*( ) function shall fail, and the file pointer shall remain unchanged, if:

55523 [EINVAL] The *offset* argument is invalid. The value is negative.

55524 [EOVERFLOW] The file is a regular file and an attempt was made to read at or beyond the
55525 offset maximum associated with the file.

55526 [ENXIO] A request was outside the capabilities of the device.

55527 [ESPIPE] *fildes* is associated with a pipe or FIFO.

55528 **EXAMPLES**

55529 **Reading Data into a Buffer**

55530 The following example reads data from the file associated with the file descriptor *fd* into the
55531 buffer pointed to by *buf*.

```
55532 #include <sys/types.h>
55533 #include <unistd.h>
55534 ...
55535 char buf[20];
55536 size_t nbytes;
55537 ssize_t bytes_read;
55538 int fd;
55539 ...
55540 nbytes = sizeof(buf);
55541 bytes_read = read(fd, buf, nbytes);
55542 ...
```

55543 **APPLICATION USAGE**

55544 None.

55545 **RATIONALE**

55546 This volume of POSIX.1-200x does not specify the value of the file offset after an error is
55547 returned; there are too many cases. For programming errors, such as [EBADF], the concept is
55548 meaningless since no file is involved. For errors that are detected immediately, such as
55549 [EAGAIN], clearly the pointer should not change. After an interrupt or hardware error, however,
55550 an updated value would be very useful and is the behavior of many implementations.

55551 Note that a *read*( ) of zero bytes does not modify the last data access timestamp. A *read*( ) that
55552 requests more than zero bytes, but returns zero, is required to modify the last data access
55553 timestamp.

55554 Implementations are allowed, but not required, to perform error checking for *read*( ) requests of
55555 zero bytes.

Input and Output

The use of I/O with large byte counts has always presented problems. Ideas such as *lread*( ) and *lwrite*( ) (using and returning **long**s) were considered at one time. The current solution is to use abstract types on the ISO C standard function to *read*( ) and *write*( ). The abstract types can be declared so that existing functions work, but can also be declared so that larger types can be represented in future implementations. It is presumed that whatever constraints limit the maximum range of **size_t** also limit portable I/O requests to the same range. This volume of POSIX.1-200x also limits the range further by requiring that the byte count be limited so that a signed return value remains meaningful. Since the return type is also a (signed) abstract type, the byte count can be defined by the implementation to be larger than an **int** can hold.

The standard developers considered adding atomicity requirements to a pipe or FIFO, but recognized that due to the nature of pipes and FIFOs there could be no guarantee of atomicity of reads of {PIPE_BUF} or any other size that would be an aid to applications portability.

This volume of POSIX.1-200x requires that no action be taken for *read*( ) or *write*( ) when *nbyte* is zero. This is not intended to take precedence over detection of errors (such as invalid buffer pointers or file descriptors). This is consistent with the rest of this volume of POSIX.1-200x, but the phrasing here could be misread to require detection of the zero case before any other errors. A value of zero is to be considered a correct value, for which the semantics are a no-op.

I/O is intended to be atomic to ordinary files and pipes and FIFOs. Atomic means that all the bytes from a single operation that started out together end up together, without interleaving from other I/O operations. It is a known attribute of terminals that this is not honored, and terminals are explicitly (and implicitly permanently) excepted, making the behavior unspecified. The behavior for other device types is also left unspecified, but the wording is intended to imply that future standards might choose to specify atomicity (or not).

There were recommendations to add format parameters to *read*( ) and *write*( ) in order to handle networked transfers among heterogeneous file system and base hardware types. Such a facility may be required for support by the OSI presentation of layer services. However, it was determined that this should correspond with similar C-language facilities, and that is beyond the scope of this volume of POSIX.1-200x. The concept was suggested to the developers of the ISO C standard for their consideration as a possible area for future work.

In 4.3 BSD, a *read*( ) or *write*( ) that is interrupted by a signal before transferring any data does not by default return an [EINTR] error, but is restarted. In 4.2 BSD, 4.3 BSD, and the Eighth Edition, there is an additional function, *select*( ), whose purpose is to pause until specified activity (data to read, space to write, and so on) is detected on specified file descriptors. It is common in applications written for those systems for *select*( ) to be used before *read*( ) in situations (such as keyboard input) where interruption of I/O due to a signal is desired.

The issue of which files or file types are interruptible is considered an implementation design issue. This is often affected primarily by hardware and reliability issues.

There are no references to actions taken following an "unrecoverable error". It is considered beyond the scope of this volume of POSIX.1-200x to describe what happens in the case of hardware errors.

Earlier versions of this standard allowed two very different behaviors with regard to the handling of interrupts. In order to minimize the resulting confusion, it was decided that POSIX.1-200x should support only one of these behaviors. Historical practice on AT&T-derived systems was to have *read*( ) and *write*( ) return –1 and set *errno* to [EINTR] when interrupted after some, but not all, of the data requested had been transferred. However, the U.S. Department of Commerce FIPS 151-1 and FIPS 151-2 require the historical BSD behavior, in which *read*( ) and

write( ) return the number of bytes actually transferred before the interrupt. If –1 is returned when any data is transferred, it is difficult to recover from the error on a seekable device and impossible on a non-seekable device. Most new implementations support this behavior. The behavior required by POSIX.1-200x is to return the number of bytes transferred.

POSIX.1-200x does not specify when an implementation that buffers *read*( )s actually moves the data into the user-supplied buffer, so an implementation may choose to do this at the latest possible moment. Therefore, an interrupt arriving earlier may not cause *read*( ) to return a partial byte count, but rather to return –1 and set *errno* to [EINTR].

Consideration was also given to combining the two previous options, and setting *errno* to [EINTR] while returning a short count. However, not only is there no existing practice that implements this, it is also contradictory to the idea that when *errno* is set, the function responsible shall return –1.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

The *pread*( ) function is added.

Issue 6

The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are marked as part of the XSI STREAMS Option Group.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION now states that if *read*( ) is interrupted by a signal after it has successfully read some data, it returns the number of bytes read. In Issue 3, it was optional whether *read*( ) returned the number of bytes read, or whether it returned –1 with *errno* set to [EINTR]. This is a FIPS requirement.
- In the DESCRIPTION, text is added to indicate that for regular files, no data transfer occurs past the offset maximum established in the open file description associated with *fildes*. This change is to support large files.
- The [EOVERFLOW] mandatory error condition is added.
- The [ENXIO] optional error condition is added.

Text referring to sockets is added to the DESCRIPTION.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The effect of reading zero bytes is clarified.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that

read( ) results are unspecified for typed memory objects.

New RATIONALE is added to explain the atomicity requirements for input and output operations.

The following error conditions are added for operations on sockets: [EAGAIN], [ECONNRESET], [ENOTCONN], and [ETIMEDOUT].

The [EIO] error is made optional.

The following error conditions are added for operations on sockets: [ENOBUFS] and [ENOMEM].

The *readv*( ) function is split out into a separate reference page.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/108 is applied, updating the [EAGAIN] error in the ERRORS section from "the process would be delayed" to "the thread would be delayed".

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/109 is applied, making an editorial correction in the RATIONALE section.

Issue 7

The *pread*( ) function is moved from the XSI option to the Base.

Functionality relating to the XSI STREAMS option is marked obsolescent.

Changes are made related to support for finegrained timestamps.

NAME

readdir, readdir_r — read a directory

SYNOPSIS

```
#include <dirent.h>

struct dirent *readdir(DIR *dirp);
int readdir_r(DIR *restrict dirp, struct dirent *restrict entry,
    struct dirent **restrict result);
```

DESCRIPTION

The type **DIR**, which is defined in the **<dirent.h>** header, represents a *directory stream*, which is an ordered sequence of all the directory entries in a particular directory. Directory entries represent files; files may be removed from a directory or added to a directory asynchronously to the operation of *readdir*( ).

The *readdir*( ) function shall return a pointer to a structure representing the directory entry at the current position in the directory stream specified by the argument *dirp*, and position the directory stream at the next entry. It shall return a null pointer upon reaching the end of the directory stream. The structure **dirent** defined in the **<dirent.h>** header describes a directory entry. The value of the structure's *d_ino* member shall be set to the file serial number of the file named by the *d_name* member. If the *d_name* member names a symbolic link, the value of the *d_ino* member shall be set to the file serial number of the symbolic link itself.

The *readdir*( ) function shall not return directory entries containing empty names. If entries for dot or dot-dot exist, one entry shall be returned for dot and one entry shall be returned for dot-dot; otherwise, they shall not be returned.

The pointer returned by *readdir*( ) points to data which may be overwritten by another call to *readdir*( ) on the same directory stream. This data is not overwritten by another call to *readdir*( ) on a different directory stream.

If a file is removed from or added to the directory after the most recent call to *opendir*( ) or *rewinddir*( ), whether a subsequent call to *readdir*( ) returns an entry for that file is unspecified.

The *readdir*( ) function may buffer several directory entries per actual read operation; *readdir*( ) shall mark for update the last data access timestamp of the directory each time the directory is actually read.

After a call to *fork*( ), either the parent or child (but not both) may continue processing the directory stream using *readdir*( ), *rewinddir*( ), or *seekdir*( ). If both the parent and child processes use these functions, the result is undefined. XSI

The *readdir*( ) function need not be thread-safe.

Applications wishing to check for error situations should set *errno* to 0 before calling *readdir*( ). If *errno* is set to non-zero on return, an error occurred.

The *readdir_r*( ) function shall initialize the **dirent** structure referenced by *entry* to represent the directory entry at the current position in the directory stream referred to by *dirp*, store a pointer to this structure at the location referenced by *result*, and position the directory stream at the next entry.

The storage pointed to by *entry* shall be large enough for a **dirent** with an array of **char** *d_name* members containing at least {NAME_MAX}+1 elements.

Upon successful return, the pointer returned at **result* shall have the same value as the argument *entry*. Upon reaching the end of the directory stream, this pointer shall have the value NULL.

The *readdir_r*( ) function shall not return directory entries containing empty names.

If a file is removed from or added to the directory after the most recent call to *opendir*( ) or *rewinddir*( ), whether a subsequent call to *readdir_r*( ) returns an entry for that file is unspecified.

The *readdir_r*( ) function may buffer several directory entries per actual read operation; *readdir_r*( ) shall mark for update the last data access timestamp of the directory each time the directory is actually read.

RETURN VALUE

Upon successful completion, *readdir*( ) shall return a pointer to an object of type **struct dirent**. When an error is encountered, a null pointer shall be returned and *errno* shall be set to indicate the error. When the end of the directory is encountered, a null pointer shall be returned and *errno* is not changed.

If successful, the *readdir_r*( ) function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions shall fail if:

[EOVERFLOW] One of the values in the structure to be returned cannot be represented correctly.

These functions may fail if:

[EBADF] The *dirp* argument does not refer to an open directory stream.

[ENOENT] The current position of the directory stream is invalid.

EXAMPLES

The following sample program searches the current directory for each of the arguments supplied on the command line.

```
#include <dirent.h>
#include <errno.h>
#include <stdio.h>
#include <string.h>

static void lookup(const char *arg)
{
    DIR *dirp;
    struct dirent *dp;

    if ((dirp = opendir(".")) == NULL) {
        perror("couldn't open '.'");
        return;
    }

    do {
        errno = 0;
        if ((dp = readdir(dirp)) != NULL) {
            if (strcmp(dp->d_name, arg) != 0)
                continue;

            (void) printf("found %s\n", arg);
            (void) closedir(dirp);
                return;

        }
    } while (dp != NULL);
```

```
        if (errno != 0)
            perror("error reading directory");
        else
            (void) printf("failed to find %s\n", arg);
        (void) closedir(dirp);
        return;
    }

    int main(int argc, char *argv[])
    {
        int i;
        for (i = 1; i < argc; i++)
            lookup(argv[i]);
        return (0);
    }
```

APPLICATION USAGE

The *readdir*( ) function should be used in conjunction with *opendir*( ), *closedir*( ), and *rewinddir*( ) to examine the contents of the directory.

The *readdir_r*( ) function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

The returned value of *readdir*( ) merely *represents* a directory entry. No equivalence should be inferred.

Historical implementations of *readdir*( ) obtain multiple directory entries on a single read operation, which permits subsequent *readdir*( ) operations to operate from the buffered information. Any wording that required each successful *readdir*( ) operation to mark the directory last data access timestamp for update would disallow such historical performance-oriented implementations.

When returning a directory entry for the root of a mounted file system, some historical implementations of *readdir*( ) returned the file serial number of the underlying mount point, rather than of the root of the mounted file system. This behavior is considered to be a bug, since the underlying file serial number has no significance to applications.

Since *readdir*( ) returns NULL when it detects an error and when the end of the directory is encountered, an application that needs to tell the difference must set *errno* to zero before the call and check it if NULL is returned. Since the function must not change *errno* in the second case and must set it to a non-zero value in the first case, a zero *errno* after a call returning NULL indicates end-of-directory; otherwise, an error.

Routines to deal with this problem more directly were proposed:

```
int derror (dirp)
DIR *dirp;
```

```
void clearderr (dirp)
DIR *dirp;
```

The first would indicate whether an error had occurred, and the second would clear the error indication. The simpler method involving *errno* was adopted instead by requiring that *readdir*( ) not change *errno* when end-of-directory is encountered.

An error or signal indicating that a directory has changed while open was considered but rejected.

The thread-safe version of the directory reading function returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call. Either the {NAME_MAX} compile-time constant or the corresponding *pathconf*( ) option can be used to determine the maximum sizes of returned pathnames.

FUTURE DIRECTIONS

None.

XBD **<dirent.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 2.

Issue 5

Large File Summit extensions are added.

The *readdir_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *readdir*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *readdir_r*( ) function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U026/7 is applied, correcting the prototype for *readdir_r*( ).

The Open Group Corrigendum U026/8 is applied, clarifying the wording of the successful return for the *readdir_r*( ) function.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- A statement is added to the DESCRIPTION indicating the disposition of certain fields in **struct dirent** when an entry refers to a symbolic link.
- The [EOVERFLOW] mandatory error condition is added. This change is to support large files.
- The [ENOENT] optional error condition is added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The **restrict** keyword is added to the *readdir_r*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/50 is applied, replacing the EXAMPLES section with a new example.

Issue 7

Austin Group Interpretation 1003.1-2001 #059 is applied, updating the ERRORS section.

Austin Group Interpretation 1003.1-2001 #156 is applied.

The *readdir_r*( ) function is moved from the Thread-Safe Functions option to the Base.

Changes are made related to support for finegrained timestamps.

The value of the *d_ino* member is no longer unspecified for symbolic links.

SD5-XSH-ERN-193 is applied.

NAME

readlink, readlinkat — read the contents of a symbolic link relative to a directory file descriptor

SYNOPSIS

```
#include <unistd.h>

ssize_t readlink(const char *restrict path, char *restrict buf,
    size_t bufsize);
ssize_t readlinkat(int fd, const char *restrict path,
    char *restrict buf, size_t bufsize);
```

DESCRIPTION

The *readlink*( ) function shall place the contents of the symbolic link referred to by *path* in the buffer *buf* which has size *bufsize*. If the number of bytes in the symbolic link is less than *bufsize*, the contents of the remainder of *buf* are unspecified. If the *buf* argument is not large enough to contain the link content, the first *bufsize* bytes shall be placed in *buf*.

If the value of *bufsize* is greater than {SSIZE_MAX}, the result is implementation-defined.

Upon successful completion, *readlink*( ) shall mark for update the last data access timestamp of the symbolic link.

The *readlinkat*( ) function shall be equivalent to the *readlink*( ) function except in the case where *path* specifies a relative path. In this case the symbolic link whose content is read is relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function shall not perform the check.

If *readlinkat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working directory is used and the behavior shall be identical to a call to *readlink*( ).

RETURN VALUE

Upon successful completion, *readlink*( ) shall return the count of bytes placed in the buffer. Otherwise, it shall return a value of –1, leave the buffer unchanged, and set *errno* to indicate the error.

Upon successful completion, the *readlinkat*( ) function shall return 0. Otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

These functions shall fail if:

[EACCES] Search permission is denied for a component of the path prefix of *path*.

[EINVAL] The *path* argument names a file that is not a symbolic link.

[EIO] An I/O error occurred while reading from the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix is not a directory, or the *path* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

The *readlinkat*( ) function shall fail if:

[EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

These functions may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

The *readlinkat*( ) function may fail if:

[ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a file descriptor associated with a directory.

EXAMPLES

Reading the Name of a Symbolic Link

The following example shows how to read the name of a symbolic link named **/modules/pass1**.

```
#include <unistd.h>

char buf[1024];
ssizet_t len;
...
if ((len = readlink("/modules/pass1", buf, sizeof(buf)-1)) != -1)
    buf[len] = '\0';
```

APPLICATION USAGE

Conforming applications should not assume that the returned contents of the symbolic link are null-terminated.

RATIONALE

Since POSIX.1-200x does not require any association of file times with symbolic links, there is no requirement that file times be updated by *readlink*( ). The type associated with *bufsiz* is a **size_t** in order to be consistent with both the ISO C standard and the definition of *read*( ). The behavior specified for *readlink*( ) when *bufsiz* is zero represents historical practice. For this case, the standard developers considered a change whereby *readlink*( ) would return the number of non-null bytes contained in the symbolic link with the buffer *buf* remaining unchanged; however, since the **stat** structure member *st_size* value can be used to determine the size of buffer necessary to contain the contents of the symbolic link as returned by *readlink*( ), this proposal was rejected, and the historical practice retained.

The purpose of the *readlinkat*( ) function is to read the content of symbolic links in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *readlink*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *readlinkat*( ) function it can be guaranteed that the symbolic link read is located relative to the desired directory.

FUTURE DIRECTIONS

None.

fstatat( ), *symlink( )*

XBD **<unistd.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The return type is changed to **ssize_t**, to align with the IEEE P1003.1a draft standard.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- This function is made mandatory.
- In this function it is possible for the return value to exceed the range of the type **ssize_t** (since **size_t** has a larger range of positive values than **ssize_t**). A sentence restricting the size of the **size_t** object is added to the description to resolve this conflict.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The FUTURE DIRECTIONS section is changed to None.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

The **restrict** keyword is added to the *readlink( )* prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

SD5-XSH-ERN-189 is applied, updating the ERRORS section.

The *readlinkat( )* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

The [EACCES] error is removed from the "may fail" error conditions.

Changes are made to allow a directory to be opened for searching.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory. +

NAME

readv — read a vector

SYNOPSIS

XSI

```
#include <sys/uio.h>

ssize_t readv(int fildes, const struct iovec *iov, int iovcnt);
```

DESCRIPTION

The *readv*( ) function shall be equivalent to *read*( ), except as described below. The *readv*( ) function shall place the input data into the *iovcnt* buffers specified by the members of the *iov* array: *iov*[0], *iov*[1], ..., *iov*[*iovcnt*–1]. The *iovcnt* argument is valid if greater than 0 and less than or equal to {IOV_MAX}.

Each *iovec* entry specifies the base address and length of an area in memory where data should be placed. The *readv*( ) function shall always fill an area completely before proceeding to the next.

Upon successful completion, *readv*( ) shall mark for update the last data access timestamp of the file.

RETURN VALUE

Refer to *read*( ).

ERRORS

Refer to *read*( ).

In addition, the *readv*( ) function shall fail if:

[EINVAL] The sum of the *iov_len* values in the *iov* array overflowed an **ssize_t**.

The *readv*( ) function may fail if:

[EINVAL] The *iovcnt* argument was less than or equal to 0, or greater than {IOV_MAX}.

EXAMPLES

Reading Data into an Array

The following example reads data from the file associated with the file descriptor *fd* into the buffers specified by members of the *iov* array.

```
#include <sys/types.h>
#include <sys/uio.h>
#include <unistd.h>
...
ssize_t bytes_read;
int fd;
char buf0[20];
char buf1[30];
char buf2[40];
int iovcnt;
struct iovec iov[3];

iov[0].iov_base = buf0;
iov[0].iov_len = sizeof(buf0);
iov[1].iov_base = buf1;
iov[1].iov_len = sizeof(buf1);
iov[2].iov_base = buf2;
```

```
        iov[2].iov_len = sizeof(buf2);
        ...
        iovcnt = sizeof(iov) / sizeof(struct iovec);
        bytes_read = readv(fd, iov, iovcnt);
        ...
```

APPLICATION USAGE

None.

RATIONALE

Refer to *read( )*.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 6

Split out from the *read( )* reference page.

Issue 7

Changes are made related to support for finegrained timestamps.

NAME

realloc — memory reallocator

SYNOPSIS

```
#include <stdlib.h>

void *realloc(void *ptr, size_t size);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *realloc*( ) function shall change the size of the memory object pointed to by *ptr* to the size specified by *size*. The contents of the object shall remain unchanged up to the lesser of the new and old sizes. If the new size of the memory object would require movement of the object, the space for the previous instantiation of the object is freed. If the new size is larger, the contents of the newly allocated portion of the object are unspecified. If *size* is 0 and *ptr* is not a null pointer, the object pointed to is freed. If the space cannot be allocated, the object shall remain unchanged.

If *ptr* is a null pointer, *realloc*( ) shall be equivalent to *malloc*( ) for the specified size.

If *ptr* does not match a pointer returned earlier by *calloc*( ), *malloc*( ), or *realloc*( ) or if the space has previously been deallocated by a call to *free*( ) or *realloc*( ), the behavior is undefined.

The order and contiguity of storage allocated by successive calls to *realloc*( ) is unspecified. The pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to a pointer to any type of object and then used to access such an object in the space allocated (until the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object disjoint from any other object. The pointer returned shall point to the start (lowest byte address) of the allocated space. If the space cannot be allocated, a null pointer shall be returned.

RETURN VALUE

Upon successful completion with a size not equal to 0, *realloc*( ) shall return a pointer to the (possibly moved) allocated space. If *size* is 0, either a null pointer or a unique pointer that can be successfully passed to *free*( ) shall be returned. If there is not enough available memory, *realloc*( ) CX shall return a null pointer and set *errno* to [ENOMEM].

ERRORS

The *realloc*( ) function shall fail if:

CX [ENOMEM] Insufficient memory is available.

EXAMPLES

None.

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, if there is not enough available memory, the setting of *errno* to [ENOMEM] is added.
- The [ENOMEM] error condition is added.

NAME

realpath — resolve a pathname

SYNOPSIS

XSI
```
#include <stdlib.h>

char *realpath(const char *restrict file_name,
    char *restrict resolved_name);
```

DESCRIPTION

The *realpath*( ) function shall derive, from the pathname pointed to by *file_name*, an absolute pathname that resolves to the same directory entry, whose resolution does not involve `'.'`, `'..'`, or symbolic links. If *resolved_name* is a null pointer, the generated pathname shall be stored as a null-terminated string in a buffer allocated as if by a call to *malloc*( ). Otherwise, if {PATH_MAX} is defined as a constant in the **<limits.h>** header, then the generated pathname shall be stored as a null-terminated string, up to a maximum of {PATH_MAX} bytes, in the buffer pointed to by *resolved_name*.

If *resolved_name* is not a null pointer and {PATH_MAX} is not defined as a constant in the **<limits.h>** header, the behavior is undefined.

RETURN VALUE

Upon successful completion, *realpath*( ) shall return a pointer to the buffer containing the resolved name. Otherwise, *realpath*( ) shall return a null pointer and set *errno* to indicate the error.

If the *resolved_name* argument is a null pointer, the pointer returned by *realpath*( ) can be passed to *free*( ).

If the *resolved_name* argument is not a null pointer and the *realpath*( ) function fails, the contents of the buffer pointed to by *resolved_name* are undefined.

ERRORS

The *realpath*( ) function shall fail if:

[EACCES] Read or search permission was denied for a component of *file_name*.

[EINVAL] The *file_name* argument is a null pointer.

[EIO] An error occurred while reading from the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *file_name* argument.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *file_name* does not name an existing file or *file_name* points to an empty string.

[ENOTDIR] A component of the path prefix is not a directory, or the *file_name* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

The *realpath*( ) function may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *file_name* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[ENOMEM] Insufficient storage space is available.

EXAMPLES

Generating an Absolute Pathname

The following example generates an absolute pathname for the file identified by the *symlinkpath* argument. The generated pathname is stored in the buffer pointed to by *actualpath*.

```
#include <stdlib.h>
...
char *symlinkpath = "/tmp/symlink/file";
char *actualpath;

actualpath = realpath(symlinkpath, NULL);
if (actualpath != NULL)
{
    ... use actualpath ...

    free(actualpath);
}
else
{
    ... handle error ...
}
```

APPLICATION USAGE

For functions that allocate memory as if by *malloc*( ), the application should release such memory when it is no longer required by a call to *free*( ). For *realpath*( ), this is the return value.

RATIONALE

Since *realpath*( ) has no *length* argument, if {PATH_MAX} is not defined as a constant in **<limits.h>**, applications have no way of determining how large a buffer they need to allocate for it to be safe to pass to *realpath*( ). A {PATH_MAX} value obtained from a prior *pathconf*( ) call is out-of-date by the time *realpath*( ) is called. Hence the only reliable way to use *realpath*( ) when {PATH_MAX} is not defined in **<limits.h>** is to pass a null pointer for *resolved_name* so that *realpath*( ) will allocate a buffer of the necessary size.

FUTURE DIRECTIONS

None.

SEE ALSO

fpathconf( ), *free*( ), *getcwd*( ), *sysconf*( )

XBD **<limits.h>**, **<stdlib.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The **restrict** keyword is added to the *realpath*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/51 is applied, adding new text to the DESCRIPTION for the case when *resolved_name* is a null pointer, changing the [EINVAL] error text, adding text to the RATIONALE, and adding text to FUTURE DIRECTIONS.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/110 is applied, updating the ERRORS section to refer to the *file_name* argument, rather than a nonexistent *path* argument.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

This function is updated for passing a null pointer to *realpath*( ) for the *resolved_name* argument.

The APPLICATION USAGE section is updated to clarify that memory is allocated as if by *malloc*( ).

NAME

recv — receive a message from a connected socket

SYNOPSIS

```
#include <sys/socket.h>

ssize_t recv(int socket, void *buffer, size_t length, int flags);
```

DESCRIPTION

The *recv*( ) function shall receive a message from a connection-mode or connectionless-mode socket. It is normally used with connected sockets because it does not permit the application to retrieve the source address of received data.

The *recv*( ) function takes the following arguments:

socket Specifies the socket file descriptor.

buffer Points to a buffer where the message should be stored.

length Specifies the length in bytes of the buffer pointed to by the *buffer* argument.

flags Specifies the type of message reception. Values of this argument are formed by logically OR'ing zero or more of the following values:

MSG_PEEK Peeks at an incoming message. The data is treated as unread and the next *recv*( ) or similar function shall still return this data.

MSG_OOB Requests out-of-band data. The significance and semantics of out-of-band data are protocol-specific.

MSG_WAITALL On SOCK_STREAM sockets this requests that the function block until the full amount of data can be returned. The function may return the smaller amount of data if the socket is a message-based socket, if a signal is caught, if the connection is terminated, if MSG_PEEK was specified, or if an error is pending for the socket.

The *recv*( ) function shall return the length of the message written to the buffer pointed to by the *buffer* argument. For message-based sockets, such as SOCK_DGRAM and SOCK_SEQPACKET, the entire message shall be read in a single operation. If a message is too long to fit in the supplied buffer, and MSG_PEEK is not set in the *flags* argument, the excess bytes shall be discarded. For stream-based sockets, such as SOCK_STREAM, message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it becomes available, and no data shall be discarded.

If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first message.

If no messages are available at the socket and O_NONBLOCK is not set on the socket's file descriptor, *recv*( ) shall block until a message arrives. If no messages are available at the socket and O_NONBLOCK is set on the socket's file descriptor, *recv*( ) shall fail and set *errno* to [EAGAIN] or [EWOULDBLOCK].

RETURN VALUE

Upon successful completion, *recv*( ) shall return the length of the message in bytes. If no messages are available to be received and the peer has performed an orderly shutdown, *recv*( ) shall return 0. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *recv*( ) function shall fail if:

[EAGAIN] or [EWOULDBLOCK]
: The socket's file descriptor is marked O_NONBLOCK and no data is waiting to be received; or MSG_OOB is set and no out-of-band data is available and either the socket's file descriptor is marked O_NONBLOCK or the socket does not support blocking to await out-of-band data.

[EBADF]
: The *socket* argument is not a valid file descriptor.

[ECONNRESET]
: A connection was forcibly closed by a peer.

[EINTR]
: The *recv*( ) function was interrupted by a signal that was caught, before any data was available.

[EINVAL]
: The MSG_OOB flag is set and no out-of-band data is available.

[ENOTCONN]
: A receive is attempted on a connection-mode socket that is not connected.

[ENOTSOCK]
: The *socket* argument does not refer to a socket.

[EOPNOTSUPP]
: The specified flags are not supported for this socket type or protocol.

[ETIMEDOUT]
: The connection timed out during connection establishment, or due to a transmission timeout on active connection.

The *recv*( ) function may fail if:

[EIO]
: An I/O error occurred while reading from or writing to the file system.

[ENOBUFS]
: Insufficient resources were available in the system to perform the operation.

[ENOMEM]
: Insufficient memory was available to fulfill the request.

EXAMPLES

None.

APPLICATION USAGE

The *recv*( ) function is equivalent to *recvfrom*( ) with a zero *address_len* argument, and to *read*( ) if no flags are used.

The *select*( ) and *poll*( ) functions can be used to determine when data is available to be received.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

poll( ), *pselect*( ), *read*( ), *recvmsg*( ), *recvfrom*( ), *send*( ), *sendmsg*( ), *sendto*( ), *shutdown*( ), *socket*( ), *write*( )

XBD **<sys/socket.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

recvfrom — receive a message from a socket

SYNOPSIS

```
#include <sys/socket.h>

ssize_t recvfrom(int socket, void *restrict buffer, size_t length,
    int flags, struct sockaddr *restrict address,
    socklen_t *restrict address_len);
```

DESCRIPTION

The *recvfrom*( ) function shall receive a message from a connection-mode or connectionless-mode socket. It is normally used with connectionless-mode sockets because it permits the application to retrieve the source address of received data.

The *recvfrom*( ) function takes the following arguments:

socket Specifies the socket file descriptor.

buffer Points to the buffer where the message should be stored.

length Specifies the length in bytes of the buffer pointed to by the *buffer* argument.

flags Specifies the type of message reception. Values of this argument are formed by logically OR'ing zero or more of the following values:

MSG_PEEK Peeks at an incoming message. The data is treated as unread and the next *recvfrom*( ) or similar function shall still return this data.

MSG_OOB Requests out-of-band data. The significance and semantics of out-of-band data are protocol-specific.

MSG_WAITALL On SOCK_STREAM sockets this requests that the function block until the full amount of data can be returned. The function may return the smaller amount of data if the socket is a message-based socket, if a signal is caught, if the connection is terminated, if MSG_PEEK was specified, or if an error is pending for the socket.

address A null pointer, or points to a **sockaddr** structure in which the sending address is to be stored. The length and format of the address depend on the address family of the socket.

address_len Specifies the length of the **sockaddr** structure pointed to by the *address* argument.

The *recvfrom*( ) function shall return the length of the message written to the buffer pointed to by the *buffer* argument. For message-based sockets, such as SOCK_RAW, SOCK_DGRAM, and SOCK_SEQPACKET, the entire message shall be read in a single operation. If a message is too long to fit in the supplied buffer, and MSG_PEEK is not set in the *flags* argument, the excess bytes shall be discarded. For stream-based sockets, such as SOCK_STREAM, message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it becomes available, and no data shall be discarded.

If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first message.

Not all protocols provide the source address for messages. If the *address* argument is not a null pointer and the protocol provides the source address of messages, the source address of the

56297 received message shall be stored in the **sockaddr** structure pointed to by the *address* argument,
56298 and the length of this address shall be stored in the object pointed to by the *address_len*
56299 argument.

56300 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,
56301 the stored address shall be truncated.

56302 If the *address* argument is not a null pointer and the protocol does not provide the source address
56303 of messages, the value stored in the object pointed to by *address* is unspecified.

56304 If no messages are available at the socket and O_NONBLOCK is not set on the socket's file
56305 descriptor, *recvfrom*( ) shall block until a message arrives. If no messages are available at the
56306 socket and O_NONBLOCK is set on the socket's file descriptor, *recvfrom*( ) shall fail and set *errno*
56307 to [EAGAIN] or [EWOULDBLOCK].

56308 **RETURN VALUE**

56309 Upon successful completion, *recvfrom*( ) shall return the length of the message in bytes. If no
56310 messages are available to be received and the peer has performed an orderly shutdown,
56311 *recvfrom*( ) shall return 0. Otherwise, the function shall return –1 and set *errno* to indicate the
56312 error.

56313 **ERRORS**

56314 The *recvfrom*( ) function shall fail if:

56315 [EAGAIN] or [EWOULDBLOCK]
56316 The socket's file descriptor is marked O_NONBLOCK and no data is waiting
56317 to be received; or MSG_OOB is set and no out-of-band data is available and
56318 either the socket's file descriptor is marked O_NONBLOCK or the socket does
56319 not support blocking to await out-of-band data.

56320 [EBADF] The *socket* argument is not a valid file descriptor.

56321 [ECONNRESET] A connection was forcibly closed by a peer.

56322 [EINTR] A signal interrupted *recvfrom*( ) before any data was available.

56323 [EINVAL] The MSG_OOB flag is set and no out-of-band data is available.

56324 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

56325 [ENOTSOCK] The *socket* argument does not refer to a socket.

56326 [EOPNOTSUPP] The specified flags are not supported for this socket type.

56327 [ETIMEDOUT] The connection timed out during connection establishment, or due to a
56328 transmission timeout on active connection.

56329 The *recvfrom*( ) function may fail if:

56330 [EIO] An I/O error occurred while reading from or writing to the file system.

56331 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

56332 [ENOMEM] Insufficient memory was available to fulfill the request.

EXAMPLES

None.

APPLICATION USAGE

The *select*( ) and *poll*( ) functions can be used to determine when data is available to be received.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

recvmsg — receive a message from a socket

SYNOPSIS

```
#include <sys/socket.h>

ssize_t recvmsg(int socket, struct msghdr *message, int flags);
```

DESCRIPTION

The *recvmsg*( ) function shall receive a message from a connection-mode or connectionless-mode socket. It is normally used with connectionless-mode sockets because it permits the application to retrieve the source address of received data.

The *recvmsg*( ) function takes the following arguments:

socket Specifies the socket file descriptor.

message Points to a **msghdr** structure, containing both the buffer to store the source address and the buffers for the incoming message. The length and format of the address depend on the address family of the socket. The *msg_flags* member is ignored on input, but may contain meaningful values on output.

flags Specifies the type of message reception. Values of this argument are formed by logically OR'ing zero or more of the following values:

MSG_OOB Requests out-of-band data. The significance and semantics of out-of-band data are protocol-specific.

MSG_PEEK Peeks at the incoming message.

MSG_WAITALL On SOCK_STREAM sockets this requests that the function block until the full amount of data can be returned. The function may return the smaller amount of data if the socket is a message-based socket, if a signal is caught, if the connection is terminated, if MSG_PEEK was specified, or if an error is pending for the socket.

The *recvmsg*( ) function shall receive messages from unconnected or connected sockets and shall return the length of the message.

The *recvmsg*( ) function shall return the total length of the message. For message-based sockets, such as SOCK_DGRAM and SOCK_SEQPACKET, the entire message shall be read in a single operation. If a message is too long to fit in the supplied buffers, and MSG_PEEK is not set in the *flags* argument, the excess bytes shall be discarded, and MSG_TRUNC shall be set in the *msg_flags* member of the **msghdr** structure. For stream-based sockets, such as SOCK_STREAM, message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it becomes available, and no data shall be discarded.

If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first message.

If no messages are available at the socket and O_NONBLOCK is not set on the socket's file descriptor, *recvmsg*( ) shall block until a message arrives. If no messages are available at the socket and O_NONBLOCK is set on the socket's file descriptor, the *recvmsg*( ) function shall fail and set *errno* to [EAGAIN] or [EWOULDBLOCK].

In the **msghdr** structure, the *msg_name* and *msg_namelen* members specify the source address if the socket is unconnected. If the socket is connected, the *msg_name* and *msg_namelen* members shall be ignored. The *msg_name* member may be a null pointer if no names are desired or required. The *msg_iov* and *msg_iovlen* fields are used to specify where the received data shall be

stored. *msg_iov* points to an array of **iovec** structures; *msg_iovlen* shall be set to the dimension of this array. In each **iovec** structure, the *iov_base* field specifies a storage area and the *iov_len* field gives its size in bytes. Each storage area indicated by *msg_iov* is filled with received data in turn until all of the received data is stored or all of the areas have been filled.

Upon successful completion, the *msg_flags* member of the message header shall be the bitwise-inclusive OR of all of the following flags that indicate conditions detected for the received message:

MSG_EOR End-of-record was received (if supported by the protocol).

MSG_OOB Out-of-band data was received.

MSG_TRUNC Normal data was truncated.

MSG_CTRUNC Control data was truncated.

RETURN VALUE

Upon successful completion, *recvmsg*( ) shall return the length of the message in bytes. If no messages are available to be received and the peer has performed an orderly shutdown, *recvmsg*( ) shall return 0. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *recvmsg*( ) function shall fail if:

[EAGAIN] or [EWOULDBLOCK]
The socket's file descriptor is marked O_NONBLOCK and no data is waiting to be received; or MSG_OOB is set and no out-of-band data is available and either the socket's file descriptor is marked O_NONBLOCK or the socket does not support blocking to await out-of-band data.

[EBADF] The *socket* argument is not a valid open file descriptor.

[ECONNRESET] A connection was forcibly closed by a peer.

[EINTR] This function was interrupted by a signal before any data was available.

[EINVAL] The sum of the *iov_len* values overflows a **ssize_t**, or the MSG_OOB flag is set and no out-of-band data is available.

[EMSGSIZE] The *msg_iovlen* member of the **msghdr** structure pointed to by *message* is less than or equal to 0, or is greater than {IOV_MAX}.

[ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

[ENOTSOCK] The *socket* argument does not refer to a socket.

[EOPNOTSUPP] The specified flags are not supported for this socket type.

[ETIMEDOUT] The connection timed out during connection establishment, or due to a transmission timeout on active connection.

The *recvmsg*( ) function may fail if:

[EIO] An I/O error occurred while reading from or writing to the file system.

[ENOBUFS] Insufficient resources were available in the system to perform the operation.

[ENOMEM] Insufficient memory was available to fulfill the request.

EXAMPLES

None.

APPLICATION USAGE

The *select*( ) and *poll*( ) functions can be used to determine when data is available to be received.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD **<sys/socket.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

regcomp, regerror, regexec, regfree — regular expression matching

SYNOPSIS

```
#include <regex.h>

int regcomp(regex_t *restrict preg, const char *restrict pattern,
    int cflags);
size_t regerror(int errcode, const regex_t *restrict preg,
    char *restrict errbuf, size_t errbuf_size);
int regexec(const regex_t *restrict preg, const char *restrict string,
    size_t nmatch, regmatch_t pmatch[restrict], int eflags);
void regfree(regex_t *preg);
```

DESCRIPTION

These functions interpret *basic* and *extended* regular expressions as described in XBD Chapter 9 (on page 181).

The **regex_t** structure is defined in **<regex.h>** and contains at least the following member:

Member Type	Member Name	Description
`size_t`	`re_nsub`	Number of parenthesized subexpressions.

The **regmatch_t** structure is defined in **<regex.h>** and contains at least the following members:

Member Type	Member Name	Description
regoff_t	*rm_so*	Byte offset from start of *string* to start of substring.
regoff_t	*rm_eo*	Byte offset from start of *string* of the first character after the end of substring.

The *regcomp*( ) function shall compile the regular expression contained in the string pointed to by the *pattern* argument and place the results in the structure pointed to by *preg*. The *cflags* argument is the bitwise-inclusive OR of zero or more of the following flags, which are defined in the **<regex.h>** header:

REG_EXTENDED Use Extended Regular Expressions.

REG_ICASE Ignore case in match (see XBD Chapter 9, on page 181).

REG_NOSUB Report only success/fail in *regexec*( ).

REG_NEWLINE Change the handling of <newline> characters, as described in the text.

The default regular expression type for *pattern* is a Basic Regular Expression. The application can specify Extended Regular Expressions using the REG_EXTENDED *cflags* flag.

If the REG_NOSUB flag was not set in *cflags*, then *regcomp*( ) shall set *re_nsub* to the number of parenthesized subexpressions (delimited by `"\(\)"` in basic regular expressions or `"( )"` in extended regular expressions) found in *pattern*.

The *regexec*( ) function compares the null-terminated string specified by *string* with the compiled regular expression *preg* initialized by a previous call to *regcomp*( ). If it finds a match, *regexec*( ) shall return 0; otherwise, it shall return non-zero indicating either no match or an error. The *eflags* argument is the bitwise-inclusive OR of zero or more of the following flags, which are defined in the **<regex.h>** header:

REG_NOTBOL The first character of the string pointed to by *string* is not the beginning of the line. Therefore, the <circumflex> character (`'^'`), when taken as a special character, shall not match the beginning of *string*.

REG_NOTEOL The last character of the string pointed to by *string* is not the end of the line. Therefore, the <dollar-sign> (`'$'`), when taken as a special character, shall not match the end of *string*.

If *nmatch* is 0 or REG_NOSUB was set in the *cflags* argument to *regcomp*( ), then *regexec*( ) shall ignore the *pmatch* argument. Otherwise, the application shall ensure that the *pmatch* argument points to an array with at least *nmatch* elements, and *regexec*( ) shall fill in the elements of that array with offsets of the substrings of *string* that correspond to the parenthesized subexpressions of *pattern*: *pmatch*[*i*].*rm_so* shall be the byte offset of the beginning and *pmatch*[*i*].*rm_eo* shall be one greater than the byte offset of the end of substring *i*. (Subexpression *i* begins at the *i*th matched open parenthesis, counting from 1.) Offsets in *pmatch*[0] identify the substring that corresponds to the entire regular expression. Unused elements of *pmatch* up to *pmatch*[*nmatch*–1] shall be filled with –1. If there are more than *nmatch* subexpressions in *pattern* (*pattern* itself counts as a subexpression), then *regexec*( ) shall still do the match, but shall record only the first *nmatch* substrings.

When matching a basic or extended regular expression, any given parenthesized subexpression of *pattern* might participate in the match of several different substrings of *string*, or it might not match any substring even though the pattern as a whole did match. The following rules shall be used to determine which substrings to report in *pmatch* when matching regular expressions:

1. If subexpression *i* in a regular expression is not contained within another subexpression, and it participated in the match several times, then the byte offsets in *pmatch*[*i*] shall delimit the last such match.
2. If subexpression *i* is not contained within another subexpression, and it did not participate in an otherwise successful match, the byte offsets in *pmatch*[*i*] shall be –1. A subexpression does not participate in the match when:

   `'*'` or `"\{\}"` appears immediately after the subexpression in a basic regular expression, or `'*'`, `'?'`, or `"{}"` appears immediately after the subexpression in an extended regular expression, and the subexpression did not match (matched 0 times)

   or:

   `'|'` is used in an extended regular expression to select this subexpression or another, and the other subexpression matched.
3. If subexpression *i* is contained within another subexpression *j*, and *i* is not contained within any other subexpression that is contained within *j*, and a match of subexpression *j* is reported in *pmatch*[*j*], then the match or non-match of subexpression *i* reported in *pmatch*[*i*] shall be as described in 1. and 2. above, but within the substring reported in *pmatch*[*j*] rather than the whole string. The offsets in *pmatch*[*i*] are still relative to the start of *string*.
4. If subexpression *i* is contained in subexpression *j*, and the byte offsets in *pmatch*[*j*] are –1, then the pointers in *pmatch*[*i*] shall also be –1.
5. If subexpression *i* matched a zero-length string, then both byte offsets in *pmatch*[*i*] shall be the byte offset of the character or null terminator immediately following the zero-length string.

If, when *regexec*( ) is called, the locale is different from when the regular expression was compiled, the result is undefined.

If REG_NEWLINE is not set in *cflags*, then a <newline> in *pattern* or *string* shall be treated as an

ordinary character. If REG_NEWLINE is set, then <newline> shall be treated as an ordinary character except as follows:

1. A <newline> in *string* shall not be matched by a <period> outside a bracket expression or by any form of a non-matching list (see XBD Chapter 9, on page 181).
2. A <circumflex> (`'^'`) in *pattern*, when used to specify expression anchoring (see XBD Section 9.3.8, on page 187), shall match the zero-length string immediately after a <newline> in *string*, regardless of the setting of REG_NOTBOL.
3. A <dollar-sign> (`'$'`) in *pattern*, when used to specify expression anchoring, shall match the zero-length string immediately before a <newline> in *string*, regardless of the setting of REG_NOTEOL.

The *regfree*( ) function frees any memory allocated by *regcomp*( ) associated with *preg*.

The following constants are defined as error return values:

REG_BADBR	Content of `"\{\}"` invalid: not a number, number too large, more than two numbers, first larger than second.
REG_BADPAT	Invalid regular expression.
REG_BADRPT	`'?'`, `'*'`, or `'+'` not preceded by valid regular expression.
REG_EBRACE	`"\{\}"` imbalance.
REG_EBRACK	`"[]"` imbalance.
REG_ECOLLATE	Invalid collating element referenced.
REG_ECTYPE	Invalid character class type referenced.
REG_EESCAPE	Trailing <backslash> character in pattern.
REG_EPAREN	`"\(\)"` or `"()"` imbalance.
REG_ERANGE	Invalid endpoint in range expression.
REG_ESPACE	Out of memory.
REG_ESUBREG	Number in `"\digit"` invalid or in error.
REG_NOMATCH	*regexec*( ) failed to match.

If more than one error occurs in processing a function call, any one of the possible constants may be returned, as the order of detection is unspecified.

The *regerror*( ) function provides a mapping from error codes returned by *regcomp*( ) and *regexec*( ) to unspecified printable strings. It generates a string corresponding to the value of the *errcode* argument, which the application shall ensure is the last non-zero value returned by *regcomp*( ) or *regexec*( ) with the given value of *preg*. If *errcode* is not such a value, the content of the generated string is unspecified.

If *preg* is a null pointer, but *errcode* is a value returned by a previous call to *regexec*( ) or *regcomp*( ), the *regerror*( ) still generates an error string corresponding to the value of *errcode*, but it might not be as detailed under some implementations.

If the *errbuf_size* argument is not 0, *regerror*( ) shall place the generated string into the buffer of size *errbuf_size* bytes pointed to by *errbuf*. If the string (including the terminating null) cannot fit in the buffer, *regerror*( ) shall truncate the string and null-terminate the result.

If *errbuf_size* is 0, *regerror*( ) shall ignore the *errbuf* argument, and return the size of the buffer

needed to hold the generated string.

If the *preg* argument to *regexec*( ) or *regfree*( ) is not a compiled regular expression returned by *regcomp*( ), the result is undefined. A *preg* is no longer treated as a compiled regular expression after it is given to *regfree*( ).

RETURN VALUE

Upon successful completion, the *regcomp*( ) function shall return 0. Otherwise, it shall return an integer value indicating an error as described in **<regex.h>**, and the content of *preg* is undefined. If a code is returned, the interpretation shall be as given in **<regex.h>**.

If *regcomp*( ) detects an invalid RE, it may return REG_BADPAT, or it may return one of the error codes that more precisely describes the error.

Upon successful completion, the *regexec*( ) function shall return 0. Otherwise, it shall return REG_NOMATCH to indicate no match.

Upon successful completion, the *regerror*( ) function shall return the number of bytes needed to hold the entire generated string, including the null termination. If the return value is greater than *errbuf_size*, the string returned in the buffer pointed to by *errbuf* has been truncated.

The *regfree*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

```
#include <regex.h>

/*
 * Match string against the extended regular expression in
 * pattern, treating errors as no match.
 *
 * Return 1 for match, 0 for no match.
 */

int
match(const char *string, char *pattern)
{
    int    status;
    regex_t    re;

    if (regcomp(&re, pattern, REG_EXTENDED|REG_NOSUB) != 0) {
        return(0);      /* Report error. */
    }
    status = regexec(&re, string, (size_t) 0, NULL, 0);
    regfree(&re);
    if (status != 0) {
        return(0);      /* Report error. */
    }
    return(1);
}
```

The following demonstrates how the REG_NOTBOL flag could be used with *regexec*( ) to find all substrings in a line that match a pattern supplied by a user. (For simplicity of the example, very little error checking is done.)

```
(void) regcomp (&re, pattern, 0);
```

```
/* This call to regexec() finds the first match on the line. */
error = regexec (&re, &buffer[0], 1, &pm, 0);
while (error == 0) {  /* While matches found. */
    /* Substring found between pm.rm_so and pm.rm_eo. */
    /* This call to regexec() finds the next match. */
    error = regexec (&re, buffer + pm.rm_eo, 1, &pm, REG_NOTBOL);
}
```

APPLICATION USAGE

An application could use:

```
regerror(code,preg,(char *)NULL,(size_t)0)
```

to find out how big a buffer is needed for the generated string, *malloc*( ) a buffer to hold the string, and then call *regerror*( ) again to get the string. Alternatively, it could allocate a fixed, static buffer that is big enough to hold most strings, and then use *malloc*( ) to allocate a larger buffer if it finds that this is too small.

To match a pattern as described in XCU Section 2.13 (on page 2332), use the *fnmatch*( ) function.

RATIONALE

The *regexec*( ) function must fill in all *nmatch* elements of *pmatch*, where *nmatch* and *pmatch* are supplied by the application, even if some elements of *pmatch* do not correspond to subexpressions in *pattern*. The application developer should note that there is probably no reason for using a value of *nmatch* that is larger than *preg*–>*re_nsub*+1.

The REG_NEWLINE flag supports a use of RE matching that is needed in some applications like text editors. In such applications, the user supplies an RE asking the application to find a line that matches the given expression. An anchor in such an RE anchors at the beginning or end of any line. Such an application can pass a sequence of <newline>-separated lines to *regexec*( ) as a single long string and specify REG_NEWLINE to *regcomp*( ) to get the desired behavior. The application must ensure that there are no explicit <newline> characters in *pattern* if it wants to ensure that any match occurs entirely within a single line.

The REG_NEWLINE flag affects the behavior of *regexec*( ), but it is in the *cflags* parameter to *regcomp*( ) to allow flexibility of implementation. Some implementations will want to generate the same compiled RE in *regcomp*( ) regardless of the setting of REG_NEWLINE and have *regexec*( ) handle anchors differently based on the setting of the flag. Other implementations will generate different compiled REs based on the REG_NEWLINE.

The REG_ICASE flag supports the operations taken by the *grep* **–i** option and the historical implementations of *ex* and *vi*. Including this flag will make it easier for application code to be written that does the same thing as these utilities.

The substrings reported in *pmatch*[ ] are defined using offsets from the start of the string rather than pointers. This allows type-safe access to both constant and non-constant strings.

The type **regoff_t** is used for the elements of *pmatch*[ ] to ensure that the application can represent large arrays in memory (important for an application conforming to the Shell and Utilities volume of POSIX.1-200x).

The 1992 edition of this standard required **regoff_t** to be at least as wide as **off_t**, to facilitate future extensions in which the string to be searched is taken from a file. However, these future extensions have not appeared. The requirement rules out popular implementations with 32-bit **regoff_t** and 64-bit **off_t**, so it has been removed.

The standard developers rejected the inclusion of a *regsub*( ) function that would be used to do substitutions for a matched RE. While such a routine would be useful to some applications, its

utility would be much more limited than the matching function described here. Both RE parsing and substitution are possible to implement without support other than that required by the ISO C standard, but matching is much more complex than substituting. The only difficult part of substitution, given the information supplied by *regexec*( ), is finding the next character in a string when there can be multi-byte characters. That is a much larger issue, and one that needs a more general solution.

The *errno* variable has not been used for error returns to avoid filling the *errno* name space for this feature.

The interface is defined so that the matched substrings *rm_sp* and *rm_ep* are in a separate **regmatch_t** structure instead of in **regex_t**. This allows a single compiled RE to be used simultaneously in several contexts; in *main*( ) and a signal handler, perhaps, or in multiple threads of lightweight processes. (The *preg* argument to *regexec*( ) is declared with type **const**, so the implementation is not permitted to use the structure to store intermediate results.) It also allows an application to request an arbitrary number of substrings from an RE. The number of subexpressions in the RE is reported in *re_nsub* in *preg*. With this change to *regexec*( ), consideration was given to dropping the REG_NOSUB flag since the user can now specify this with a zero *nmatch* argument to *regexec*( ). However, keeping REG_NOSUB allows an implementation to use a different (perhaps more efficient) algorithm if it knows in *regcomp*( ) that no subexpressions need be reported. The implementation is only required to fill in *pmatch* if *nmatch* is not zero and if REG_NOSUB is not specified. Note that the **size_t** type, as defined in the ISO C standard, is unsigned, so the description of *regexec*( ) does not need to address negative values of *nmatch*.

REG_NOTBOL was added to allow an application to do repeated searches for the same pattern in a line. If the pattern contains a <circumflex> character that should match the beginning of a line, then the pattern should only match when matched against the beginning of the line. Without the REG_NOTBOL flag, the application could rewrite the expression for subsequent matches, but in the general case this would require parsing the expression. The need for REG_NOTEOL is not as clear; it was added for symmetry.

The addition of the *regerror*( ) function addresses the historical need for conforming application programs to have access to error information more than "Function failed to compile/match your RE for unknown reasons".

This interface provides for two different methods of dealing with error conditions. The specific error codes (REG_EBRACE, for example), defined in **<regex.h>**, allow an application to recover from an error if it is so able. Many applications, especially those that use patterns supplied by a user, will not try to deal with specific error cases, but will just use *regerror*( ) to obtain a human-readable error message to present to the user.

The *regerror*( ) function uses a scheme similar to *confstr*( ) to deal with the problem of allocating memory to hold the generated string. The scheme used by *strerror*( ) in the ISO C standard was considered unacceptable since it creates difficulties for multi-threaded applications.

The *preg* argument is provided to *regerror*( ) to allow an implementation to generate a more descriptive message than would be possible with *errcode* alone. An implementation might, for example, save the character offset of the offending character of the pattern in a field of *preg*, and then include that in the generated message string. The implementation may also ignore *preg*.

A REG_FILENAME flag was considered, but omitted. This flag caused *regexec*( ) to match patterns as described in XCU Section 2.13 (on page 2332) instead of REs. This service is now provided by the *fnmatch*( ) function.

Notice that there is a difference in philosophy between the ISO POSIX-2: 1993 standard and

POSIX.1-200x in how to handle a "bad" regular expression. The ISO POSIX-2: 1993 standard says that many bad constructs "produce undefined results", or that "the interpretation is undefined". POSIX.1-200x, however, says that the interpretation of such REs is unspecified. The term "undefined" means that the action by the application is an error, of similar severity to passing a bad pointer to a function.

The *regcomp*( ) and *regexec*( ) functions are required to accept any null-terminated string as the *pattern* argument. If the meaning of the string is "undefined", the behavior of the function is "unspecified". POSIX.1-200x does not specify how the functions will interpret the pattern; they might return error codes, or they might do pattern matching in some completely unexpected way, but they should not do something like abort the process.

FUTURE DIRECTIONS

None.

SEE ALSO

fnmatch( ), *glob*( )

XBD Chapter 9 (on page 181), **<regex.h>**, **<sys/types.h>**

XCU Section 2.13 (on page 2332)

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 5

Moved from POSIX2 C-language Binding to BASE.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

The normative text is updated to avoid use of the term "must" for application requirements.

The REG_ENOSYS constant is removed.

The **restrict** keyword is added to the *regcomp*( ), *regerror*( ), and *regexec*( ) prototypes for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #134 is applied, clarifying that if more than one error occurs in processing a function call, any one of the possible constants may be returned.

SD5-XBD-ERN-60 is applied.

NAME

remainder, remainderf, remainderl — remainder function

SYNOPSIS

```
#include <math.h>

double remainder(double x, double y);
float remainderf(float x, float y);
long double remainderl(long double x, long double y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall return the floating-point remainder $r=x-ny$ when y is non-zero. The value n is the integral value nearest the exact value x/y. When $|n-x/y|=\frac{1}{2}$, the value n is chosen to be even.

The behavior of *remainder*( ) shall be independent of the rounding mode.

RETURN VALUE

Upon successful completion, these functions shall return the floating-point remainder $r=x-ny$ when y is non-zero.

On systems that do not support the IEC 60559 Floating-Point option, if y is zero, it is implementation-defined whether a domain error occurs or zero is returned.

MX If x or y is NaN, a NaN shall be returned.

If x is infinite or y is 0 and the other is non-NaN, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

ERRORS

These functions shall fail if:

MX Domain Error — The x argument is ±Inf, or the y argument is ±0 and the other argument is non-NaN.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Domain Error — The y argument is zero.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.19 (on page 116), **<math.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The *remainder*( ) function is no longer marked as an extension.

The *remainderf*( ) and *remainderl*( ) functions are added for alignment with the ISO/IEC 9899: 1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899: 1999 standard.

IEC 60559: 1989 standard floating-point extensions over the ISO/IEC 9899: 1999 standard are marked.

Issue 7

ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #55 (SD5-XSH-ERN-82) is applied.

NAME

remove — remove a file

SYNOPSIS

```
#include <stdio.h>

int remove(const char *path);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *remove*( ) function shall cause the file named by the pathname pointed to by *path* to be no longer accessible by that name. A subsequent attempt to open that file using that name shall fail, unless it is created anew.

CX If *path* does not name a directory, *remove*(*path*) shall be equivalent to *unlink*(*path*).

If *path* names a directory, *remove*(*path*) shall be equivalent to *rmdir*(*path*).

RETURN VALUE

CX Refer to *rmdir*( ) or *unlink*( ).

ERRORS

CX Refer to *rmdir*( ) or *unlink*( ).

EXAMPLES

Removing Access to a File

The following example shows how to remove access to a file named **/home/cnd/old_mods**.

```
#include <stdio.h>

int status;
...
status = remove("/home/cnd/old_mods");
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

rmdir( ), *unlink*( )

XBD **<stdio.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ISO C standard.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION, RETURN VALUE, and ERRORS sections are updated so that if *path* is not a directory, *remove*( ) is equivalent to *unlink*( ), and if it is a directory, it is equivalent to *rmdir*( ).

NAME

remque — remove an element from a queue

SYNOPSIS

XSI

```
#include <search.h>

void remque(void *element);
```

DESCRIPTION

Refer to *insque( )*.

NAME

remquo, remquof, remquol — remainder functions

SYNOPSIS

```
#include <math.h>

double remquo(double x, double y, int *quo);
float remquof(float x, float y, int *quo);
long double remquol(long double x, long double y, int *quo);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *remquo*( ), *remquof*( ), and *remquol*( ) functions shall compute the same remainder as the *remainder*( ), *remainderf*( ), and *remainderl*( ) functions, respectively. In the object pointed to by *quo*, they store a value whose sign is the sign of x/y and whose magnitude is congruent modulo 2^n to the magnitude of the integral quotient of x/y, where n is an implementation-defined integer greater than or equal to 3. If y is zero, the value stored in the object pointed to by *quo* is unspecified.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

These functions shall return x REM y.

On systems that do not support the IEC 60559 Floating-Point option, if y is zero, it is implementation-defined whether a domain error occurs or zero is returned.

MX If x or y is NaN, a NaN shall be returned.

If x is ±Inf or y is zero and the other argument is non-NaN, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

ERRORS

These functions shall fail if:

MX

Domain Error	The x argument is ±Inf, or the y argument is ±0 and the other argument is non-NaN. If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Domain Error	The y argument is zero. If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

These functions are intended for implementing argument reductions which can exploit a few low-order bits of the quotient. Note that *x* may be so large in magnitude relative to *y* that an exact representation of the quotient is not practical.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

Issue 7

ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #56 (SD5-XSH-ERN-83) is applied.

NAME

rename, renameat — rename file relative to directory file descriptor

SYNOPSIS

```
#include <stdio.h>

int rename(const char *old, const char *new);
CX int renameat(int oldfd, const char *old, int newfd,
        const char *new);
```

DESCRIPTION

CX For *rename*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *rename*( ) function shall change the name of a file. The *old* argument points to the pathname CX of the file to be renamed. The *new* argument points to the new pathname of the file. If the *new* argument does not resolve to an existing directory entry for a file of type directory and the *new* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters after all symbolic links have been processed, *rename*( ) shall fail.

If either the *old* or *new* argument names a symbolic link, *rename*( ) shall operate on the symbolic link itself, and shall not resolve the last component of the argument. If the *old* argument and the *new* argument resolve to either the same existing directory entry or different directory entries for the same existing file, *rename*( ) shall return successfully and perform no other action.

If the *old* argument points to the pathname of a file that is not a directory, the *new* argument shall not point to the pathname of a directory. If the link named by the *new* argument exists, it shall be removed and *old* renamed to *new*. In this case, a link named *new* shall remain visible to other processes throughout the renaming operation and refer either to the file referred to by *new* or *old* before the operation began. Write access permission is required for both the directory containing *old* and the directory containing *new*.

If the *old* argument points to the pathname of a directory, the *new* argument shall not point to the pathname of a file that is not a directory. If the directory named by the *new* argument exists, it shall be removed and *old* renamed to *new*. In this case, a link named *new* shall exist throughout the renaming operation and shall refer either to the directory referred to by *new* or *old* before the operation began. If *new* names an existing directory, it shall be required to be an empty directory.

If either *pathname* argument refers to a path whose final component is either dot or dot-dot, *rename*( ) shall fail.

If the *old* argument points to a pathname of a symbolic link, the symbolic link shall be renamed. If the *new* argument points to a pathname of a symbolic link, the symbolic link shall be removed.

The *old* pathname shall not name an ancestor directory of the *new* pathname. Write access permission is required for the directory containing *old* and the directory containing *new*. If the *old* argument points to the pathname of a directory, write access permission may be required for the directory named by *old*, and, if it exists, the directory named by *new*.

If the link named by the *new* argument exists and the file's link count becomes 0 when it is removed and no process has the file open, the space occupied by the file shall be freed and the file shall no longer be accessible. If one or more processes have the file open when the last link is removed, the link shall be removed before *rename*( ) returns, but the removal of the file contents shall be postponed until all references to the file are closed.

Upon successful completion, *rename*( ) shall mark for update the last data modification and last

file status change timestamps of the parent directory of each file.

If the *rename*( ) function fails for any reason other than [EIO], any file named by *new* shall be unaffected.

The *renameat*( ) function shall be equivalent to the *rename*( ) function except in the case where either *old* or *new* specifies a relative path. If *old* is a relative path, the file to be renamed is located relative to the directory associated with the file descriptor *oldfd* instead of the current working directory. If *new* is a relative path, the same happens only relative to the directory associated with *newfd*. If the file descriptor was opened without O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function shall not perform the check.

If *renameat*( ) is passed the special value AT_FDCWD in the *oldfd* or *newfd* parameter, the current working directory shall be used in the determination of the file for the respective *path* parameter.

RETURN VALUE

CX Upon successful completion, the *rename*( ) function shall return 0. Otherwise, it shall return –1, *errno* shall be set to indicate the error, and neither the file named by *old* nor the file named by *new* shall be changed or created.

CX Upon successful completion, the *renameat*( ) function shall return 0. Otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

CX The *rename*( ) and *renameat*( ) functions shall fail if:

CX [EACCES] A component of either path prefix denies search permission; or one of the directories containing *old* or *new* denies write permissions; or, write permission is required and is denied for a directory pointed to by the *old* or *new* arguments.

CX [EBUSY] The directory named by *old* or *new* is currently in use by the system or another process, and the implementation considers this an error.

CX [EEXIST] or [ENOTEMPTY]
The link named by *new* is a directory that is not an empty directory.

CX [EINVAL] The *old* pathname names an ancestor directory of the *new* pathname, or either *pathname* argument contains a final component that is dot or dot-dot.

CX [EIO] A physical I/O error has occurred.

CX [EISDIR] The *new* argument points to a directory and the *old* argument points to a file that is not a directory.

CX [ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

CX [EMLINK] The file named by *old* is a directory, and the link count of the parent directory of *new* would exceed {LINK_MAX}.

CX [ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

CX [ENOENT] The link named by *old* does not name an existing file, a component of the path prefix of *new* does not exist, or either *old* or *new* points to an empty string.

CX [ENOSPC] The directory that would contain *new* cannot be extended.

CX [ENOTDIR] A component of either path prefix is not a directory; or the *old* argument names a directory and the *new* argument names a non-directory file; or the *old* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory; or the *new* argument names a nonexistant file, contains at least one non-<slash> character, and ends with one or more trailing <slash> characters.

XSI [EPERM] or [EACCES]
The S_ISVTX flag is set on the directory containing the file referred to by *old* and the process does not satisfy the criteria specified in XBD Section 4.2 (on page 107) with respect to *old*; or *new* refers to an existing file, the S_ISVTX flag is set on the directory containing this file, and the process does not satisfy the criteria specified in XBD Section 4.2 with respect to this file.

CX [EROFS] The requested operation requires writing in a directory on a read-only file system.

CX [EXDEV] The links named by *new* and *old* are on different file systems and the implementation does not support links between file systems.

CX In addition, the *renameat( )* function shall fail if:

[EACCES] *oldfd* or *newfd* was not opened with O_SEARCH and the permissions of the directory underlying *oldfd* or *newfd* respectively do not permit directory searches.

[EBADF] The *old* argument does not specify an absolute path and the *oldfd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching, or the *new* argument does not specify an absolute path and the *newfd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

CX The *rename( )* and *renameat( )* functions may fail if:

OB XSR [EBUSY] The file named by the *old* or *new* arguments is a named STREAM.

CX [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

CX [ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

CX [ETXTBSY] The file to be renamed is a pure procedure (shared text) file that is being executed.

CX The *renameat( )* function may fail if:

[ENOTDIR] The *old* argument is not an absolute path and *oldfd* is neither AT_FDCWD nor a file descriptor associated with a directory, or the *new* argument is not an absolute path and *newfd* is neither AT_FDCWD nor a file descriptor associated with a directory.

EXAMPLES

Renaming a File

The following example shows how to rename a file named **/home/cnd/mod1** to **/home/cnd/mod2**.

```
#include <stdio.h>

int status;
...
status = rename("/home/cnd/mod1", "/home/cnd/mod2");
```

APPLICATION USAGE

Some implementations mark for update the last file status change timestamp of renamed files and some do not. Applications which make use of the last file status change timestamp may behave differently with respect to renamed files unless they are designed to allow for either behavior.

RATIONALE

This *rename*( ) function is equivalent for regular files to that defined by the ISO C standard. Its inclusion here expands that definition to include actions on directories and specifies behavior when the *new* parameter names a file that already exists. That specification requires that the action of the function be atomic.

One of the reasons for introducing this function was to have a means of renaming directories while permitting implementations to prohibit the use of *link*( ) and *unlink*( ) with directories, thus constraining links to directories to those made by *mkdir*( ).

The specification that if *old* and *new* refer to the same file is intended to guarantee that:

```
rename("x", "x");
```

does not remove the file.

Renaming dot or dot-dot is prohibited in order to prevent cyclical file system paths.

See also the descriptions of [ENOTEMPTY] and [ENAMETOOLONG] in *rmdir*( ) and [EBUSY] in *unlink*( ). For a discussion of [EXDEV], see *link*( ).

The purpose of the *renameat*( ) function is to rename files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *rename*( ), resulting in unspecified behavior. By opening file descriptors for the source and target directories and using the *renameat*( ) function it can be guaranteed that that renamed file is located correctly and the resulting file is in the desired directory.

FUTURE DIRECTIONS

None.

link( ), *rmdir*( ), *symlink*( ), *unlink*( )

XBD Section 4.2 (on page 107), **<stdio.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The [EBUSY] error is added to the optional part of the ERRORS section.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] mandatory error condition is added.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Details are added regarding the treatment of symbolic links.
- The [ELOOP] optional error condition is added.

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #016 is applied, changing the definition of the [ENOTDIR] error.

Austin Group Interpretation 1003.1-2001 #076 is applied, clarifying the behavior if the final component of a path is either dot or dot-dot, and adding the associated [EINVAL] error case.

Austin Group Interpretation 1003.1-2001 #143 is applied.

Austin Group Interpretation 1003.1-2001 #145 is applied, clarifying that the [ENOENT] error condition also applies to the case in which a component of *new* does not exist.

Austin Group Interpretations 1003.1-2001 #174 and #181 are applied.

The *renameat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

NAME

rewind — reset the file position indicator in a stream

SYNOPSIS

```
#include <stdio.h>

void rewind(FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The call:

```
rewind(stream)
```

shall be equivalent to:

```
(void) fseek(stream, 0L, SEEK_SET)
```

except that *rewind*( ) shall also clear the error indicator.

CX Since *rewind*( ) does not return a value, an application wishing to detect errors should clear *errno*, then call *rewind*( ), and if *errno* is non-zero, assume an error has occurred.

RETURN VALUE

The *rewind*( ) function shall not return a value.

ERRORS

CX Refer to *fseek*( ) with the exception of [EINVAL] which does not apply.

EXAMPLES

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

NAME

rewinddir — reset the position of a directory stream to the beginning of a directory

SYNOPSIS

```
#include <dirent.h>

void rewinddir(DIR *dirp);
```

DESCRIPTION

The *rewinddir*( ) function shall reset the position of the directory stream to which *dirp* refers to the beginning of the directory. It shall also cause the directory stream to refer to the current state of the corresponding directory, as a call to *opendir*( ) would have done. If *dirp* does not refer to a directory stream, the effect is undefined.

After a call to the *fork*( ) function, either the parent or child (but not both) may continue processing the directory stream using *readdir*( ), *rewinddir*( ), or *seekdir*( ). If both the parent and child processes use these functions, the result is undefined.

XSI

RETURN VALUE

The *rewinddir*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The *rewinddir*( ) function should be used in conjunction with *opendir*( ), *readdir*( ), and *closedir*( ) to examine the contents of the directory. This method is recommended for portability.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

closedir( ), *fdopendir*( ), *readdir*( )

XBD **<dirent.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 2.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

NAME

rint, rintf, rintl — round-to-nearest integral value

SYNOPSIS

```
#include <math.h>

double rint(double x);
float rintf(float x);
long double rintl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall return the integral value (represented as a **double**) nearest *x* in the direction of the current rounding mode. The current rounding mode is implementation-defined.

If the current rounding mode rounds toward negative infinity, then *rint*( ) shall be equivalent to *floor*( ). If the current rounding mode rounds toward positive infinity, then *rint*( ) shall be equivalent to *ceil*( ).

These functions differ from the *nearbyint*( ), *nearbyintf*( ), and *nearbyintl*( ) functions only in that they may raise the inexact floating-point exception if the result differs in value from the argument.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the integer (represented as a double precision number) nearest *x* in the direction of the current rounding mode.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0 or ±Inf, *x* shall be returned.

XSI If the correct value would cause overflow, a range error shall occur and *rint*( ), *rintf*( ), and *rintl*( ) shall return the value of the macro ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (with the same sign as *x*), respectively.

ERRORS

These functions shall fail if:

XSI

Range Error	The result would cause an overflow.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XBD Section 4.19 (on page 116), **<math.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The *rintf*( ) and *rintl*( ) functions are added.
- The *rint*( ) function is no longer marked as an extension.
- The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899: 1999 standard.

  IEC 60559: 1989 standard floating-point extensions over the ISO/IEC 9899: 1999 standard are marked.

NAME

rmdir — remove a directory

SYNOPSIS

```
#include <unistd.h>

int rmdir(const char *path);
```

DESCRIPTION

The *rmdir*( ) function shall remove a directory whose name is given by *path*. The directory shall be removed only if it is an empty directory.

If the directory is the root directory or the current working directory of any process, it is unspecified whether the function succeeds, or whether it shall fail and set *errno* to [EBUSY].

If *path* names a symbolic link, then *rmdir*( ) shall fail and set *errno* to [ENOTDIR].

If the *path* argument refers to a path whose final component is either dot or dot-dot, *rmdir*( ) shall fail.

If the directory's link count becomes 0 and no process has the directory open, the space occupied by the directory shall be freed and the directory shall no longer be accessible. If one or more processes have the directory open when the last link is removed, the dot and dot-dot entries, if present, shall be removed before *rmdir*( ) returns and no new entries may be created in the directory, but the directory shall not be removed until all references to the directory are closed.

If the directory is not an empty directory, *rmdir*( ) shall fail and set *errno* to [EEXIST] or [ENOTEMPTY].

Upon successful completion, *rmdir*( ) shall mark for update the last data modification and last file status change timestamps of the parent directory.

RETURN VALUE

Upon successful completion, the function *rmdir*( ) shall return 0. Otherwise, –1 shall be returned, and *errno* set to indicate the error. If –1 is returned, the named directory shall not be changed.

ERRORS

The *rmdir*( ) function shall fail if:

[EACCES] Search permission is denied on a component of the path prefix, or write permission is denied on the parent directory of the directory to be removed.

[EBUSY] The directory to be removed is currently in use by the system or some process and the implementation considers this to be an error.

[EEXIST] or [ENOTEMPTY]
The *path* argument names a directory that is not an empty directory, or there are hard links to the directory other than dot or a single entry in dot-dot.

[EINVAL] The *path* argument contains a last component that is dot.

[EIO] A physical I/O error has occurred.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file, or the *path* argument names a nonexistent directory or points to an empty string.

[ENOTDIR] A component of *path* is not a directory.

XSI [EPERM] or [EACCES]
The S_ISVTX flag is set on the directory containing the file referred to by the *path* argument and the process does not satisfy the criteria specified in XBD Section 4.2 (on page 107).

[EROFS] The directory entry to be removed resides on a read-only file system.

The *rmdir*( ) function may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

EXAMPLES

Removing a Directory

The following example shows how to remove a directory named **/home/cnd/mod1**.

```
#include <unistd.h>

int status;
...
status = rmdir("/home/cnd/mod1");
```

APPLICATION USAGE

None.

RATIONALE

The *rmdir*( ) and *rename*( ) functions originated in 4.2 BSD, and they used [ENOTEMPTY] for the condition when the directory to be removed does not exist or *new* already exists. When the 1984 /usr/group standard was published, it contained [EEXIST] instead. When these functions were adopted into System V, the 1984 /usr/group standard was used as a reference. Therefore, several existing applications and implementations support/use both forms, and no agreement could be reached on either value. All implementations are required to supply both [EEXIST] and [ENOTEMPTY] in **<errno.h>** with distinct values, so that applications can use both values in C-language **case** statements.

The meaning of deleting *pathname***/dot** is unclear, because the name of the file (directory) in the parent directory to be removed is not clear, particularly in the presence of multiple links to a directory.

The POSIX.1-1990 standard was silent with regard to the behavior of *rmdir*( ) when there are multiple hard links to the directory being removed. The requirement to set *errno* to [EEXIST] or [ENOTEMPTY] clarifies the behavior in this case.

If the current working directory of the process is being removed, that should be an allowed error.

Virtually all existing implementations detect [ENOTEMPTY] or the case of dot-dot. The text in Section 2.3 (on page 477) about returning any one of the possible errors permits that behavior to continue. The [ELOOP] error may be returned if more than {SYMLOOP_MAX} symbolic links are encountered during resolution of the *path* argument.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to indicate the results of naming a symbolic link in *path*.
- The [EIO] mandatory error condition is added.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

Austin Group Interpretation 1003.1-2001 #181 is applied, updating the requirements for operations when the S_ISVTX bit is set.

Changes are made related to support for finegrained timestamps.

NAME

round, roundf, roundl — round to the nearest integer value in a floating-point format

SYNOPSIS

```
#include <math.h>

double round(double x);
float roundf(float x);
long double roundl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall round their argument to the nearest integer value in floating-point format, rounding halfway cases away from zero, regardless of the current rounding direction.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the rounded integer value.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0 or ±Inf, *x* shall be returned.

XSI If the correct value would cause overflow, a range error shall occur and *round*( ), *roundf*( ), and *roundl*( ) shall return the value of the macro ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (with the same sign as *x*), respectively.

ERRORS

These functions may fail if:

XSI

Range Error	The result overflows.
	If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

scalbln, scalblnf, scalblnl, scalbn, scalbnf, scalbnl — compute exponent using FLT_RADIX

SYNOPSIS

```
#include <math.h>

double scalbln(double x, long n);
float scalblnf(float x, long n);
long double scalblnl(long double x, long n);
double scalbn(double x, int n);
float scalbnf(float x, int n);
long double scalbnl(long double x, int n);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute $x * \text{FLT\_RADIX}^n$ efficiently, not normally by computing FLT_RADIX^n explicitly.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return $x * \text{FLT\_RADIX}^n$.

If the result would cause overflow, a range error shall occur and these functions shall return ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (according to the sign of *x*) as appropriate for the return type of the function.

If the correct value would cause underflow, and is not representable, a range error may occur, and MX either 0.0 (if supported), or an implementation-defined value shall be returned.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0 or ±Inf, *x* shall be returned.

If *n* is 0, *x* shall be returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

ERRORS

These functions shall fail if:

Range Error — The result overflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

Range Error — The result underflows.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression

(*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

These functions are named so as to avoid conflicting with the historical definition of the *scalb*( ) function from the Single UNIX Specification. The difference is that the *scalb*( ) function has a second argument of **double** instead of **int**. The *scalb*( ) function is not part of the ISO C standard. The three functions whose second type is **long** are provided because the factor required to scale from the smallest positive floating-point value to the largest finite one, on many implementations, is too large to represent in the minimum-width **int** format.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

57463 **NAME**

57464 scandir — scan a directory

57465 **SYNOPSIS**

57466 ```
#include <dirent.h>
```

57467 ```
int scandir(const char *dir, struct dirent ***namelist,
    int (*sel)(const struct dirent *),
57468     int (*compar)(const struct dirent **, const struct dirent **));
```

57469 **DESCRIPTION**

57470 Refer to *alphasort( )*.

57472 **NAME**

57473 scanf — convert formatted input

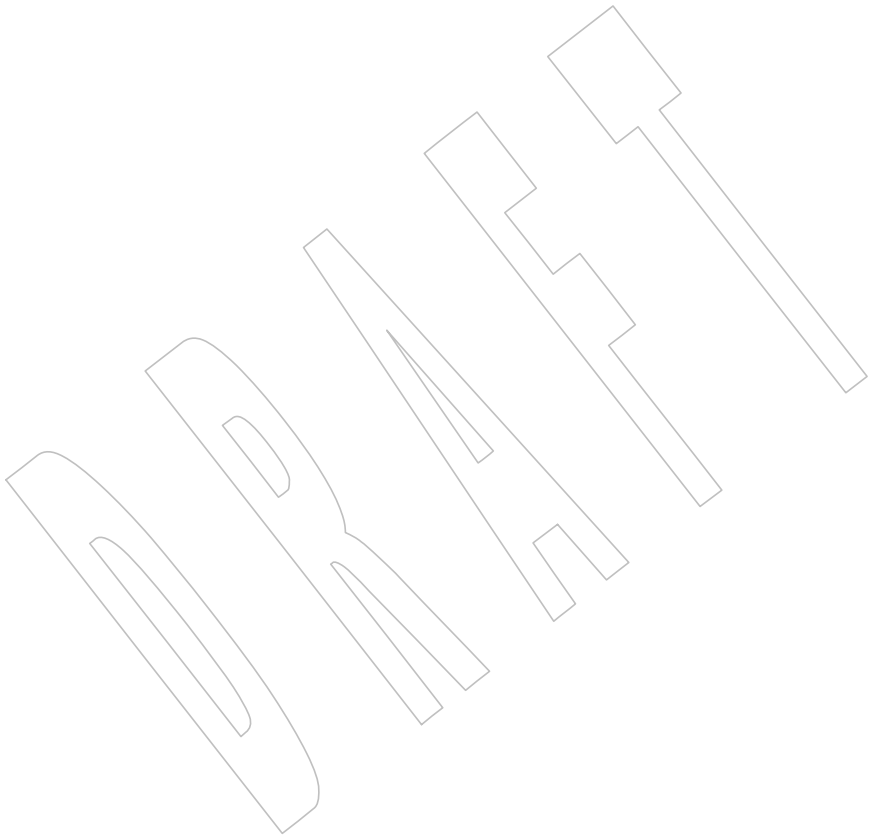
57474 **SYNOPSIS**

57475
```
#include <stdio.h>
```

57476
```
int scanf(const char *restrict format, ...);
```

57477 **DESCRIPTION**

57478 Refer to *fscanf( )*.



NAME

sched_get_priority_max, sched_get_priority_min — get priority limits (**REALTIME**)

SYNOPSIS

PS | TPS

```
#include <sched.h>

int sched_get_priority_max(int policy);
int sched_get_priority_min(int policy);
```

DESCRIPTION

The *sched_get_priority_max*( ) and *sched_get_priority_min*( ) functions shall return the appropriate maximum or minimum, respectively, for the scheduling policy specified by *policy*.

The value of *policy* shall be one of the scheduling policy values defined in **<sched.h>**.

RETURN VALUE

If successful, the *sched_get_priority_max*( ) and *sched_get_priority_min*( ) functions shall return the appropriate maximum or minimum values, respectively. If unsuccessful, they shall return a value of –1 and set *errno* to indicate the error.

ERRORS

The *sched_get_priority_max*( ) and *sched_get_priority_min*( ) functions shall fail if:

[EINVAL] The value of the *policy* parameter does not represent a defined scheduling policy.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

These functions are marked as part of the Process Scheduling option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Process Scheduling option.

The [ESRCH] error condition has been removed since these functions do not take a *pid* argument.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/52 is applied, changing the PS margin code in the SYNOPSIS to PS | TPS.

NAME

sched_getparam — get scheduling parameters (**REALTIME**)

SYNOPSIS

PS
```
#include <sched.h>

int sched_getparam(pid_t pid, struct sched_param *param);
```

DESCRIPTION

The *sched_getparam*( ) function shall return the scheduling parameters of a process specified by *pid* in the **sched_param** structure pointed to by *param*.

If a process specified by *pid* exists, and if the calling process has permission, the scheduling parameters for the process whose process ID is equal to *pid* shall be returned.

If *pid* is zero, the scheduling parameters for the calling process shall be returned. The behavior of the *sched_getparam*( ) function is unspecified if the value of *pid* is negative.

RETURN VALUE

Upon successful completion, the *sched_getparam*( ) function shall return zero. If the call to *sched_getparam*( ) is unsuccessful, the function shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *sched_getparam*( ) function shall fail if:

[EPERM] The requesting process does not have permission to obtain the scheduling parameters of the specified process.

[ESRCH] No process can be found corresponding to that specified by *pid*.

NAME

sched_getscheduler — get scheduling policy (**REALTIME**)

SYNOPSIS

PS
```
#include <sched.h>

int sched_getscheduler(pid_t pid);
```

DESCRIPTION

The *sched_getscheduler*( ) function shall return the scheduling policy of the process specified by *pid*. If the value of *pid* is negative, the behavior of the *sched_getscheduler*( ) function is unspecified.

The values that can be returned by *sched_getscheduler*( ) are defined in the **<sched.h>** header.

If a process specified by *pid* exists, and if the calling process has permission, the scheduling policy shall be returned for the process whose process ID is equal to *pid*.

If *pid* is zero, the scheduling policy shall be returned for the calling process.

RETURN VALUE

Upon successful completion, the *sched_getscheduler*( ) function shall return the scheduling policy of the specified process. If unsuccessful, the function shall return –1 and set *errno* to indicate the error.

ERRORS

The *sched_getscheduler*( ) function shall fail if:

[EPERM] The requesting process does not have permission to determine the scheduling policy of the specified process.

[ESRCH] No process can be found corresponding to that specified by *pid*.

NAME

sched_rr_get_interval — get execution time limits (**REALTIME**)

SYNOPSIS

PS | TPS

```
#include <sched.h>

int sched_rr_get_interval(pid_t pid, struct timespec *interval);
```

DESCRIPTION

The *sched_rr_get_interval*( ) function shall update the **timespec** structure referenced by the *interval* argument to contain the current execution time limit (that is, time quantum) for the process specified by *pid*. If *pid* is zero, the current execution time limit for the calling process shall be returned.

RETURN VALUE

If successful, the *sched_rr_get_interval*( ) function shall return zero. Otherwise, it shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *sched_rr_get_interval*( ) function shall fail if:

[ESRCH] No process can be found corresponding to that specified by *pid*.

NAME

sched_setparam — set scheduling parameters (**REALTIME**)

SYNOPSIS

PS
```
#include <sched.h>

int sched_setparam(pid_t pid, const struct sched_param *param);
```

DESCRIPTION

The *sched_setparam*( ) function shall set the scheduling parameters of the process specified by *pid* to the values specified by the **sched_param** structure pointed to by *param*. The value of the *sched_priority* member in the **sched_param** structure shall be any integer within the inclusive priority range for the current scheduling policy of the process specified by *pid*. Higher numerical values for the priority represent higher priorities. If the value of *pid* is negative, the behavior of the *sched_setparam*( ) function is unspecified.

If a process specified by *pid* exists, and if the calling process has permission, the scheduling parameters shall be set for the process whose process ID is equal to *pid*.

If *pid* is zero, the scheduling parameters shall be set for the calling process.

The conditions under which one process has permission to change the scheduling parameters of another process are implementation-defined.

Implementations may require the requesting process to have appropriate privileges to set its own scheduling parameters or those of another process.

See Scheduling Policies (on page 501) for a description on how this function affects the scheduling of the threads within the target process.

SS If the current scheduling policy for the target process is not SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC, the result is implementation-defined; this case includes the SCHED_OTHER policy.

SS The specified *sched_ss_repl_period* shall be greater than or equal to the specified *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail.

The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the function to succeed; if not, the function shall fail. It is unspecified whether the *sched_ss_repl_period* and *sched_ss_init_budget* values are stored as provided by this function or are rounded to align with the resolution of the clock being used.

This function is not atomic with respect to other threads in the process. Threads may continue to execute while this function call is in the process of changing the scheduling policy for the underlying kernel-scheduled entities used by the process contention scope threads.

RETURN VALUE

If successful, the *sched_setparam*( ) function shall return zero.

If the call to *sched_setparam*( ) is unsuccessful, the priority shall remain unchanged, and the function shall return a value of –1 and set *errno* to indicate the error.

ERRORS

The *sched_setparam*( ) function shall fail if:

[EINVAL] One or more of the requested scheduling parameters is outside the range defined for the scheduling policy of the specified *pid*.

[EPERM] The requesting process does not have permission to set the scheduling parameters for the specified process, or does not have appropriate privileges to invoke *sched_setparam*( ).

[ESRCH] No process can be found corresponding to that specified by *pid*.

EXAMPLES

None.

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *sched_setparam*( ) function is marked as part of the Process Scheduling option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Process Scheduling option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the effect of this function on a thread's scheduling parameters is added.
- Sections describing two-level scheduling and atomicity of the function are added.

The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #100 is applied.

Issue 7

Austin Group Interpretation 1003.1-2001 #061 is applied, updating the DESCRIPTION.

Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements for the *sched_ss_repl_period* and *sched_ss_init_budget* values.

NAME

sched_setscheduler — set scheduling policy and parameters (**REALTIME**)

SYNOPSIS

PS
```
#include <sched.h>

int sched_setscheduler(pid_t pid, int policy,
    const struct sched_param *param);
```

DESCRIPTION

The *sched_setscheduler*( ) function shall set the scheduling policy and scheduling parameters of the process specified by *pid* to *policy* and the parameters specified in the **sched_param** structure pointed to by *param*, respectively. The value of the *sched_priority* member in the **sched_param** structure shall be any integer within the inclusive priority range for the scheduling policy specified by *policy*. If the value of *pid* is negative, the behavior of the *sched_setscheduler*( ) function is unspecified.

The possible values for the *policy* parameter are defined in the **<sched.h>** header.

If a process specified by *pid* exists, and if the calling process has permission, the scheduling policy and scheduling parameters shall be set for the process whose process ID is equal to *pid*.

If *pid* is zero, the scheduling policy and scheduling parameters shall be set for the calling process.

The conditions under which one process has appropriate privileges to change the scheduling parameters of another process are implementation-defined.

Implementations may require that the requesting process have permission to set its own scheduling parameters or those of another process. Additionally, implementation-defined restrictions may apply as to the appropriate privileges required to set the scheduling policy of the process, or the scheduling policy of another process, to a particular value.

The *sched_setscheduler*( ) function shall be considered successful if it succeeds in setting the scheduling policy and scheduling parameters of the process specified by *pid* to the values specified by *policy* and the structure pointed to by *param*, respectively.

See Scheduling Policies (on page 501) for a description on how this function affects the scheduling of the threads within the target process.

SS If the current scheduling policy for the target process is not SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC, the result is implementation-defined; this case includes the SCHED_OTHER policy.

SS The specified *sched_ss_repl_period* shall be greater than or equal to the specified *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail.

The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the function to succeed; if not, the function shall fail. It is unspecified whether the *sched_ss_repl_period* and *sched_ss_init_budget* values are stored as provided by this function or are rounded to align with the resolution of the clock being used.

This function is not atomic with respect to other threads in the process. Threads may continue to execute while this function call is in the process of changing the scheduling policy and associated scheduling parameters for the underlying kernel-scheduled entities used by the process contention scope threads.

RETURN VALUE

Upon successful completion, the function shall return the former scheduling policy of the specified process. If the *sched_setscheduler*( ) function fails to complete successfully, the policy and scheduling parameters shall remain unchanged, and the function shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *sched_setscheduler*( ) function shall fail if:

[EINVAL] The value of the *policy* parameter is invalid, or one or more of the parameters contained in *param* is outside the valid range for the specified scheduling policy.

[EPERM] The requesting process does not have permission to set either or both of the scheduling parameters or the scheduling policy of the specified process.

[ESRCH] No process can be found corresponding to that specified by *pid*.

EXAMPLES

None.

APPLICATION USAGE

None.

NAME

sched_yield — yield the processor

SYNOPSIS

```
#include <sched.h>

int sched_yield(void);
```

DESCRIPTION

The *sched_yield*( ) function shall force the running thread to relinquish the processor until it again becomes the head of its thread list. It takes no arguments.

RETURN VALUE

The *sched_yield*( ) function shall return 0 if it completes successfully; otherwise, it shall return a value of –1 and set *errno* to indicate the error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The conceptual model for scheduling semantics in POSIX.1-200x defines a set of thread lists. This set of thread lists is always present regardless of the scheduling options supported by the system. On a system where the Process Scheduling option is not supported, portable applications should not make any assumptions regarding whether threads from other processes will be on the same thread list.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XBD **<sched.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Issue 6

The *sched_yield*( ) function is now marked as part of the Process Scheduling and Threads options.

Issue 7

SD5-XSH-ERN-120 is applied, adding APPLICATION USAGE.

The *sched_yield*( ) function is moved to the Base.

NAME

seed48 — seed a uniformly distributed pseudo-random non-negative long integer generator

SYNOPSIS

XSI

```
#include <stdlib.h>

unsigned short *seed48(unsigned short seed16v[3]);
```

DESCRIPTION

Refer to *drand48( )*.

NAME

seekdir — set the position of a directory stream

SYNOPSIS

XSI

```
#include <dirent.h>

void seekdir(DIR *dirp, long loc);
```

DESCRIPTION

The *seekdir*( ) function shall set the position of the next *readdir*( ) operation on the directory stream specified by *dirp* to the position specified by *loc*. The value of *loc* should have been returned from an earlier call to *telldir*( ) using the same directory stream. The new position reverts to the one associated with the directory stream when *telldir*( ) was performed.

If the value of *loc* was not obtained from an earlier call to *telldir*( ), or if a call to *rewinddir*( ) occurred between the call to *telldir*( ) and the call to *seekdir*( ), the results of subsequent calls to *readdir*( ) are unspecified.

RETURN VALUE

The *seekdir*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The original standard developers perceived that there were restrictions on the use of the *seekdir*( ) and *telldir*( ) functions related to implementation details, and for that reason these functions need not be supported on all POSIX-conforming systems. They are required on implementations supporting the XSI option.

One of the perceived problems of implementation is that returning to a given point in a directory is quite difficult to describe formally, in spite of its intuitive appeal, when systems that use B-trees, hashing functions, or other similar mechanisms to order their directories are considered. The definition of *seekdir*( ) and *telldir*( ) does not specify whether, when using these interfaces, a given directory entry will be seen at all, or more than once.

On systems not supporting these functions, their capability can sometimes be accomplished by saving a filename found by *readdir*( ) and later using *rewinddir*( ) and a loop on *readdir*( ) to relocate the position from which the filename was saved.

FUTURE DIRECTIONS

None.

SEE ALSO

fdopendir( ), *readdir*( ), *telldir*( )

XBD **<dirent.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 2.

Issue 6

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

Issue 7

SD5-XSH-ERN-200 is applied, updating the DESCRIPTION to note that the value of *loc* should have been returned from an earlier call to *telldir*( ) using the same directory stream.

57875 **NAME**

57876 select — synchronous I/O multiplexing

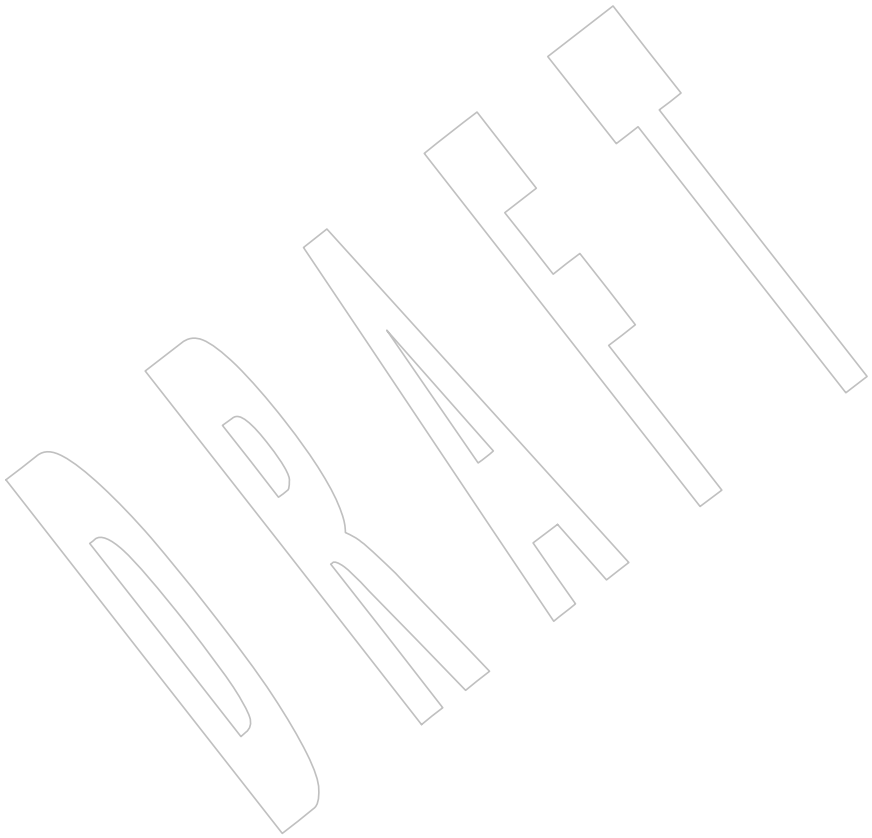
57877 **SYNOPSIS**

57878 ```
#include <sys/select.h>
```

57879 ```
int select(int nfds, fd_set *restrict readfds,
    fd_set *restrict writefds, fd_set *restrict errorfds,
    struct timeval *restrict timeout);
```

57882 **DESCRIPTION**

57883 Refer to *pselect( )*.



57884 **NAME**

57885 sem_close — close a named semaphore

57886 **SYNOPSIS**

57887 `#include <semaphore.h>`

57888 `int sem_close(sem_t *sem);`

57889 **DESCRIPTION**

57890 The *sem_close*( ) function shall indicate that the calling process is finished using the named
57891 semaphore indicated by *sem*. The effects of calling *sem_close*( ) for an unnamed semaphore (one
57892 created by *sem_init*( )) are undefined. The *sem_close*( ) function shall deallocate (that is, make
57893 available for reuse by a subsequent *sem_open*( ) by this process) any system resources allocated
57894 by the system for use by this process for this semaphore. The effect of subsequent use of the
57895 semaphore indicated by *sem* by this process is undefined. If the semaphore has not been
57896 removed with a successful call to *sem_unlink*( ), then *sem_close*( ) has no effect on the state of the
57897 semaphore. If the *sem_unlink*( ) function has been successfully invoked for *name* after the most
57898 recent call to *sem_open*( ) with O_CREAT for this semaphore, then when all processes that have
57899 opened the semaphore close it, the semaphore is no longer accessible.

57900 **RETURN VALUE**

57901 Upon successful completion, a value of zero shall be returned. Otherwise, a value of –1 shall be
57902 returned and *errno* set to indicate the error.

57903 **ERRORS**

57904 The *sem_close*( ) function may fail if:

57905 [EINVAL] The *sem* argument is not a valid semaphore descriptor.

57906 **EXAMPLES**

57907 None.

57908 **APPLICATION USAGE**

57909 The *sem_close*( ) function is part of the Semaphores option and need not be available on all
57910 implementations.

57911 **RATIONALE**

57912 None.

57913 **FUTURE DIRECTIONS**

57914 None.

57918 **CHANGE HISTORY**

57919 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

57920 **Issue 6**

57921 The *sem_close*( ) function is marked as part of the Semaphores option.

57922 The [ENOSYS] error condition has been removed as stubs need not be provided if an
57923 implementation does not support the Semaphores option.

57924 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/113 is applied, updating the ERRORS
57925 section so that the [EINVAL] error becomes optional.

57926 **Issue 7**
57927 The *sem_close*( ) function is moved from the Semaphores option to the Base.

NAME

sem_destroy — destroy an unnamed semaphore

SYNOPSIS

```
#include <semaphore.h>

int sem_destroy(sem_t *sem);
```

DESCRIPTION

The *sem_destroy*( ) function shall destroy the unnamed semaphore indicated by *sem*. Only a semaphore that was created using *sem_init*( ) may be destroyed using *sem_destroy*( ); the effect of calling *sem_destroy*( ) with a named semaphore is undefined. The effect of subsequent use of the semaphore *sem* is undefined until *sem* is reinitialized by another call to *sem_init*( ).

It is safe to destroy an initialized semaphore upon which no threads are currently blocked. The effect of destroying a semaphore upon which other threads are currently blocked is undefined.

RETURN VALUE

Upon successful completion, a value of zero shall be returned. Otherwise, a value of –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *sem_destroy*( ) function may fail if:

[EINVAL] The *sem* argument is not a valid semaphore.

[EBUSY] There are currently processes blocked on the semaphore.

EXAMPLES

None.

APPLICATION USAGE

The *sem_destroy*( ) function is part of the Semaphores option and need not be available on all implementations.

Issue 6

The *sem_destroy*( ) function is marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/114 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

57967 **Issue 7**
57968 The *sem_destroy*( ) function is moved from the Semaphores option to the Base.

NAME

sem_getvalue — get the value of a semaphore

SYNOPSIS

```
#include <semaphore.h>

int sem_getvalue(sem_t *restrict sem, int *restrict sval);
```

DESCRIPTION

The *sem_getvalue*( ) function shall update the location referenced by the *sval* argument to have the value of the semaphore referenced by *sem* without affecting the state of the semaphore. The updated value represents an actual semaphore value that occurred at some unspecified time during the call, but it need not be the actual value of the semaphore when it is returned to the calling process.

If *sem* is locked, then the object to which *sval* points shall either be set to zero or to a negative number whose absolute value represents the number of processes waiting for the semaphore at some unspecified time during the call.

RETURN VALUE

Upon successful completion, the *sem_getvalue*( ) function shall return a value of zero. Otherwise, it shall return a value of –1 and set *errno* to indicate the error.

ERRORS

The *sem_getvalue*( ) function may fail if:

[EINVAL] The *sem* argument does not refer to a valid semaphore.

EXAMPLES

None.

APPLICATION USAGE

The *sem_getvalue*( ) function is part of the Semaphores option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *sem_getvalue*( ) function is marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

The *sem_timedwait*( ) function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *sem_getvalue*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/54 is applied.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/115 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

Issue 7

The *sem_getvalue*( ) function is moved from the Semaphores option to the Base.

58016 **NAME**

58017 sem_init — initialize an unnamed semaphore

58018 **SYNOPSIS**

58019 `#include <semaphore.h>`

58020 `int sem_init(sem_t *sem, int pshared, unsigned value);`

58021 **DESCRIPTION**

58022 The *sem_init*( ) function shall initialize the unnamed semaphore referred to by *sem*. The value of
58023 the initialized semaphore shall be *value*. Following a successful call to *sem_init*( ), the semaphore
58024 may be used in subsequent calls to *sem_wait*( ), *sem_timedwait*( ), *sem_trywait*( ), *sem_post*( ), and
58025 *sem_destroy*( ). This semaphore shall remain usable until the semaphore is destroyed.

58026 If the *pshared* argument has a non-zero value, then the semaphore is shared between processes;
58027 in this case, any process that can access the semaphore *sem* can use *sem* for performing
58028 *sem_wait*( ), *sem_timedwait*( ), *sem_trywait*( ), *sem_post*( ), and *sem_destroy*( ) operations.

58029 Only *sem* itself may be used for performing synchronization. The result of referring to copies of
58030 *sem* in calls to *sem_wait*( ), *sem_timedwait*( ), *sem_trywait*( ), *sem_post*( ), and *sem_destroy*( ) is
58031 undefined.

58032 If the *pshared* argument is zero, then the semaphore is shared between threads of the process; any
58033 thread in this process can use *sem* for performing *sem_wait*( ), *sem_timedwait*( ), *sem_trywait*( ),
58034 *sem_post*( ), and *sem_destroy*( ) operations. The use of the semaphore by threads other than those
58035 created in the same process is undefined.

58036 Attempting to initialize an already initialized semaphore results in undefined behavior.

58037 **RETURN VALUE**

58038 Upon successful completion, the *sem_init*( ) function shall initialize the semaphore in *sem* and
58039 return 0. Otherwise, it shall return –1 and set *errno* to indicate the error.

58040 **ERRORS**

58041 The *sem_init*( ) function shall fail if:

58042 [EINVAL] The *value* argument exceeds {SEM_VALUE_MAX}.

58043 [ENOSPC] A resource required to initialize the semaphore has been exhausted, or the
58044 limit on semaphores ({SEM_NSEMS_MAX}) has been reached.

58045 [EPERM] The process lacks appropriate privileges to initialize the semaphore.

58046 **EXAMPLES**

58047 None.

58048 **APPLICATION USAGE**

58049 The *sem_init*( ) function is part of the Semaphores option and need not be available on all
58050 implementations.

58051 **RATIONALE**

58052 None.

58053 **FUTURE DIRECTIONS**

58054 None.

58055 **SEE ALSO**

58056 *sem_destroy*( ), *sem_post*( ), *sem_timedwait*( ), *sem_trywait*( )

58057 XBD **<semaphore.h>**

58058 **CHANGE HISTORY**

58059 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

58060 **Issue 6**

58061 The *sem_init*( ) function is marked as part of the Semaphores option.

58062 The [ENOSYS] error condition has been removed as stubs need not be provided if an
58063 implementation does not support the Semaphores option.

58064 The *sem_timedwait*( ) function is added to the SEE ALSO section for alignment with IEEE Std
58065 1003.1d-1999.

58066 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/116 is applied, updating the
58067 DESCRIPTION to add the *sem_timedwait*( ) function for alignment with IEEE Std 1003.1d-1999.

58068 **Issue 7**

58069 SD5-XSH-ERN-176 is applied.

58070 The *sem_init*( ) function is moved from the Semaphores option to the Base.

58071 **NAME**

58072 sem_open — initialize and open a named semaphore

58073 **SYNOPSIS**

58074 ```
#include <semaphore.h>
```

58075 ```
sem_t *sem_open(const char *name, int oflag, ...);
```

58076 **DESCRIPTION**

58077 The *sem_open*( ) function shall establish a connection between a named semaphore and a process.
58078 Following a call to *sem_open*( ) with semaphore name *name*, the process may reference the
58079 semaphore associated with *name* using the address returned from the call. This semaphore may
58080 be used in subsequent calls to *sem_wait*( ), *sem_timedwait*( ), *sem_trywait*( ), *sem_post*( ), and
58081 *sem_close*( ). The semaphore remains usable by this process until the semaphore is closed by a
58082 successful call to *sem_close*( ), *_exit*( ), or one of the *exec* functions.

58083 The *oflag* argument controls whether the semaphore is created or merely accessed by the call to
58084 *sem_open*( ). The following flag bits may be set in *oflag*:

58085 O_CREAT This flag is used to create a semaphore if it does not already exist. If O_CREAT is
58086 set and the semaphore already exists, then O_CREAT has no effect, except as noted
58087 under O_EXCL. Otherwise, *sem_open*( ) creates a named semaphore. The O_CREAT
58088 flag requires a third and a fourth argument: *mode*, which is of type **mode_t**, and
58089 *value*, which is of type **unsigned**. The semaphore is created with an initial value of
58090 *value*. Valid initial values for semaphores are less than or equal to
58091 {SEM_VALUE_MAX}.

58092 The user ID of the semaphore shall be set to the effective user ID of the process.
58093 The group ID of the semaphore shall be set to the effective group ID of the process;
58094 however, if the *name* argument is visible in the file system, the group ID may be set
58095 to the group ID of the containing directory. The permission bits of the semaphore
58096 are set to the value of the *mode* argument except those set in the file mode creation
58097 mask of the process. When bits in *mode* other than the file permission bits are
58098 specified, the effect is unspecified.

58099 After the semaphore named *name* has been created by *sem_open*( ) with the
58100 O_CREAT flag, other processes can connect to the semaphore by calling
58101 *sem_open*( ) with the same value of *name*.

58102 O_EXCL If O_EXCL and O_CREAT are set, *sem_open*( ) fails if the semaphore *name* exists.
58103 The check for the existence of the semaphore and the creation of the semaphore if it
58104 does not exist are atomic with respect to other processes executing *sem_open*( ) with
58105 O_EXCL and O_CREAT set. If O_EXCL is set and O_CREAT is not set, the effect is
58106 undefined.

58107 If flags other than O_CREAT and O_EXCL are specified in the *oflag* parameter, the
58108 effect is unspecified.

58109 The *name* argument points to a string naming a semaphore object. It is unspecified whether the
58110 name appears in the file system and is visible to functions that take pathnames as arguments.
58111 The *name* argument conforms to the construction rules for a pathname, except that the
58112 interpretation of <slash> characters other than the leading <slash> character in *name* is
58113 implementation-defined, and that the length limits for the *name* argument are implementation-
58114 defined and need not be the same as the pathname limits {PATH_MAX} and {NAME_MAX}. If
58115 *name* begins with the <slash> character, then processes calling *sem_open*( ) with the same value of
58116 *name* shall refer to the same semaphore object, as long as that name has not been removed. If
58117 *name* does not begin with the <slash> character, the effect is implementation-defined.

If a process makes multiple successful calls to *sem_open*( ) with the same value for *name*, the same semaphore address shall be returned for each such successful call, provided that there have been no calls to *sem_unlink*( ) for this semaphore, and at least one previous successful *sem_open*( ) call for this semaphore has not been matched with a *sem_close*( ) call.

References to copies of the semaphore produce undefined results.

RETURN VALUE

Upon successful completion, the *sem_open*( ) function shall return the address of the semaphore. Otherwise, it shall return a value of SEM_FAILED and set *errno* to indicate the error. The symbol SEM_FAILED is defined in the **<semaphore.h>** header. No successful return from *sem_open*( ) shall return the value SEM_FAILED.

ERRORS

If any of the following conditions occur, the *sem_open*( ) function shall return SEM_FAILED and set *errno* to the corresponding value:

[EACCES] The named semaphore exists and the permissions specified by *oflag* are denied, or the named semaphore does not exist and permission to create the named semaphore is denied.

[EEXIST] O_CREAT and O_EXCL are set and the named semaphore already exists.

[EINTR] The *sem_open*( ) operation was interrupted by a signal.

[EINVAL] The *sem_open*( ) operation is not supported for the given name, or O_CREAT was specified in *oflag* and *value* was greater than {SEM_VALUE_MAX}.

[EMFILE] Too many semaphore descriptors or file descriptors are currently in use by this process.

[ENFILE] Too many semaphores are currently open in the system.

[ENOENT] O_CREAT is not set and the named semaphore does not exist.

[ENOMEM] There is insufficient memory for the creation of the new named semaphore.

[ENOSPC] There is insufficient space on a storage device for the creation of the new named semaphore.

If any of the following conditions occur, the *sem_open*( ) function may return SEM_FAILED and set *errno* to the corresponding value:

[ENAMETOOLONG]
The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI systems, or has a pathname component that is longer than {_POSIX_NAME_MAX} on systems that do not support the XSI option or longer than {_XOPEN_NAME_MAX} on XSI systems.

EXAMPLES

None.

APPLICATION USAGE

The *sem_open*( ) function is part of the Semaphores option and need not be available on all implementations.

RATIONALE

Early drafts required an error return value of –1 with the type **sem_t** * for the *sem_open*( ) function, which is not guaranteed to be portable across implementations. The revised text provides the symbolic error code SEM_FAILED to eliminate the type conflict.

FUTURE DIRECTIONS

A future version might require the *sem_open*( ) and *sem_unlink*( ) functions to have semantics similar to normal file system operations.

XBD **<semaphore.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *sem_open*( ) function is marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

The *sem_timedwait*( ) function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/117 is applied, updating the DESCRIPTION to add the *sem_timedwait*( ) function for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/118 is applied, updating the DESCRIPTION to describe the conditions to return the same semaphore address on a call to *sem_open*( ). The words "and at least one previous successful *sem_open*( ) call for this semaphore has not been matched with a *sem_close*( ) call" are added.

Issue 7

Austin Group Interpretation 1003.1-2001 #066 is applied, updating the [ENOSPC] error case and adding the [ENOMEM] error case.

Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and adding [ENAMETOOLONG] as a "may fail" error.

Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the user ID and group ID of the semaphore.

The *sem_open*( ) function is moved from the Semaphores option to the Base.

NAME

sem_post — unlock a semaphore

SYNOPSIS

```
#include <semaphore.h>

int sem_post(sem_t *sem);
```

DESCRIPTION

The *sem_post*( ) function shall unlock the semaphore referenced by *sem* by performing a semaphore unlock operation on that semaphore.

If the semaphore value resulting from this operation is positive, then no threads were blocked waiting for the semaphore to become unlocked; the semaphore value is simply incremented.

If the value of the semaphore resulting from this operation is zero, then one of the threads blocked waiting for the semaphore shall be allowed to return successfully from its call to *sem_wait*( ). PS If the Process Scheduling option is supported, the thread to be unblocked shall be chosen in a manner appropriate to the scheduling policies and parameters in effect for the blocked threads. In the case of the schedulers SCHED_FIFO and SCHED_RR, the highest priority waiting thread shall be unblocked, and if there is more than one highest priority thread blocked waiting for the semaphore, then the highest priority thread that has been waiting the longest shall be unblocked. If the Process Scheduling option is not defined, the choice of a thread to unblock is unspecified.

SS If the Process Sporadic Server option is supported, and the scheduling policy is SCHED_SPORADIC, the semantics are as per SCHED_FIFO above.

The *sem_post*( ) function shall be async-signal-safe and may be invoked from a signal-catching function.

RETURN VALUE

If successful, the *sem_post*( ) function shall return zero; otherwise, the function shall return –1 and set *errno* to indicate the error.

ERRORS

The *sem_post*( ) function may fail if:

[EINVAL] The *sem* argument does not refer to a valid semaphore.

EXAMPLES

See *sem_timedwait*( ).

APPLICATION USAGE

The *sem_post*( ) function is part of the Semaphores option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.11 (on page 110), **<semaphore.h>**

58232 **CHANGE HISTORY**

58233 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

58234 **Issue 6**

58235 The *sem_post*( ) function is marked as part of the Semaphores option.

58236 The [ENOSYS] error condition has been removed as stubs need not be provided if an
58237 implementation does not support the Semaphores option.

58238 The *sem_timedwait*( ) function is added to the SEE ALSO section for alignment with IEEE Std
58239 1003.1d-1999.

58240 SCHED_SPORADIC is added to the list of scheduling policies for which the thread that is to be
58241 unblocked is specified for alignment with IEEE Std 1003.1d-1999.

58242 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/119 is applied, updating the ERRORS
58243 section so that the [EINVAL] error becomes optional.

58244 **Issue 7**

58245 Austin Group Interpretation 1003.1-2001 #156 is applied.

58246 The *sem_post*( ) function is moved from the Semaphores option to the Base.

58247 **NAME**

58248 sem_timedwait — lock a semaphore

58249 **SYNOPSIS**

58250 ```
#include <semaphore.h>
```

58251 ```
#include <time.h>
```

58252 ```
int sem_timedwait(sem_t *restrict sem,
```

58253 ```
    const struct timespec *restrict abstime);
```

58254 **DESCRIPTION**

58255 The *sem_timedwait*( ) function shall lock the semaphore referenced by *sem* as in the *sem_wait*( )
58256 function. However, if the semaphore cannot be locked without waiting for another process or
58257 thread to unlock the semaphore by performing a *sem_post*( ) function, this wait shall be
58258 terminated when the specified timeout expires.

58259 The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the
58260 clock on which timeouts are based (that is, when the value of that clock equals or exceeds
58261 *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the
58262 call.

58263 The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall
58264 be the resolution of the clock on which it is based. The **timespec** data type is defined as a
58265 structure in the **<time.h>** header.

58266 Under no circumstance shall the function fail with a timeout if the semaphore can be locked
58267 immediately. The validity of the *abstime* need not be checked if the semaphore can be locked
58268 immediately.

58269 **RETURN VALUE**

58270 The *sem_timedwait*( ) function shall return zero if the calling process successfully performed the
58271 semaphore lock operation on the semaphore designated by *sem*. If the call was unsuccessful, the
58272 state of the semaphore shall be unchanged, and the function shall return a value of −1 and set
58273 *errno* to indicate the error.

58274 **ERRORS**

58275 The *sem_timedwait*( ) function shall fail if:

58276 [EINVAL] The process or thread would have blocked, and the *abstime* parameter
58277 specified a nanoseconds field value less than zero or greater than or equal to
58278 1 000 million.

58279 [ETIMEDOUT] The semaphore could not be locked before the specified timeout expired.

58280 The *sem_timedwait*( ) function may fail if:

58281 [EDEADLK] A deadlock condition was detected.

58282 [EINTR] A signal interrupted this function.

58283 [EINVAL] The *sem* argument does not refer to a valid semaphore.

EXAMPLES

The program shown below operates on an unnamed semaphore. The program expects two command-line arguments. The first argument specifies a seconds value that is used to set an alarm timer to generate a SIGALRM signal. This handler performs a *sem_post*(3) to increment the semaphore that is being waited on in *main*( ) using *sem_timedwait*( ). The second command-line argument specifies the length of the timeout, in seconds, for *sem_timedwait*( ).

```
#include <unistd.h>
#include <stdio.h>
#include <stdlib.h>
#include <semaphore.h>
#include <time.h>
#include <assert.h>
#include <errno.h>
#include <signal.h>

sem_t sem;

static void
handler(int sig)
{
    write(STDOUT_FILENO, "sem_post() from handler\n", 24);
    if (sem_post(&sem) == -1) {
        write(STDERR_FILENO, "sem_post() failed\n", 18);
        _exit(EXIT_FAILURE);
    }
}

int
main(int argc, char *argv[])
{
    struct sigaction sa;
    struct timespec ts;
    int s;

    if (argc != 3) {
        fprintf(stderr, "Usage: %s <alarm-secs> <wait-secs>\n",
            argv[0]);
        exit(EXIT_FAILURE);
    }

    if (sem_init(&sem, 0, 0) == -1) {
        perror("sem_init");
        exit(EXIT_FAILURE);
    }

    /* Establish SIGALRM handler; set alarm timer using argv[1] */

    sa.sa_handler = handler;
    sigemptyset(&sa.sa_mask);
    sa.sa_flags = 0;
    if (sigaction(SIGALRM, &sa, NULL) == -1) {
        perror("sigaction");
        exit(EXIT_FAILURE);
    }
```

```
        alarm(atoi(argv[1]));

        /* Calculate relative interval as current time plus
           number of seconds given argv[2] */

        if (clock_gettime(CLOCK_REALTIME, &ts) == -1) {
            perror("clock_gettime");
            exit(EXIT_FAILURE);
        }
        ts.tv_sec += atoi(argv[2]);

        printf("main() about to call sem_timedwait()\n");
        while ((s = sem_timedwait(&sem, &ts)) == -1 && errno == EINTR)
            continue;       /* Restart if interrupted by handler */

        /* Check what happened */

        if (s == -1) {
            if (errno == ETIMEDOUT)
                printf("sem_timedwait() timed out\n");
            else
                perror("sem_timedwait");
        } else
            printf("sem_timedwait() succeeded\n");

        exit((s == 0) ? EXIT_SUCCESS : EXIT_FAILURE);
    }
```

APPLICATION USAGE

Applications using these functions may be subject to priority inversion, as discussed in XBD Section 3.285 (on page 79).

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 3.285 (on page 79), **<semaphore.h>**, **<time.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/120 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

Issue 7

The *sem_timedwait( )* function is moved from the Semaphores option to the Base.

Functionality relating to the Timers option is moved to the Base.

An example is added.

NAME

sem_trywait, sem_wait — lock a semaphore

SYNOPSIS

```
#include <semaphore.h>

int sem_trywait(sem_t *sem);
int sem_wait(sem_t *sem);
```

DESCRIPTION

The *sem_trywait*( ) function shall lock the semaphore referenced by *sem* only if the semaphore is currently not locked; that is, if the semaphore value is currently positive. Otherwise, it shall not lock the semaphore.

The *sem_wait*( ) function shall lock the semaphore referenced by *sem* by performing a semaphore lock operation on that semaphore. If the semaphore value is currently zero, then the calling thread shall not return from the call to *sem_wait*( ) until it either locks the semaphore or the call is interrupted by a signal.

Upon successful return, the state of the semaphore shall be locked and shall remain locked until the *sem_post*( ) function is executed and returns successfully.

The *sem_wait*( ) function is interruptible by the delivery of a signal.

RETURN VALUE

The *sem_trywait*( ) and *sem_wait*( ) functions shall return zero if the calling process successfully performed the semaphore lock operation on the semaphore designated by *sem*. If the call was unsuccessful, the state of the semaphore shall be unchanged, and the function shall return a value of –1 and set *errno* to indicate the error.

ERRORS

The *sem_trywait*( ) function shall fail if:

[EAGAIN] The semaphore was already locked, so it cannot be immediately locked by the *sem_trywait*( ) operation.

The *sem_trywait*( ) and *sem_wait*( ) functions may fail if:

[EDEADLK] A deadlock condition was detected.

[EINTR] A signal interrupted this function.

[EINVAL] The *sem* argument does not refer to a valid semaphore.

EXAMPLES

None.

APPLICATION USAGE

Applications using these functions may be subject to priority inversion, as discussed in XBD Section 3.285 (on page 79).

The *sem_trywait*( ) and *sem_wait*( ) functions are part of the Semaphores option and need not be provided on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *sem_trywait( )* and *sem_wait( )* functions are marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

The *sem_timedwait( )* function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/121 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

Issue 7

SD5-XSH-ERN-54 is applied, removing the *sem_wait( )* function from the "shall fail" error cases.

The *sem_trywait( )* and *sem_wait( )* functions are moved from the Semaphores option to the Base.

NAME

sem_unlink — remove a named semaphore

SYNOPSIS

```
#include <semaphore.h>

int sem_unlink(const char *name);
```

DESCRIPTION

The *sem_unlink*( ) function shall remove the semaphore named by the string *name*. If the semaphore named by *name* is currently referenced by other processes, then *sem_unlink*( ) shall have no effect on the state of the semaphore. If one or more processes have the semaphore open when *sem_unlink*( ) is called, destruction of the semaphore is postponed until all references to the semaphore have been destroyed by calls to *sem_close*( ), *_exit*( ), or *exec*. Calls to *sem_open*( ) to recreate or reconnect to the semaphore refer to a new semaphore after *sem_unlink*( ) is called. The *sem_unlink*( ) call shall not block until all references have been destroyed; it shall return immediately.

RETURN VALUE

Upon successful completion, the *sem_unlink*( ) function shall return a value of 0. Otherwise, the semaphore shall not be changed and the function shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *sem_unlink*( ) function shall fail if:

[EACCES] Permission is denied to unlink the named semaphore.

[ENOENT] The named semaphore does not exist.

The *sem_unlink*( ) function may fail if:

[ENAMETOOLONG]
The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems that do not support the XSI option (XSI) or exceeds {_XOPEN_PATH_MAX} on XSI systems, or has a pathname component that is longer than {_POSIX_NAME_MAX} on systems that do not support the XSI option (XSI) or longer than {_XOPEN_NAME_MAX} on XSI systems. A call to *sem_unlink*( ) with a *name* argument that contains the same semaphore name as was previously used in a successful *sem_open*( ) call shall not give an [ENAMETOOLONG] error.

EXAMPLES

None.

APPLICATION USAGE

The *sem_unlink*( ) function is part of the Semaphores option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

A future version might require the *sem_open*( ) and *sem_unlink*( ) functions to have semantics similar to normal file system operations.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

Issue 7

Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a "shall fail" to a "may fail" error.

Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

The *sem_unlink( )* function is moved from the Semaphores option to the Base.

58483 **NAME**

58484 sem_wait — lock a semaphore

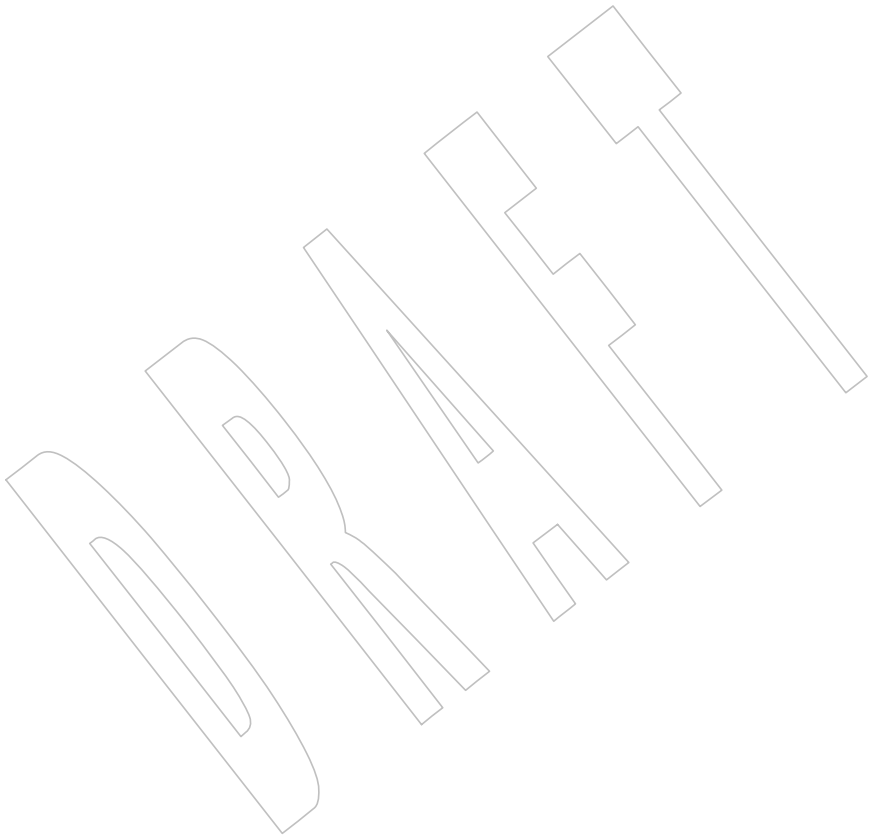
58485 **SYNOPSIS**

58486 `#include <semaphore.h>`

58487 `int sem_wait(sem_t *sem);`

58488 **DESCRIPTION**

58489 Refer to *sem_trywait( )*.



NAME

semctl — XSI semaphore control operations

SYNOPSIS

XSI
```
#include <sys/sem.h>

int semctl(int semid, int semnum, int cmd, ...);
```

DESCRIPTION

The *semctl*( ) function operates on XSI semaphores (see XBD Section 4.16, on page 113). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 497).

The *semctl*( ) function provides a variety of semaphore control operations as specified by *cmd*. The fourth argument is optional and depends upon the operation requested. If required, it is of type **union semun**, which the application shall explicitly declare:

```
union semun {
    int val;
    struct semid_ds *buf;
    unsigned short  *array;
} arg;
```

The following semaphore control operations as specified by *cmd* are executed with respect to the semaphore specified by *semid* and *semnum*. The level of permission required for each operation is shown with each command; see Section 2.7 (on page 496). The symbolic names for the values of *cmd* are defined in the **<sys/sem.h>** header:

GETVAL — Return the value of *semval*; see **<sys/sem.h>**. Requires read permission.

SETVAL — Set the value of *semval* to *arg.val*, where *arg* is the value of the fourth argument to *semctl*( ). When this command is successfully executed, the *semadj* value corresponding to the specified semaphore in all processes is cleared. Requires alter permission; see Section 2.7 (on page 496).

GETPID — Return the value of *sempid*. Requires read permission.

GETNCNT — Return the value of *semncnt*. Requires read permission.

GETZCNT — Return the value of *semzcnt*. Requires read permission.

The following values of *cmd* operate on each *semval* in the set of semaphores:

GETALL — Return the value of *semval* for each semaphore in the semaphore set and place into the array pointed to by *arg.array*, where *arg* is the fourth argument to *semctl*( ). Requires read permission.

SETALL — Set the value of *semval* for each semaphore in the semaphore set according to the array pointed to by *arg.array*, where *arg* is the fourth argument to *semctl*( ). When this command is successfully executed, the *semadj* values corresponding to each specified semaphore in all processes are cleared. Requires alter permission.

The following values of *cmd* are also available:

IPC_STAT — Place the current value of each member of the **semid_ds** data structure associated with *semid* into the structure pointed to by *arg.buf*, where *arg* is the fourth argument to *semctl*( ). The contents of this structure are defined in **<sys/sem.h>**. Requires read permission.

IPC_SET — Set the value of the following members of the **semid_ds** data structure associated with *semid* to the corresponding value found in the structure pointed to by *arg.buf*, where *arg* is the fourth argument to *semctl( )*:

```
sem_perm.uid
sem_perm.gid
sem_perm.mode
```

The mode bits specified in Section 2.7.1 (on page 496) are copied into the corresponding bits of the *sem_perm.mode* associated with *semid*. The stored values of any other bits are unspecified.

This command can only be executed by a process that has an effective user ID equal to either that of a process with appropriate privileges or to the value of *sem_perm.cuid* or *sem_perm.uid* in the **semid_ds** data structure associated with *semid*.

IPC_RMID — Remove the semaphore identifier specified by *semid* from the system and destroy the set of semaphores and **semid_ds** data structure associated with it. This command can only be executed by a process that has an effective user ID equal to either that of a process with appropriate privileges or to the value of *sem_perm.cuid* or *sem_perm.uid* in the **semid_ds** data structure associated with *semid*.

RETURN VALUE

If successful, the value returned by *semctl( )* depends on *cmd* as follows:

GETVAL	The value of *semval*.
GETPID	The value of *sempid*.
GETNCNT	The value of *semncnt*.
GETZCNT	The value of *semzcnt*.
All others	0.

Otherwise, *semctl( )* shall return −1 and set *errno* to indicate the error.

ERRORS

The *semctl( )* function shall fail if:

[EACCES] — Operation permission is denied to the calling process; see Section 2.7 (on page 496).

[EINVAL] — The value of *semid* is not a valid semaphore identifier, or the value of *semnum* is less than 0 or greater than or equal to *sem_nsems*, or the value of *cmd* is not a valid command.

[EPERM] — The argument *cmd* is equal to IPC_RMID or IPC_SET and the effective user ID of the calling process is not equal to that of a process with appropriate privileges and it is not equal to the value of *sem_perm.cuid* or *sem_perm.uid* in the data structure associated with *semid*.

[ERANGE] — The argument *cmd* is equal to SETVAL or SETALL and the value to which *semval* is to be set is greater than the system-imposed maximum.

EXAMPLES

None.

APPLICATION USAGE

The fourth parameter in the SYNOPSIS section is now specified as "..." in order to avoid a clash with the ISO C standard when referring to the union *semun* (as defined in Issue 3) and for backwards-compatibility.

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 496) can be easily modified to use the alternative interfaces.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 5

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to the APPLICATION USAGE section.

NAME

semget — get set of XSI semaphores

SYNOPSIS

XSI

```
#include <sys/sem.h>

int semget(key_t key, int nsems, int semflg);
```

DESCRIPTION

The *semget*( ) function operates on XSI semaphores (see XBD Section 4.16, on page 113). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 497).

The *semget*( ) function shall return the semaphore identifier associated with *key*.

A semaphore identifier with its associated **semid_ds** data structure and its associated set of *nsems* semaphores (see **<sys/sem.h>**) is created for *key* if one of the following is true:

- The argument *key* is equal to IPC_PRIVATE.
- The argument *key* does not already have a semaphore identifier associated with it and (*semflg* &IPC_CREAT) is non-zero.

Upon creation, the **semid_ds** data structure associated with the new semaphore identifier is initialized as follows:

- In the operation permissions structure *sem_perm.cuid*, *sem_perm.uid*, *sem_perm.cgid*, and *sem_perm.gid* shall be set equal to the effective user ID and effective group ID, respectively, of the calling process.
- The low-order 9 bits of *sem_perm.mode* shall be set equal to the low-order 9 bits of *semflg*.
- The variable *sem_nsems* shall be set equal to the value of *nsems*.
- The variable *sem_otime* shall be set equal to 0 and *sem_ctime* shall be set equal to the current time.
- The data structure associated with each semaphore in the set need not be initialized. The *semctl*( ) function with the command SETVAL or SETALL can be used to initialize each semaphore.

RETURN VALUE

Upon successful completion, *semget*( ) shall return a non-negative integer, namely a semaphore identifier; otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *semget*( ) function shall fail if:

[EACCES] A semaphore identifier exists for *key*, but operation permission as specified by the low-order 9 bits of *semflg* would not be granted; see Section 2.7 (on page 496).

[EEXIST] A semaphore identifier exists for the argument *key* but ((*semflg* &IPC_CREAT) &&(*semflg* &IPC_EXCL)) is non-zero.

[EINVAL] The value of *nsems* is either less than or equal to 0 or greater than the system-imposed limit, or a semaphore identifier exists for the argument *key*, but the number of semaphores in the set associated with it is less than *nsems* and *nsems* is not equal to 0.

[ENOENT] A semaphore identifier does not exist for the argument *key* and (*semflg* &IPC_CREAT) is equal to 0.

[ENOSPC] A semaphore identifier is to be created but the system-imposed limit on the maximum number of allowed semaphores system-wide would be exceeded.

EXAMPLES

Creating a Semaphore Identifier

The following example gets a unique semaphore key using the *ftok*( ) function, then gets a semaphore ID associated with that key using the *semget*( ) function (the first call also tests to make sure the semaphore exists). If the semaphore does not exist, the program creates it, as shown by the second call to *semget*( ). In creating the semaphore for the queuing process, the program attempts to create one semaphore with read/write permission for all. It also uses the IPC_EXCL flag, which forces *semget*( ) to fail if the semaphore already exists.

After creating the semaphore, the program uses a call to *semop*( ) to initialize it to the values in the *sbuf* array. The number of processes that can execute concurrently without queuing is initially set to 2. The final call to *semget*( ) creates a semaphore identifier that can be used later in the program.

```
#include <sys/types.h>
#include <stdio.h>
#include <sys/ipc.h>
#include <sys/sem.h>
#include <sys/stat.h>
#include <errno.h>
#include <unistd.h>
#include <stdlib.h>
#include <pwd.h>
#include <fcntl.h>
#include <limits.h>
...
key_t semkey;
int semid, pfd, fv;
struct sembuf sbuf;
char *lgn;
char filename[PATH_MAX+1];
struct stat outstat;
struct passwd *pw;
...
/* Get unique key for semaphore. */
if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
    perror("IPC error: ftok"); exit(1);
}

/* Get semaphore ID associated with this key. */
if ((semid = semget(semkey, 0, 0)) == -1) {

    /* Semaphore does not exist - Create. */
    if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
        S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1)
    {
        /* Initialize the semaphore. */
```

```
58684                sbuf.sem_num = 0;
58685                sbuf.sem_op = 2;  /* This is the number of runs
58686                                     without queuing. */
58687                sbuf.sem_flg = 0;
58688                if (semop(semid, &sbuf, 1) == -1) {
58689                    perror("IPC error: semop"); exit(1);
58690                }
58691            }
58692            else if (errno == EEXIST) {
58693                if ((semid = semget(semkey, 0, 0)) == -1) {
58694                    perror("IPC error 1: semget"); exit(1);
58695                }
58696            }
58697            else {
58698                perror("IPC error 2: semget"); exit(1);
58699            }
58700        }
58701        ...
```

58702 **APPLICATION USAGE**

58703 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
58704 Application developers who need to use IPC should design their applications so that modules
58705 using the IPC routines described in Section 2.7 (on page 496) can be easily modified to use the
58706 alternative interfaces.

NAME

semop — XSI semaphore operations

SYNOPSIS

XSI

```
#include <sys/sem.h>

int semop(int semid, struct sembuf *sops, size_t nsops);
```

DESCRIPTION

The *semop*( ) function operates on XSI semaphores (see XBD Section 4.16, on page 113). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 497).

The *semop*( ) function shall perform atomically a user-defined array of semaphore operations in array order on the set of semaphores associated with the semaphore identifier specified by the argument *semid*.

The argument *sops* is a pointer to a user-defined array of semaphore operation structures. The implementation shall not modify elements of this array unless the application uses implementation-defined extensions.

The argument *nsops* is the number of such structures in the array.

Each structure, **sembuf**, includes the following members:

Member Type	Member Name	Description
short	*sem_num*	Semaphore number.
short	*sem_op*	Semaphore operation.
short	*sem_flg*	Operation flags.

Each semaphore operation specified by *sem_op* is performed on the corresponding semaphore specified by *semid* and *sem_num*.

The variable *sem_op* specifies one of three semaphore operations:

1. If *sem_op* is a negative integer and the calling process has alter permission, one of the following shall occur:

   - If *semval*(see **<sys/sem.h>**) is greater than or equal to the absolute value of *sem_op*, the absolute value of *sem_op* is subtracted from *semval*. Also, if (*sem_flg* &SEM_UNDO) is non-zero, the absolute value of *sem_op* shall be added to the *semadj* value of the calling process for the specified semaphore.
   - If *semval* is less than the absolute value of *sem_op* and (*sem_flg* &IPC_NOWAIT) is non-zero, *semop*( ) shall return immediately.
   - If *semval* is less than the absolute value of *sem_op* and (*sem_flg* &IPC_NOWAIT) is 0, *semop*( ) shall increment the *semncnt* associated with the specified semaphore and suspend execution of the calling thread until one of the following conditions occurs:

     — The value of *semval* becomes greater than or equal to the absolute value of *sem_op*. When this occurs, the value of *semncnt* associated with the specified semaphore shall be decremented, the absolute value of *sem_op* shall be subtracted from *semval* and, if (*sem_flg* &SEM_UNDO) is non-zero, the absolute value of *sem_op* shall be added to the *semadj* value of the calling process for the specified semaphore.

— The *semid* for which the calling thread is awaiting action is removed from the system. When this occurs, *errno* shall be set equal to [EIDRM] and –1 shall be returned.

— The calling thread receives a signal that is to be caught. When this occurs, the value of *semncnt* associated with the specified semaphore shall be decremented, and the calling thread shall resume execution in the manner prescribed in *sigaction*( ).

2. If *sem_op* is a positive integer and the calling process has alter permission, the value of *sem_op* shall be added to *semval* and, if (*sem_flg* &SEM_UNDO) is non-zero, the value of *sem_op* shall be subtracted from the *semadj* value of the calling process for the specified semaphore.

3. If *sem_op* is 0 and the calling process has read permission, one of the following shall occur:

   - If *semval* is 0, *semop*( ) shall return immediately.
   - If *semval* is non-zero and (*sem_flg* &IPC_NOWAIT) is non-zero, *semop*( ) shall return immediately.
   - If *semval* is non-zero and (*sem_flg* &IPC_NOWAIT) is 0, *semop*( ) shall increment the *semzcnt* associated with the specified semaphore and suspend execution of the calling thread until one of the following occurs:

     — The value of *semval* becomes 0, at which time the value of *semzcnt* associated with the specified semaphore shall be decremented.

     — The *semid* for which the calling thread is awaiting action is removed from the system. When this occurs, *errno* shall be set equal to [EIDRM] and –1 shall be returned.

     — The calling thread receives a signal that is to be caught. When this occurs, the value of *semzcnt* associated with the specified semaphore shall be decremented, and the calling thread shall resume execution in the manner prescribed in *sigaction*( ).

Upon successful completion, the value of *sempid* for each semaphore specified in the array pointed to by *sops* shall be set equal to the process ID of the calling process.

RETURN VALUE

Upon successful completion, *semop*( ) shall return 0; otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *semop*( ) function shall fail if:

[E2BIG] The value of *nsops* is greater than the system-imposed maximum.

[EACCES] Operation permission is denied to the calling process; see Section 2.7 (on page 496).

[EAGAIN] The operation would result in suspension of the calling process but (*sem_flg* &IPC_NOWAIT) is non-zero.

[EFBIG] The value of *sem_num* is less than 0 or greater than or equal to the number of semaphores in the set associated with *semid*.

[EIDRM] The semaphore identifier *semid* is removed from the system.

[EINTR] The *semop*( ) function was interrupted by a signal.

[EINVAL] The value of *semid* is not a valid semaphore identifier, or the number of individual semaphores for which the calling process requests a SEM_UNDO would exceed the system-imposed limit.

[ENOSPC] The limit on the number of individual processes requesting a SEM_UNDO would be exceeded.

[ERANGE] An operation would cause a *semval* to overflow the system-imposed limit, or an operation would cause a *semadj* value to overflow the system-imposed limit.

EXAMPLES

Setting Values in Semaphores

The following example sets the values of the two semaphores associated with the *semid* identifier to the values contained in the *sb* array.

```
#include <sys/sem.h>
...
int semid;
struct sembuf sb[2];
int nsops = 2;
int result;

/* Adjust value of semaphore in the semaphore array semid. */
sb[0].sem_num = 0;
sb[0].sem_op = -1;
sb[0].sem_flg = SEM_UNDO | IPC_NOWAIT;
sb[1].sem_num = 1;
sb[1].sem_op =  1;
sb[1].sem_flg = 0;

result = semop(semid, sb, nsops);
```

Creating a Semaphore Identifier

The following example gets a unique semaphore key using the *ftok*( ) function, then gets a semaphore ID associated with that key using the *semget*( ) function (the first call also tests to make sure the semaphore exists). If the semaphore does not exist, the program creates it, as shown by the second call to *semget*( ). In creating the semaphore for the queuing process, the program attempts to create one semaphore with read/write permission for all. It also uses the IPC_EXCL flag, which forces *semget*( ) to fail if the semaphore already exists.

After creating the semaphore, the program uses a call to *semop*( ) to initialize it to the values in the *sbuf* array. The number of processes that can execute concurrently without queuing is initially set to 2. The final call to *semget*( ) creates a semaphore identifier that can be used later in the program.

The final call to *semop*( ) acquires the semaphore and waits until it is free; the SEM_UNDO option releases the semaphore when the process exits, waiting until there are less than two processes running concurrently.

```
#include <sys/types.h>
#include <stdio.h>
#include <sys/ipc.h>
#include <sys/sem.h>
#include <sys/stat.h>
#include <errno.h>
#include <unistd.h>
#include <stdlib.h>
#include <pwd.h>
#include <fcntl.h>
#include <limits.h>
...
key_t semkey;
int semid, pfd, fv;
struct sembuf sbuf;
char *lgn;
char filename[PATH_MAX+1];
struct stat outstat;
struct passwd *pw;
...
/* Get unique key for semaphore. */
if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
    perror("IPC error: ftok"); exit(1);
}
/* Get semaphore ID associated with this key. */
if ((semid = semget(semkey, 0, 0)) == -1) {
    /* Semaphore does not exist - Create. */
    if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
        S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1)
    {
        /* Initialize the semaphore. */
        sbuf.sem_num = 0;
        sbuf.sem_op = 2;  /* This is the number of runs without queuing. */
        sbuf.sem_flg = 0;
        if (semop(semid, &sbuf, 1) == -1) {
            perror("IPC error: semop"); exit(1);
        }
    }
    else if (errno == EEXIST) {
        if ((semid = semget(semkey, 0, 0)) == -1) {
            perror("IPC error 1: semget"); exit(1);
        }
    }
    else {
        perror("IPC error 2: semget"); exit(1);
    }
}
...
sbuf.sem_num = 0;
sbuf.sem_op = -1;
sbuf.sem_flg = SEM_UNDO;
```

```
        if (semop(semid, &sbuf, 1) == -1) {
            perror("IPC Error: semop"); exit(1);
        }
```

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 496) can be easily modified to use the alternative interfaces.

NAME

send — send a message on a socket

SYNOPSIS

```
#include <sys/socket.h>

ssize_t send(int socket, const void *buffer, size_t length, int flags);
```

DESCRIPTION

The *send*( ) function shall initiate transmission of a message from the specified socket to its peer. The *send*( ) function shall send a message only when the socket is connected. If the socket is a connectionless-mode socket, the message shall be sent to the pre-specified peer address.

The *send*( ) function takes the following arguments:

socket Specifies the socket file descriptor.

buffer Points to the buffer containing the message to send.

length Specifies the length of the message in bytes.

flags Specifies the type of message transmission. Values of this argument are formed by logically OR'ing zero or more of the following flags:

MSG_EOR Terminates a record (if supported by the protocol).

MSG_OOB Sends out-of-band data on sockets that support out-of-band communications. The significance and semantics of out-of-band data are protocol-specific.

MSG_NOSIGNAL Requests not to send the SIGPIPE signal if an attempt to send is made on a stream-oriented socket that is no longer connected. The [EPIPE] error shall still be returned.

The length of the message to be sent is specified by the *length* argument. If the message is too long to pass through the underlying protocol, *send*( ) shall fail and no data shall be transmitted.

Successful completion of a call to *send*( ) does not guarantee delivery of the message. A return value of –1 indicates only locally-detected errors.

If space is not available at the sending socket to hold the message to be transmitted, and the socket file descriptor does not have O_NONBLOCK set, *send*( ) shall block until space is available. If space is not available at the sending socket to hold the message to be transmitted, and the socket file descriptor does have O_NONBLOCK set, *send*( ) shall fail. The *select*( ) and *poll*( ) functions can be used to determine when it is possible to send more data.

The socket in use may require the process to have appropriate privileges to use the *send*( ) function.

RETURN VALUE

Upon successful completion, *send*( ) shall return the number of bytes sent. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *send*( ) function shall fail if:

[EAGAIN] or [EWOULDBLOCK]
The socket's file descriptor is marked O_NONBLOCK and the requested operation would block.

58966 [EBADF] The *socket* argument is not a valid file descriptor.

58967 [ECONNRESET] A connection was forcibly closed by a peer.

58968 [EDESTADDRREQ]
58969 The socket is not connection-mode and no peer address is set.

58970 [EINTR] A signal interrupted *send*( ) before any data was transmitted.

58971 [EMSGSIZE] The message is too large to be sent all at once, as the socket requires.

58972 [ENOTCONN] The socket is not connected.

58973 [ENOTSOCK] The *socket* argument does not refer to a socket.

58974 [EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or
58975 more of the values set in *flags*.

58976 [EPIPE] The socket is shut down for writing, or the socket is connection-mode and is
58977 no longer connected. In the latter case, and if the socket is of type
58978 SOCK_STREAM or SOCK_SEQPACKET and the MSG_NOSIGNAL flag is not
58979 set, the SIGPIPE signal is generated to the calling thread.

58980 The *send*( ) function may fail if:

58981 [EACCES] The calling process does not have appropriate privileges.

58982 [EIO] An I/O error occurred while reading from or writing to the file system.

58983 [ENETDOWN] The local network interface used to reach the destination is down.

58984 [ENETUNREACH]
58985 No route to the network is present.

58986 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

58987 **EXAMPLES**

58988 None.

58989 **APPLICATION USAGE**

58990 The *send*( ) function is equivalent to *sendto*( ) with a null pointer *dest_len* argument, and to *write*( )
58991 if no flags are used.

59002 **Issue 7**

59003 Austin Group Interpretation 1003.1-2001 #035 is applied, updating the DESCRIPTION to clarify
59004 the behavior when the socket is a connectionless-mode socket.

The MSG_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

The [EPIPE] error is modified.

NAME

sendmsg — send a message on a socket using a message structure

SYNOPSIS

```
#include <sys/socket.h>

ssize_t sendmsg(int socket, const struct msghdr *message, int flags);
```

DESCRIPTION

The *sendmsg*( ) function shall send a message through a connection-mode or connectionless-mode socket. If the socket is a connectionless-mode socket, the message shall be sent to the address specified by **msghdr** if no pre-specified peer address has been set. If a peer address has been pre-specified, either the message shall be sent to the address specified in **msghdr** (overriding the pre-specified peer address), or the function shall return –1 and set *errno* to [EISCONN]. If the socket is connection-mode, the destination address in **msghdr** shall be ignored.

The *sendmsg*( ) function takes the following arguments:

socket Specifies the socket file descriptor.

message Points to a **msghdr** structure, containing both the destination address and the buffers for the outgoing message. The length and format of the address depend on the address family of the socket. The *msg_flags* member is ignored.

flags Specifies the type of message transmission. The application may specify 0 or the following flag:

MSG_EOR Terminates a record (if supported by the protocol).

MSG_OOB Sends out-of-band data on sockets that support out-of-bound data. The significance and semantics of out-of-band data are protocol-specific.

MSG_NOSIGNAL Requests not to send the SIGPIPE signal if an attempt to send is made on a stream-oriented socket that is no longer connected. The [EPIPE] error shall still be returned.

The *msg_iov* and *msg_iovlen* fields of *message* specify zero or more buffers containing the data to be sent. *msg_iov* points to an array of **iovec** structures; *msg_iovlen* shall be set to the dimension of this array. In each **iovec** structure, the *iov_base* field specifies a storage area and the *iov_len* field gives its size in bytes. Some of these sizes can be zero. The data from each storage area indicated by *msg_iov* is sent in turn.

Successful completion of a call to *sendmsg*( ) does not guarantee delivery of the message. A return value of –1 indicates only locally-detected errors.

If space is not available at the sending socket to hold the message to be transmitted and the socket file descriptor does not have O_NONBLOCK set, the *sendmsg*( ) function shall block until space is available. If space is not available at the sending socket to hold the message to be transmitted and the socket file descriptor does have O_NONBLOCK set, the *sendmsg*( ) function shall fail.

If the socket protocol supports broadcast and the specified address is a broadcast address for the socket protocol, *sendmsg*( ) shall fail if the SO_BROADCAST option is not set for the socket.

The socket in use may require the process to have appropriate privileges to use the *sendmsg*( ) function.

RETURN VALUE

Upon successful completion, *sendmsg*( ) shall return the number of bytes sent. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *sendmsg*( ) function shall fail if:

[EAGAIN] or [EWOULDBLOCK]
: The socket's file descriptor is marked O_NONBLOCK and the requested operation would block.

[EAFNOSUPPORT]
: Addresses in the specified address family cannot be used with this socket.

[EBADF]
: The *socket* argument is not a valid file descriptor.

[ECONNRESET]
: A connection was forcibly closed by a peer.

[EINTR]
: A signal interrupted *sendmsg*( ) before any data was transmitted.

[EINVAL]
: The sum of the *iov_len* values overflows an **ssize_t**.

[EMSGSIZE]
: The message is too large to be sent all at once (as the socket requires), or the *msg_iovlen* member of the **msghdr** structure pointed to by *message* is less than or equal to 0 or is greater than {IOV_MAX}.

[ENOTCONN]
: The socket is connection-mode but is not connected.

[ENOTSOCK]
: The *socket* argument does not refer to a socket.

[EOPNOTSUPP]
: The *socket* argument is associated with a socket that does not support one or more of the values set in *flags*.

[EPIPE]
: The socket is shut down for writing, or the socket is connection-mode and is no longer connected. In the latter case, and if the socket is of type SOCK_STREAM or SOCK_SEQPACKET and the MSG_NOSIGNAL flag is not set, the SIGPIPE signal is generated to the calling thread.

If the address family of the socket is AF_UNIX, then *sendmsg*( ) shall fail if:

[EIO]
: An I/O error occurred while reading from or writing to the file system.

[ELOOP]
: A loop exists in symbolic links encountered during resolution of the pathname in the socket address.

[ENAMETOOLONG]
: The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT]
: A component of the pathname does not name an existing file or the path name is an empty string.

[ENOTDIR]
: A component of the path prefix of the pathname in the socket address is not a directory, or the pathname in the socket address contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

The *sendmsg*( ) function may fail if:

[EACCES]
: Search permission is denied for a component of the path prefix; or write access to the named socket is denied.

[EDESTADDRREQ]
The socket is not connection-mode and does not have its peer address set, and no destination address was specified.

[EHOSTUNREACH]
The destination host cannot be reached (probably because the host is down or a remote router cannot reach it).

[EIO] An I/O error occurred while reading from or writing to the file system.

[EISCONN] A destination address was specified and the socket is already connected.

[ENETDOWN] The local network interface used to reach the destination is down.

[ENETUNREACH]
No route to the network is present.

[ENOBUFS] Insufficient resources were available in the system to perform the operation.

[ENOMEM] Insufficient memory was available to fulfill the request.

If the address family of the socket is AF_UNIX, then *sendmsg*( ) may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in the socket address.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

EXAMPLES

Done.

APPLICATION USAGE

The *select*( ) and *poll*( ) functions can be used to determine when it is possible to send more data.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 7

Austin Group Interpretation 1003.1-2001 #073 is applied, updating the DESCRIPTION.

Austin Group Interpretation 1003.1-2001 #143 is applied.

The MSG_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

59134 The [EPIPE] error is modified.

NAME

sendto — send a message on a socket

SYNOPSIS

```
#include <sys/socket.h>

ssize_t sendto(int socket, const void *message, size_t length,
    int flags, const struct sockaddr *dest_addr,
    socklen_t dest_len);
```

DESCRIPTION

The *sendto*( ) function shall send a message through a connection-mode or connectionless-mode socket.

If the socket is a connectionless-mode socket, the message shall be sent to the address specified by *dest_addr* if no pre-specified peer address has been set. If a peer address has been pre-specified, either the message shall be sent to the address specified by *dest_addr* (overriding the pre-specified peer address), or the function shall return –1 and set *errno* to [EISCONN].

If the socket is connection-mode, *dest_addr* shall be ignored.

The *sendto*( ) function takes the following arguments:

socket Specifies the socket file descriptor.

message Points to a buffer containing the message to be sent.

length Specifies the size of the message in bytes.

flags Specifies the type of message transmission. Values of this argument are formed by logically OR'ing zero or more of the following flags:

- MSG_EOR — Terminates a record (if supported by the protocol).
- MSG_OOB — Sends out-of-band data on sockets that support out-of-band data. The significance and semantics of out-of-band data are protocol-specific.
- MSG_NOSIGNAL — Requests not to send the SIGPIPE signal if an attempt to send is made on a stream-oriented socket that is no longer connected. The [EPIPE] error shall still be returned.

dest_addr Points to a **sockaddr** structure containing the destination address. The length and format of the address depend on the address family of the socket.

dest_len Specifies the length of the **sockaddr** structure pointed to by the *dest_addr* argument.

If the socket protocol supports broadcast and the specified address is a broadcast address for the socket protocol, *sendto*( ) shall fail if the SO_BROADCAST option is not set for the socket.

The *dest_addr* argument specifies the address of the target.

The *length* argument specifies the length of the message.

Successful completion of a call to *sendto*( ) does not guarantee delivery of the message. A return value of –1 indicates only locally-detected errors.

If space is not available at the sending socket to hold the message to be transmitted and the socket file descriptor does not have O_NONBLOCK set, *sendto*( ) shall block until space is available. If space is not available at the sending socket to hold the message to be transmitted

and the socket file descriptor does have O_NONBLOCK set, *sendto*( ) shall fail.

The socket in use may require the process to have appropriate privileges to use the *sendto*( ) function.

RETURN VALUE

Upon successful completion, *sendto*( ) shall return the number of bytes sent. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *sendto*( ) function shall fail if:

[EAFNOSUPPORT]
: Addresses in the specified address family cannot be used with this socket.

[EAGAIN] or [EWOULDBLOCK]
: The socket's file descriptor is marked O_NONBLOCK and the requested operation would block.

[EBADF]
: The *socket* argument is not a valid file descriptor.

[ECONNRESET]
: A connection was forcibly closed by a peer.

[EINTR]
: A signal interrupted *sendto*( ) before any data was transmitted.

[EMSGSIZE]
: The message is too large to be sent all at once, as the socket requires.

[ENOTCONN]
: The socket is connection-mode but is not connected.

[ENOTSOCK]
: The *socket* argument does not refer to a socket.

[EOPNOTSUPP]
: The *socket* argument is associated with a socket that does not support one or more of the values set in *flags*.

[EPIPE]
: The socket is shut down for writing, or the socket is connection-mode and is no longer connected. In the latter case, and if the socket is of type SOCK_STREAM or SOCK_SEQPACKET and the MSG_NOSIGNAL flag is not set, the SIGPIPE signal is generated to the calling thread.

If the address family of the socket is AF_UNIX, then *sendto*( ) shall fail if:

[EIO]
: An I/O error occurred while reading from or writing to the file system.

[ELOOP]
: A loop exists in symbolic links encountered during resolution of the pathname in the socket address.

[ENAMETOOLONG]
: The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT]
: A component of the pathname does not name an existing file or the pathname is an empty string.

[ENOTDIR]
: A component of the path prefix of the pathname in the socket address is not a directory, or the pathname in the socket address contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

The *sendto*( ) function may fail if:

[EACCES] Search permission is denied for a component of the path prefix; or write access to the named socket is denied.

[EDESTADDRREQ] The socket is not connection-mode and does not have its peer address set, and no destination address was specified.

[EHOSTUNREACH] The destination host cannot be reached (probably because the host is down or a remote router cannot reach it).

[EINVAL] The *dest_len* argument is not a valid length for the address family.

[EIO] An I/O error occurred while reading from or writing to the file system.

[EISCONN] A destination address was specified and the socket is already connected.

[ENETDOWN] The local network interface used to reach the destination is down.

[ENETUNREACH] No route to the network is present.

[ENOBUFS] Insufficient resources were available in the system to perform the operation.

[ENOMEM] Insufficient memory was available to fulfill the request.

If the address family of the socket is AF_UNIX, then *sendto*( ) may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in the socket address.

[ENAMETOOLONG] The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

EXAMPLES

None.

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretations 1003.1-2001 #035 and #073 are applied, updating the [EISCONN] error and the DESCRIPTION.

Austin Group Interpretation 1003.1-2001 #143 is applied, clarifying the [ENAMETOOLONG] error condition.

The MSG_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

The [EPIPE] error is modified.

NAME

setbuf — assign buffering to a stream

SYNOPSIS

```
#include <stdio.h>

void setbuf(FILE *restrict stream, char *restrict buf);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

Except that it returns no value, the function call:

```
setbuf(stream, buf)
```

shall be equivalent to:

```
setvbuf(stream, buf, _IOFBF, BUFSIZ)
```

if *buf* is not a null pointer, or to:

```
setvbuf(stream, buf, _IONBF, BUFSIZ)
```

if *buf* is a null pointer.

RETURN VALUE

The *setbuf*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

A common source of error is allocating buffer space as an "automatic" variable in a code block, and then failing to close the stream in the same block.

With *setbuf*( ), allocating a buffer of BUFSIZ bytes does not necessarily imply that all of BUFSIZ bytes are used for the buffer area.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

Issue 6

The prototype for *setbuf*( ) is updated for alignment with the ISO/IEC 9899: 1999 standard.

NAME

setegid — set the effective group ID

SYNOPSIS

```
#include <unistd.h>

int setegid(gid_t gid);
```

DESCRIPTION

If *gid* is equal to the real group ID or the saved set-group-ID, or if the process has appropriate privileges, *setegid*( ) shall set the effective group ID of the calling process to *gid*; the real group ID, saved set-group-ID, and any supplementary group IDs shall remain unchanged.

The *setegid*( ) function shall not affect the supplementary group list in any way.

RETURN VALUE

Upon successful completion, 0 shall be returned; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *setegid*( ) function shall fail if:

[EINVAL] The value of the *gid* argument is invalid and is not supported by the implementation.

[EPERM] The process does not have appropriate privileges and *gid* does not match the real group ID or the saved set-group-ID.

EXAMPLES

None.

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

NAME

setenv — add or change environment variable

SYNOPSIS

CX
```
#include <stdlib.h>

int setenv(const char *envname, const char *envval, int overwrite);
```

DESCRIPTION

The *setenv*( ) function shall update or add a variable in the environment of the calling process. The *envname* argument points to a string containing the name of an environment variable to be added or altered. The environment variable shall be set to the value to which *envval* points. The function shall fail if *envname* points to a string which contains an '=' character. If the environment variable named by *envname* already exists and the value of *overwrite* is non-zero, the function shall return success and the environment shall be updated. If the environment variable named by *envname* already exists and the value of *overwrite* is zero, the function shall return success and the environment shall remain unchanged.

If the application modifies *environ* or the pointers to which it points, the behavior of *setenv*( ) is undefined. The *setenv*( ) function shall update the list of pointers to which *environ* points.

The strings described by *envname* and *envval* are copied by this function.

The *setenv*( ) function need not be thread-safe.

RETURN VALUE

Upon successful completion, zero shall be returned. Otherwise, –1 shall be returned, *errno* set to indicate the error, and the environment shall be unchanged.

ERRORS

The *setenv*( ) function shall fail if:

[EINVAL] The *name* argument is a null pointer, points to an empty string, or points to a string containing an '=' character.

[ENOMEM] Insufficient memory was available to add a variable or its value to the environment.

EXAMPLES

None.

APPLICATION USAGE

See *exec*( ) for restrictions on changing the environment in multi-threaded applications.

RATIONALE

Unanticipated results may occur if *setenv*( ) changes the external variable *environ*. In particular, if the optional *envp* argument to *main*( ) is present, it is not changed, and thus may point to an obsolete copy of the environment (as may any other copy of *environ*). However, other than the aforementioned restriction, the standard developers intended that the traditional method of walking through the environment by way of the *environ* pointer must be supported.

It was decided that *setenv*( ) should be required by this version because it addresses a piece of missing functionality, and does not impose a significant burden on the implementor.

There was considerable debate as to whether the System V *putenv*( ) function or the BSD *setenv*( ) function should be required as a mandatory function. The *setenv*( ) function was chosen because it permitted the implementation of the *unsetenv*( ) function to delete environmental variables, without specifying an additional interface. The *putenv*( ) function is available as part of the XSI option.

The standard developers considered requiring that *setenv*( ) indicate an error when a call to it would result in exceeding {ARG_MAX}. The requirement was rejected since the condition might be temporary, with the application eventually reducing the environment size. The ultimate success or failure depends on the size at the time of a call to *exec*, which returns an indication of this error condition.

FUTURE DIRECTIONS

None.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

NAME

seteuid — set effective user ID

SYNOPSIS

```
#include <unistd.h>

int seteuid(uid_t uid);
```

DESCRIPTION

If *uid* is equal to the real user ID or the saved set-user-ID, or if the process has appropriate privileges, *seteuid*( ) shall set the effective user ID of the calling process to *uid*; the real user ID and saved set-user-ID shall remain unchanged.

The *seteuid*( ) function shall not affect the supplementary group list in any way.

RETURN VALUE

Upon successful completion, 0 shall be returned; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *seteuid*( ) function shall fail if:

[EINVAL] The value of the *uid* argument is invalid and is not supported by the implementation.

[EPERM] The process does not have appropriate privileges and *uid* does not match the real user ID or the saved set-user-ID.

EXAMPLES

None.

CHANGE HISTORY

First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/123 is applied, making an editorial correction to the [EPERM] error in the ERRORS section.

NAME

setgid — set-group-ID

SYNOPSIS

```
#include <unistd.h>

int setgid(gid_t gid);
```

DESCRIPTION

If the process has appropriate privileges, *setgid*( ) shall set the real group ID, effective group ID, and the saved set-group-ID of the calling process to *gid*.

If the process does not have appropriate privileges, but *gid* is equal to the real group ID or the saved set-group-ID, *setgid*( ) shall set the effective group ID to *gid*; the real group ID and saved set-group-ID shall remain unchanged.

The *setgid*( ) function shall not affect the supplementary group list in any way.

Any supplementary group IDs of the calling process shall remain unchanged.

RETURN VALUE

Upon successful completion, 0 is returned. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *setgid*( ) function shall fail if:

[EINVAL] The value of the *gid* argument is invalid and is not supported by the implementation.

[EPERM] The process does not have appropriate privileges and *gid* does not match the real group ID or the saved set-group-ID.

XBD **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

- Functionality associated with _POSIX_SAVED_IDS is now mandated. This is a FIPS requirement.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The effects of *setgid*( ) in processes without appropriate privileges are changed.
- A requirement that the supplementary group list is not affected is added.

NAME

setgrent — reset the group database to the first entry

    struct itimerval *restrict ovalue);
```

DESCRIPTION

Refer to *getitimer( )*.

59496 **NAME**

59497 setjmp — set jump point for a non-local goto

59498 **SYNOPSIS**

59499
```
#include <setjmp.h>
```

59500
```
int setjmp(jmp_buf env);
```

59501 **DESCRIPTION**

59502 CX The functionality described on this reference page is aligned with the ISO C standard. Any
59503 conflict between the requirements described here and the ISO C standard is unintentional. This
59504 volume of POSIX.1-200x defers to the ISO C standard.

59505 A call to *setjmp*( ) shall save the calling environment in its *env* argument for later use by
59506 *longjmp*( ).

59507 It is unspecified whether *setjmp*( ) is a macro or a function. If a macro definition is suppressed in
59508 order to access an actual function, or a program defines an external identifier with the name
59509 *setjmp*, the behavior is undefined.

59510 An application shall ensure that an invocation of *setjmp*( ) appears in one of the following
59511 contexts only:

59512 - The entire controlling expression of a selection or iteration statement
59513 - One operand of a relational or equality operator with the other operand an integral
59514 constant expression, with the resulting expression being the entire controlling expression
59515 of a selection or iteration statement
59516 - The operand of a unary '!' operator with the resulting expression being the entire
59517 controlling expression of a selection or iteration
59518 - The entire expression of an expression statement (possibly cast to **void**)

59519 If the invocation appears in any other context, the behavior is undefined.

59520 **RETURN VALUE**

59521 If the return is from a direct invocation, *setjmp*( ) shall return 0. If the return is from a call to
59522 *longjmp*( ), *setjmp*( ) shall return a non-zero value.

59523 **ERRORS**

59524 No errors are defined.

NAME

setkey — set encoding key (**CRYPT**)

SYNOPSIS

XSI

```
#include <stdlib.h>

void setkey(const char *key);
```

DESCRIPTION

The *setkey*( ) function provides access to an implementation-defined encoding algorithm. The argument of *setkey*( ) is an array of length 64 bytes containing only the bytes with numerical value of 0 and 1. If this string is divided into groups of 8, the low-order bit in each group is ignored; this gives a 56-bit key which is used by the algorithm. This is the key that shall be used with the algorithm to encode a string *block* passed to *encrypt*( ).

The *setkey*( ) function shall not change the setting of *errno* if successful. An application wishing to check for error situations should set *errno* to 0 before calling *setkey*( ). If *errno* is non-zero on return, an error has occurred.

The *setkey*( ) function need not be thread-safe.

RETURN VALUE

No values are returned.

ERRORS

The *setkey*( ) function shall fail if:

[ENOSYS] The functionality is not supported on this implementation.

EXAMPLES

None.

APPLICATION USAGE

Decoding need not be implemented in all environments. This is related to government restrictions in some countries on encryption and decryption routines. Historical practice has been to ship a different version of the encryption library without the decryption feature in the routines supplied. Thus the exported version of *encrypt*( ) does encoding but not decoding.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

NAME

setlocale — set program locale

SYNOPSIS

```
#include <locale.h>

char *setlocale(int category, const char *locale);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *setlocale*( ) function selects the appropriate piece of the locale of the process, as specified by the *category* and *locale* arguments, and may be used to change or query the entire locale of the process or portions thereof. The value *LC_ALL* for *category* names the entire locale of the process; other values for *category* name only a part of the locale of the process:

LC_COLLATE Affects the behavior of regular expressions and the collation functions.

LC_CTYPE Affects the behavior of regular expressions, character classification, character conversion functions, and wide-character functions.

CX *LC_MESSAGES* Affects what strings are expected by commands and utilities as affirmative or negative responses.

XSI It also affects what strings are given by commands and utilities as affirmative or negative responses, and the content of messages.

LC_MONETARY Affects the behavior of functions that handle monetary values.

LC_NUMERIC Affects the behavior of functions that handle numeric values.

LC_TIME Affects the behavior of the time conversion functions.

The *locale* argument is a pointer to a character string containing the required setting of *category*. The contents of this string are implementation-defined. In addition, the following preset values of *locale* are defined for all settings of *category*:

CX "POSIX" Specifies the minimal environment for C-language translation called the POSIX locale. If *setlocale*( ) is not invoked, the POSIX locale is the default at entry to *main*( ).

"C" Equivalent to "POSIX".

CX "" Specifies an implementation-defined native environment. The determination of the name of the new locale for the specified category depends on the value of the associated environment variables, *LC_** and *LANG*; see XBD Chapter 7 (on page 135) and Chapter 8 (on page 173).

A null pointer Used to direct *setlocale*( ) to query the current internationalized environment and return the name of the locale.

CX Setting all of the categories of the locale of the process is similar to successively setting each individual category of the locale of the process, except that all error checking is done before any actions are performed. To set all the categories of the locale of the process, *setlocale*( ) is invoked as:

```
setlocale(LC_ALL, "");
```

In this case, *setlocale*( ) shall first verify that the values of all the environment variables it needs according to the precedence rules (described in XBD Chapter 8, on page 173) indicate supported

locales. If the value of any of these environment variable searches yields a locale that is not supported (and non-null), *setlocale*( ) shall return a null pointer and the locale of the process shall not be changed. If all environment variables name supported locales, *setlocale*( ) shall proceed as if it had been called for each category, using the appropriate value from the associated environment variable or from the implementation-defined default if there is no such value.

The locale state is common to all threads within a process.

RETURN VALUE

Upon successful completion, *setlocale*( ) shall return the string associated with the specified category for the new locale. Otherwise, *setlocale*( ) shall return a null pointer and the locale of the process is not changed.

A null pointer for *locale* causes *setlocale*( ) to return a pointer to the string associated with the *category* for the current locale of the process. The locale of the process shall not be changed.

The string returned by *setlocale*( ) is such that a subsequent call with that string and its associated *category* shall restore that part of the locale of the process. The application shall not modify the string returned which may be overwritten by a subsequent call to *setlocale*( ).

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The following code illustrates how a program can initialize the international environment for one language, while selectively modifying the locale of the process such that regular expressions and string operations can be applied to text recorded in a different language:

```
setlocale(LC_ALL, "De");
setlocale(LC_COLLATE, "Fr@dict");
```

Internationalized programs must call *setlocale*( ) to initiate a specific language operation. This can be done by calling *setlocale*( ) as follows:

```
setlocale(LC_ALL, "");
```

Changing the setting of *LC_MESSAGES* has no effect on catalogs that have already been opened by calls to *catopen*( ).

RATIONALE

The ISO C standard defines a collection of functions to support internationalization. One of the most significant aspects of these functions is a facility to set and query the *international environment*. The international environment is a repository of information that affects the behavior of certain functionality, namely:

1. Character handling
2. Collating
3. Date/time formatting
4. Numeric editing
5. Monetary formatting
6. Messaging

The *setlocale*( ) function provides the application developer with the ability to set all or portions,

called *categories*, of the international environment. These categories correspond to the areas of functionality mentioned above. The syntax for *setlocale*( ) is as follows:

```
char *setlocale(int category, const char *locale);
```

where *category* is the name of one of following categories, namely:

LC_COLLATE
LC_CTYPE
LC_MESSAGES
LC_MONETARY
LC_NUMERIC
LC_TIME

In addition, a special value called *LC_ALL* directs *setlocale*( ) to set all categories.

There are two primary uses of *setlocale*( ):

1. Querying the international environment to find out what it is set to
2. Setting the international environment, or *locale*, to a specific value

The behavior of *setlocale*( ) in these two areas is described below. Since it is difficult to describe the behavior in words, examples are used to illustrate the behavior of specific uses.

To query the international environment, *setlocale*( ) is invoked with a specific category and the null pointer as the locale. The null pointer is a special directive to *setlocale*( ) that tells it to query rather than set the international environment. The following syntax is used to query the name of the international environment:

```
setlocale({LC_ALL, LC_COLLATE, LC_CTYPE, LC_MESSAGES, LC_MONETARY, \
    LC_NUMERIC, LC_TIME},(char *) NULL);
```

The *setlocale*( ) function shall return the string corresponding to the current international environment. This value may be used by a subsequent call to *setlocale*( ) to reset the international environment to this value. However, it should be noted that the return value from *setlocale*( ) may be a pointer to a static area within the function and is not guaranteed to remain unchanged (that is, it may be modified by a subsequent call to *setlocale*( )). Therefore, if the purpose of calling *setlocale*( ) is to save the value of the current international environment so it can be changed and reset later, the return value should be copied to an array of **char** in the calling program.

There are three ways to set the international environment with *setlocale*( ):

setlocale(*category*, *string*)

This usage sets a specific *category* in the international environment to a specific value corresponding to the value of the *string*. A specific example is provided below:

```
setlocale(LC_ALL, "fr_FR.ISO-8859-1");
```

In this example, all categories of the international environment are set to the locale corresponding to the string `"fr_FR.ISO-8859-1"`, or to the French language as spoken in France using the ISO/IEC 8859-1: 1998 standard codeset.

If the string does not correspond to a valid locale, *setlocale*( ) shall return a null pointer and the international environment is not changed. Otherwise, *setlocale*( ) shall return the name of the locale just set.

setlocale(*category*, "C")
The ISO C standard states that one locale must exist on all conforming implementations. The name of the locale is C and corresponds to a minimal international environment needed to support the C programming language.

setlocale(*category*, "")
This sets a specific category to an implementation-defined default. This corresponds to the value of the environment variables.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

Extensions beyond the ISO C standard are marked.

The normative text is updated to avoid use of the term "must" for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/124 is applied, updating the DESCRIPTION to clarify the behavior of:

```
setlocale(LC_ALL, "");
```

Issue 7

Functionality relating to the Threads option is moved to the Base.

NAME

setlogmask — set the log priority mask

SYNOPSIS

XSI

```
#include <syslog.h>

int setlogmask(int maskpri);
```

DESCRIPTION

Refer to *closelog( )*.

59743 **NAME**

59744 setnetent — network database function

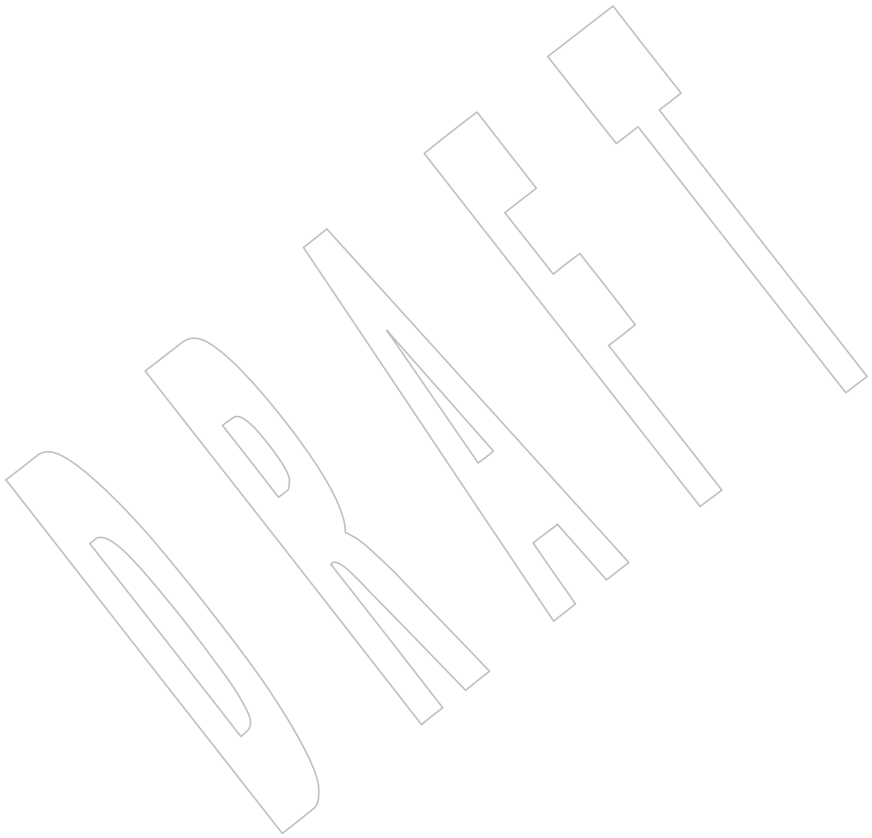
59745 **SYNOPSIS**

59746
```
#include <netdb.h>
```

59747
```
void setnetent(int stayopen);
```

59748 **DESCRIPTION**

59749 Refer to *endnetent( )*.



NAME

setpgid — set process group ID for job control

SYNOPSIS

```
#include <unistd.h>

int setpgid(pid_t pid, pid_t pgid);
```

DESCRIPTION

The *setpgid*( ) function shall either join an existing process group or create a new process group within the session of the calling process.

The process group ID of a session leader shall not change.

Upon successful completion, the process group ID of the process with a process ID that matches *pid* shall be set to *pgid*.

As a special case, if *pid* is 0, the process ID of the calling process shall be used. Also, if *pgid* is 0, the process ID of the indicated process shall be used.

RETURN VALUE

Upon successful completion, *setpgid*( ) shall return 0; otherwise, −1 shall be returned and *errno* shall be set to indicate the error.

ERRORS

The *setpgid*( ) function shall fail if:

[EACCES] The value of the *pid* argument matches the process ID of a child process of the calling process and the child process has successfully executed one of the *exec* functions.

[EINVAL] The value of the *pgid* argument is less than 0, or is not a value supported by the implementation.

[EPERM] The process indicated by the *pid* argument is a session leader.

[EPERM] The value of the *pid* argument matches the process ID of a child process of the calling process and the child process is not in the same session as the calling process.

[EPERM] The value of the *pgid* argument is valid but does not match the process ID of the process indicated by the *pid* argument and there is no process with a process group ID that matches the value of the *pgid* argument in the same session as the calling process.

[ESRCH] The value of the *pid* argument does not match the process ID of the calling process or of a child process of the calling process.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *setpgid*( ) function shall group processes together for the purpose of signaling, placement in foreground or background, and other job control actions.

The *setpgid*( ) function is similar to the *setpgrp*( ) function of 4.2 BSD, except that 4.2 BSD allowed the specified new process group to assume any value. This presents certain security problems and is more flexible than necessary to support job control.

To provide tighter security, *setpgid*( ) only allows the calling process to join a process group already in use inside its session or create a new process group whose process group ID was equal to its process ID.

When a job control shell spawns a new job, the processes in the job must be placed into a new process group via *setpgid*( ). There are two timing constraints involved in this action:

1. The new process must be placed in the new process group before the appropriate program is launched via one of the *exec* functions.
2. The new process must be placed in the new process group before the shell can correctly send signals to the new process group.

To address these constraints, the following actions are performed. The new processes call *setpgid*( ) to alter their own process groups after *fork*( ) but before *exec*. This satisfies the first constraint. Under 4.3 BSD, the second constraint is satisfied by the synchronization property of *vfork*( ); that is, the shell is suspended until the child has completed the *exec*, thus ensuring that the child has completed the *setpgid*( ). A new version of *fork*( ) with this same synchronization property was considered, but it was decided instead to merely allow the parent shell process to adjust the process group of its child processes via *setpgid*( ). Both timing constraints are now satisfied by having both the parent shell and the child attempt to adjust the process group of the child process; it does not matter which succeeds first.

Since it would be confusing to an application to have its process group change after it began executing (that is, after *exec*), and because the child process would already have adjusted its process group before this, the [EACCES] error was added to disallow this.

One non-obvious use of *setpgid*( ) is to allow a job control shell to return itself to its original process group (the one in effect when the job control shell was executed). A job control shell does this before returning control back to its parent when it is terminating or suspending itself as a way of restoring its job control "state" back to what its parent would expect. (Note that the original process group of the job control shell typically matches the process group of its parent, but this is not necessarily always the case.)

FUTURE DIRECTIONS

None.

exec, *getpgrp*( ), *setsid*( ), *tcsetpgrp*( )

XBD **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The *setpgid*( ) function is mandatory since _POSIX_JOB_CONTROL is required to be defined in this version. This is a FIPS requirement.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/56 is applied, changing the wording in

the DESCRIPTION from "the process group ID of the indicated process shall be used" to "the process ID of the indicated process shall be used". This change reverts the wording to as in the ISO POSIX-1: 1996 standard; it appeared to be an unintentional change.

NAME

setpgrp — set the process group ID

SYNOPSIS

OB XSI

```
#include <unistd.h>

pid_t setpgrp(void);
```

DESCRIPTION

If the calling process is not already a session leader, *setpgrp*( ) sets the process group ID of the calling process to the process ID of the calling process. If *setpgrp*( ) creates a new session, then the new session has no controlling terminal.

The *setpgrp*( ) function has no effect when the calling process is a session leader.

RETURN VALUE

Upon completion, *setpgrp*( ) shall return the process group ID.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

It is unspecified whether this function behaves as *setpgid*(0,0) or *setsid*( ) unless the process is already a session leader. Therefore, applications are encouraged to use *setpgid*( ) or *setsid*( ) as appropriate.

RATIONALE

None.

FUTURE DIRECTIONS

The *setpgrp*( ) function may be removed in a future version.

int setpriority(int which, id_t who, int nice);
```

DESCRIPTION

Refer to *getpriority( )*.

59880 **NAME**

59881 setprotoent — network protocol database functions

59882 **SYNOPSIS**

59883 `#include <netdb.h>`

59884 `void setprotoent(int stayopen);`

59885 **DESCRIPTION**

59886 Refer to *endprotoent( )*.

NAME

setpwent — user database function

SYNOPSIS

XSI
```
#include <pwd.h>

void setpwent(void);
```

DESCRIPTION

Refer to *endpwent( )*.

NAME

setregid — set real and effective group IDs

SYNOPSIS

XSI

```
#include <unistd.h>

int setregid(gid_t rgid, gid_t egid);
```

DESCRIPTION

The *setregid*( ) function shall set the real and effective group IDs of the calling process.

If *rgid* is –1, the real group ID shall not be changed; if *egid* is –1, the effective group ID shall not be changed.

The real and effective group IDs may be set to different values in the same call.

Only a process with appropriate privileges can set the real group ID and the effective group ID to any valid value.

A non-privileged process can set either the real group ID to the saved set-group-ID from one of the *exec* family of functions, or the effective group ID to the saved set-group-ID or the real group ID.

If the real group ID is being set (*rgid* is not –1), or the effective group ID is being set to a value not equal to the real group ID, then the saved set-group-ID of the current process shall be set equal to the new effective group ID.

Any supplementary group IDs of the calling process remain unchanged.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to indicate the error, and neither of the group IDs are changed.

ERRORS

The *setregid*( ) function shall fail if:

[EINVAL] The value of the *rgid* or *egid* argument is invalid or out-of-range.

[EPERM] The process does not have appropriate privileges and a change other than changing the real group ID to the saved set-group-ID, or changing the effective group ID to the real group ID or the saved set-group-ID, was requested.

EXAMPLES

None.

APPLICATION USAGE

If a non-privileged set-group-ID process sets its effective group ID to its real group ID, it can only set its effective group ID back to the previous value if *rgid* was –1 in the *setregid*( ) call, since the saved-group-ID is not changed in that case. If *rgid* was equal to the real group ID in the *setregid*( ) call, then the saved set-group-ID will also have been changed to the real user ID.

RATIONALE

Earlier versions of this standard did not specify whether the saved set-group-ID was affected by *setregid*( ) calls. This version specifies common existing practice that constitutes an important security feature. The ability to set both the effective group ID and saved set-group-ID to be the same as the real group ID means that any security weakness in code that is executed after that point cannot result in malicious code being executed with the previous effective group ID. Privileged applications could already do this using just *setgid*( ), but for non-privileged

applications the only standard method available is to use this feature of *setregid*( ).

FUTURE DIRECTIONS

None.

SEE ALSO

exec, *getegid*( ), *geteuid*( ), *getgid*( ), *getuid*( ), *setegid*( ), *seteuid*( ), *setgid*( ), *setreuid*( ), *setuid*( )

XBD **<unistd.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The DESCRIPTION is updated to indicate that the saved set-group-ID can be set by any of the *exec* family of functions, not just *execve*( ).

Issue 7

SD5-XSH-ERN-177 is applied, adding the ability to set both the effective group ID and saved set-group-ID to be the same as the real group ID.

59952 **NAME**

59953 setreuid — set real and effective user IDs

59954 **SYNOPSIS**

59955 XSI
```
#include <unistd.h>

int setreuid(uid_t ruid, uid_t euid);
```

59957 **DESCRIPTION**

59958 The *setreuid*( ) function shall set the real and effective user IDs of the current process to the
59959 values specified by the *ruid* and *euid* arguments. If *ruid* or *euid* is –1, the corresponding effective
59960 or real user ID of the current process shall be left unchanged.

59961 A process with appropriate privileges can set either ID to any value. An unprivileged process
59962 can only set the effective user ID if the *euid* argument is equal to either the real, effective, or
59963 saved user ID of the process.

59964 If the real user ID is being set (*ruid* is not –1), or the effective user ID is being set to a value not
59965 equal to the real user ID, then the saved set-user-ID of the current process shall be set equal to
59966 the new effective user ID.

59967 It is unspecified whether a process without appropriate privileges is permitted to change the real
59968 user ID to match the current effective user ID or saved set-user-ID of the process.

59969 **RETURN VALUE**

59970 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
59971 indicate the error.

59972 **ERRORS**

59973 The *setreuid*( ) function shall fail if:

59974 [EINVAL] The value of the *ruid* or *euid* argument is invalid or out-of-range.

59975 [EPERM] The current process does not have appropriate privileges, and either an
59976 attempt was made to change the effective user ID to a value other than the real
59977 user ID or the saved set-user-ID or an attempt was made to change the real
59978 user ID to a value not permitted by the implementation.

59979 **EXAMPLES**

59980 **Setting the Effective User ID to the Real User ID**

59981 The following example sets the effective user ID of the calling process to the real user ID, so that
59982 files created later will be owned by the current user. It also sets the saved set-user-ID to the real
59983 user ID, so any future attempt to set the effective user ID back to its previous value will fail.

```
59984 #include <unistd.h>
59985 #include <sys/types.h>
59986 ...
59987 setreuid(getuid(), getuid());
59988 ...
```

59989 **APPLICATION USAGE**

59990 None.

RATIONALE

Earlier versions of this standard did not specify whether the saved set-user-ID was affected by *setreuid*( ) calls. This version specifies common existing practice that constitutes an important security feature. The ability to set both the effective user ID and saved set-user-ID to be the same as the real user ID means that any security weakness in code that is executed after that point cannot result in malicious code being executed with the previous effective user ID. Privileged applications could already do this using just *setuid*( ), but for non-privileged applications the only standard method available is to use this feature of *setreuid*( ).

FUTURE DIRECTIONS

None.

60011 **NAME**

60012 setrlimit — control maximum resource consumption

60013 **SYNOPSIS**

60014 XSI
```
#include <sys/resource.h>

int setrlimit(int resource, const struct rlimit *rlp);
```

60016 **DESCRIPTION**

60017 Refer to *getrlimit( )*.

60018 **NAME**

60019 setservent — network services database functions

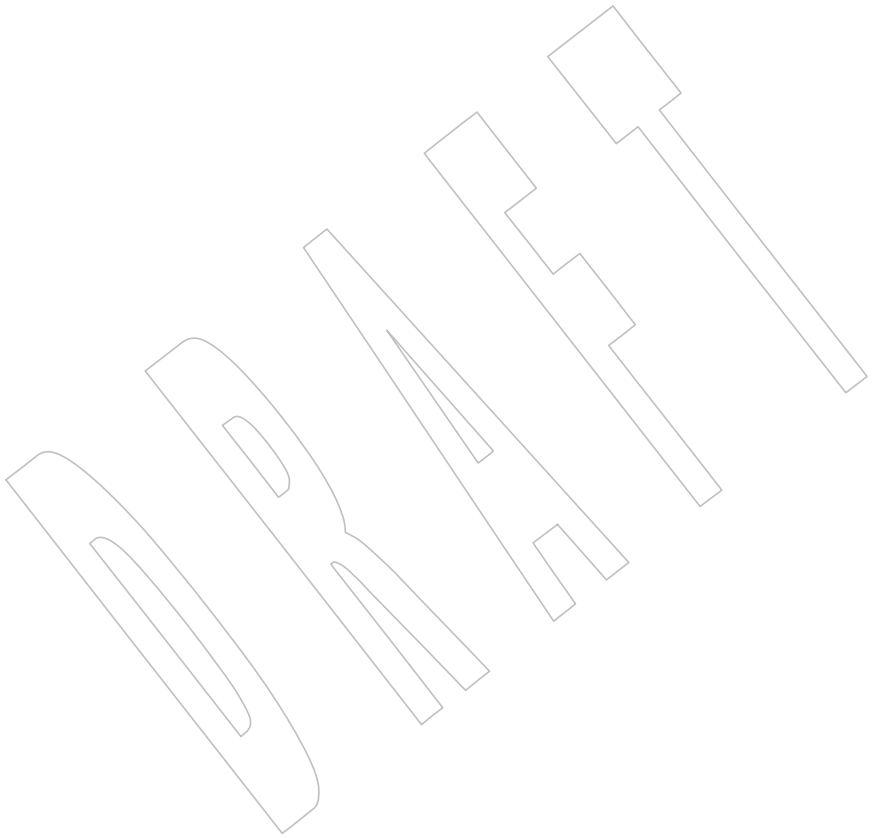
60020 **SYNOPSIS**

60021 `#include <netdb.h>`

60022 `void setservent(int stayopen);`

60023 **DESCRIPTION**

60024 Refer to *endservent( )*.



60025 **NAME**

60026 setsid — create session and set process group ID

60027 **SYNOPSIS**

60028 `#include <unistd.h>`

60029 `pid_t setsid(void);`

60030 **DESCRIPTION**

60031 The *setsid*( ) function shall create a new session, if the calling process is not a process group
60032 leader. Upon return the calling process shall be the session leader of this new session, shall be
60033 the process group leader of a new process group, and shall have no controlling terminal. The
60034 process group ID of the calling process shall be set equal to the process ID of the calling process.
60035 The calling process shall be the only process in the new process group and the only process in
60036 the new session.

60037 **RETURN VALUE**

60038 Upon successful completion, *setsid*( ) shall return the value of the new process group ID of the
60039 calling process. Otherwise, it shall return (**pid_t**)–1 and set *errno* to indicate the error.

60040 **ERRORS**

60041 The *setsid*( ) function shall fail if:

60042 [EPERM] The calling process is already a process group leader, or the process group ID
60043 of a process other than the calling process matches the process ID of the
60044 calling process.

60045 **EXAMPLES**

60046 None.

60047 **APPLICATION USAGE**

60048 None.

60049 **RATIONALE**

60050 The *setsid*( ) function is similar to the *setpgrp*( ) function of System V. System V, without job
60051 control, groups processes into process groups and creates new process groups via *setpgrp*( ); only
60052 one process group may be part of a login session.

60053 Job control allows multiple process groups within a login session. In order to limit job control
60054 actions so that they can only affect processes in the same login session, this volume of
60055 POSIX.1-200x adds the concept of a session that is created via *setsid*( ). The *setsid*( ) function also
60056 creates the initial process group contained in the session. Additional process groups can be
60057 created via the *setpgid*( ) function. A System V process group would correspond to a POSIX
60058 System Interfaces session containing a single POSIX process group. Note that this function
60059 requires that the calling process not be a process group leader. The usual way to ensure this is
60060 true is to create a new process with *fork*( ) and have it call *setsid*( ). The *fork*( ) function
60061 guarantees that the process ID of the new process does not match any existing process group ID.

60062 **FUTURE DIRECTIONS**

60063 None.

60066 XBD **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

60076 **NAME**

60077 setsockopt — set the socket options

60078 **SYNOPSIS**

60079
```
#include <sys/socket.h>
```

60080
```
int setsockopt(int socket, int level, int option_name,
```
60081
```
    const void *option_value, socklen_t option_len);
```

60082 **DESCRIPTION**

60083 The *setsockopt*( ) function shall set the option specified by the *option_name* argument, at the
60084 protocol level specified by the *level* argument, to the value pointed to by the *option_value*
60085 argument for the socket associated with the file descriptor specified by the *socket* argument.

60086 The *level* argument specifies the protocol level at which the option resides. To set options at the
60087 socket level, specify the *level* argument as SOL_SOCKET. To set options at other levels, supply
60088 the appropriate *level* identifier for the protocol controlling the option. For example, to indicate
60089 that an option is interpreted by the TCP (Transport Control Protocol), set *level* to IPPROTO_TCP
60090 as defined in the **<netinet/in.h>** header.

60091 The *option_name* argument specifies a single option to set. It can be one of the socket-level
60092 options defined in **<sys/socket.h>** and described in Section 2.10.16 (on page 522). If *setsockopt*( )
60093 is called with *option_name* equal to SO_ACCEPTCONN, SO_ERROR, or SO_TYPE, the behavior
60094 is unspecified.

60095 **RETURN VALUE**

60096 Upon successful completion, *setsockopt*( ) shall return 0. Otherwise, –1 shall be returned and
60097 *errno* set to indicate the error.

60098 **ERRORS**

60099 The *setsockopt*( ) function shall fail if:

60100 [EBADF] The *socket* argument is not a valid file descriptor.

60101 [EDOM] The send and receive timeout values are too big to fit into the timeout fields in
60102 the socket structure.

60103 [EINVAL] The specified option is invalid at the specified socket level or the socket has
60104 been shut down.

60105 [EISCONN] The socket is already connected, and a specified option cannot be set while the
60106 socket is connected.

60107 [ENOPROTOOPT]
60108 The option is not supported by the protocol.

60109 [ENOTSOCK] The *socket* argument does not refer to a socket.

60110 The *setsockopt*( ) function may fail if:

60111 [ENOMEM] There was insufficient memory available for the operation to complete.

60112 [ENOBUFS] Insufficient resources are available in the system to complete the call.

EXAMPLES

None.

APPLICATION USAGE

The *setsockopt*( ) function provides an application program with the means to control socket behavior. An application program can use *setsockopt*( ) to allocate buffer space, control timeouts, or permit socket data broadcasts. The **<sys/socket.h>** header defines the socket-level options available to *setsockopt*( ).

Options may exist at multiple protocol levels. The SO_ options are always present at the uppermost socket level.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/125 is applied, updating the SO_LINGER option in the DESCRIPTION to refer to the calling thread rather than the process.

Issue 7

Austin Group Interpretation 1003.1-2001 #158 is applied, removing text relating to socket options that is now in Section 2.10.16 (on page 522).

60136 **NAME**

60137 setstate — switch pseudo-random number generator state arrays

60138 **SYNOPSIS**

60139 XSI
```
#include <stdlib.h>

char *setstate(char *state);
```
60140

60141 **DESCRIPTION**

60142 Refer to *initstate( )*.

NAME

setuid — set user ID

SYNOPSIS

```
#include <unistd.h>

int setuid(uid_t uid);
```

DESCRIPTION

If the process has appropriate privileges, *setuid*( ) shall set the real user ID, effective user ID, and the saved set-user-ID of the calling process to *uid*.

If the process does not have appropriate privileges, but *uid* is equal to the real user ID or the saved set-user-ID, *setuid*( ) shall set the effective user ID to *uid*; the real user ID and saved set-user-ID shall remain unchanged.

The *setuid*( ) function shall not affect the supplementary group list in any way.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *setuid*( ) function shall fail, return –1, and set *errno* to the corresponding value if one or more of the following are true:

[EINVAL] The value of the *uid* argument is invalid and not supported by the implementation.

[EPERM] The process does not have appropriate privileges and *uid* does not match the real user ID or the saved set-user-ID.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The various behaviors of the *setuid*( ) and *setgid*( ) functions when called by non-privileged processes reflect the behavior of different historical implementations. For portability, it is recommended that new non-privileged applications use the *seteuid*( ) and *setegid*( ) functions instead.

The saved set-user-ID capability allows a program to regain the effective user ID established at the last *exec* call. Similarly, the saved set-group-ID capability allows a program to regain the effective group ID established at the last *exec* call. These capabilities are derived from System V. Without them, a program might have to run as superuser in order to perform the same functions, because superuser can write on the user's files. This is a problem because such a program can write on any user's files, and so must be carefully written to emulate the permissions of the calling process properly. In System V, these capabilities have traditionally been implemented only via the *setuid*( ) and *setgid*( ) functions for non-privileged processes. The fact that the behavior of those functions was different for privileged processes made them difficult to use. The POSIX.1-1990 standard defined the *setuid*( ) function to behave differently for privileged and unprivileged users. When the caller had appropriate privileges, the function set the real user ID, effective user ID, and saved set-user ID of the calling process on implementations that supported it. When the caller did not have appropriate privileges, the function set only the effective user ID, subject to permission checks. The former use is generally needed for utilities like *login* and *su*, which are not conforming applications and thus outside the

scope of POSIX.1-200x. These utilities wish to change the user ID irrevocably to a new value, generally that of an unprivileged user. The latter use is needed for conforming applications that are installed with the set-user-ID bit and need to perform operations using the real user ID.

POSIX.1-200x augments the latter functionality with a mandatory feature named _POSIX_SAVED_IDS. This feature permits a set-user-ID application to switch its effective user ID back and forth between the values of its *exec*-time real user ID and effective user ID. Unfortunately, the POSIX.1-1990 standard did not permit a conforming application using this feature to work properly when it happened to be executed with (implementation-defined) appropriate privileges. Furthermore, the application did not even have a means to tell whether it had this privilege. Since the saved set-user-ID feature is quite desirable for applications, as evidenced by the fact that NIST required it in FIPS 151-2, it has been mandated by POSIX.1-200x. However, there are implementors who have been reluctant to support it given the limitation described above.

The 4.3BSD system handles the problem by supporting separate functions: *setuid*( ) (which always sets both the real and effective user IDs, like *setuid*( ) in POSIX.1-200x for privileged users), and *seteuid*( ) (which always sets just the effective user ID, like *setuid*( ) in POSIX.1-200x for non-privileged users). This separation of functionality into distinct functions seems desirable. 4.3BSD does not support the saved set-user-ID feature. It supports similar functionality of switching the effective user ID back and forth via *setreuid*( ), which permits reversing the real and effective user IDs. This model seems less desirable than the saved set-user-ID because the real user ID changes as a side-effect. The current 4.4BSD includes saved effective IDs and uses them for *seteuid*( ) and *setegid*( ) as described above. The *setreuid*( ) and *setregid*( ) functions will be deprecated or removed.

The solution here is:

- Require that all implementations support the functionality of the saved set-user-ID, which is set by the *exec* functions and by privileged calls to *setuid*( ).
- Add the *seteuid*( ) and *setegid*( ) functions as portable alternatives to *setuid*( ) and *setgid*( ) for non-privileged and privileged processes.

Historical systems have provided two mechanisms for a set-user-ID process to change its effective user ID to be the same as its real user ID in such a way that it could return to the original effective user ID: the use of the *setuid*( ) function in the presence of a saved set-user-ID, or the use of the BSD *setreuid*( ) function, which was able to swap the real and effective user IDs. The changes included in POSIX.1-200x provide a new mechanism using *seteuid*( ) in conjunction with a saved set-user-ID. Thus, all implementations with the new *seteuid*( ) mechanism will have a saved set-user-ID for each process, and most of the behavior controlled by _POSIX_SAVED_IDS has been changed to agree with the case where the option was defined. The *kill*( ) function is an exception. Implementors of the new *seteuid*( ) mechanism will generally be required to maintain compatibility with the older mechanisms previously supported by their systems. However, compatibility with this use of *setreuid*( ) and with the _POSIX_SAVED_IDS behavior of *kill*( ) is unfortunately complicated. If an implementation with a saved set-user-ID allows a process to use *setreuid*( ) to swap its real and effective user IDs, but were to leave the saved set-user-ID unmodified, the process would then have an effective user ID equal to the original real user ID, and both real and saved set-user-ID would be equal to the original effective user ID. In that state, the real user would be unable to kill the process, even though the effective user ID of the process matches that of the real user, if the *kill*( ) behavior of _POSIX_SAVED_IDS was used. This is obviously not acceptable. The alternative choice, which is used in at least one implementation, is to change the saved set-user-ID to the effective user ID during most calls to *setreuid*( ). The standard developers considered that alternative to be less correct than the retention of the old behavior of *kill*( ) in such systems. Current conforming applications shall

accommodate either behavior from *kill*( ), and there appears to be no strong reason for *kill*( ) to check the saved set-user-ID rather than the effective user ID.

FUTURE DIRECTIONS

None.

XBD **<sys/types.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The functionality associated with _POSIX_SAVED_IDS is now mandatory. This is a FIPS requirement.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The effects of *setuid*( ) in processes without appropriate privileges are changed.
- A requirement that the supplementary group list is not affected is added.

60259 **NAME**

60260 setutxent — reset the user accounting database to the first entry

60261 **SYNOPSIS**

60262 XSI
```
#include <utmpx.h>
```
60263
```
void setutxent(void);
```

60264 **DESCRIPTION**

60265 Refer to *endutxent( )*.

NAME

setvbuf — assign buffering to a stream

SYNOPSIS

```
#include <stdio.h>

int setvbuf(FILE *restrict stream, char *restrict buf, int type,
    size_t size);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *setvbuf*( ) function may be used after the stream pointed to by *stream* is associated with an open file but before any other operation (other than an unsuccessful call to *setvbuf*( )) is performed on the stream. The argument *type* determines how *stream* shall be buffered, as follows:

- {_IOFBF} shall cause input/output to be fully buffered.
- {_IOLBF} shall cause input/output to be line buffered.
- {_IONBF} shall cause input/output to be unbuffered.

If *buf* is not a null pointer, the array it points to may be used instead of a buffer allocated by *setvbuf*( ) and the argument *size* specifies the size of the array; otherwise, *size* may determine the size of a buffer allocated by the *setvbuf*( ) function. The contents of the array at any time are unspecified.

For information about streams, see Section 2.5 (on page 490).

RETURN VALUE

Upon successful completion, *setvbuf*( ) shall return 0. Otherwise, it shall return a non-zero value CX if an invalid value is given for *type* or if the request cannot be honored, and may set *errno* to indicate the error.

ERRORS

The *setvbuf*( ) function may fail if:

CX [EBADF] The file descriptor underlying *stream* is not valid.

EXAMPLES

None.

APPLICATION USAGE

A common source of error is allocating buffer space as an "automatic" variable in a code block, and then failing to close the stream in the same block.

With *setvbuf*( ), allocating a buffer of *size* bytes does not necessarily imply that all of *size* bytes are used for the buffer area.

Applications should note that many implementations only provide line buffering on input from terminal devices.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Extensions beyond the ISO C standard are marked.

The *setvbuf( )* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

60316 **NAME**

60317 shm_open — open a shared memory object (**REALTIME**)

60318 **SYNOPSIS**

60319 SHM
```
#include <sys/mman.h>

int shm_open(const char *name, int oflag, mode_t mode);
```

60321 **DESCRIPTION**

60322 The *shm_open*( ) function shall establish a connection between a shared memory object and a file
60323 descriptor. It shall create an open file description that refers to the shared memory object and a
60324 file descriptor that refers to that open file description. The file descriptor is used by other
60325 functions to refer to that shared memory object. The *name* argument points to a string naming a
60326 shared memory object. It is unspecified whether the name appears in the file system and is
60327 visible to other functions that take pathnames as arguments. The *name* argument conforms to the
60328 construction rules for a pathname, except that the interpretation of <slash> characters other than
60329 the leading <slash> character in *name* is implementation-defined, and that the length limits for
60330 the *name* argument are implementation-defined and need not be the same as the pathname limits
60331 {PATH_MAX} and {NAME_MAX}. If *name* begins with the <slash> character, then processes
60332 calling *shm_open*( ) with the same value of *name* refer to the same shared memory object, as long
60333 as that name has not been removed. If *name* does not begin with the <slash> character, the effect
60334 is implementation-defined.

60335 If successful, *shm_open*( ) shall return a file descriptor for the shared memory object that is the
60336 lowest numbered file descriptor not currently open for that process. The open file description is
60337 new, and therefore the file descriptor does not share it with any other processes. It is unspecified
60338 whether the file offset is set. The FD_CLOEXEC file descriptor flag associated with the new file
60339 descriptor is set.

60340 The file status flags and file access modes of the open file description are according to the value
60341 of *oflag*. The *oflag* argument is the bitwise-inclusive OR of the following flags defined in the
60342 **<fcntl.h>** header. Applications specify exactly one of the first two values (access modes) below
60343 in the value of *oflag*:

60344 O_RDONLY Open for read access only.

60345 O_RDWR Open for read or write access.

60346 Any combination of the remaining flags may be specified in the value of *oflag*:

60347 O_CREAT If the shared memory object exists, this flag has no effect, except as noted
60348 under O_EXCL below. Otherwise, the shared memory object is created. The
60349 user ID of the shared memory object shall be set to the effective user ID of the
60350 process. The group ID of the shared memory object shall be set to the effective
60351 group ID of the process; however, if the *name* argument is visible in the file
60352 system, the group ID may be set to the group ID of the containing directory.
60353 The permission bits of the shared memory object shall be set to the value of
60354 the *mode* argument except those set in the file mode creation mask of the
60355 process. When bits in *mode* other than the file permission bits are set, the effect
60356 is unspecified. The *mode* argument does not affect whether the shared memory
60357 object is opened for reading, for writing, or for both. The shared memory
60358 object has a size of zero.

60359 O_EXCL If O_EXCL and O_CREAT are set, *shm_open*( ) fails if the shared memory
60360 object exists. The check for the existence of the shared memory object and the
60361 creation of the object if it does not exist is atomic with respect to other

processes executing *shm_open*( ) naming the same shared memory object with O_EXCL and O_CREAT set. If O_EXCL is set and O_CREAT is not set, the result is undefined.

O_TRUNC If the shared memory object exists, and it is successfully opened O_RDWR, the object shall be truncated to zero length and the mode and owner shall be unchanged by this function call. The result of using O_TRUNC with O_RDONLY is undefined.

When a shared memory object is created, the state of the shared memory object, including all data associated with the shared memory object, persists until the shared memory object is unlinked and all other references are gone. It is unspecified whether the name and shared memory object state remain valid after a system reboot.

RETURN VALUE

Upon successful completion, the *shm_open*( ) function shall return a non-negative integer representing the lowest numbered unused file descriptor. Otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *shm_open*( ) function shall fail if:

[EACCES] The shared memory object exists and the permissions specified by *oflag* are denied, or the shared memory object does not exist and permission to create the shared memory object is denied, or O_TRUNC is specified and write permission is denied.

[EEXIST] O_CREAT and O_EXCL are set and the named shared memory object already exists.

[EINTR] The *shm_open*( ) operation was interrupted by a signal.

[EINVAL] The *shm_open*( ) operation is not supported for the given name.

[EMFILE] All file descriptors available to the process are currently open.

[ENFILE] Too many shared memory objects are currently open in the system.

[ENOENT] O_CREAT is not set and the named shared memory object does not exist.

[ENOSPC] There is insufficient space for the creation of the new shared memory object.

The *shm_open*( ) function may fail if:

[ENAMETOOLONG]
The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems that do not support the XSI option XSI or exceeds {_XOPEN_PATH_MAX} on XSI systems, or has a pathname component that is longer than {_POSIX_NAME_MAX} on systems that do not support the XSI option XSI or longer than {_XOPEN_NAME_MAX} on XSI systems.

EXAMPLES

Creating and Mapping a Shared Memory Object

The following code segment demonstrates the use of *shm_open*( ) to create a shared memory object which is then sized using *ftruncate*( ) before being mapped into the process address space using *mmap*( ):

```
#include <unistd.h>
#include <sys/mman.h>
...

#define MAX_LEN 10000
struct region {        /* Defines "structure" of shared memory */
    int len;
    char buf[MAX_LEN];
};
struct region *rptr;
int fd;

/* Create shared memory object and set its size */

fd = shm_open("/myregion", O_CREAT | O_RDWR, S_IRUSR | S_IWUSR);
if (fd == -1)
    /* Handle error */;

if (ftruncate(fd, sizeof(struct region)) == -1)
    /* Handle error */;

/* Map shared memory object */

rptr = mmap(NULL, sizeof(struct region),
        PROT_READ | PROT_WRITE, MAP_SHARED, fd, 0);
if (rptr == MAP_FAILED)
    /* Handle error */;

/* Now we can refer to mapped region using fields of rptr;
   for example, rptr->len */
...
```

APPLICATION USAGE

None.

RATIONALE

When the Memory Mapped Files option is supported, the normal *open*( ) call is used to obtain a descriptor to a file to be mapped according to existing practice with *mmap*( ). When the Shared Memory Objects option is supported, the *shm_open*( ) function shall obtain a descriptor to the shared memory object to be mapped.

There is ample precedent for having a file descriptor represent several types of objects. In the POSIX.1-1990 standard, a file descriptor can represent a file, a pipe, a FIFO, a tty, or a directory. Many implementations simply have an operations vector, which is indexed by the file descriptor type and does very different operations. Note that in some cases the file descriptor passed to generic operations on file descriptors is returned by *open*( ) or *creat*( ) and in some cases returned by alternate functions, such as *pipe*( ). The latter technique is used by *shm_open*( ).

Note that such shared memory objects can actually be implemented as mapped files. In both cases, the size can be set after the open using *ftruncate*( ). The *shm_open*( ) function itself does not

create a shared object of a specified size because this would duplicate an extant function that set the size of an object referenced by a file descriptor.

On implementations where memory objects are implemented using the existing file system, the *shm_open*( ) function may be implemented using a macro that invokes *open*( ), and the *shm_unlink*( ) function may be implemented using a macro that invokes *unlink*( ).

For implementations without a permanent file system, the definition of the name of the memory objects is allowed not to survive a system reboot. Note that this allows systems with a permanent file system to implement memory objects as data structures internal to the implementation as well.

On implementations that choose to implement memory objects using memory directly, a *shm_open*( ) followed by an *ftruncate*( ) and *close*( ) can be used to preallocate a shared memory area and to set the size of that preallocation. This may be necessary for systems without virtual memory hardware support in order to ensure that the memory is contiguous.

The set of valid open flags to *shm_open*( ) was restricted to O_RDONLY, O_RDWR, O_CREAT, and O_TRUNC because these could be easily implemented on most memory mapping systems. This volume of POSIX.1-200x is silent on the results if the implementation cannot supply the requested file access because of implementation-defined reasons, including hardware ones.

The error conditions [EACCES] and [ENOTSUP] are provided to inform the application that the implementation cannot complete a request.

[EACCES] indicates for implementation-defined reasons, probably hardware-related, that the implementation cannot comply with a requested mode because it conflicts with another requested mode. An example might be that an application desires to open a memory object two times, mapping different areas with different access modes. If the implementation cannot map a single area into a process space in two places, which would be required if different access modes were required for the two areas, then the implementation may inform the application at the time of the second open.

[ENOTSUP] indicates for implementation-defined reasons, probably hardware-related, that the implementation cannot comply with a requested mode at all. An example would be that the hardware of the implementation cannot support write-only shared memory areas.

On all implementations, it may be desirable to restrict the location of the memory objects to specific file systems for performance (such as a RAM disk) or implementation-defined reasons (shared memory supported directly only on certain file systems). The *shm_open*( ) function may be used to enforce these restrictions. There are a number of methods available to the application to determine an appropriate name of the file or the location of an appropriate directory. One way is from the environment via *getenv*( ). Another would be from a configuration file.

This volume of POSIX.1-200x specifies that memory objects have initial contents of zero when created. This is consistent with current behavior for both files and newly allocated memory. For those implementations that use physical memory, it would be possible that such implementations could simply use available memory and give it to the process uninitialized. This, however, is not consistent with standard behavior for the uninitialized data area, the stack, and of course, files. Finally, it is highly desirable to set the allocated memory to zero for security reasons. Thus, initializing memory objects to zero is required.

FUTURE DIRECTIONS

A future version might require the *shm_open*( ) and *shm_unlink*( ) functions to have semantics similar to normal file system operations.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *shm_open*( ) function is marked as part of the Shared Memory Objects option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Shared Memory Objects option.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/126 is applied, adding the example to the EXAMPLES section.

Issue 7

Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and changing [ENAMETOOLONG] from a "shall fail" to a "may fail" error.

Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the user ID and group ID of the shared memory object.

NAME

shm_unlink — remove a shared memory object (**REALTIME**)

SYNOPSIS

SHM

```
#include <sys/mman.h>

int shm_unlink(const char *name);
```

DESCRIPTION

The *shm_unlink*( ) function shall remove the name of the shared memory object named by the string pointed to by *name*.

If one or more references to the shared memory object exist when the object is unlinked, the name shall be removed before *shm_unlink*( ) returns, but the removal of the memory object contents shall be postponed until all open and map references to the shared memory object have been removed.

Even if the object continues to exist after the last *shm_unlink*( ), reuse of the name shall subsequently cause *shm_open*( ) to behave as if no shared memory object of this name exists (that is, *shm_open*( ) will fail if O_CREAT is not set, or will create a new shared memory object if O_CREAT is set).

RETURN VALUE

Upon successful completion, a value of zero shall be returned. Otherwise, a value of −1 shall be returned and *errno* set to indicate the error. If −1 is returned, the named shared memory object shall not be changed by this function call.

ERRORS

The *shm_unlink*( ) function shall fail if:

[EACCES] Permission is denied to unlink the named shared memory object.

[ENOENT] The named shared memory object does not exist.

The *shm_unlink*( ) function may fail if:

[ENAMETOOLONG]

The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems that do not support the XSI option XSI or exceeds {_XOPEN_PATH_MAX} on XSI systems, or has a pathname component that is longer than {_POSIX_NAME_MAX} on systems that do not support the XSI option XSI or longer than {_XOPEN_NAME_MAX} on XSI systems. A call to *shm_unlink*( ) with a *name* argument that contains the same shared memory object name as was previously used in a successful *shm_open*( ) call shall not give an [ENAMETOOLONG] error.

EXAMPLES

None.

APPLICATION USAGE

Names of memory objects that were allocated with *open*( ) are deleted with *unlink*( ) in the usual fashion. Names of memory objects that were allocated with *shm_open*( ) are deleted with *shm_unlink*( ). Note that the actual memory object is not destroyed until the last close and unmap on it have occurred if it was already in use.

RATIONALE

None.

FUTURE DIRECTIONS

A future version might require the *shm_open*( ) and *shm_unlink*( ) functions to have semantics similar to normal file system operations.

close( ), *mmap*( ), *munmap*( ), *shmat*( ), *shmctl*( ), *shmdt*( ), *shm_open*( )

XBD **<sys/mman.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *shm_unlink*( ) function is marked as part of the Shared Memory Objects option.

In the DESCRIPTION, text is added to clarify that reusing the same name after a *shm_unlink*( ) will not attach to the old shared memory object.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Shared Memory Objects option.

Issue 7

Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a "shall fail" to a "may fail" error.

Austin Group Interpretation 1003.1-2001 #141 is applied, adding FUTURE DIRECTIONS.

NAME

shmat — XSI shared memory attach operation

SYNOPSIS

XSI
```
#include <sys/shm.h>

void *shmat(int shmid, const void *shmaddr, int shmflg);
```

DESCRIPTION

The *shmat*( ) function operates on XSI shared memory (see XBD Section 3.340, on page 88). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 497).

The *shmat*( ) function attaches the shared memory segment associated with the shared memory identifier specified by *shmid* to the address space of the calling process. The segment is attached at the address specified by one of the following criteria:

- If *shmaddr* is a null pointer, the segment is attached at the first available address as selected by the system.
- If *shmaddr* is not a null pointer and (*shmflg* &SHM_RND) is non-zero, the segment is attached at the address given by (*shmaddr* –((*uintptr_t*)*shmaddr* %SHMLBA)). The character `'%'` is the C-language remainder operator.
- If *shmaddr* is not a null pointer and (*shmflg* &SHM_RND) is 0, the segment is attached at the address given by *shmaddr*.
- The segment is attached for reading if (*shmflg* &SHM_RDONLY) is non-zero and the calling process has read permission; otherwise, if it is 0 and the calling process has read and write permission, the segment is attached for reading and writing.

RETURN VALUE

Upon successful completion, *shmat*( ) shall increment the value of *shm_nattch* in the data structure associated with the shared memory ID of the attached shared memory segment and return the segment's start address.

Otherwise, the shared memory segment shall not be attached, *shmat*( ) shall return –1, and *errno* shall be set to indicate the error.

ERRORS

The *shmat*( ) function shall fail if:

[EACCES] Operation permission is denied to the calling process; see Section 2.7 (on page 496).

[EINVAL] The value of *shmid* is not a valid shared memory identifier, the *shmaddr* is not a null pointer, and the value of (*shmaddr* –((*uintptr_t*)*shmaddr* %SHMLBA)) is an illegal address for attaching shared memory; or the *shmaddr* is not a null pointer, (*shmflg* &SHM_RND) is 0, and the value of *shmaddr* is an illegal address for attaching shared memory.

[EMFILE] The number of shared memory segments attached to the calling process would exceed the system-imposed limit.

[ENOMEM] The available data space is not large enough to accommodate the shared memory segment.

EXAMPLES

None.

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 496) can be easily modified to use the alternative interfaces.

NAME

shmctl — XSI shared memory control operations

SYNOPSIS

XSI

```
#include <sys/shm.h>

int shmctl(int shmid, int cmd, struct shmid_ds *buf);
```

DESCRIPTION

The *shmctl*( ) function operates on XSI shared memory (see XBD Section 3.340, on page 88). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 497).

The *shmctl*( ) function provides a variety of shared memory control operations as specified by *cmd*. The following values for *cmd* are available:

IPC_STAT — Place the current value of each member of the **shmid_ds** data structure associated with *shmid* into the structure pointed to by *buf*. The contents of the structure are defined in **<sys/shm.h>**.

IPC_SET — Set the value of the following members of the **shmid_ds** data structure associated with *shmid* to the corresponding value found in the structure pointed to by *buf*:

`shm_perm.uid`
`shm_perm.gid`
`shm_perm.mode` Low-order nine bits.

IPC_SET can only be executed by a process that has an effective user ID equal to either that of a process with appropriate privileges or to the value of *shm_perm.cuid* or *shm_perm.uid* in the **shmid_ds** data structure associated with *shmid*.

IPC_RMID — Remove the shared memory identifier specified by *shmid* from the system and destroy the shared memory segment and **shmid_ds** data structure associated with it. IPC_RMID can only be executed by a process that has an effective user ID equal to either that of a process with appropriate privileges or to the value of *shm_perm.cuid* or *shm_perm.uid* in the **shmid_ds** data structure associated with *shmid*.

RETURN VALUE

Upon successful completion, *shmctl*( ) shall return 0; otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *shmctl*( ) function shall fail if:

[EACCES] — The argument *cmd* is equal to IPC_STAT and the calling process does not have read permission; see Section 2.7 (on page 496).

[EINVAL] — The value of *shmid* is not a valid shared memory identifier, or the value of *cmd* is not a valid command.

[EPERM] — The argument *cmd* is equal to IPC_RMID or IPC_SET and the effective user ID of the calling process is not equal to that of a process with appropriate privileges and it is not equal to the value of *shm_perm.cuid* or *shm_perm.uid* in the data structure associated with *shmid*.

The *shmctl*( ) function may fail if:

[EOVERFLOW] The *cmd* argument is IPC_STAT and the *gid* or *uid* value is too large to be stored in the structure pointed to by the *buf* argument.

EXAMPLES

None.

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 496) can be easily modified to use the alternative interfaces.

NAME

shmdt — XSI shared memory detach operation

SYNOPSIS

XSI
```
#include <sys/shm.h>

int shmdt(const void *shmaddr);
```

DESCRIPTION

The *shmdt*( ) function operates on XSI shared memory (see XBD Section 3.340, on page 88). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 497).

The *shmdt*( ) function detaches the shared memory segment located at the address specified by *shmaddr* from the address space of the calling process.

RETURN VALUE

Upon successful completion, *shmdt*( ) shall decrement the value of *shm_nattch* in the data structure associated with the shared memory ID of the attached shared memory segment and return 0.

Otherwise, the shared memory segment shall not be detached, *shmdt*( ) shall return –1, and *errno* shall be set to indicate the error.

ERRORS

The *shmdt*( ) function shall fail if:

[EINVAL] The value of *shmaddr* is not the data segment start address of a shared memory segment.

EXAMPLES

None.

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 496) can be easily modified to use the alternative interfaces.

NAME

shmget — get an XSI shared memory segment

SYNOPSIS

XSI
```
#include <sys/shm.h>

int shmget(key_t key, size_t size, int shmflg);
```

DESCRIPTION

The *shmget*( ) function operates on XSI shared memory (see XBD Section 3.340, on page 88). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 497).

The *shmget*( ) function shall return the shared memory identifier associated with *key*.

A shared memory identifier, associated data structure, and shared memory segment of at least *size* bytes (see **<sys/shm.h>**) are created for *key* if one of the following is true:

- The argument *key* is equal to IPC_PRIVATE.
- The argument *key* does not already have a shared memory identifier associated with it and (*shmflg* &IPC_CREAT) is non-zero.

Upon creation, the data structure associated with the new shared memory identifier shall be initialized as follows:

- The values of *shm_perm.cuid*, *shm_perm.uid*, *shm_perm.cgid*, and *shm_perm.gid* are set equal to the effective user ID and effective group ID, respectively, of the calling process.
- The low-order nine bits of *shm_perm.mode* are set equal to the low-order nine bits of *shmflg*.
- The value of *shm_segsz* is set equal to the value of *size*.
- The values of *shm_lpid*, *shm_nattch*, *shm_atime*, and *shm_dtime* are set equal to 0.
- The value of *shm_ctime* is set equal to the current time.

When the shared memory segment is created, it shall be initialized with all zero values.

RETURN VALUE

Upon successful completion, *shmget*( ) shall return a non-negative integer, namely a shared memory identifier; otherwise, it shall return –1 and set *errno* to indicate the error.

ERRORS

The *shmget*( ) function shall fail if:

[EACCES] A shared memory identifier exists for *key* but operation permission as specified by the low-order nine bits of *shmflg* would not be granted; see Section 2.7 (on page 496).

[EEXIST] A shared memory identifier exists for the argument *key* but (*shmflg* &IPC_CREAT) &&(*shmflg* &IPC_EXCL) is non-zero.

[EINVAL] A shared memory segment is to be created and the value of size is less than the system-imposed minimum or greater than the system-imposed maximum.

[EINVAL] No shared memory segment is to be created and a shared memory segment exists for *key* but the size of the segment associated with it is less than *size* and *size* is not 0.

60777 [ENOENT] A shared memory identifier does not exist for the argument *key* and (*shmflg*
60778 &IPC_CREAT) is 0.

60779 [ENOMEM] A shared memory identifier and associated shared memory segment shall be
60780 created, but the amount of available physical memory is not sufficient to fill
60781 the request.

60782 [ENOSPC] A shared memory identifier is to be created, but the system-imposed limit on
60783 the maximum number of allowed shared memory identifiers system-wide
60784 would be exceeded.

NAME

shutdown — shut down socket send and receive operations

SYNOPSIS

```
#include <sys/socket.h>

int shutdown(int socket, int how);
```

DESCRIPTION

The *shutdown*( ) function shall cause all or part of a full-duplex connection on the socket associated with the file descriptor *socket* to be shut down.

The *shutdown*( ) function takes the following arguments:

socket Specifies the file descriptor of the socket.

how Specifies the type of shutdown. The values are as follows:

SHUT_RD Disables further receive operations.

SHUT_WR Disables further send operations.

SHUT_RDWR Disables further send and receive operations.

The *shutdown*( ) function disables subsequent send and/or receive operations on a socket, depending on the value of the *how* argument.

RETURN VALUE

Upon successful completion, *shutdown*( ) shall return 0; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *shutdown*( ) function shall fail if:

[EBADF] The *socket* argument is not a valid file descriptor.

[EINVAL] The *how* argument is invalid.

[ENOTCONN] The socket is not connected.

[ENOTSOCK] The *socket* argument does not refer to a socket.

The *shutdown*( ) function may fail if:

[ENOBUFS] Insufficient resources were available in the system to perform the operation.

60845 **CHANGE HISTORY**
60846 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

NAME

sigaction — examine and change a signal action

SYNOPSIS

CX
```
#include <signal.h>

int sigaction(int sig, const struct sigaction *restrict act,
    struct sigaction *restrict oact);
```

DESCRIPTION

The *sigaction*( ) function allows the calling process to examine and/or specify the action to be associated with a specific signal. The argument *sig* specifies the signal; acceptable values are defined in **<signal.h>**.

The structure **sigaction**, used to describe an action to be taken, is defined in the **<signal.h>** header to include at least the following members:

Member Type	Member Name	Description
void(*) (int)	*sa_handler*	Pointer to a signal-catching function or one of the macros SIG_IGN or SIG_DFL.
sigset_t	*sa_mask*	Additional set of signals to be blocked during execution of signal-catching function.
int	*sa_flags*	Special flags to affect behavior of signal.
void(*) (int, siginfo_t *, void *)	*sa_sigaction*	Pointer to a signal-catching function.

The storage occupied by *sa_handler* and *sa_sigaction* may overlap, and a conforming application shall not use both simultaneously.

If the argument *act* is not a null pointer, it points to a structure specifying the action to be associated with the specified signal. If the argument *oact* is not a null pointer, the action previously associated with the signal is stored in the location pointed to by the argument *oact*. If the argument *act* is a null pointer, signal handling is unchanged; thus, the call can be used to enquire about the current handling of a given signal. The SIGKILL and SIGSTOP signals shall not be added to the signal mask using this mechanism; this restriction shall be enforced by the system without causing an error to be indicated.

If the SA_SIGINFO flag (see below) is cleared in the *sa_flags* field of the **sigaction** structure, the *sa_handler* field identifies the action to be associated with the specified signal. If the SA_SIGINFO flag is set in the *sa_flags* field, the *sa_sigaction* field specifies a signal-catching function.

The *sa_flags* field can be used to modify the behavior of the specified signal.

The following flags, defined in the **<signal.h>** header, can be set in *sa_flags*:

XSI SA_NOCLDSTOP Do not generate SIGCHLD when children stop or stopped children continue.

If *sig* is SIGCHLD and the SA_NOCLDSTOP flag is not set in *sa_flags*, and the implementation supports the SIGCHLD signal, then a SIGCHLD signal shall be generated for the calling process whenever any of its child processes stop and a SIGCHLD signal may be generated for the calling process whenever any of its stopped child processes are continued. If *sig* is SIGCHLD and the SA_NOCLDSTOP flag is set in *sa_flags*, then the

60892 implementation shall not generate a SIGCHLD signal in this way.

60893 XSI SA_ONSTACK If set and an alternate signal stack has been declared with *sigaltstack*( ), the
60894 signal shall be delivered to the calling process on that stack. Otherwise,
60895 the signal shall be delivered on the current stack.

60896 SA_RESETHAND If set, the disposition of the signal shall be reset to SIG_DFL and the
60897 SA_SIGINFO flag shall be cleared on entry to the signal handler.

60898 **Note:** SIGILL and SIGTRAP cannot be automatically reset when delivered;
60899 the system silently enforces this restriction.

60900 Otherwise, the disposition of the signal shall not be modified on entry to
60901 the signal handler.

60902 In addition, if this flag is set, *sigaction*( ) may behave as if the
60903 SA_NODEFER flag were also set.

60904 SA_RESTART This flag affects the behavior of interruptible functions; that is, those
60905 specified to fail with *errno* set to [EINTR]. If set, and a function specified
60906 as interruptible is interrupted by this signal, the function shall restart and
60907 shall not fail with [EINTR] unless otherwise specified. If an interruptible
60908 function which uses a timeout is restarted, the duration of the timeout
60909 following the restart is set to an unspecified value that does not exceed
60910 the original timeout value. If the flag is not set, interruptible functions
60911 interrupted by this signal shall fail with *errno* set to [EINTR].

60912 SA_SIGINFO If cleared and the signal is caught, the signal-catching function shall be
60913 entered as:

60914 `void func(int signo);`

60915 where *signo* is the only argument to the signal-catching function. In this
60916 case, the application shall use the *sa_handler* member to describe the
60917 signal-catching function and the application shall not modify the
60918 *sa_sigaction* member.

60919 If SA_SIGINFO is set and the signal is caught, the signal-catching
60920 function shall be entered as:

60921 `void func(int signo, siginfo_t *info, void *context);`

60922 where two additional arguments are passed to the signal-catching
60923 function. The second argument shall point to an object of type **siginfo_t**
60924 explaining the reason why the signal was generated; the third argument
60925 can be cast to a pointer to an object of type **ucontext_t** to refer to the
60926 receiving thread's context that was interrupted when the signal was
60927 delivered. In this case, the application shall use the *sa_sigaction* member to
60928 describe the signal-catching function and the application shall not modify
60929 the *sa_handler* member.

60930 The *si_signo* member contains the system-generated signal number.

60931 XSI The *si_errno* member may contain implementation-defined additional
60932 error information; if non-zero, it contains an error number identifying the
60933 condition that caused the signal to be generated.

60934 The *si_code* member contains a code identifying the cause of the signal, as
60935 described in Section 2.4.3 (on page 486).

SA_NOCLDWAIT If set, and *sig* equals SIGCHLD, child processes of the calling processes shall not be transformed into zombie processes when they terminate. If the calling process subsequently waits for its children, and the process has no unwaited-for children that were transformed into zombie processes, it shall block until all of its children terminate, and *wait*( ), *waitid*( ), and *waitpid*( ) shall fail and set *errno* to [ECHILD]. Otherwise, terminating child processes shall be transformed into zombie processes, unless SIGCHLD is set to SIG_IGN.

SA_NODEFER If set and *sig* is caught, *sig* shall not be added to the thread's signal mask on entry to the signal handler unless it is included in *sa_mask*. Otherwise, *sig* shall always be added to the thread's signal mask on entry to the signal handler.

When a signal is caught by a signal-catching function installed by *sigaction*( ), a new signal mask is calculated and installed for the duration of the signal-catching function (or until a call to either *sigprocmask*( ) or *sigsuspend*( ) is made). This mask is formed by taking the union of the current signal mask and the value of the *sa_mask* for the signal being delivered, and unless SA_NODEFER or SA_RESETHAND is set, then including the signal being delivered. If and when the user's signal handler returns normally, the original signal mask is restored.

Once an action is installed for a specific signal, it shall remain installed until another action is explicitly requested (by another call to *sigaction*( )), until the SA_RESETHAND flag causes resetting of the handler, or until one of the *exec* functions is called.

If the previous action for *sig* had been established by *signal*( ), the values of the fields returned in the structure pointed to by *oact* are unspecified, and in particular *oact->sa_handler* is not necessarily the same value passed to *signal*( ). However, if a pointer to the same structure or a copy thereof is passed to a subsequent call to *sigaction*( ) via the *act* argument, handling of the signal shall be as if the original call to *signal*( ) were repeated.

If *sigaction*( ) fails, no new signal handler is installed.

It is unspecified whether an attempt to set the action for a signal that cannot be caught or ignored to SIG_DFL is ignored or causes an error to be returned with *errno* set to [EINVAL].

If SA_SIGINFO is not set in *sa_flags*, then the disposition of subsequent occurrences of *sig* when it is already pending is implementation-defined; the signal-catching function shall be invoked with a single argument. If SA_SIGINFO is set in *sa_flags*, then subsequent occurrences of *sig* generated by *sigqueue*( ) or as a result of any signal-generating function that supports the specification of an application-defined value (when *sig* is already pending) shall be queued in FIFO order until delivered or accepted; the signal-catching function shall be invoked with three arguments. The application specified value is passed to the signal-catching function as the *si_value* member of the **siginfo_t** structure.

The result of the use of *sigaction*( ) and a *sigwait*( ) function concurrently within a process on the same signal is unspecified.

RETURN VALUE

Upon successful completion, *sigaction*( ) shall return 0; otherwise, –1 shall be returned, *errno* shall be set to indicate the error, and no new signal-catching function shall be installed.

ERRORS

The *sigaction*( ) function shall fail if:

[EINVAL] The *sig* argument is not a valid signal number or an attempt is made to catch a signal that cannot be caught or ignore a signal that cannot be ignored.

[ENOTSUP] The SA_SIGINFO bit flag is set in the *sa_flags* field of the **sigaction** structure.

The *sigaction*( ) function may fail if:

[EINVAL] An attempt was made to set the action to SIG_DFL for a signal that cannot be caught or ignored (or both).

In addition, the *sigaction*( ) function may fail if the SA_SIGINFO flag is set in the *sa_flags* field of the **sigaction** structure for a signal not in the range SIGRTMIN to SIGRTMAX.

EXAMPLES

Establishing a Signal Handler

The following example demonstrates the use of *sigaction*( ) to establish a handler for the SIGINT signal.

```
#include <signal.h>

static void handler(int signum)
{
    /* Take appropriate actions for signal delivery */
}

int main()
{
    struct sigaction sa;

    sa.sa_handler = handler;
    sigemptyset(&sa.sa_mask);
    sa.sa_flags = SA_RESTART; /* Restart functions if
                                 interrupted by handler */
    if (sigaction(SIGINT, &sa, NULL) == -1)
        /* Handle error */;

    /* Further code */
}
```

APPLICATION USAGE

The *sigaction*( ) function supersedes the *signal*( ) function, and should be used in preference. In particular, *sigaction*( ) and *signal*( ) should not be used in the same process to control the same signal. The behavior of async-signal-safe functions, as defined in their respective DESCRIPTION sections, is as specified by this volume of POSIX.1-200x, regardless of invocation from a signal-catching function. This is the only intended meaning of the statement that async-signal-safe functions may be used in signal-catching functions without restrictions. Applications must still consider all effects of such functions on such things as data structures, files, and process state. In particular, application developers need to consider the restrictions on interactions when interrupting *sleep*( ) and interactions among multiple handles for a file description. The fact that any specific function is listed as async-signal-safe does not necessarily mean that invocation of that function from a signal-catching function is recommended.

In order to prevent errors arising from interrupting non-async-signal-safe function calls, applications should protect calls to these functions either by blocking the appropriate signals or

through the use of some programmatic semaphore (see *semget( )*, *sem_init( )*, *sem_open( )*, and so on). Note in particular that even the "safe" functions may modify *errno*; the signal-catching function, if not executing as an independent thread, should save and restore its value in order to avoid the possibility that delivery of a signal in between an error return from a function that sets *errno* and the subsequent examination of *errno* could result in the signal-catching function changing the value of *errno*. Naturally, the same principles apply to the async-signal-safety of application routines and asynchronous data access. Note that *longjmp( )* and *siglongjmp( )* are not in the list of async-signal-safe functions. This is because the code executing after *longjmp( )* and *siglongjmp( )* can call any unsafe functions with the same danger as calling those unsafe functions directly from the signal handler. Applications that use *longjmp( )* and *siglongjmp( )* from within signal handlers require rigorous protection in order to be portable. Many of the other functions that are excluded from the list are traditionally implemented using either *malloc( )* or *free( )* functions or the standard I/O library, both of which traditionally use data structures in a non-async-signal-safe manner. Since any combination of different functions using a common data structure can cause async-signal-safety problems, this volume of POSIX.1-200x does not define the behavior when any unsafe function is called in a signal handler that interrupts an unsafe function.

If the signal occurs other than as the result of calling *abort( )*, *kill( )*, or *raise( )*, the behavior is undefined if the signal handler calls any function in the standard library other than one of the functions listed in the table of sync-signal-safe functions in Section 2.4.3 (on page 486), or refers to any object other than *errno* with static storage duration other than by assigning a value to a static storage duration variable of type **volatile sig_atomic_t**. Unless all signal handlers have *errno* set on return as it was on entry, the value of *errno* is unspecified.

Usually, the signal is executed on the stack that was in effect before the signal was delivered. An alternate stack may be specified to receive a subset of the signals being caught.

When the signal handler returns, the receiving thread resumes execution at the point it was interrupted unless the signal handler makes other arrangements. If *longjmp( )* or *_longjmp( )* is used to leave the signal handler, then the signal mask must be explicitly restored.

This volume of POSIX.1-200x defines the third argument of a signal handling function when SA_SIGINFO is set as a **void *** instead of a **ucontext_t ***, but without requiring type checking. New applications should explicitly cast the third argument of the signal handling function to **ucontext_t ***.

The BSD optional four argument signal handling function is not supported by this volume of POSIX.1-200x. The BSD declaration would be:

```
void handler(int sig, int code, struct sigcontext *scp,
    char *addr);
```

where *sig* is the signal number, *code* is additional information on certain signals, *scp* is a pointer to the **sigcontext** structure, and *addr* is additional address information. Much the same information is available in the objects pointed to by the second argument of the signal handler specified when SA_SIGINFO is set.

Since the *sigaction( )* function is allowed but not required to set SA_NODEFER when the application sets the SA_RESETHAND flag, applications which depend on the SA_RESETHAND functionality for the newly installed signal handler must always explicitly set SA_NODEFER when they set SA_RESETHAND in order to be portable.

RATIONALE

Although this volume of POSIX.1-200x requires that signals that cannot be ignored shall not be added to the signal mask when a signal-catching function is entered, there is no explicit requirement that subsequent calls to *sigaction*( ) reflect this in the information returned in the *oact* argument. In other words, if SIGKILL is included in the *sa_mask* field of *act*, it is unspecified whether or not a subsequent call to *sigaction*( ) returns with SIGKILL included in the *sa_mask* field of *oact*.

The SA_NOCLDSTOP flag, when supplied in the *act->sa_flags* parameter, allows overloading SIGCHLD with the System V semantics that each SIGCLD signal indicates a single terminated child. Most conforming applications that catch SIGCHLD are expected to install signal-catching functions that repeatedly call the *waitpid*( ) function with the WNOHANG flag set, acting on each child for which status is returned, until *waitpid*( ) returns zero. If stopped children are not of interest, the use of the SA_NOCLDSTOP flag can prevent the overhead from invoking the signal-catching routine when they stop.

Some historical implementations also define other mechanisms for stopping processes, such as the *ptrace*( ) function. These implementations usually do not generate a SIGCHLD signal when processes stop due to this mechanism; however, that is beyond the scope of this volume of POSIX.1-200x.

This volume of POSIX.1-200x requires that calls to *sigaction*( ) that supply a NULL *act* argument succeed, even in the case of signals that cannot be caught or ignored (that is, SIGKILL or SIGSTOP). The System V *signal*( ) and BSD *sigvec*( ) functions return [EINVAL] in these cases and, in this respect, their behavior varies from *sigaction*( ).

This volume of POSIX.1-200x requires that *sigaction*( ) properly save and restore a signal action set up by the ISO C standard *signal*( ) function. However, there is no guarantee that the reverse is true, nor could there be given the greater amount of information conveyed by the **sigaction** structure. Because of this, applications should avoid using both functions for the same signal in the same process. Since this cannot always be avoided in case of general-purpose library routines, they should always be implemented with *sigaction*( ).

It was intended that the *signal*( ) function should be implementable as a library routine using *sigaction*( ).

The POSIX Realtime Extension extends the *sigaction*( ) function as specified by the POSIX.1-1990 standard to allow the application to request on a per-signal basis via an additional signal action flag that the extra parameters, including the application-defined signal value, if any, be passed to the signal-catching function.

FUTURE DIRECTIONS

None.

XBD **<signal.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and POSIX Threads Extension.

In the DESCRIPTION, the second argument to *func* when SA_SIGINFO is set is no longer permitted to be NULL, and the description of permitted **siginfo_t** contents is expanded by reference to **<signal.h>**.

Since the X/OPEN UNIX Extension functionality is now folded into the BASE, the [ENOTSUP] error is deleted.

Issue 6

The Open Group Corrigendum U028/7 is applied. In the paragraph entitled "Signal Effects on Other Functions", a reference to *sigpending*( ) is added.

In the DESCRIPTION, the text "Signal Generation and Delivery", "Signal Actions", and "Signal Effects on Other Functions" are moved to a separate section of this volume of POSIX.1-200x.

Text describing functionality from the Realtime Signals Extension option is marked.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The [ENOTSUP] error condition is added.

The normative text is updated to avoid use of the term "must" for application requirements.

The **restrict** keyword is added to the *sigaction*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

References to the *wait3*( ) function are removed.

The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an extension over the ISO C standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/57 is applied, changing text in the table describing the **sigaction** structure.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/127 is applied, removing text from the DESCRIPTION duplicated later in the same section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/128 is applied, updating the DESCRIPTION and APPLICATION USAGE sections. Changes are made to refer to the thread rather than the process.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/129 is applied, adding the example to the EXAMPLES section.

Issue 7

Austin Group Interpretation 1003.1-2001 #004 is applied.

Austin Group Interpretations 1003.1-2001 #065 and #084 are applied, clarifying the role of the SA_NODEFER flag with respect to the signal mask, and clarifying the SA_RESTART flag for interrupted functions which use timeouts.

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XSH-ERN-167 is applied, updating the APPLICATION USAGE section.

SD5-XSH-ERN-172 is applied, updating the DESCRIPTION to make optional the requirement that when the SA_RESETHAND flag is set, *sigaction*( ) shall behave as if the SA_NODEFER flag were also set.

61150 Functionality relating to the Realtime Signals Extension option is moved to the Base.

61151 The description of the *si_code* member is replaced with a reference to Section 2.4.3 (on page 486).

61152 **NAME**

61153 sigaddset — add a signal to a signal set

61154 **SYNOPSIS**

61155 CX
```
#include <signal.h>

int sigaddset(sigset_t *set, int signo);
```

61156

61157 **DESCRIPTION**

61158 The *sigaddset*( ) function adds the individual signal specified by the *signo* to the signal set pointed
61159 to by *set*.

61160 Applications shall call either *sigemptyset*( ) or *sigfillset*( ) at least once for each object of type
61161 **sigset_t** prior to any other use of that object. If such an object is not initialized in this way, but is
61162 nonetheless supplied as an argument to any of *pthread_sigmask*( ), *sigaction*( ), *sigaddset*( ),
61163 *sigdelset*( ), *sigismember*( ), *sigpending*( ), *sigprocmask*( ), *sigsuspend*( ), *sigtimedwait*( ), *sigwait*( ), or
61164 *sigwaitinfo*( ), the results are undefined.

61165 **RETURN VALUE**

61166 Upon successful completion, *sigaddset*( ) shall return 0; otherwise, it shall return –1 and set *errno*
61167 to indicate the error.

61168 **ERRORS**

61169 The *sigaddset*( ) function may fail if:

61170 [EINVAL] The value of the *signo* argument is an invalid or unsupported signal number.

61171 **EXAMPLES**

61172 None.

61173 **APPLICATION USAGE**

61174 None.

61175 **RATIONALE**

61176 None.

61177 **FUTURE DIRECTIONS**

61178 None.

61179 **SEE ALSO**

61180 Section 2.4 (on page 484), *pthread_sigmask*( ), *sigaction*( ), *sigdelset*( ), *sigemptyset*( ), *sigfillset*( ),
61181 *sigismember*( ), *sigpending*( ), *sigsuspend*( )

61182 XBD **<signal.h>**

61183 **CHANGE HISTORY**

61184 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

61185 **Issue 5**

61186 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
61187 previous issues.

61188 **Issue 6**

61189 The normative text is updated to avoid use of the term "must" for application requirements.

61190 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
61191 extension over the ISO C standard.

61192 **NAME**

61193 sigaltstack — set and get signal alternate stack context

61194 **SYNOPSIS**

61195 XSI
```
#include <signal.h>

int sigaltstack(const stack_t *restrict ss, stack_t *restrict oss);
```
61196

61197 **DESCRIPTION**

61198 The *sigaltstack*( ) function allows a process to define and examine the state of an alternate stack
61199 for signal handlers for the current thread. Signals that have been explicitly declared to execute
61200 on the alternate stack shall be delivered on the alternate stack.

61201 If *ss* is not a null pointer, it points to a **stack_t** structure that specifies the alternate signal stack
61202 that shall take effect upon return from *sigaltstack*( ). The *ss_flags* member specifies the new stack
61203 state. If it is set to SS_DISABLE, the stack is disabled and *ss_sp* and *ss_size* are ignored.
61204 Otherwise, the stack shall be enabled, and the *ss_sp* and *ss_size* members specify the new address
61205 and size of the stack.

61206 The range of addresses starting at *ss_sp* up to but not including *ss_sp*+*ss_size* is available to the
61207 implementation for use as the stack. This function makes no assumptions regarding which end
61208 is the stack base and in which direction the stack grows as items are pushed.

61209 If *oss* is not a null pointer, upon successful completion it shall point to a **stack_t** structure that
61210 specifies the alternate signal stack that was in effect prior to the call to *sigaltstack*( ). The *ss_sp*
61211 and *ss_size* members specify the address and size of that stack. The *ss_flags* member specifies the
61212 stack's state, and may contain one of the following values:

61213 SS_ONSTACK The process is currently executing on the alternate signal stack. Attempts to
61214 modify the alternate signal stack while the process is executing on it fail. This
61215 flag shall not be modified by processes.

61216 SS_DISABLE The alternate signal stack is currently disabled.

61217 The value SIGSTKSZ is a system default specifying the number of bytes that would be used to
61218 cover the usual case when manually allocating an alternate stack area. The value MINSIGSTKSZ
61219 is defined to be the minimum stack size for a signal handler. In computing an alternate stack
61220 size, a program should add that amount to its stack requirements to allow for the system
61221 implementation overhead. The constants SS_ONSTACK, SS_DISABLE, SIGSTKSZ, and
61222 MINSIGSTKSZ are defined in **<signal.h>**.

61223 After a successful call to one of the *exec* functions, there are no alternate signal stacks in the new
61224 process image.

61225 In some implementations, a signal (whether or not indicated to execute on the alternate stack)
61226 shall always execute on the alternate stack if it is delivered while another signal is being caught
61227 using the alternate stack.

61228 Use of this function by library threads that are not bound to kernel-scheduled entities results in
61229 undefined behavior.

61230 **RETURN VALUE**

61231 Upon successful completion, *sigaltstack*( ) shall return 0; otherwise, it shall return –1 and set *errno*
61232 to indicate the error.

61233 **ERRORS**

61234 The *sigaltstack*( ) function shall fail if:

61235 [EINVAL] The *ss* argument is not a null pointer, and the *ss_flags* member pointed to by *ss*
61236 contains flags other than SS_DISABLE.

61237 [ENOMEM] The size of the alternate stack area is less than MINSIGSTKSZ.

61238 [EPERM] An attempt was made to modify an active stack.

61239 **EXAMPLES**

61240 **Allocating Memory for an Alternate Stack**

61241 The following example illustrates a method for allocating memory for an alternate stack.

```
61242 #include <signal.h>
61243 ...
61244 if ((sigstk.ss_sp = malloc(SIGSTKSZ)) == NULL)
61245     /* Error return. */
61246 sigstk.ss_size = SIGSTKSZ;
61247 sigstk.ss_flags = 0;
61248 if (sigaltstack(&sigstk,(stack_t *)0) < 0)
61249     perror("sigaltstack");
```

61250 **APPLICATION USAGE**

61251 On some implementations, stack space is automatically extended as needed. On those
61252 implementations, automatic extension is typically not available for an alternate stack. If the stack
61253 overflows, the behavior is undefined.

61254 **RATIONALE**

61255 None.

61256 **FUTURE DIRECTIONS**

61257 None.

61258 **SEE ALSO**

61259 Section 2.4 (on page 484), *exec*, *sigaction*( ), *sigsetjmp*( )

61260 XBD **<signal.h>**

61261 **CHANGE HISTORY**

61262 First released in Issue 4, Version 2.

61263 **Issue 5**

61264 Moved from X/OPEN UNIX extension to BASE.

61265 The last sentence of the DESCRIPTION was included as an APPLICATION USAGE note in
61266 previous issues.

61267 **Issue 6**

61268 The normative text is updated to avoid use of the term "must" for application requirements.

61269 The **restrict** keyword is added to the *sigaltstack*( ) prototype for alignment with the
61270 ISO/IEC 9899: 1999 standard.

61271 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/58 is applied, updating the first sentence
61272 to include "for the current thread".

61273 **NAME**

61274 sigdelset — delete a signal from a signal set

61275 **SYNOPSIS**

61276 CX
```
#include <signal.h>

int sigdelset(sigset_t *set, int signo);
```
61277

61278 **DESCRIPTION**

61279 The *sigdelset*( ) function deletes the individual signal specified by *signo* from the signal set
61280 pointed to by *set*.

61281 Applications should call either *sigemptyset*( ) or *sigfillset*( ) at least once for each object of type
61282 **sigset_t** prior to any other use of that object. If such an object is not initialized in this way, but is
61283 nonetheless supplied as an argument to any of *pthread_sigmask*( ), *sigaction*( ), *sigaddset*( ),
61284 *sigdelset*( ), *sigismember*( ), *sigpending*( ), *sigprocmask*( ), *sigsuspend*( ), *sigtimedwait*( ), *sigwait*( ), or
61285 *sigwaitinfo*( ), the results are undefined.

61286 **RETURN VALUE**

61287 Upon successful completion, *sigdelset*( ) shall return 0; otherwise, it shall return –1 and set *errno*
61288 to indicate the error.

61289 **ERRORS**

61290 The *sigdelset*( ) function may fail if:

61291 [EINVAL] The *signo* argument is not a valid signal number, or is an unsupported signal
61292 number.

61293 **EXAMPLES**

61294 None.

61295 **APPLICATION USAGE**

61296 None.

61297 **RATIONALE**

61298 None.

61299 **FUTURE DIRECTIONS**

61300 None.

61303 *sigismember*( ), *sigpending*( ), *sigsuspend*( )

61304 XBD **<signal.h>**

61305 **CHANGE HISTORY**

61306 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

61307 **Issue 5**

61308 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
61309 previous issues.

61310 **Issue 6**

61311 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
61312 extension over the ISO C standard.

61313 **NAME**

61314 sigemptyset — initialize and empty a signal set

61315 **SYNOPSIS**

61316 CX
```
#include <signal.h>

int sigemptyset(sigset_t *set);
```
61317

61318 **DESCRIPTION**

61319 The *sigemptyset*( ) function initializes the signal set pointed to by *set*, such that all signals defined
61320 in POSIX.1-200x are excluded.

61321 **RETURN VALUE**

61322 Upon successful completion, *sigemptyset*( ) shall return 0; otherwise, it shall return –1 and set
61323 *errno* to indicate the error.

61324 **ERRORS**

61325 No errors are defined.

61326 **EXAMPLES**

61327 None.

61328 **APPLICATION USAGE**

61329 None.

61330 **RATIONALE**

61331 The implementation of the *sigemptyset*( ) (or *sigfillset*( )) function could quite trivially clear (or set)
61332 all the bits in the signal set. Alternatively, it would be reasonable to initialize part of the
61333 structure, such as a version field, to permit binary-compatibility between releases where the size
61334 of the set varies. For such reasons, either *sigemptyset*( ) or *sigfillset*( ) must be called prior to any
61335 other use of the signal set, even if such use is read-only (for example, as an argument to
61336 *sigpending*( )). This function is not intended for dynamic allocation.

61337 The *sigfillset*( ) and *sigemptyset*( ) functions require that the resulting signal set include (or
61338 exclude) all the signals defined in this volume of POSIX.1-200x. Although it is outside the scope
61339 of this volume of POSIX.1-200x to place this requirement on signals that are implemented as
61340 extensions, it is recommended that implementation-defined signals also be affected by these
61341 functions. However, there may be a good reason for a particular signal not to be affected. For
61342 example, blocking or ignoring an implementation-defined signal may have undesirable side-
61343 effects, whereas the default action for that signal is harmless. In such a case, it would be
61344 preferable for such a signal to be excluded from the signal set returned by *sigfillset*( ).

61345 In early proposals there was no distinction between invalid and unsupported signals (the names
61346 of optional signals that were not supported by an implementation were not defined by that
61347 implementation). The [EINVAL] error was thus specified as a required error for invalid signals.
61348 With that distinction, it is not necessary to require implementations of these functions to
61349 determine whether an optional signal is actually supported, as that could have a significant
61350 performance impact for little value. The error could have been required for invalid signals and
61351 optional for unsupported signals, but this seemed unnecessarily complex. Thus, the error is
61352 optional in both cases.

61353 **FUTURE DIRECTIONS**

61354 None.

61355 **SEE ALSO**

61356 Section 2.4 (on page 484), *pthread_sigmask( )*, *sigaction( )*, *sigaddset( )*, *sigdelset( )*, *sigfillset( )*,

61393 extension over the ISO C standard.

NAME

sighold, sigignore, sigpause, sigrelse, sigset — signal management

SYNOPSIS

OB XSI
```
#include <signal.h>

int sighold(int sig);
int sigignore(int sig);
int sigpause(int sig);
int sigrelse(int sig);
void (*sigset(int sig, void (*disp)(int)))(int);
```

DESCRIPTION

Use of any of these functions is unspecified in a multi-threaded process.

The *sighold*( ), *sigignore*( ), *sigpause*( ), *sigrelse*( ), and *sigset*( ) functions provide simplified signal management.

The *sigset*( ) function shall modify signal dispositions. The *sig* argument specifies the signal, which may be any signal except SIGKILL and SIGSTOP. The *disp* argument specifies the signal's disposition, which may be SIG_DFL, SIG_IGN, or the address of a signal handler. If *sigset*( ) is used, and *disp* is the address of a signal handler, the system shall add *sig* to the signal mask of the calling process before executing the signal handler; when the signal handler returns, the system shall restore the signal mask of the calling process to its state prior to the delivery of the signal. In addition, if *sigset*( ) is used, and *disp* is equal to SIG_HOLD, *sig* shall be added to the signal mask of the calling process and *sig*'s disposition shall remain unchanged. If *sigset*( ) is used, and *disp* is not equal to SIG_HOLD, *sig* shall be removed from the signal mask of the calling process.

The *sighold*( ) function shall add *sig* to the signal mask of the calling process.

The *sigrelse*( ) function shall remove *sig* from the signal mask of the calling process.

The *sigignore*( ) function shall set the disposition of *sig* to SIG_IGN.

The *sigpause*( ) function shall remove *sig* from the signal mask of the calling process and suspend the calling process until a signal is received. The *sigpause*( ) function shall restore the signal mask of the process to its original state before returning.

If the action for the SIGCHLD signal is set to SIG_IGN, child processes of the calling processes shall not be transformed into zombie processes when they terminate. If the calling process subsequently waits for its children, and the process has no unwaited-for children that were transformed into zombie processes, it shall block until all of its children terminate, and *wait*( ), *waitid*( ), and *waitpid*( ) shall fail and set *errno* to [ECHILD].

RETURN VALUE

Upon successful completion, *sigset*( ) shall return SIG_HOLD if the signal had been blocked and the signal's previous disposition if it had not been blocked. Otherwise, SIG_ERR shall be returned and *errno* set to indicate the error.

The *sigpause*( ) function shall suspend execution of the thread until a signal is received, whereupon it shall return –1 and set *errno* to [EINTR].

For all other functions, upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to indicate the error.

61436 **ERRORS**

61437 These functions shall fail if:

61438 [EINVAL] The *sig* argument is an illegal signal number.

61439 The *sigset*( ) and *sigignore*( ) functions shall fail if:

61440 [EINVAL] An attempt is made to catch a signal that cannot be caught, or to ignore a
61441 signal that cannot be ignored.

61442 **EXAMPLES**

61443 None.

61444 **APPLICATION USAGE**

61445 The *sigaction*( ) function provides a more comprehensive and reliable mechanism for controlling
61446 signals; new applications should use the *sigaction*( ) function instead of the obsolescent *sigset*( )
61447 function.

61448 The *sighold*( ) function, in conjunction with *sigrelse*( ) or *sigpause*( ), may be used to establish
61449 critical regions of code that require the delivery of a signal to be temporarily deferred. For
61450 broader portability, the *pthread_sigmask*( ) or *sigprocmask*( ) functions should be used instead of
61451 the obsolescent *sighold*( ) and *sigrelse*( ) functions.

61452 For broader portability, the *sigsuspend*( ) function should be used instead of the obsolescent
61453 *sigpause*( ) function.

61454 **RATIONALE**

61455 Each of these historic functions has a direct analog in the other functions which are required to
61456 be per-thread and thread-safe (aside from *sigprocmask*( ), which is replaced by *pthread_sigmask*( )).
61457 The *sigset*( ) function can be implemented as a simple wrapper for *sigaction*( ). The *sighold*( )
61458 function is equivalent to *sigprocmask*( ) or *pthread_sigmask*( ) with SIG_BLOCK set. The *sigignore*( )
61459 function is equivalent to *sigaction*( ) with SIG_IGN set. The *sigpause*( ) function is equivalent to
61460 *sigsuspend*( ). The *sigrelse*( ) function is equivalent to *sigprocmask*( ) or *pthread_sigmask*( ) with
61461 SIG_UNBLOCK set.

61462 **FUTURE DIRECTIONS**

61463 These functions may be removed in a future version.

61464 **SEE ALSO**

61465 Section 2.4 (on page 484), *exec*, *pause*( ), *pthread_sigmask*( ), *sigaction*( ), *signal*( ), *sigsuspend*( ),
61466 *wait*( ), *waitid*( )

61467 XBD **<signal.h>**

61468 **CHANGE HISTORY**

61469 First released in Issue 4, Version 2.

61470 **Issue 5**

61471 Moved from X/OPEN UNIX extension to BASE.

61472 The DESCRIPTION is updated to indicate that the *sigpause*( ) function restores the signal mask of
61473 the process to its original state before returning.

61474 The RETURN VALUE section is updated to indicate that the *sigpause*( ) function suspends
61475 execution of the process until a signal is received, whereupon it returns –1 and sets *errno* to
61476 [EINTR].

61477 **Issue 6**

61478 The normative text is updated to avoid use of the term "must" for application requirements.

61479 References to the *wait3*( ) function are removed.

61480 The XSI functions are split out into their own reference page.

61481 **Issue 7**

61482 SD5-XSH-ERN-113 and SD5-XSH-ERN-42 are applied, marking these functions obsolescent and
61483 updating the APPLICATION USAGE and RATIONALE sections.

NAME

siginterrupt — allow signals to interrupt functions

SYNOPSIS

OB XSI
```
#include <signal.h>

int siginterrupt(int sig, int flag);
```

DESCRIPTION

The *siginterrupt*( ) function shall change the restart behavior when a function is interrupted by the specified signal. The function *siginterrupt*(*sig*, *flag*) has an effect as if implemented as:

```
int siginterrupt(int sig, int flag) {
    int ret;
    struct sigaction act;

    (void) sigaction(sig, NULL, &act);
    if (flag)
        act.sa_flags &= ~SA_RESTART;
    else
        act.sa_flags |= SA_RESTART;
    ret = sigaction(sig, &act, NULL);
    return ret;
}
```

RETURN VALUE

Upon successful completion, *siginterrupt*( ) shall return 0; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *siginterrupt*( ) function shall fail if:

[EINVAL] The *sig* argument is not a valid signal number.

EXAMPLES

None.

APPLICATION USAGE

The *siginterrupt*( ) function supports programs written to historical system interfaces. Applications should use the *sigaction*( ) with the SA_RESTART flag instead of the obsolescent *siginterrupt*( ) function.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD **<signal.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

61524 **Issue 5**

61525 Moved from X/OPEN UNIX extension to BASE.

61526 **Issue 6**

61527 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/59 is applied, correcting the declaration in
61528 the sample implementation given in the DESCRIPTION.

61529 **Issue 7**

61530 The *siginterrupt*( ) function is marked obsolescent.

61531 **NAME**

61532 sigismember — test for a signal in a signal set

61533 **SYNOPSIS**

61534 CX
```
#include <signal.h>

int sigismember(const sigset_t *set, int signo);
```
61535

61536 **DESCRIPTION**

61537 The *sigismember*( ) function shall test whether the signal specified by *signo* is a member of the set
61538 pointed to by *set*.

61539 Applications should call either *sigemptyset*( ) or *sigfillset*( ) at least once for each object of type
61540 **sigset_t** prior to any other use of that object. If such an object is not initialized in this way, but is
61541 nonetheless supplied as an argument to any of *pthread_sigmask*( ), *sigaction*( ), *sigaddset*( ),
61542 *sigdelset*( ), *sigismember*( ), *sigpending*( ), *sigprocmask*( ), *sigsuspend*( ), *sigtimedwait*( ), *sigwait*( ), or
61543 *sigwaitinfo*( ), the results are undefined.

61544 **RETURN VALUE**

61545 Upon successful completion, *sigismember*( ) shall return 1 if the specified signal is a member of
61546 the specified set, or 0 if it is not. Otherwise, it shall return –1 and set *errno* to indicate the error.

61547 **ERRORS**

61548 The *sigismember*( ) function may fail if:

61549 [EINVAL] The *signo* argument is not a valid signal number, or is an unsupported signal
61550 number.

61551 **EXAMPLES**

61552 None.

61553 **APPLICATION USAGE**

61554 None.

61555 **RATIONALE**

61556 None.

61557 **FUTURE DIRECTIONS**

61558 None.

61559 **SEE ALSO**

61560 Section 2.4 (on page 484), *pthread_sigmask*( ), *sigaction*( ), *sigaddset*( ), *sigdelset*( ), *sigfillset*( ),
61561 *sigemptyset*( ), *sigpending*( ), *sigsuspend*( )

61562 XBD **<signal.h>**

61563 **CHANGE HISTORY**

61564 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

61565 **Issue 5**

61566 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
61567 previous issues.

61568 **Issue 6**

61569 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
61570 extension over the ISO C standard.

61571 **NAME**

61572 siglongjmp — non-local goto with signal handling

61573 **SYNOPSIS**

61574 CX
```
#include <setjmp.h>

void siglongjmp(sigjmp_buf env, int val);
```

61576 **DESCRIPTION**

61577 The *siglongjmp*( ) function shall be equivalent to the *longjmp*( ) function, except as follows:

61578 • References to *setjmp*( ) shall be equivalent to *sigsetjmp*( ).

61579 • The *siglongjmp*( ) function shall restore the saved signal mask if and only if the *env*
61580 argument was initialized by a call to *sigsetjmp*( ) with a non-zero *savemask* argument.

61581 **RETURN VALUE**

61582 After *siglongjmp*( ) is completed, program execution shall continue as if the corresponding
61583 invocation of *sigsetjmp*( ) had just returned the value specified by *val*. The *siglongjmp*( ) function
61584 shall not cause *sigsetjmp*( ) to return 0; if *val* is 0, *sigsetjmp*( ) shall return the value 1.

61585 **ERRORS**

61586 No errors are defined.

61587 **EXAMPLES**

61588 None.

61589 **APPLICATION USAGE**

61590 The distinction between *setjmp*( ) or *longjmp*( ) and *sigsetjmp*( ) or *siglongjmp*( ) is only significant
61591 for programs which use *sigaction*( ), *sigprocmask*( ), or *sigsuspend*( ).

61592 **RATIONALE**

61593 None.

61594 **FUTURE DIRECTIONS**

61595 None.

61596 **SEE ALSO**

61597 *longjmp*( ), *pthread_sigmask*( ), *setjmp*( ), *sigsetjmp*( ), *sigsuspend*( )

61598 XBD **<setjmp.h>**

61599 **CHANGE HISTORY**

61600 First released in Issue 3. Included for alignment with the ISO POSIX-1 standard.

61601 **Issue 5**

61602 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

61603 **Issue 6**

61604 The DESCRIPTION is rewritten in terms of *longjmp*( ).

61605 The SYNOPSIS is marked CX since the presence of this function in the **<setjmp.h>** header is an
61606 extension over the ISO C standard.

NAME

signal — signal management

SYNOPSIS

```
#include <signal.h>

void (*signal(int sig, void (*func)(int)))(int);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

Use of this function is unspecified in a multi-threaded process.

The *signal*( ) function chooses one of three ways in which receipt of the signal number *sig* is to be subsequently handled. If the value of *func* is SIG_DFL, default handling for that signal shall occur. If the value of *func* is SIG_IGN, the signal shall be ignored. Otherwise, the application shall ensure that *func* points to a function to be called when that signal occurs. An invocation of such a function because of a signal, or (recursively) of any further functions called by that invocation (other than functions in the standard library), is called a "signal handler".

When a signal occurs, and *func* points to a function, it is implementation-defined whether the equivalent of a:

```
signal(sig, SIG_DFL);
```

is executed or the implementation prevents some implementation-defined set of signals (at least including *sig*) from occurring until the current signal handling has completed. (If the value of *sig* is SIGILL, the implementation may alternatively define that no action is taken.) Next the equivalent of:

```
(*func)(sig);
```

is executed. If and when the function returns, if the value of *sig* was SIGFPE, SIGILL, or SIGSEGV or any other implementation-defined value corresponding to a computational exception, the behavior is undefined. Otherwise, the program shall resume execution at the CX point it was interrupted. If the signal occurs as the result of calling the *abort*( ), *raise*( ), *kill*( ), *pthread_kill*( ), or *sigqueue*( ) function, the signal handler shall not call the *raise*( ) function.

CX If the signal occurs other than as the result of calling *abort*( ), *raise*( ), *kill*( ), *pthread_kill*( ), or *sigqueue*( ), the behavior is undefined if the signal handler refers to any object with static storage duration other than by assigning a value to an object declared as volatile **sig_atomic_t**, or if the signal handler calls any function in the standard library other than one of the functions listed in Section 2.4 (on page 484). Furthermore, if such a call fails, the value of *errno* is unspecified.

At program start-up, the equivalent of:

```
signal(sig, SIG_IGN);
```

is executed for some signals, and the equivalent of:

```
signal(sig, SIG_DFL);
```

CX is executed for all other signals (see *exec*).

RETURN VALUE

If the request can be honored, *signal*( ) shall return the value of *func* for the most recent call to *signal*( ) for the specified signal *sig*. Otherwise, SIG_ERR shall be returned and a positive value shall be stored in *errno*.

61650 **ERRORS**

61651 The *signal*( ) function shall fail if:

61652 CX [EINVAL] The *sig* argument is not a valid signal number or an attempt is made to catch a
61653 signal that cannot be caught or ignore a signal that cannot be ignored.

61654 The *signal*( ) function may fail if:

61655 CX [EINVAL] An attempt was made to set the action to SIG_DFL for a signal that cannot be
61656 caught or ignored (or both).

61657 **EXAMPLES**

61658 None.

61659 **APPLICATION USAGE**

61660 The *sigaction*( ) function provides a more comprehensive and reliable mechanism for controlling
61661 signals; new applications should use *sigaction*( ) rather than *signal*( ).

61662 **RATIONALE**

61663 None.

61664 **FUTURE DIRECTIONS**

61665 None.

61666 **SEE ALSO**

61667 Section 2.4 (on page 484), *exec*, *pause*( ), *sigaction*( ), *sigsuspend*( ), *waitid*( )

61668 XBD **<signal.h>**

61669 **CHANGE HISTORY**

61670 First released in Issue 1. Derived from Issue 1 of the SVID.

61671 **Issue 5**

61672 Moved from X/OPEN UNIX extension to BASE.

61673 The DESCRIPTION is updated to indicate that the *sigpause*( ) function restores the signal mask of
61674 the process to its original state before returning.

61675 The RETURN VALUE section is updated to indicate that the *sigpause*( ) function suspends
61676 execution of the process until a signal is received, whereupon it returns –1 and sets *errno* to
61677 [EINTR].

61678 **Issue 6**

61679 Extensions beyond the ISO C standard are marked.

61680 The normative text is updated to avoid use of the term "must" for application requirements.

61681 The DESCRIPTION is updated for alignment with the ISO/IEC 9899: 1999 standard.

61682 References to the *wait3*( ) function are removed.

61683 The *sighold*( ), *sigignore*( ), *sigrelse*( ), and *sigset*( ) functions are split out onto their own reference
61684 page.

61685 **NAME**

61686 signbit — test sign

61687 **SYNOPSIS**

61688
```
#include <math.h>
```

61689
```
int signbit(real-floating x);
```

61690 **DESCRIPTION**

61691 CX The functionality described on this reference page is aligned with the ISO C standard. Any
61692 conflict between the requirements described here and the ISO C standard is unintentional. This
61693 volume of POSIX.1-200x defers to the ISO C standard.

61694 The *signbit*( ) macro shall determine whether the sign of its argument value is negative. NaNs,
61695 zeros, and infinities have a sign bit.

61696 **RETURN VALUE**

61697 The *signbit*( ) macro shall return a non-zero value if and only if the sign of its argument value is
61698 negative.

61699 **ERRORS**

61700 No errors are defined.

61701 **EXAMPLES**

61702 None.

61703 **APPLICATION USAGE**

61704 None.

61705 **RATIONALE**

61706 None.

NAME

signgam — log gamma function

SYNOPSIS

XSI

```
#include <math.h>

extern int signgam;
```

DESCRIPTION

Refer to *lgamma( )*.

61721 **NAME**

61722 sigpause — remove a signal from the signal mask and suspend the thread

61723 **SYNOPSIS**

61724 OB XSI
```
#include <signal.h>

int sigpause(int sig);
```

61726 **DESCRIPTION**

61727 Refer to *sighold( )*.

61728 **NAME**

61729 sigpending — examine pending signals

61730 **SYNOPSIS**

61731 CX
```
#include <signal.h>

int sigpending(sigset_t *set);
```
61732

61733 **DESCRIPTION**

61734 The *sigpending*( ) function shall store, in the location referenced by the *set* argument, the set of
61735 signals that are blocked from delivery to the calling thread and that are pending on the process
61736 or the calling thread.

61737 **RETURN VALUE**

61738 Upon successful completion, *sigpending*( ) shall return 0; otherwise, −1 shall be returned and
61739 *errno* set to indicate the error.

61740 **ERRORS**

61741 No errors are defined.

61742 **EXAMPLES**

61743 None.

61744 **APPLICATION USAGE**

61745 None.

61746 **RATIONALE**

61747 None.

61748 **FUTURE DIRECTIONS**

61749 None.

61750 **SEE ALSO**

61752 XBD **<signal.h>**

61753 **CHANGE HISTORY**

61754 First released in Issue 3.

61755 **Issue 5**

61756 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

61757 **Issue 6**

61758 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
61759 extension over the ISO C standard.

61760 **NAME**

61761 sigprocmask — examine and change blocked signals

61762 **SYNOPSIS**

61763 CX
```
#include <signal.h>

int sigprocmask(int how, const sigset_t *restrict set,
    sigset_t *restrict oset);
```

61766 **DESCRIPTION**

61767 Refer to *pthread_sigmask( )*.

61768 **NAME**

61769 sigqueue — queue a signal to a process

61770 **SYNOPSIS**

61771 CX
```
#include <signal.h>

int sigqueue(pid_t pid, int signo, const union sigval value);
```
61772

61773 **DESCRIPTION**

61774 The *sigqueue*( ) function shall cause the signal specified by *signo* to be sent with the value
61775 specified by *value* to the process specified by *pid*. If *signo* is zero (the null signal), error checking
61776 is performed but no signal is actually sent. The null signal can be used to check the validity of
61777 *pid*.

61778 The conditions required for a process to have permission to queue a signal to another process are
61779 the same as for the *kill*( ) function.

61780 The *sigqueue*( ) function shall return immediately. If SA_SIGINFO is set for *signo* and if the
61781 resources were available to queue the signal, the signal shall be queued and sent to the receiving
61782 process. If SA_SIGINFO is not set for *signo*, then *signo* shall be sent at least once to the receiving
61783 process; it is unspecified whether *value* shall be sent to the receiving process as a result of this
61784 call.

61785 If the value of *pid* causes *signo* to be generated for the sending process, and if *signo* is not blocked
61786 for the calling thread and if no other thread has *signo* unblocked or is waiting in a *sigwait*( )
61787 function for *signo*, either *signo* or at least the pending, unblocked signal shall be delivered to the
61788 calling thread before the *sigqueue*( ) function returns. Should any multiple pending signals in the
61789 range SIGRTMIN to SIGRTMAX be selected for delivery, it shall be the lowest numbered one.
61790 The selection order between realtime and non-realtime signals, or between multiple pending
61791 non-realtime signals, is unspecified.

61792 **RETURN VALUE**

61793 Upon successful completion, the specified signal shall have been queued, and the *sigqueue*( )
61794 function shall return a value of zero. Otherwise, the function shall return a value of −1 and set
61795 *errno* to indicate the error.

61796 **ERRORS**

61797 The *sigqueue*( ) function shall fail if:

61798 [EAGAIN] No resources are available to queue the signal. The process has already
61799 queued {SIGQUEUE_MAX} signals that are still pending at the receiver(s), or
61800 a system-wide resource limit has been exceeded.

61801 [EINVAL] The value of the *signo* argument is an invalid or unsupported signal number.

61802 [EPERM] The process does not have appropriate privileges to send the signal to the
61803 receiving process.

61804 [ESRCH] The process *pid* does not exist.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *sigqueue*( ) function allows an application to queue a realtime signal to itself or to another process, specifying the application-defined value. This is common practice in realtime applications on existing realtime systems. It was felt that specifying another function in the *sig*... name space already carved out for signals was preferable to extending the interface to *kill*( ).

Such a function became necessary when the put/get event function of the message queues was removed. It should be noted that the *sigqueue*( ) function implies reduced performance in a security-conscious implementation as the access permissions between the sender and receiver have to be checked on each send when the *pid* is resolved into a target process. Such access checks were necessary only at message queue open in the previous interface.

The standard developers required that *sigqueue*( ) have the same semantics with respect to the null signal as *kill*( ), and that the same permission checking be used. But because of the difficulty of implementing the "broadcast" semantic of *kill*( ) (for example, to process groups) and the interaction with resource allocation, this semantic was not adopted. The *sigqueue*( ) function queues a signal to a single process specified by the *pid* argument.

The *sigqueue*( ) function can fail if the system has insufficient resources to queue the signal. An explicit limit on the number of queued signals that a process could send was introduced. While the limit is "per-sender", this volume of POSIX.1-200x does not specify that the resources be part of the state of the sender. This would require either that the sender be maintained after exit until all signals that it had sent to other processes were handled or that all such signals that had not yet been acted upon be removed from the queue(s) of the receivers. This volume of POSIX.1-200x does not preclude this behavior, but an implementation that allocated queuing resources from a system-wide pool (with per-sender limits) and that leaves queued signals pending after the sender exits is also permitted.

FUTURE DIRECTIONS

None.

SEE ALSO

Section 2.8.1 (on page 497)

XBD **<signal.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Issue 6

The *sigqueue*( ) function is marked as part of the Realtime Signals Extension option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Realtime Signals Extension option.

Issue 7

The *sigqueue*( ) function is moved from the Realtime Signals Extension option to the Base.

sigrelse( )

NAME

sigrelse, sigset — signal management

SYNOPSIS

OB XSI

```
#include <signal.h>

int sigrelse(int sig);
void (*sigset(int sig, void (*disp)(int)))(int);
```

DESCRIPTION

Refer to *sighold( )*.

61856 **NAME**

61857 sigsetjmp — set jump point for a non-local goto

61858 **SYNOPSIS**

61859 CX
```
#include <setjmp.h>

int sigsetjmp(sigjmp_buf env, int savemask);
```

61860

61861 **DESCRIPTION**

61862 The *sigsetjmp*( ) function shall be equivalent to the *setjmp*( ) function, except as follows:

61863 • References to *setjmp*( ) are equivalent to *sigsetjmp*( ).

61864 • References to *longjmp*( ) are equivalent to *siglongjmp*( ).

61865 • If the value of the *savemask* argument is not 0, *sigsetjmp*( ) shall also save the current signal
61866 mask of the calling thread as part of the calling environment.

61867 **RETURN VALUE**

61868 If the return is from a successful direct invocation, *sigsetjmp*( ) shall return 0. If the return is from
61869 a call to *siglongjmp*( ), *sigsetjmp*( ) shall return a non-zero value.

61870 **ERRORS**

61871 No errors are defined.

61872 **EXAMPLES**

61873 None.

61874 **APPLICATION USAGE**

61875 The distinction between *setjmp*( )/*longjmp*( ) and *sigsetjmp*( )/*siglongjmp*( ) is only significant for
61876 programs which use *sigaction*( ), *sigprocmask*( ), or *sigsuspend*( ).

61877 Note that since this function is defined in terms of *setjmp*( ), if *savemask* is zero, it is unspecified
61878 whether the signal mask is saved.

61879 **RATIONALE**

61880 The ISO C standard specifies various restrictions on the usage of the *setjmp*( ) macro in order to
61881 permit implementors to recognize the name in the compiler and not implement an actual
61882 function. These same restrictions apply to the *sigsetjmp*( ) macro.

61883 There are processors that cannot easily support these calls, but this was not considered a
61884 sufficient reason to exclude them.

61885 4.2 BSD, 4.3 BSD, and XSI-conformant systems provide functions named *_setjmp*( ) and
61886 *_longjmp*( ) that, together with *setjmp*( ) and *longjmp*( ), provide the same functionality as
61887 *sigsetjmp*( ) and *siglongjmp*( ). On those systems, *setjmp*( ) and *longjmp*( ) save and restore signal
61888 masks, while *_setjmp*( ) and *_longjmp*( ) do not. On System V Release 3 and in corresponding
61889 issues of the SVID, *setjmp*( ) and *longjmp*( ) are explicitly defined not to save and restore signal
61890 masks. In order to permit existing practice in both cases, the relation of *setjmp*( ) and *longjmp*( ) to
61891 signal masks is not specified, and a new set of functions is defined instead.

61892 The *longjmp*( ) and *siglongjmp*( ) functions operate as in the previous issue provided the matching
61893 *setjmp*( ) or *sigsetjmp*( ) has been performed in the same thread. Non-local jumps into contexts
61894 saved by other threads would be at best a questionable practice and were not considered worthy
61895 of standardization.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The DESCRIPTION is reworded in terms of *setjmp*( ).

The SYNOPSIS is marked CX since the presence of this function in the **<setjmp.h>** header is an extension over the ISO C standard.

NAME

sigsuspend — wait for a signal

SYNOPSIS

CX
```
#include <signal.h>

int sigsuspend(const sigset_t *sigmask);
```

DESCRIPTION

The *sigsuspend*( ) function shall replace the current signal mask of the calling thread with the set of signals pointed to by *sigmask* and then suspend the thread until delivery of a signal whose action is either to execute a signal-catching function or to terminate the process. This shall not cause any other signals that may have been pending on the process to become pending on the thread.

If the action is to terminate the process then *sigsuspend*( ) shall never return. If the action is to execute a signal-catching function, then *sigsuspend*( ) shall return after the signal-catching function returns, with the signal mask restored to the set that existed prior to the *sigsuspend*( ) call.

It is not possible to block signals that cannot be ignored. This is enforced by the system without causing an error to be indicated.

RETURN VALUE

Since *sigsuspend*( ) suspends thread execution indefinitely, there is no successful completion return value. If a return occurs, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *sigsuspend*( ) function shall fail if:

[EINTR] A signal is caught by the calling process and control is returned from the signal-catching function.

EXAMPLES

None.

APPLICATION USAGE

Normally, at the beginning of a critical code section, a specified set of signals is blocked using the *sigprocmask*( ) function. When the thread has completed the critical section and needs to wait for the previously blocked signal(s), it pauses by calling *sigsuspend*( ) with the mask that was returned by the *sigprocmask*( ) call.

RATIONALE

Code which wants to avoid the ambiguity of the signal mask for thread cancellation handlers can install an additional cancellation handler which resets the signal mask to the expected value.

```
void cleanup(void *arg)
{
    sigset_t *ss = (sigset_t *) arg;
    pthread_sigmask(SIG_SETMASK, ss, NULL);
}

int call_sigsuspend(const sigset_t *mask)
{
    sigset_t oldmask;
    int result;
    pthread_sigmask(SIG_SETMASK, NULL, &oldmask);
    pthread_cleanup_push(cleanup, &oldmask);
```

```
        result = sigsuspend(sigmask);
        pthread_cleanup_pop(0);
        return result;
    }
```

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The text in the RETURN VALUE section has been changed from "suspends process execution" to "suspends thread execution". This reflects IEEE PASC Interpretation 1003.1c #40.

Text in the APPLICATION USAGE section has been replaced.

The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an extension over the ISO C standard.

Issue 7

SD5-XSH-ERN-122 is applied, adding the example code in the RATIONALE.

NAME

sigtimedwait, sigwaitinfo — wait for queued signals

SYNOPSIS

CX
```
#include <signal.h>

int sigtimedwait(const sigset_t *restrict set,
    siginfo_t *restrict info,
    const struct timespec *restrict timeout);
int sigwaitinfo(const sigset_t *restrict set,
    siginfo_t *restrict info);
```

DESCRIPTION

The *sigtimedwait*( ) function shall be equivalent to *sigwaitinfo*( ) except that if none of the signals specified by *set* are pending, *sigtimedwait*( ) shall wait for the time interval specified in the **timespec** structure referenced by *timeout*. If the **timespec** structure pointed to by *timeout* is zero-valued and if none of the signals specified by *set* are pending, then *sigtimedwait*( ) shall return immediately with an error. If *timeout* is the null pointer, the behavior is unspecified. MON If the Monotonic Clock option is supported, the CLOCK_MONOTONIC clock shall be used to measure the time interval specified by the *timeout* argument.

The *sigwaitinfo*( ) function selects the pending signal from the set specified by *set*. Should any of multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it shall be the lowest numbered one. The selection order between realtime and non-realtime signals, or between multiple pending non-realtime signals, is unspecified. If no signal in *set* is pending at the time of the call, the calling thread shall be suspended until one or more signals in *set* become pending or until it is interrupted by an unblocked, caught signal.

The *sigwaitinfo*( ) function shall be equivalent to the *sigwait*( ) function if the *info* argument is NULL. If the *info* argument is non-NULL, the *sigwaitinfo*( ) function shall be equivalent to *sigwait*( ), except that the selected signal number shall be stored in the *si_signo* member, and the cause of the signal shall be stored in the *si_code* member. If any value is queued to the selected signal, the first such queued value shall be dequeued and, if the *info* argument is non-NULL, the value shall be stored in the *si_value* member of *info*. The system resource used to queue the signal shall be released and returned to the system for other use. If no value is queued, the content of the *si_value* member is undefined. If no further signals are queued for the selected signal, the pending indication for that signal shall be reset.

RETURN VALUE

Upon successful completion (that is, one of the signals specified by *set* is pending or is generated) *sigwaitinfo*( ) and *sigtimedwait*( ) shall return the selected signal number. Otherwise, the function shall return a value of −1 and set *errno* to indicate the error.

ERRORS

The *sigtimedwait*( ) function shall fail if:

[EAGAIN] No signal specified by *set* was generated within the specified timeout period.

The *sigtimedwait*( ) and *sigwaitinfo*( ) functions may fail if:

[EINTR] The wait was interrupted by an unblocked, caught signal. It shall be documented in system documentation whether this error causes these functions to fail.

The *sigtimedwait*( ) function may also fail if:

[EINVAL] The *timeout* argument specified a *tv_nsec* value less than zero or greater than or equal to 1 000 million.

An implementation should only check for this error if no signal is pending in *set* and it is necessary to wait.

EXAMPLES

None.

APPLICATION USAGE

The *sigtimedwait*( ) function times out and returns an [EAGAIN] error. Application developers should note that this is inconsistent with other functions such as *pthread_cond_timedwait*( ) that return [ETIMEDOUT].

RATIONALE

Existing programming practice on realtime systems uses the ability to pause waiting for a selected set of events and handle the first event that occurs in-line instead of in a signal-handling function. This allows applications to be written in an event-directed style similar to a state machine. This style of programming is useful for largescale transaction processing in which the overall throughput of an application and the ability to clearly track states are more important than the ability to minimize the response time of individual event handling.

It is possible to construct a signal-waiting macro function out of the realtime signal function mechanism defined in this volume of POSIX.1-200x. However, such a macro has to include the definition of a generalized handler for all signals to be waited on. A significant portion of the overhead of handler processing can be avoided if the signal-waiting function is provided by the kernel. This volume of POSIX.1-200x therefore provides two signal-waiting functions—one that waits indefinitely and one with a timeout—as part of the overall realtime signal function specification.

The specification of a function with a timeout allows an application to be written that can be broken out of a wait after a set period of time if no event has occurred. It was argued that setting a timer event before the wait and recognizing the timer event in the wait would also implement the same functionality, but at a lower performance level. Because of the performance degradation associated with the user-level specification of a timer event and the subsequent cancellation of that timer event after the wait completes for a valid event, and the complexity associated with handling potential race conditions associated with the user-level method, the separate function has been included.

Note that the semantics of the *sigwaitinfo*( ) function are nearly identical to that of the *sigwait*( ) function defined by this volume of POSIX.1-200x. The only difference is that *sigwaitinfo*( ) returns the queued signal value in the *value* argument. The return of the queued value is required so that applications can differentiate between multiple events queued to the same signal number.

The two distinct functions are being maintained because some implementations may choose to implement the POSIX Threads Extension functions and not implement the queued signals extensions. Note, though, that *sigwaitinfo*( ) does not return the queued value if the *value* argument is NULL, so the POSIX Threads Extension *sigwait*( ) function can be implemented as a macro on *sigwaitinfo*( ).

The *sigtimedwait*( ) function was separated from the *sigwaitinfo*( ) function to address concerns regarding the overloading of the *timeout* pointer to indicate indefinite wait (no timeout), timed wait, and immediate return, and concerns regarding consistency with other functions where the conditional and timed waits were separate functions from the pure blocking function. The semantics of *sigtimedwait*( ) are specified such that *sigwaitinfo*( ) could be implemented as a macro

with a null pointer for *timeout*.

The *sigwait* functions provide a synchronous mechanism for threads to wait for asynchronously-generated signals. One important question was how many threads that are suspended in a call to a *sigwait*( ) function for a signal should return from the call when the signal is sent. Four choices were considered:

1. Return an error for multiple simultaneous calls to *sigwait* functions for the same signal.
2. One or more threads return.
3. All waiting threads return.
4. Exactly one thread returns.

Prohibiting multiple calls to *sigwait*( ) for the same signal was felt to be overly restrictive. The "one or more" behavior made implementation of conforming packages easy at the expense of forcing POSIX threads clients to protect against multiple simultaneous calls to *sigwait*( ) in application code in order to achieve predictable behavior. There was concern that the "all waiting threads" behavior would result in "signal broadcast storms", consuming excessive CPU resources by replicating the signals in the general case. Furthermore, no convincing examples could be presented that delivery to all was either simpler or more powerful than delivery to one.

Thus, the consensus was that exactly one thread that was suspended in a call to a *sigwait* function for a signal should return when that signal occurs. This is not an onerous restriction as:

- A multi-way signal wait can be built from the single-way wait.
- Signals should only be handled by application-level code, as library routines cannot guess what the application wants to do with signals generated for the entire process.
- Applications can thus arrange for a single thread to wait for any given signal and call any needed routines upon its arrival.

In an application that is using signals for interprocess communication, signal processing is typically done in one place. Alternatively, if the signal is being caught so that process cleanup can be done, the signal handler thread can call separate process cleanup routines for each portion of the application. Since the application main line started each portion of the application, it is at the right abstraction level to tell each portion of the application to clean up.

Certainly, there exist programming styles where it is logical to consider waiting for a single signal in multiple threads. A simple *sigwait_multiple*( ) routine can be constructed to achieve this goal. A possible implementation would be to have each *sigwait_multiple*( ) caller registered as having expressed interest in a set of signals. The caller then waits on a thread-specific condition variable. A single server thread calls a *sigwait*( ) function on the union of all registered signals. When the *sigwait*( ) function returns, the appropriate state is set and condition variables are broadcast. New *sigwait_multiple*( ) callers may cause the pending *sigwait*( ) call to be canceled and reissued in order to update the set of signals being waited for.

FUTURE DIRECTIONS

None.

XBD **<signal.h>**, **<time.h>**

62107 **CHANGE HISTORY**

62108 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the
62109 POSIX Threads Extension.

62110 **Issue 6**

62111 These functions are marked as part of the Realtime Signals Extension option.

62112 The Open Group Corrigendum U035/3 is applied. The SYNOPSIS of the *sigwaitinfo*( ) function
62113 has been corrected so that the second argument is of type **siginfo_t** *.

62114 The [ENOSYS] error condition has been removed as stubs need not be provided if an
62115 implementation does not support the Realtime Signals Extension option.

62116 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the
62117 CLOCK_MONOTONIC clock, if supported, is used to measure timeout intervals.

62118 The **restrict** keyword is added to the *sigtimedwait*( ) and *sigwaitinfo*( ) prototypes for alignment
62119 with the ISO/IEC 9899: 1999 standard.

62120 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/130 is applied, restoring wording in the
62121 RETURN VALUE section to that in the original base document ("An implementation should
62122 only check for this error if no signal is pending in *set* and it is necessary to wait").

62123 **Issue 7**

62124 The *sigtimedwait*( ) and *sigwaitinfo*( ) functions are moved from the Realtime Signals Extension
62125 option to the Base.

62126 **NAME**

62127 sigwait — wait for queued signals

62128 **SYNOPSIS**

62129 CX
```
#include <signal.h>

int sigwait(const sigset_t *restrict set, int *restrict sig);
```
62130

62131 **DESCRIPTION**

62132 The *sigwait*( ) function shall select a pending signal from *set*, atomically clear it from the system's
62133 set of pending signals, and return that signal number in the location referenced by *sig*. If prior to
62134 the call to *sigwait*( ) there are multiple pending instances of a single signal number, it is
62135 implementation-defined whether upon successful return there are any remaining pending
62136 signals for that signal number. If the implementation supports queued signals and there are
62137 multiple signals queued for the signal number selected, the first such queued signal shall cause a
62138 return from *sigwait*( ) and the remainder shall remain queued. If no signal in *set* is pending at the
62139 time of the call, the thread shall be suspended until one or more becomes pending. The signals
62140 defined by *set* shall have been blocked at the time of the call to *sigwait*( ); otherwise, the behavior
62141 is undefined. The effect of *sigwait*( ) on the signal actions for the signals in *set* is unspecified.

62142 If more than one thread is using *sigwait*( ) to wait for the same signal, no more than one of these
62143 threads shall return from *sigwait*( ) with the signal number. If more than a single thread is
62144 blocked in *sigwait*( ) for a signal when that signal is generated for the process, it is unspecified
62145 which of the waiting threads returns from *sigwait*( ). If the signal is generated for a specific
62146 thread, as by *pthread_kill*( ), only that thread shall return.

62147 Should any of the multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it
62148 shall be the lowest numbered one. The selection order between realtime and non-realtime
62149 signals, or between multiple pending non-realtime signals, is unspecified.

62150 **RETURN VALUE**

62151 Upon successful completion, *sigwait*( ) shall store the signal number of the received signal at the
62152 location referenced by *sig* and return zero. Otherwise, an error number shall be returned to
62153 indicate the error.

62154 **ERRORS**

62155 The *sigwait*( ) function may fail if:

62156 [EINVAL] The *set* argument contains an invalid or unsupported signal number.

62157 **EXAMPLES**

62158 None.

62159 **APPLICATION USAGE**

62160 None.

62161 **RATIONALE**

62162 To provide a convenient way for a thread to wait for a signal, this volume of POSIX.1-200x
62163 provides the *sigwait*( ) function. For most cases where a thread has to wait for a signal, the
62164 *sigwait*( ) function should be quite convenient, efficient, and adequate.

62165 However, requests were made for a lower-level primitive than *sigwait*( ) and for semaphores that
62166 could be used by threads. After some consideration, threads were allowed to use semaphores
62167 and *sem_post*( ) was defined to be async-signal and async-cancel-safe.

62168 In summary, when it is necessary for code run in response to an asynchronous signal to notify a
62169 thread, *sigwait*( ) should be used to handle the signal. Alternatively, if the implementation
62170 provides semaphores, they also can be used, either following *sigwait*( ) or from within a signal

handling routine previously registered with *sigaction*( ).

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Issue 6

The **restrict** keyword is added to the *sigwait*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/131 is applied, updating the DESCRIPTION to state that if more than a single thread is blocked in *sigwait*( ), it is unspecified which of the waiting threads returns, and that if a signal is generated for a specific thread only that thread shall return.

Issue 7

Functionality relating to the Realtime Signals Extension option is moved to the Base.

62190 **NAME**

62191 sigwaitinfo — wait for queued signals

62192 **SYNOPSIS**

62193
```
#include <signal.h>
```

62194
```
int sigwaitinfo(const sigset_t *restrict set, siginfo_t *restrict info);
```

62195 **DESCRIPTION**

62196 Refer to *sigtimedwait( )*.

NAME

sin, sinf, sinl — sine function

SYNOPSIS

```
#include <math.h>

double sin(double x);
float sinf(float x);
long double sinl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the sine of their argument *x*, measured in radians.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the sine of *x*.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, *x* shall be returned.

If *x* is subnormal, a range error may occur and *x* should be returned.

If *x* is ±Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

ERRORS

These functions shall fail if:

MX

Domain Error	The *x* argument is ±Inf.
	If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

MX

Range Error	The value of *x* is subnormal
	If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

Taking the Sine of a 45-Degree Angle

```
#include <math.h>
...
double radians = 45.0 * M_PI / 180;
double result;
...
result = sin(radians);
```

APPLICATION USAGE

These functions may lose accuracy when their argument is near a multiple of π or is far from 0.0.

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes in previous issues.

Issue 6

The *sinf( )* and *sinl( )* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

NAME

sinh, sinhf, sinhl — hyperbolic sine functions

SYNOPSIS

```
#include <math.h>

double sinh(double x);
float sinhf(float x);
long double sinhl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the hyperbolic sine of their argument *x*.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the hyperbolic sine of *x*.

If the result would cause an overflow, a range error shall occur and ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (with the same sign as *x*) shall be returned as appropriate for the type of the function.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0 or ±Inf, *x* shall be returned.

If *x* is subnormal, a range error may occur and *x* should be returned.

ERRORS

These functions shall fail if:

Range Error — The result would cause an overflow.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

MX Range Error — The value *x* is subnormal.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

62323 **NAME**

62324 sinl — sine function

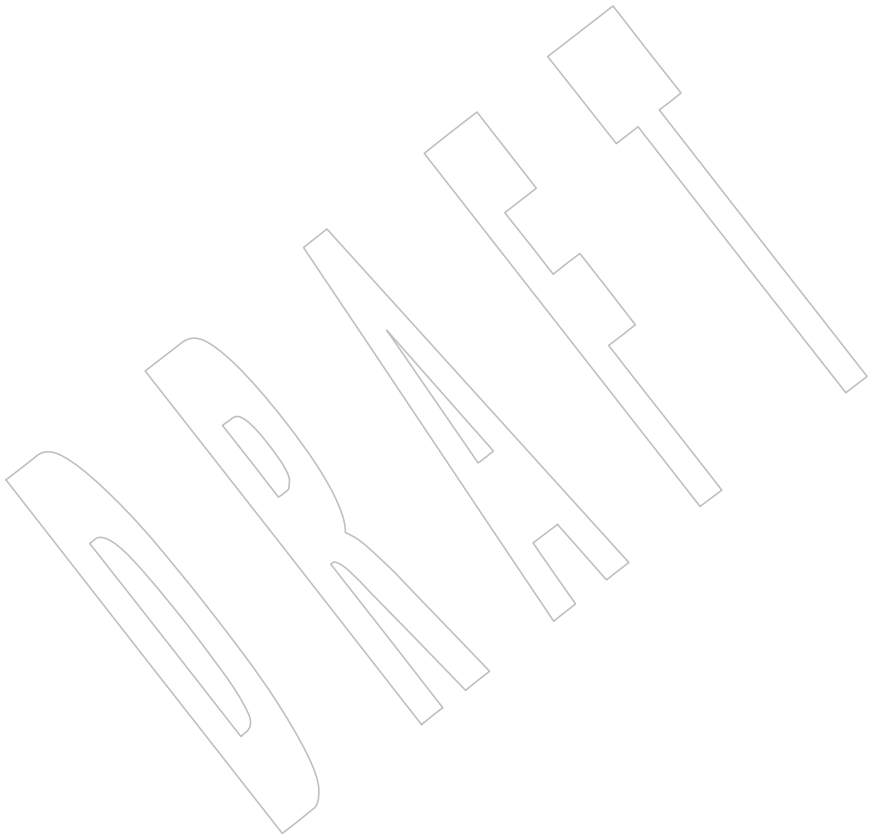
62325 **SYNOPSIS**

62326
```
#include <math.h>
```

62327
```
long double sinl(long double x);
```

62328 **DESCRIPTION**

62329 Refer to *sin*( ).



62330 **NAME**

62331 sleep — suspend execution for an interval of time

62332 **SYNOPSIS**

62333
```
#include <unistd.h>
```

62334
```
unsigned sleep(unsigned seconds);
```

62335 **DESCRIPTION**

62336 The *sleep*( ) function shall cause the calling thread to be suspended from execution until either
62337 the number of realtime seconds specified by the argument *seconds* has elapsed or a signal is
62338 delivered to the calling thread and its action is to invoke a signal-catching function or to
62339 terminate the process. The suspension time may be longer than requested due to the scheduling
62340 of other activity by the system.

62341 If a SIGALRM signal is generated for the calling process during execution of *sleep*( ) and if the
62342 SIGALRM signal is being ignored or blocked from delivery, it is unspecified whether *sleep*( )
62343 returns when the SIGALRM signal is scheduled. If the signal is being blocked, it is also
62344 unspecified whether it remains pending after *sleep*( ) returns or it is discarded.

62345 If a SIGALRM signal is generated for the calling process during execution of *sleep*( ), except as a
62346 result of a prior call to *alarm*( ), and if the SIGALRM signal is not being ignored or blocked from
62347 delivery, it is unspecified whether that signal has any effect other than causing *sleep*( ) to return.

62348 If a signal-catching function interrupts *sleep*( ) and examines or changes either the time a
62349 SIGALRM is scheduled to be generated, the action associated with the SIGALRM signal, or
62350 whether the SIGALRM signal is blocked from delivery, the results are unspecified.

62351 If a signal-catching function interrupts *sleep*( ) and calls *siglongjmp*( ) or *longjmp*( ) to restore an
62352 environment saved prior to the *sleep*( ) call, the action associated with the SIGALRM signal and
62353 the time at which a SIGALRM signal is scheduled to be generated are unspecified. It is also
62354 unspecified whether the SIGALRM signal is blocked, unless the signal mask of the process is
62355 restored as part of the environment.

62356 XSI Interactions between *sleep*( ) and *setitimer*( ) are unspecified.

62357 **RETURN VALUE**

62358 If *sleep*( ) returns because the requested time has elapsed, the value returned shall be 0. If *sleep*( )
62359 returns due to delivery of a signal, the return value shall be the "unslept" amount (the requested
62360 time minus the time actually slept) in seconds.

62361 **ERRORS**

62362 No errors are defined.

62363 **EXAMPLES**

62364 None.

62365 **APPLICATION USAGE**

62366 None.

62367 **RATIONALE**

62368 There are two general approaches to the implementation of the *sleep*( ) function. One is to use the
62369 *alarm*( ) function to schedule a SIGALRM signal and then suspend the calling thread waiting for
62370 that signal. The other is to implement an independent facility. This volume of POSIX.1-200x
62371 permits either approach.

62372 In order to comply with the requirement that no primitive shall change a process attribute unless
62373 explicitly described by this volume of POSIX.1-200x, an implementation using SIGALRM must
62374 carefully take into account any SIGALRM signal scheduled by previous *alarm*( ) calls, the action

previously established for SIGALRM, and whether SIGALRM was blocked. If a SIGALRM has been scheduled before the *sleep*( ) would ordinarily complete, the *sleep*( ) must be shortened to that time and a SIGALRM generated (possibly simulated by direct invocation of the signal-catching function) before *sleep*( ) returns. If a SIGALRM has been scheduled after the *sleep*( ) would ordinarily complete, it must be rescheduled for the same time before *sleep*( ) returns. The action and blocking for SIGALRM must be saved and restored.

Historical implementations often implement the SIGALRM-based version using *alarm*( ) and *pause*( ). One such implementation is prone to infinite hangups, as described in *pause*( ). Another such implementation uses the C-language *setjmp*( ) and *longjmp*( ) functions to avoid that window. That implementation introduces a different problem: when the SIGALRM signal interrupts a signal-catching function installed by the user to catch a different signal, the *longjmp*( ) aborts that signal-catching function. An implementation based on *sigprocmask*( ), *alarm*( ), and *sigsuspend*( ) can avoid these problems.

Despite all reasonable care, there are several very subtle, but detectable and unavoidable, differences between the two types of implementations. These are the cases mentioned in this volume of POSIX.1-200x where some other activity relating to SIGALRM takes place, and the results are stated to be unspecified. All of these cases are sufficiently unusual as not to be of concern to most applications.

See also the discussion of the term *realtime* in *alarm*( ).

Since *sleep*( ) can be implemented using *alarm*( ), the discussion about alarms occurring early under *alarm*( ) applies to *sleep*( ) as well.

Application developers should note that the type of the argument *seconds* and the return value of *sleep*( ) is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces Application cannot pass a value greater than the minimum guaranteed value for {UINT_MAX}, which the ISO C standard sets as 65 535, and any application passing a larger value is restricting its portability. A different type was considered, but historical implementations, including those with a 16-bit **int** type, consistently use either **unsigned** or **int**.

Scheduling delays may cause the process to return from the *sleep*( ) function significantly after the requested time. In such cases, the return value should be set to zero, since the formula (requested time minus the time actually spent) yields a negative number and *sleep*( ) returns an **unsigned**.

FUTURE DIRECTIONS

None.

62418 **NAME**

62419 snprintf — print formatted output

62420 **SYNOPSIS**

62421 ```
#include <stdio.h>
```

62422 ```
int snprintf(char *restrict s, size_t n,
```

62423 ```
    const char *restrict format, ...);
```

62424 **DESCRIPTION**

62425 Refer to *fprintf( )*.
```

NAME

sockatmark — determine whether a socket is at the out-of-band mark

SYNOPSIS

```
#include <sys/socket.h>

int sockatmark(int s);
```

DESCRIPTION

The *sockatmark*( ) function shall determine whether the socket specified by the descriptor *s* is at the out-of-band data mark (see Section 2.10.12, on page 520). If the protocol for the socket supports out-of-band data by marking the stream with an out-of-band data mark, the *sockatmark*( ) function shall return 1 when all data preceding the mark has been read and the out-of-band data mark is the first element in the receive queue. The *sockatmark*( ) function shall not remove the mark from the stream.

RETURN VALUE

Upon successful completion, the *sockatmark*( ) function shall return a value indicating whether the socket is at an out-of-band data mark. If the protocol has marked the data stream and all data preceding the mark has been read, the return value shall be 1; if there is no mark, or if data precedes the mark in the receive queue, the *sockatmark*( ) function shall return 0. Otherwise, it shall return a value of –1 and set *errno* to indicate the error.

ERRORS

The *sockatmark*( ) function shall fail if:

[EBADF] The *s* argument is not a valid file descriptor.

[ENOTTY] The file associated with the *s* argument is not a socket.

EXAMPLES

None.

APPLICATION USAGE

The use of this function between receive operations allows an application to determine which received data precedes the out-of-band data and which follows the out-of-band data.

There is an inherent race condition in the use of this function. On an empty receive queue, the current read of the location might well be at the "mark", but the system has no way of knowing that the next data segment that will arrive from the network will carry the mark, and *sockatmark*( ) will return false, and the next read operation will silently consume the mark.

Hence, this function can only be used reliably when the application already knows that the out-of-band data has been seen by the system or that it is known that there is data waiting to be read at the socket (via SIGURG or *select*( )). See Section 2.10.11 (on page 520), Section 2.10.12 (on page 520), Section 2.10.14 (on page 521), and *pselect*( ) for details.

RATIONALE

The *sockatmark*( ) function replaces the historical SIOCATMARK command to *ioctl*( ) which implemented the same functionality on many implementations. Using a wrapper function follows the adopted conventions to avoid specifying commands to the *ioctl*( ) function, other than those now included to support XSI STREAMS. The *sockatmark*( ) function could be implemented as follows:

```
#include <sys/ioctl.h>

int sockatmark(int s)
{
    int val;
```

```
        if (ioctl(s,SIOCATMARK,&val)==-1)
            return(-1);
        return(val);
    }
```

The use of [ENOTTY] to indicate an incorrect descriptor type matches the historical behavior of SIOCATMARK.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1g-2000.

Issue 7

SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

62486 **NAME**

62487 socket — create an endpoint for communication

62488 **SYNOPSIS**

62489
```
#include <sys/socket.h>
```

62490
```
int socket(int domain, int type, int protocol);
```

62491 **DESCRIPTION**

62492 The *socket*( ) function shall create an unbound socket in a communications domain, and return a
62493 file descriptor that can be used in later function calls that operate on sockets.

62494 The *socket*( ) function takes the following arguments:

62495 *domain* Specifies the communications domain in which a socket is to be created.

62496 *type* Specifies the type of socket to be created.

62497 *protocol* Specifies a particular protocol to be used with the socket. Specifying a *protocol*
62498 of 0 causes *socket*( ) to use an unspecified default protocol appropriate for the
62499 requested socket type.

62500 The *domain* argument specifies the address family used in the communications domain. The
62501 address families supported by the system are implementation-defined.

62502 Symbolic constants that can be used for the domain argument are defined in the **<sys/socket.h>**
62503 header.

62504 The *type* argument specifies the socket type, which determines the semantics of communication
62505 over the socket. The following socket types are defined; implementations may specify additional
62506 socket types:

62507 SOCK_STREAM Provides sequenced, reliable, bidirectional, connection-mode byte
62508 streams, and may provide a transmission mechanism for out-of-band
62509 data.

62510 SOCK_DGRAM Provides datagrams, which are connectionless-mode, unreliable messages
62511 of fixed maximum length.

62512 SOCK_SEQPACKET Provides sequenced, reliable, bidirectional, connection-mode transmission
62513 paths for records. A record can be sent using one or more output
62514 operations and received using one or more input operations, but a single
62515 operation never transfers part of more than one record. Record
62516 boundaries are visible to the receiver via the MSG_EOR flag.

62517 If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address
62518 family. If the *protocol* argument is zero, the default protocol for this address family and type shall
62519 be used. The protocols supported by the system are implementation-defined.

62520 The process may need to have appropriate privileges to use the *socket*( ) function or to create
62521 some sockets.

62522 **RETURN VALUE**

62523 Upon successful completion, *socket*( ) shall return a non-negative integer, the socket file
62524 descriptor. Otherwise, a value of −1 shall be returned and *errno* set to indicate the error.

62525 **ERRORS**

62526 The *socket*( ) function shall fail if:

62527 [EAFNOSUPPORT]

62528 The implementation does not support the specified address family.

62529 [EMFILE] All file descriptors available to the process are currently open.

62530 [ENFILE] No more file descriptors are available for the system.

62531 [EPROTONOSUPPORT]

62532 The protocol is not supported by the address family, or the protocol is not
62533 supported by the implementation.

62534 [EPROTOTYPE] The socket type is not supported by the protocol.

62535 The *socket*( ) function may fail if:

62536 [EACCES] The process does not have appropriate privileges.

62537 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

62538 [ENOMEM] Insufficient memory was available to fulfill the request.

62539 **EXAMPLES**

62540 None.

62541 **APPLICATION USAGE**

62542 The documentation for specific address families specifies which protocols each address family
62543 supports. The documentation for specific protocols specifies which socket types each protocol
62544 supports.

62545 The application can determine whether an address family is supported by trying to create a
62546 socket with *domain* set to the protocol in question.

62547 **RATIONALE**

NAME

socketpair — create a pair of connected sockets

SYNOPSIS

```
#include <sys/socket.h>

int socketpair(int domain, int type, int protocol,
    int socket_vector[2]);
```

DESCRIPTION

The *socketpair*( ) function shall create an unbound pair of connected sockets in a specified *domain*, of a specified *type*, under the protocol optionally specified by the *protocol* argument. The two sockets shall be identical. The file descriptors used in referencing the created sockets shall be returned in *socket_vector*[0] and *socket_vector*[1].

The *socketpair*( ) function takes the following arguments:

domain Specifies the communications domain in which the sockets are to be created.

type Specifies the type of sockets to be created.

protocol Specifies a particular protocol to be used with the sockets. Specifying a *protocol* of 0 causes *socketpair*( ) to use an unspecified default protocol appropriate for the requested socket type.

socket_vector Specifies a 2-integer array to hold the file descriptors of the created socket pair.

The *type* argument specifies the socket type, which determines the semantics of communications over the socket. The following socket types are defined; implementations may specify additional socket types:

SOCK_STREAM Provides sequenced, reliable, bidirectional, connection-mode byte streams, and may provide a transmission mechanism for out-of-band data.

SOCK_DGRAM Provides datagrams, which are connectionless-mode, unreliable messages of fixed maximum length.

SOCK_SEQPACKET Provides sequenced, reliable, bidirectional, connection-mode transmission paths for records. A record can be sent using one or more output operations and received using one or more input operations, but a single operation never transfers part of more than one record. Record boundaries are visible to the receiver via the MSG_EOR flag.

If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address family. If the *protocol* argument is zero, the default protocol for this address family and type shall be used. The protocols supported by the system are implementation-defined.

The process may need to have appropriate privileges to use the *socketpair*( ) function or to create some sockets.

RETURN VALUE

Upon successful completion, this function shall return 0; otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *socketpair*( ) function shall fail if:

[EAFNOSUPPORT]
The implementation does not support the specified address family.

62600 [EMFILE] All, or all but one, of the file descriptors available to the process are currently
62601 open.

62602 [ENFILE] No more file descriptors are available for the system.

62603 [EOPNOTSUPP] The specified protocol does not permit creation of socket pairs.

62604 [EPROTONOSUPPORT]
62605 The protocol is not supported by the address family, or the protocol is not
62606 supported by the implementation.

62607 [EPROTOTYPE] The socket type is not supported by the protocol.

62608 The *socketpair*( ) function may fail if:

62609 [EACCES] The process does not have appropriate privileges.

62610 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

62611 [ENOMEM] Insufficient memory was available to fulfill the request.

62612 **EXAMPLES**

62613 None.

62614 **APPLICATION USAGE**

62615 The documentation for specific address families specifies which protocols each address family
62616 supports. The documentation for specific protocols specifies which socket types each protocol
62617 supports.

62618 The *socketpair*( ) function is used primarily with UNIX domain sockets and need not be
62619 supported for other domains.

62620 **RATIONALE**

62621 None.

sprintf( )

62631 **NAME**

62632 sprintf — print formatted output

62633 **SYNOPSIS**

62634 ```
#include <stdio.h>
```

62635 ```
int sprintf(char *restrict s, const char *restrict format, ...);
```

62636 **DESCRIPTION**

62637 Refer to *fprintf( )*.

NAME

sqrt, sqrtf, sqrtl — square root function

SYNOPSIS

```
#include <math.h>

double sqrt(double x);
float sqrtf(float x);
long double sqrtl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the square root of their argument x, $\sqrt{x}$.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the square root of x.

MX For finite values of $x < -0$, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

MX If x is NaN, a NaN shall be returned.

If x is ±0 or +Inf, x shall be returned.

If x is –Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

ERRORS

These functions shall fail if:

MX Domain Error — The finite value of x is < -0, or x is –Inf.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

Taking the Square Root of 9.0

```
#include <math.h>
...
double x = 9.0;
double result;
...
result = sqrt(x);
```

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

62740 **NAME**

62741 stderr, stdin, stdout — standard I/O streams

62742 **SYNOPSIS**

62743
```
#include <stdio.h>
```

62744
```
extern FILE *stderr, *stdin, *stdout;
```

62745 **DESCRIPTION**

62746 CX The functionality described on this reference page is aligned with the ISO C standard. Any
62747 conflict between the requirements described here and the ISO C standard is unintentional. This
62748 volume of POSIX.1-200x defers to the ISO C standard.

62749 A file with associated buffering is called a *stream* and is declared to be a pointer to a defined type
62750 **FILE**. The *fopen*( ) function shall create certain descriptive data for a stream and return a pointer
62751 to designate the stream in all further transactions. Normally, there are three open streams with
62752 constant pointers declared in the **<stdio.h>** header and associated with the standard open files.

62753 At program start-up, three streams shall be predefined and need not be opened explicitly:
62754 *standard input* (for reading conventional input), *standard output* (for writing conventional output),
62755 and *standard error* (for writing diagnostic output). When opened, the standard error stream is not
62756 fully buffered; the standard input and standard output streams are fully buffered if and only if
62757 the stream can be determined not to refer to an interactive device.

62758 CX The following symbolic values in **<unistd.h>** define the file descriptors that shall be associated
62759 with the C-language *stdin*, *stdout*, and *stderr* when the application is started:

62760 STDIN_FILENO Standard input value, *stdin*. Its value is 0.

62761 STDOUT_FILENO Standard output value, *stdout*. Its value is 1.

62762 STDERR_FILENO Standard error value, *stderr*. Its value is 2.

62763 The *stderr* stream is expected to be open for reading and writing.

62764 **RETURN VALUE**

62765 None.

62766 **ERRORS**

62767 No errors are defined.

62768 **EXAMPLES**

62769 None.

62780 **CHANGE HISTORY**
62781 First released in Issue 1.

62782 **Issue 6**
62783 Extensions beyond the ISO C standard are marked.
62784 A note that *stderr* is expected to be open for reading and writing is added to the DESCRIPTION.

62785 **NAME**

62786 stpcpy — copy a string and return a pointer to the end of the result

62787 **SYNOPSIS**

62788 CX
```
#include <string.h>

char *stpcpy(char *restrict s1, const char *restrict s2);
```

62790 **DESCRIPTION**

62791 Refer to *strcpy( )*.

NAME

stpncpy — copy fixed length string, returning a pointer to the array end

SYNOPSIS

CX
```
#include <string.h>

char *stpncpy(char *restrict s1, const char *restrict s2, size_t size);
```

DESCRIPTION

Refer to *strncpy( )*.

NAME

strcasecmp, strcasecmp_l, strncasecmp, strncasecmp_l — case-insensitive string comparisons

SYNOPSIS

```
#include <strings.h>

int strcasecmp(const char *s1, const char *s2);
int strcasecmp_l(const char *s1, const char *s2,
    locale_t locale);
int strncasecmp(const char *s1, const char *s2, size_t n);
int strncasecmp_l(const char *s1, const char *s2,
    size_t n, locale_t locale);
```

DESCRIPTION

The *strcasecmp*( ) and *strcasecmp_l*( ) functions shall compare, while ignoring differences in case, the string pointed to by *s1* to the string pointed to by *s2*. The *strncasecmp*( ) and *strncasecmp_l*( ) functions shall compare, while ignoring differences in case, not more than *n* bytes from the string pointed to by *s1* to the string pointed to by *s2*.

The *strcasecmp*( ) and *strncasecmp*( ) functions use the current locale of the process to determine the case of the characters.

The *strcasecmp_l*( ) and *strncasecmp_l*( ) functions use the locale represented by *locale* to determine the case of the characters.

When the *LC_CTYPE* category of the current locale is from the POSIX locale, *strcasecmp*( ) and *strncasecmp*( ) shall behave as if the strings had been converted to lowercase and then a byte comparison performed. Otherwise, the results are unspecified.

RETURN VALUE

Upon completion, *strcasecmp*( ) and *strcasecmp_l*( ) shall return an integer greater than, equal to, or less than 0, if the string pointed to by *s1* is, ignoring case, greater than, equal to, or less than the string pointed to by *s2*, respectively.

Upon successful completion, *strncasecmp*( ) and *strncasecmp_l*( ) shall return an integer greater than, equal to, or less than 0, if the possibly null-terminated array pointed to by *s1* is, ignoring case, greater than, equal to, or less than the possibly null-terminated array pointed to by *s2*, respectively.

ERRORS

The *strcasecmp_l*( ) and *strncasecmp_l*( ) functions may fail if:

[EINVAL] *locale* is not a valid locale object handle.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 7

The *strcasecmp*( ) and *strncasecmp*( ) functions are moved from the XSI option to the Base.

The *strcasecmp_l*( ) and *strncasecmp_l*( ) functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

62851 **NAME**

62852 strcat — concatenate two strings

62853 **SYNOPSIS**

62854
```
#include <string.h>
```

62855
```
char *strcat(char *restrict s1, const char *restrict s2);
```

62856 **DESCRIPTION**

62857 CX The functionality described on this reference page is aligned with the ISO C standard. Any
62858 conflict between the requirements described here and the ISO C standard is unintentional. This
62859 volume of POSIX.1-200x defers to the ISO C standard.

62860 The *strcat*( ) function shall append a copy of the string pointed to by *s2* (including the
62861 terminating NUL character) to the end of the string pointed to by *s1*. The initial byte of *s2*
62862 overwrites the NUL character at the end of *s1*. If copying takes place between objects that
62863 overlap, the behavior is undefined.

62864 **RETURN VALUE**

62865 The *strcat*( ) function shall return *s1*; no return value is reserved to indicate an error.

62866 **ERRORS**

62867 No errors are defined.

62868 **EXAMPLES**

62869 None.

62870 **APPLICATION USAGE**

62871 This version is aligned with the ISO C standard; this does not affect compatibility with XPG3
62872 applications. Reliable error detection by this function was never guaranteed.

62873 **RATIONALE**

62874 None.

62875 **FUTURE DIRECTIONS**

62876 None.

62881 First released in Issue 1. Derived from Issue 1 of the SVID.

62882 **Issue 6**

62883 The *strcat*( ) prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.

62884 **NAME**

62885 strchr — string scanning operation

62886 **SYNOPSIS**

62887
```
#include <string.h>
```

62888
```
char *strchr(const char *s, int c);
```

62889 **DESCRIPTION**

62890 CX The functionality described on this reference page is aligned with the ISO C standard. Any
62891 conflict between the requirements described here and the ISO C standard is unintentional. This
62892 volume of POSIX.1-200x defers to the ISO C standard.

62893 The *strchr*( ) function shall locate the first occurrence of *c* (converted to a **char**) in the string
62894 pointed to by *s*. The terminating NUL character is considered to be part of the string.

62895 **RETURN VALUE**

62896 Upon completion, *strchr*( ) shall return a pointer to the byte, or a null pointer if the byte was not
62897 found.

62898 **ERRORS**

62899 No errors are defined.

62900 **EXAMPLES**

62901 None.

NAME

strcmp — compare two strings

SYNOPSIS

```
#include <string.h>

int strcmp(const char *s1, const char *s2);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *strcmp*( ) function shall compare the string pointed to by *s1* to the string pointed to by *s2*.

The sign of a non-zero return value shall be determined by the sign of the difference between the values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings being compared.

RETURN VALUE

Upon completion, *strcmp*( ) shall return an integer greater than, equal to, or less than 0, if the string pointed to by *s1* is greater than, equal to, or less than the string pointed to by *s2*, respectively.

ERRORS

No errors are defined.

EXAMPLES

Checking a Password Entry

The following example compares the information read from standard input to the value of the name of the user entry. If the *strcmp*( ) function returns 0 (indicating a match), a further check will be made to see if the user entered the proper old password. The *crypt*( ) function shall encrypt the old password entered by the user, using the value of the encrypted password in the **passwd** structure as the salt. If this value matches the value of the encrypted **passwd** in the structure, the entered password *oldpasswd* is the correct user's password. Finally, the program encrypts the new password so that it can store the information in the **passwd** structure.

```
#include <string.h>
#include <unistd.h>
#include <stdio.h>
...
int valid_change;
struct passwd *p;
char user[100];
char oldpasswd[100];
char newpasswd[100];
char savepasswd[100];
...
if (strcmp(p->pw_name, user) == 0) {
    if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
        strcpy(savepasswd, crypt(newpasswd, user));
        p->pw_passwd = savepasswd;
        valid_change = 1;
    }
    else {
```

```
                fprintf(stderr, "Old password is not valid\n");
            }
        }
        ...
```

APPLICATION USAGE

Issue 6

Extensions beyond the ISO C standard are marked.

NAME

strcoll, strcoll_l — string comparison using collating information

SYNOPSIS

```
#include <string.h>

int strcoll(const char *s1, const char *s2);
int strcoll_l(const char *s1, const char *s2,
    locale_t locale);
```

DESCRIPTION

For *strcoll*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *strcoll*( ) and *strcoll_l*( ) functions shall compare the string pointed to by *s1* to the string pointed to by *s2*, both interpreted as appropriate to the *LC_COLLATE* category of the current locale, or of the locale represented by *locale*, respectively.

The *strcoll*( ) and *strcoll_l*( ) functions shall not change the setting of *errno* if successful.

Since no return value is reserved to indicate an error, an application wishing to check for error situations should set *errno* to 0, then call *strcoll*( ), or *strcoll_l*( ) then check *errno*.

RETURN VALUE

Upon successful completion, *strcoll*( ) shall return an integer greater than, equal to, or less than 0, according to whether the string pointed to by *s1* is greater than, equal to, or less than the string pointed to by *s2* when both are interpreted as appropriate to the current locale. On error, *strcoll*( ) may set *errno*, but no return value is reserved to indicate an error.

Upon successful completion, *strcoll_l*( ) shall return an integer greater than, equal to, or less than 0, according to whether the string pointed to by *s1* is greater than, equal to, or less than the string pointed to by *s2* when both are interpreted as appropriate to the locale represented by *locale*. On error, *strcoll_l*( ) may set *errno*, but no return value is reserved to indicate an error.

ERRORS

These functions may fail if:

[EINVAL] The *s1* or *s2* arguments contain characters outside the domain of the collating sequence.

The *strcoll_l*( ) function may fail if:

[EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

Comparing Nodes

The following example uses an application-defined function, *node_compare*( ), to compare two nodes based on an alphabetical ordering of the *string* field.

```
#include <string.h>
...
struct node { /* These are stored in the table. */
    char *string;
    int length;
};
...
```

```
63021       int node_compare(const void *node1, const void *node2)
63022       {
63023           return strcoll(((const struct node *)node1)->string,
63024               ((const struct node *)node2)->string);
63025       }
63026       ...
```

63027 **APPLICATION USAGE**

63028 The *strxfrm*( ) and *strcmp*( ) functions should be used for sorting large lists.

63029 **RATIONALE**

63030 None.

63031 **FUTURE DIRECTIONS**

63032 None.

63033 **SEE ALSO**

63034 *alphasort*( ), *strcmp*( ), *strxfrm*( )

63035 XBD **<string.h>**

63036 **CHANGE HISTORY**

63037 First released in Issue 3.

63038 **Issue 5**

63039 The DESCRIPTION is updated to indicate that *errno* does not change if the function is successful.

63040 **Issue 6**

63041 Extensions beyond the ISO C standard are marked.

63042 The following new requirements on POSIX implementations derive from alignment with the
63043 Single UNIX Specification:

63044 - The [EINVAL] optional error condition is added.

63045 An example is added.

63046 **Issue 7**

63047 The *strcoll_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API
63048 Set Part 4.

63049 **NAME**

63050 stpcpy, strcpy — copy a string and return a pointer to the end of the result

63051 **SYNOPSIS**

63052
```
#include <string.h>
```

63053 CX
```
char *stpcpy(char *restrict s1, const char *restrict s2);
```
63054
```
char *strcpy(char *restrict s1, const char *restrict s2);
```

63055 **DESCRIPTION**

63056 CX For *strcpy*( ): The functionality described on this reference page is aligned with the ISO C
63057 standard. Any conflict between the requirements described here and the ISO C standard is
63058 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

63059 CX The *stpcpy*( ) and *strcpy*( ) functions shall copy the string pointed to by *s2* (including the
63060 terminating NUL character) into the array pointed to by *s1*.

63061 If copying takes place between objects that overlap, the behavior is undefined.

63062 **RETURN VALUE**

63063 CX The *stpcpy*( ) function shall return a pointer to the terminating NUL character copied into the *s1*
63064 buffer.

63065 The *strcpy*( ) function shall return *s1*.

63066 No return values are reserved to indicate an error.

63067 **ERRORS**

63068 No errors are defined.

63069 **EXAMPLES**

63070 **Construction of a Multi-Part Message in a Single Buffer**

63071
```
#include <string.h>
#include <stdio.h>
```

63073
```
int
main (void)
{
    char buffer [10];
    char *name = buffer;

    name = stpcpy (stpcpy (stpcpy (name, "ice"),"-"), "cream");
    puts (buffer);
    return 0;
}
```

63082 **Initializing a String**

63083 The following example copies the string `"----------"` into the *permstring* variable.

63084
```
#include <string.h>
...
static char permstring[11];
...
strcpy(permstring, "----------");
...
```

63090 **Storing a Key and Data**

63091 The following example allocates space for a key using *malloc*( ) then uses *strcpy*( ) to place the
63092 key there. Then it allocates space for data using *malloc*( ), and uses *strcpy*( ) to place data there.
63093 (The user-defined function *dbfree*( ) frees memory previously allocated to an array of type **struct**
63094 **element** *.)

```
63095 #include <string.h>
63096 #include <stdlib.h>
63097 #include <stdio.h>
63098 ...
63099 /* Structure used to read data and store it. */
63100 struct element {
63101     char *key;
63102     char *data;
63103 };
63104 struct element *tbl, *curtbl;
63105 char *key, *data;
63106 int count;
63107 ...
63108 void dbfree(struct element *, int);
63109 ...
63110 if ((curtbl->key = malloc(strlen(key) + 1)) == NULL) {
63111     perror("malloc"); dbfree(tbl, count); return NULL;
63112 }
63113 strcpy(curtbl->key, key);
63114 if ((curtbl->data = malloc(strlen(data) + 1)) == NULL) {
63115     perror("malloc"); free(curtbl->key); dbfree(tbl, count); return NULL;
63116 }
63117 strcpy(curtbl->data, data);
63118 ...
```

63119 **APPLICATION USAGE**

63120 Character movement is performed differently in different implementations. Thus, overlapping
63121 moves may yield surprises.

63122 This version is aligned with the ISO C standard; this does not affect compatibility with XPG3
63123 applications. Reliable error detection by this function was never guaranteed.

63124 **RATIONALE**

63125 None.

63126 **FUTURE DIRECTIONS**

63127 None.

63128 **SEE ALSO**

63129 *strncpy*( ), *wcscpy*( )

63130 XBD **<string.h>**

63131 **CHANGE HISTORY**

63132 First released in Issue 1. Derived from Issue 1 of the SVID.

63133 **Issue 6**

63134 The *strcpy*( ) prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.

63135 **Issue 7**

63136 The *stpcpy*( ) function is added from The Open Group Technical Standard, 2006, Extended API
63137 Set Part 1.

63138 **NAME**

63139 strcspn — get the length of a complementary substring

63140 **SYNOPSIS**

63141 ```
#include <string.h>
```

63142 ```
size_t strcspn(const char *s1, const char *s2);
```

63143 **DESCRIPTION**

63144 CX The functionality described on this reference page is aligned with the ISO C standard. Any
63145 conflict between the requirements described here and the ISO C standard is unintentional. This
63146 volume of POSIX.1-200x defers to the ISO C standard.

63147 The *strcspn*( ) function shall compute the length (in bytes) of the maximum initial segment of the
63148 string pointed to by *s1* which consists entirely of bytes *not* from the string pointed to by *s2*.

63149 **RETURN VALUE**

63150 The *strcspn*( ) function shall return the length of the computed segment of the string pointed to
63151 by *s1*; no return value is reserved to indicate an error.

63152 **ERRORS**

63153 No errors are defined.

63154 **EXAMPLES**

63155 None.

63156 **APPLICATION USAGE**

63157 None.

63158 **RATIONALE**

63159 None.

63160 **FUTURE DIRECTIONS**

63161 None.

63162 **SEE ALSO**

63163 *strspn*( )

63164 XBD **<string.h>**

63165 **CHANGE HISTORY**

63166 First released in Issue 1. Derived from Issue 1 of the SVID.

63167 **Issue 5**

63168 The RETURN VALUE section is updated to indicate that *strcspn*( ) returns the length of *s1*, and
63169 not *s1* itself as was previously stated.

63170 **Issue 6**

63171 The Open Group Corrigendum U030/1 is applied. The text of the RETURN VALUE section is
63172 updated to indicate that the computed segment length is returned, not the *s1* length.

63173 **NAME**

63174 strdup, strndup — duplicate a specific number of bytes from a string

63175 **SYNOPSIS**

63176 CX
```
#include <string.h>

char *strdup(const char *s);
char *strndup(const char *s, size_t size);
```

63179 **DESCRIPTION**

63180 The *strdup*( ) function shall return a pointer to a new string, which is a duplicate of the string
63181 pointed to by *s*. The returned pointer can be passed to *free*( ). A null pointer is returned if the
63182 new string cannot be created.

63183 The *strndup*( ) function shall be equivalent to the *strdup*( ) function, duplicating the provided *s* in
63184 a new block of memory allocated as if by using *malloc*( ), with the exception being that *strndup*( )
63185 copies at most *size* plus one bytes into the newly allocated memory, terminating the new string
63186 with a NUL character. If the length of *s* is larger than *size*, only *size* bytes shall be duplicated. If
63187 *size* is larger than the length of *s*, all bytes in *s* shall be copied into the new memory buffer,
63188 including the terminating NUL character. The newly created string shall always be properly
63189 terminated.

63190 **RETURN VALUE**

63191 The *strdup*( ) function shall return a pointer to a new string on success. Otherwise, it shall return
63192 a null pointer and set *errno* to indicate the error.

63193 Upon successful completion, the *strndup*( ) function shall return a pointer to the newly allocated
63194 memory containing the duplicated string. Otherwise, it shall return a null pointer and set *errno*
63195 to indicate the error.

63196 **ERRORS**

63197 These functions shall fail if:

63198 [ENOMEM] Storage space available is insufficient.

63199 **EXAMPLES**

63200 None.

63201 **APPLICATION USAGE**

63202 For functions that allocate memory as if by *malloc*( ), the application should release such memory
63203 when it is no longer required by a call to *free*( ). For *strdup*( ) and *strndup*( ), this is the return
63204 value.

63205 **RATIONALE**

63206 None.

63207 **FUTURE DIRECTIONS**

63208 None.

63209 **SEE ALSO**

63210 *free*( ), *wcsdup*( )

63211 XBD **<string.h>**

63212 **CHANGE HISTORY**

63213 First released in Issue 4, Version 2.

63214 **Issue 5**

63215 Moved from X/OPEN UNIX extension to BASE.

63216 **Issue 7**

63217 Austin Group Interpretation 1003.1-2001 #044 is applied, changing the "may fail" [ENOMEM]
63218 error to become a "shall fail" error.

63219 The *strdup*( ) function is moved from the XSI option to the Base.

63220 The *strndup*( ) function is added from The Open Group Technical Standard, 2006, Extended API
63221 Set Part 1.

63222 The APPLICATION USAGE section is updated to clarify that memory is allocated as if by
63223 *malloc*( ).

NAME

strerror, strerror_l, strerror_r — get error message string

SYNOPSIS

```
#include <string.h>

char *strerror(int errnum);
CX char *strerror_l(int errnum, locale_t locale);
int strerror_r(int errnum, char *strerrbuf, size_t buflen);
```

DESCRIPTION

CX For *strerror*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *strerror*( ) function shall map the error number in *errnum* to a locale-dependent error message string and shall return a pointer to it. Typically, the values for *errnum* come from *errno*, but *strerror*( ) shall map any value of type **int** to a message.

The string pointed to shall not be modified by the application. The string may be overwritten by a subsequent call to *strerror*( ).

CX The string may be overwritten by a subsequent call to *strerror_l*( ) in the same thread.

The contents of the error message strings returned by *strerror*( ) should be determined by the setting of the *LC_MESSAGES* category in the current locale.

The implementation shall behave as if no function defined in this volume of POSIX.1-200x calls *strerror*( ).

CX The *strerror*( ) and *strerror_l*( ) functions shall not change the setting of *errno* if successful.

Since no return value is reserved to indicate an error, an application wishing to check for error situations should set *errno* to 0, then call *strerror*( ), then check *errno*.

The *strerror*( ) function need not be thread-safe.

The *strerror_l*( ) function shall map the error number in *errnum* to a locale-dependent error message string in the locale represented by *locale* and shall return a pointer to it.

The *strerror_r*( ) function shall map the error number in *errnum* to a locale-dependent error message string and shall return the string in the buffer pointed to by *strerrbuf*, with length *buflen*.

CX If the value of *errnum* is a valid error number, the message string shall indicate what error occurred; otherwise, if these functions complete successfully, the message string shall indicate that an unknown error occurred.

RETURN VALUE

Upon completion, whether successful or not, *strerror*( ) shall return a pointer to the generated CX message string. On error *errno* may be set, but no return value is reserved to indicate an error.

Upon successful completion, *strerror_l*( ) shall return a pointer to the generated message string. If *errnum* is not a valid error number, *errno* may be set to [EINVAL], but a pointer to a message string shall still be returned. If any other error occurs, *errno* shall be set to indicate the error and a null pointer shall be returned.

Upon successful completion, *strerror_r*( ) shall return 0. Otherwise, an error number shall be returned to indicate the error.

63266 **ERRORS**

63267 These functions may fail if:

63268 CX [EINVAL] The value of *errnum* is not a valid error number.

63269 The *strerror_l*( ) function may fail if:

63270 CX [EINVAL] The *locale* argument is not a valid locale object handle.

63271 The *strerror_r*( ) function may fail if:

63272 CX [ERANGE] Insufficient storage was supplied via *strerrbuf* and *buflen* to contain the
63273 generated message string.

63274 **EXAMPLES**

63275 None.

63276 **APPLICATION USAGE**

63277 Historically in some implementations, calls to *perror*( ) would overwrite the string that the
63278 pointer returned by *strerror*( ) points to. Such implementations did not conform to the ISO C
63279 standard; however, application developers should be aware of this behavior if they wish their
63280 applications to be portable to such implementations.

63281 **RATIONALE**

63282 The *strerror_l*( ) function is required to be thread-safe, thereby eliminating the need for an
63283 equivalent to the *strerror_r*( ) function.

63284 Earlier versions of this standard did not explicitly require that the error message strings returned
63285 by *strerror*( ) and *strerror_r*( ) provide any information about the error. This version of the
63286 standard requires a meaningful message for any successful completion.

63287 Since no return value is reserved to indicate a *strerror*( ) error, but all calls (whether successful or
63288 not) must return a pointer to a message string, on error *strerror*( ) can return a pointer to an
63289 empty string or a pointer to a meaningful string that can be printed.

63290 Note that the [EINVAL] error condition is a may fail error. If an invalid error number is supplied
63291 as the value of *errnum*, applications should be prepared to handle any of the following:

63292 1. Error (with no meaningful message): *errno* is set to [EINVAL], the return value is a pointer
63293 to an empty string.

63294 2. Successful completion: *errno* is unchanged and the return value points to a string like
63295 `"unknown error"` or `"error number xxx"` (where *xxx* is the value of *errnum*).

63296 3. Combination of #1 and #2: *errno* is set to [EINVAL] and the return value points to a string
63297 like `"unknown error"` or `"error number xxx"` (where *xxx* is the value of *errnum*).
63298 Since applications frequently use the return value of *strerror*( ) as an argument to
63299 functions like *fprintf*( ) (without checking the return value) and since applications have no
63300 way to parse an error message string to determine whether *errnum* represents a valid
63301 error number, implementations are encouraged to implement #3. Similarly,
63302 implementations are encouraged to have *strerror_r*( ) return [EINVAL] and put a string
63303 like `"unknown error"` or `"error number xxx"` in the buffer pointed to by *strerrbuf*
63304 when the value of *errnum* is not a valid error number.

63305 **FUTURE DIRECTIONS**

63306 None.

63307 **SEE ALSO**

63308 *perror( )*

63309 XBD **<string.h>**

63310 **CHANGE HISTORY**

63311 First released in Issue 3.

63312 **Issue 5**

63313 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

63314 A note indicating that the *strerror( )* function need not be reentrant is added to the
63315 DESCRIPTION.

63316 **Issue 6**

63317 Extensions beyond the ISO C standard are marked.

63318 The following new requirements on POSIX implementations derive from alignment with the
63319 Single UNIX Specification:

63320 • In the RETURN VALUE section, the fact that *errno* may be set is added.

63321 • The [EINVAL] optional error condition is added.

63322 The normative text is updated to avoid use of the term "must" for application requirements.

63323 The *strerror_r( )* function is added in response to IEEE PASC Interpretation 1003.1c #39.

63324 The *strerror_r( )* function is marked as part of the Thread-Safe Functions option.

63325 **Issue 7**

63326 Austin Group Interpretation 1003.1-2001 #072 is applied, updating the ERRORS section.

63327 Austin Group Interpretation 1003.1-2001 #156 is applied.

63328 Austin Group Interpretation 1003.1-2001 #187 is applied, clarifying the behavior when the
63329 generated error message is an empty string.

63330 SD5-XSH-ERN-191 is applied, updating the APPLICATION USAGE section.

63331 The *strerror_l( )* function is added from The Open Group Technical Standard, 2006, Extended API
63332 Set Part 4.

63333 The *strerror_r( )* function is moved from the Thread-Safe Functions option to the Base.

NAME

strfmon, strfmon_l — convert monetary value to a string

SYNOPSIS

```
#include <monetary.h>

ssize_t strfmon(char *restrict s, size_t maxsize,
    const char *restrict format, ...);
ssize_t strfmon_l(char *restrict s, size_t maxsize,
    locale_t locale, const char *restrict format, ...);
```

DESCRIPTION

The *strfmon*( ) function shall place characters into the array pointed to by *s* as controlled by the string pointed to by *format*. No more than *maxsize* bytes are placed into the array.

The format is a character string, beginning and ending in its initial state, if any, that contains two types of objects: *plain characters*, which are simply copied to the output stream, and *conversion specifications*, each of which shall result in the fetching of zero or more arguments which are converted and formatted. The results are undefined if there are insufficient arguments for the format. If the format is exhausted while arguments remain, the excess arguments are simply ignored.

The application shall ensure that a conversion specification consists of the following sequence:

- A '%' character
- Optional flags
- Optional field width
- Optional left precision
- Optional right precision
- A required conversion specifier character that determines the conversion to be performed

The *strfmon_l*( ) function shall be equivalent to the *strfmon*( ) function, except that the locale data used is from the locale represented by *locale*.

Flags

One or more of the following optional flags can be specified to control the conversion:

=*f* An '=' followed by a single character *f* which is used as the numeric fill character. In order to work with precision or width counts, the fill character shall be a single byte character; if not, the behavior is undefined. The default numeric fill character is the <space>. This flag does not affect field width filling which always uses the <space>. This flag is ignored unless a left precision (see below) is specified.

^ Do not format the currency amount with grouping characters. The default is to insert the grouping characters if defined for the current locale.

+ or (Specify the style of representing positive and negative currency amounts. Only one of '+' or '(' may be specified. If '+' is specified, the locale's equivalent of '+' and '−' are used (for example, in many locales, the empty string if positive and '−' if negative). If '(' is specified, negative amounts are enclosed within parentheses. If neither flag is specified, the '+' style is used.

! Suppress the currency symbol from the output conversion.

63375 – Specify the alignment. If this flag is present the result of the conversion is left-justified
63376 (padded to the right) rather than right-justified. This flag shall be ignored unless a field
63377 width (see below) is specified.

63378 **Field Width**

63379 *w* A decimal digit string *w* specifying a minimum field width in bytes in which the result
63380 of the conversion is right-justified (or left-justified if the flag `'-'` is specified). The
63381 default is 0.

63382 **Left Precision**

63383 *#n* A `'#'` followed by a decimal digit string *n* specifying a maximum number of digits
63384 expected to be formatted to the left of the radix character. This option can be used to
63385 keep the formatted output from multiple calls to the *strfmon*( ) function aligned in the
63386 same columns. It can also be used to fill unused positions with a special character as in
63387 `"$***123.45"`. This option causes an amount to be formatted as if it has the number
63388 of digits specified by *n*. If more than *n* digit positions are required, this conversion
63389 specification is ignored. Digit positions in excess of those actually required are filled
63390 with the numeric fill character (see the =*f* flag above).

63391 If grouping has not been suppressed with the `'^'` flag, and it is defined for the current
63392 locale, grouping separators are inserted before the fill characters (if any) are added.
63393 Grouping separators are not applied to fill characters even if the fill character is a digit.

63394 To ensure alignment, any characters appearing before or after the number in the
63395 formatted output such as currency or sign symbols are padded as necessary with
63396 <space> characters to make their positive and negative formats an equal length.

63397 **Right Precision**

63398 *.p* A <period> followed by a decimal digit string *p* specifying the number of digits after
63399 the radix character. If the value of the right precision *p* is 0, no radix character appears.
63400 If a right precision is not included, a default specified by the current locale is used. The
63401 amount being formatted is rounded to the specified number of digits prior to
63402 formatting.

63403 **Conversion Specifier Characters**

63404 The conversion specifier characters and their meanings are:

63405 `i` The **double** argument is formatted according to the locale's international currency
63406 format (for example, in the U.S.: USD 1,234.56). If the argument is ±Inf or NaN, the
63407 result of the conversion is unspecified.

63408 `n` The **double** argument is formatted according to the locale's national currency format
63409 (for example, in the U.S.: $1,234.56). If the argument is ±Inf or NaN, the result of the
63410 conversion is unspecified.

63411 `%` Convert to a `'%'`; no argument is converted. The entire conversion specification shall
63412 be %%.

63413 **Locale Information**

63414 The *LC_MONETARY* category of the locale of the process affects the behavior of this function
63415 including the monetary radix character (which may be different from the numeric radix
63416 character affected by the *LC_NUMERIC* category), the grouping separator, the currency symbols,
63417 and formats. The international currency symbol should be conformant with the ISO 4217: 2001
63418 standard.

63419 If the value of *maxsize* is greater than {SSIZE_MAX}, the result is implementation-defined.

63420 **RETURN VALUE**

63421 If the total number of resulting bytes including the terminating null byte is not more than
63422 *maxsize*, these functions shall return the number of bytes placed into the array pointed to by *s*,
63423 not including the terminating NUL character. Otherwise, –1 shall be returned, the contents of the
63424 array are unspecified, and *errno* shall be set to indicate the error.

63425 **ERRORS**

63426 These functions shall fail if:

63427 [E2BIG] Conversion stopped due to lack of space in the buffer.

63428 The *strfmon_l*( ) function may fail if:

63429 [EINVAL] *locale* is not a valid locale object.

63430 **EXAMPLES**

63431 Given a locale for the U.S. and the values 123.45, –123.45, and 3456.781, the following output
63432 might be produced. Square brackets ("`[ ]`") are used in this example to delimit the output.

63433 `%n`	`[$123.45]`	Default formatting
63434	`[-$123.45]`	
63435	`[$3,456.78]`	
63436 `%11n`	`[    $123.45]`	Right align within an 11-character field
63437	`[   -$123.45]`	
63438	`[  $3,456.78]`	
63439 `%#5n`	`[ $   123.45]`	Aligned columns for values up to 99 999
63440	`[-$   123.45]`	
63441	`[ $ 3,456.78]`	
63442 `%=*#5n`	`[ $***123.45]`	Specify a fill character
63443	`[-$***123.45]`	
63444	`[ $*3,456.78]`	
63445 `%=0#5n`	`[ $000123.45]`	Fill characters do not use grouping
63446	`[-$000123.45]`	even if the fill character is a digit
63447	`[ $03,456.78]`	
63448 `%^#5n`	`[ $  123.45]`	Disable the grouping separator
63449	`[-$  123.45]`	
63450	`[ $ 3456.78]`	
63451 `%^#5.0n`	`[ $  123]`	Round off to whole units
63452	`[-$  123]`	
63453	`[ $ 3457]`	
63454 `%^#5.4n`	`[ $  123.4500]`	Increase the precision
63455	`[-$  123.4500]`	
63456	`[ $ 3456.7810]`	

```
%(#5n       [ $   123.45 ]     Use an alternative pos/neg style
            [($   123.45)]
            [ $ 3,456.78 ]

%!(#5n      [    123.45 ]      Disable the currency symbol
            [(   123.45)]
            [  3,456.78 ]

%-14#5.4n   [ $   123.4500 ]   Left-justify the output
            [-$   123.4500 ]
            [ $ 3,456.7810 ]

%14#5.4n    [  $   123.4500]   Corresponding right-justified output
            [ -$   123.4500]
            [  $ 3,456.7810]
```

See also the EXAMPLES section in *fprintf*( ).

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

Lowercase conversion characters are reserved for future standards use and uppercase for implementation-defined use.

XBD **<monetary.h>**

CHANGE HISTORY

First released in Issue 4.

Issue 5

Moved from ENHANCED I18N to BASE.

The [ENOSYS] error is removed.

Text is added to the DESCRIPTION warning about values of *maxsize* that are greater than {SSIZE_MAX}. |

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

The **restrict** keyword is added to the *strfmon*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

The EXAMPLES section is reworked, clarifying the output format.

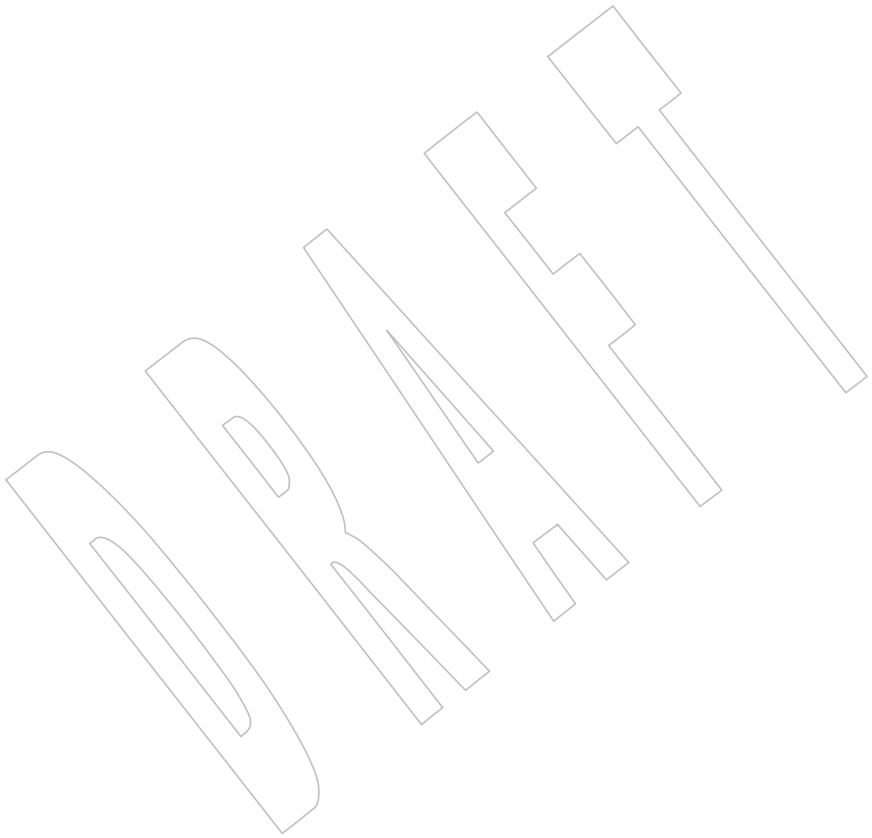
Issue 7

SD5-XSH-ERN-29 is applied, updating the examples for `%(#5n` and `%!(#5n`.

SD5-XSH-ERN-233 is applied, changing the definition of the `'+'` or `'('` flags to refer to multiple locales. + +

The *strfmon*( ) function is moved from the XSI option to the Base.

63497 The *strfmon_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API
63498 Set Part 4.



63499 **NAME**

63500 strftime, strftime_l — convert date and time to a string

63501 **SYNOPSIS**

63502 ```
#include <time.h>
```

63503 ```
size_t strftime(char *restrict s, size_t maxsize,
```
63504 ```
    const char *restrict format, const struct tm *restrict timeptr);
```
63505 CX ```
size_t strftime_l(char *restrict s, size_t maxsize,
```
63506 ```
    const char *restrict format, const struct tm *restrict timeptr,
```
63507 ```
    locale_t locale);
```

63508 **DESCRIPTION**

63509 CX For *strftime*( ): The functionality described on this reference page is aligned with the ISO C
63510 standard. Any conflict between the requirements described here and the ISO C standard is
63511 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

63512 The *strftime*( ) function shall place bytes into the array pointed to by *s* as controlled by the string
63513 pointed to by *format*. The format is a character string, beginning and ending in its initial shift
63514 state, if any. The format string consists of zero or more conversion specifications and ordinary
63515 characters.

63516 Each conversion specification is introduced by the '%' character after which the following
63517 appear in sequence:

63518 CX
- An optional flag:

  63519 0 The zero character ('0'), which specifies that the character used as the padding
  63520 character is '0',

  63521 + The <plus-sign> character ('+'), which specifies that the character used as the
  63522 padding character is '0', and that if and only if the field being produced consumes
  63523 more than four bytes to represent a year (for %F, %G, or %Y) or more than two bytes to
  63524 represent the year divided by 100 (for %C) then a leading <plus-sign> character shall
  63525 be included if the year being processed is greater than or equal to zero or a leading
  63526 minus-sign character ('−') shall be included if the year is less than zero.

  63527 The default padding character is unspecified.

- 63528 An optional minimum field width. If the converted value, including any leading '+' or
  63529 '−' sign, has fewer bytes than the minimum field width and the padding character is not
  63530 the NUL character, the output shall be padded on the left (after any leading '+' or '−'
  63531 sign) with the padding character.

- 63532 An optional E or O modifier.

- 63533 A terminating conversion specifier character that indicates the type of conversion to be
  63534 applied.

63535 CX The results are unspecified if more than one flag character is specified, a flag character is
63536 specified without a minimum field width; a minimum field width is specified without a flag
63537 character; a modifier is specified with a flag or with a minimum field width; or if a minimum
63538 field width is specified for any conversion specifier other than C, F, G, or Y.

63539 All ordinary characters (including the terminating NUL character) are copied unchanged into
63540 the array. If copying takes place between objects that overlap, the behavior is undefined. No
63541 more than maxsize bytes are placed into the array. Each conversion specifier is replaced by
63542 appropriate characters as described in the following list. The appropriate characters are

63543 determined using the *LC_TIME* category of the current locale and by the values of zero or more
63544 members of the broken-down time structure pointed to by *timeptr*, as specified in brackets in the
63545 description. If any of the specified values are outside the normal range, the characters stored are
63546 unspecified.

63547 CX The *strftime_l*( ) function shall be equivalent to the *strftime*( ) function, except that the locale data
63548 used is from the locale represented by *locale*.

63549 Local timezone information is used as though *strftime*( ) called *tzset*( ).

63550 The following conversion specifiers shall be supported:

63551 `a` Replaced by the locale's abbreviated weekday name. [*tm_wday*]

63552 `A` Replaced by the locale's full weekday name. [*tm_wday*]

63553 `b` Replaced by the locale's abbreviated month name. [*tm_mon*]

63554 `B` Replaced by the locale's full month name. [*tm_mon*]

63555 `c` Replaced by the locale's appropriate date and time representation. (See the Base
63556 Definitions volume of POSIX.1-200x, **<time.h>**.)

63557 `C` Replaced by the year divided by 100 and truncated to an integer, as a decimal number.
63558 [*tm_year*]

63559 If a minimum field width is not specified, the number of characters placed into the
63560 array pointed to by *s* will be the number of digits in the year divided by 100 or two,
63561 CX whichever is greater. If a minimum field width is specified, the number of characters
63562 placed into the array pointed to by *s* will be the number of digits in the year divided by
63563 100 or the minimum field width, whichever is greater.

63564 `d` Replaced by the day of the month as a decimal number [01,31]. [*tm_mday*]

63565 `D` Equivalent to `%m/%d/%y`. [*tm_mon*, *tm_mday*, *tm_year*]

63566 `e` Replaced by the day of the month as a decimal number [1,31]; a single digit is preceded
63567 by a space. [*tm_mday*]

63568 CX `F` Equivalent to %+4Y-%m-%d if no flag and no minimum field width are specified.
63569 [*tm_year*, *tm_mon*, *tm_mday*]

63570 CX If a minimum field width of *x* is specified, the year shall be output as if by the `Y`
63571 specifier (described below) with whatever flag was given and a minimum field width
63572 of *x*–6. If *x* is less than 6, the behavior shall be as if *x* equalled 6.

63573 If the minimum field width is specified to be 10, and the year is four digits long, then
63574 the output string produced will match the ISO 8601:2004 standard subclause 4.1.2.2
63575 complete representation, extended format date representation of a specific day. If a +
63576 flag is specified, a minimum field width of *x* is specified, and *x*–7 bytes are sufficient to
63577 hold the digits of the year (not including any needed sign character), then the output
63578 will match the ISO 8601:2004 standard subclause 4.1.2.4 complete representation,
63579 expanded format date representation of a specific day.

63580 `g` Replaced by the last 2 digits of the week-based year (see below) as a decimal number
63581 [00,99]. [*tm_year*, *tm_wday*, *tm_yday*]

63582 `G` Replaced by the week-based year (see below) as a decimal number (for example, 1977).
63583 [*tm_year*, *tm_wday*, *tm_yday*]

63584 CX If a minimum field width is specified, the number of characters placed into the array
63585 pointed to by *s* will be the number of digits and leading sign characters (if any) in the
63586 year, or the minimum field width, whichever is greater.

63587 `h` Equivalent to `%b`. [*tm_mon*]

63588 `H` Replaced by the hour (24-hour clock) as a decimal number [00,23]. [*tm_hour*]

63589 `I` Replaced by the hour (12-hour clock) as a decimal number [01,12]. [*tm_hour*]

63590 `j` Replaced by the day of the year as a decimal number [001,366]. [*tm_yday*]

63591 `m` Replaced by the month as a decimal number [01,12]. [*tm_mon*]

63592 `M` Replaced by the minute as a decimal number [00,59]. [*tm_min*]

63593 `n` Replaced by a <newline>.

63594 `p` Replaced by the locale's equivalent of either a.m. or p.m. [*tm_hour*]

63595 CX `r` Replaced by the time in a.m. and p.m. notation; in the POSIX locale this shall be
63596 equivalent to `%I:%M:%S %p`. [*tm_hour*, *tm_min*, *tm_sec*]

63597 `R` Replaced by the time in 24-hour notation (`%H:%M`). [*tm_hour*, *tm_min*]

63598 `S` Replaced by the second as a decimal number [00,60]. [*tm_sec*]

63599 `t` Replaced by a <tab>.

63600 `T` Replaced by the time (`%H:%M:%S`). [*tm_hour*, *tm_min*, *tm_sec*]

63601 `u` Replaced by the weekday as a decimal number [1,7], with 1 representing Monday.
63602 [*tm_wday*]

63603 `U` Replaced by the week number of the year as a decimal number [00,53]. The first
63604 Sunday of January is the first day of week 1; days in the new year before this are in
63605 week 0. [*tm_year*, *tm_wday*, *tm_yday*]

63606 `V` Replaced by the week number of the year (Monday as the first day of the week) as a
63607 decimal number [01,53]. If the week containing 1 January has four or more days in the
63608 new year, then it is considered week 1. Otherwise, it is the last week of the previous
63609 year, and the next week is week 1. Both January 4th and the first Thursday of January
63610 are always in week 1. [*tm_year*, *tm_wday*, *tm_yday*]

63611 `w` Replaced by the weekday as a decimal number [0,6], with 0 representing Sunday.
63612 [*tm_wday*]

63613 `W` Replaced by the week number of the year as a decimal number [00,53]. The first
63614 Monday of January is the first day of week 1; days in the new year before this are in
63615 week 0. [*tm_year*, *tm_wday*, *tm_yday*]

63616 `x` Replaced by the locale's appropriate date representation. (See the Base Definitions
63617 volume of POSIX.1-200x, **<time.h>**.)

63618 `X` Replaced by the locale's appropriate time representation. (See the Base Definitions
63619 volume of POSIX.1-200x, **<time.h>**.)

63620 `y` Replaced by the last two digits of the year as a decimal number [00,99]. [*tm_year*]

63621 `Y` Replaced by the year as a decimal number (for example, 1997). [*tm_year*]

63622 CX If a minimum field width is specified, the number of characters placed into the array
63623 pointed to by *s* will be the number of digits and leading sign characters (if any) in the

year, or the minimum field width, whichever is greater.

`z` Replaced by the offset from UTC in the ISO 8601:2004 standard format (`+hhmm` or `–hhmm`), or by no characters if no timezone is determinable. For example, `"–0430"` means 4 hours 30 minutes behind UTC (west of Greenwich). If *tm_isdst* is zero, the standard time offset is used. If *tm_isdst* is greater than zero, the daylight savings time offset is used. If *tm_isdst* is negative, no characters are returned. [*tm_isdst*] CX

`Z` Replaced by the timezone name or abbreviation, or by no bytes if no timezone information exists. [*tm_isdst*]

`%` Replaced by %.

If a conversion specification does not correspond to any of the above, the behavior is undefined.

If a **struct tm** broken-down time structure is created by *localtime*( ) or *localtime_r*( ), or modified by *mktime*( ), and the value of *TZ* is subsequently modified, the results of the `%Z` and `%z` *strftime*( ) conversion specifiers are undefined, when *strftime*( ) is called with such a broken-down time structure. CX

If a **struct tm** broken-down time structure is created or modified by *gmtime*( ) or *gmtime_r*( ), it is unspecified whether the result of the `%Z` and `%z` conversion specifiers shall refer to UTC or the current local timezone, when *strftime*( ) is called with such a broken-down time structure.

Modified Conversion Specifiers

Some conversion specifiers can be modified by the `E` or `O` modifier characters to indicate that an alternative format or specification should be used rather than the one normally used by the unmodified conversion specifier. If the alternative format or specification does not exist for the current locale (see ERA in XBD Section 7.3.5, on page 158), the behavior shall be as if the unmodified conversion specification were used.

`%Ec` Replaced by the locale's alternative appropriate date and time representation.

`%EC` Replaced by the name of the base year (period) in the locale's alternative representation.

`%Ex` Replaced by the locale's alternative date representation.

`%EX` Replaced by the locale's alternative time representation.

`%Ey` Replaced by the offset from `%EC` (year only) in the locale's alternative representation.

`%EY` Replaced by the full alternative year representation.

`%Od` Replaced by the day of the month, using the locale's alternative numeric symbols, filled as needed with leading zeros if there is any alternative symbol for zero; otherwise, with leading <space> characters.

`%Oe` Replaced by the day of the month, using the locale's alternative numeric symbols, filled as needed with leading <space> characters.

`%OH` Replaced by the hour (24-hour clock) using the locale's alternative numeric symbols.

`%OI` Replaced by the hour (12-hour clock) using the locale's alternative numeric symbols.

`%Om` Replaced by the month using the locale's alternative numeric symbols.

`%OM` Replaced by the minutes using the locale's alternative numeric symbols.

63663 %OS Replaced by the seconds using the locale's alternative numeric symbols.

63664 %Ou Replaced by the weekday as a number in the locale's alternative representation
63665 (Monday=1).

63666 %OU Replaced by the week number of the year (Sunday as the first day of the week, rules
63667 corresponding to %U) using the locale's alternative numeric symbols.

63668 %OV Replaced by the week number of the year (Monday as the first day of the week, rules
63669 corresponding to %V) using the locale's alternative numeric symbols.

63670 %Ow Replaced by the number of the weekday (Sunday=0) using the locale's alternative
63671 numeric symbols.

63672 %OW Replaced by the week number of the year (Monday as the first day of the week) using
63673 the locale's alternative numeric symbols.

63674 %Oy Replaced by the year (offset from %C) using the locale's alternative numeric symbols.

63675 %g, %G, and %V give values according to the ISO 8601:2004 standard week-based year. In this
63676 system, weeks begin on a Monday and week 1 of the year is the week that includes January 4th,
63677 which is also the week that includes the first Thursday of the year, and is also the first week that
63678 contains at least four days in the year. If the first Monday of January is the 2nd, 3rd, or 4th, the
63679 preceding days are part of the last week of the preceding year; thus, for Saturday 2nd January
63680 1999, %G is replaced by 1998 and %V is replaced by 53. If December 29th, 30th, or 31st is a
63681 Monday, it and any following days are part of week 1 of the following year. Thus, for Tuesday
63682 30th December 1997, %G is replaced by 1998 and %V is replaced by 01.

63683 If a conversion specifier is not one of the above, the behavior is undefined.

63684 **RETURN VALUE**

63685 If the total number of resulting bytes including the terminating null byte is not more than
63686 *maxsize*, these functions shall return the number of bytes placed into the array pointed to by *s*,
63687 not including the terminating NUL character. Otherwise, 0 shall be returned and the contents of
63688 the array are unspecified.

63689 **ERRORS**

63690 The *strftime_l*( ) function may fail if:

63691 CX [EINVAL] *locale* is not a valid locale object handle.

63692 **EXAMPLES**

63693 **Getting a Localized Date String**

63694 The following example first sets the locale to the user's default. The locale information will be
63695 used in the *nl_langinfo*( ) and *strftime*( ) functions. The *nl_langinfo*( ) function returns the localized
63696 date string which specifies how the date is laid out. The *strftime*( ) function takes this
63697 information and, using the **tm** structure for values, places the date and time information into
63698 *datestring*.

```
63699 #include <time.h>
63700 #include <locale.h>
63701 #include <langinfo.h>
63702 ...
63703 struct tm *tm;
63704 char datestring[256];
63705 ...
63706 setlocale (LC_ALL, "");
```

```
...
strftime (datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
...
```

APPLICATION USAGE

The range of values for %S is [00,60] rather than [00,59] to allow for the occasional leap second.

Some of the conversion specifications are duplicates of others. They are included for compatibility with *nl_cxtime*( ) and *nl_ascxtime*( ), which were published in Issue 2.

The %C, %F, %G, and %Y format specifiers in *strftime*( ) always print full values, but the *strptime*( ) %C, %F, and %Y format specifiers only scan two digits (assumed to be the first two digits of a four-digit year) for %C and four digits (assumed to be the entire (four-digit) year) for %F and %Y. This mimics the behavior of *printf*( ) and *scanf*( ); that is:

```
printf("%2d", x = 1000);
```

prints "1000", but:

```
scanf(%2d", &x);
```

when given "1000" as input will only store 10 in *x*). Applications using extended ranges of years must be sure that the number of digits specified for scanning years with *strptime*( ) matches the number of digits that will actually be present in the input stream. Historic implementations of the %Y conversion specification (with no flags and no minimum field width) produced different output formats. Some always produced at least four digits (with 0 fill for years from 0 through 999) while others only produced the number of digits present in the year (with no fill and no padding). These two forms can be produced with the '0' flag and a minimum field width options using the conversions specifications %04Y and %01Y, respectively.

In the past, the C and POSIX standards specified that %F produced an ISO 8601:2004 standard date format, but didn't specify which one. For years in the range [0001,9999], POSIX.1-200x requires that the output produced match the ISO 8601:2004 standard complete representation extended format (YYYY-MM-DD) and for years outside of this range produce output that matches the ISO 8601:2004 standard expanded representation extended format (<+/-><Underline>Y</Underline>YYYY-MM-DD). To fully meet ISO 8601:2004 standard requirements, the producer and consumer must agree on a date format that has a specific number of bytes reserved to hold the characters used to represent the years that is sufficiently large to hold all values that will be shared. For example, the %+13F conversion specification will produce output matching the format "<+/->YYYYYY-MM-DD" (a leading '+' or '−' sign; a six-digit, 0-filled year; a '−'; a two-digit, leading 0-filled month; another '−'; and the two-digit, leading 0-filled day within the month).

Note that if the year being printed is greater than 9999, the resulting string from the unadorned %F conversion specifications will not conform to the ISO 8601:2004 standard extended format, complete representation for a date and will instead be an extended format, expanded representation (presumably without the required agreement between the date's producer and consumer).

In the C locale, the E and O modifiers are ignored and the replacement strings for the following specifiers are:

%a The first three characters of %A.

%A One of Sunday, Monday, ..., Saturday.

63750 %b The first three characters of %B.

63751 %B One of January, February, . . ., December.

63752 %c Equivalent to %a %b %e %T %Y.

63753 %p One of AM or PM.

63754 %r Equivalent to %I:%M:%S %p.

63755 %x Equivalent to %m/%d/%y.

63756 %X Equivalent to %T.

63757 %Z Implementation-defined.

63758 **RATIONALE**

63759 The %Y conversion specification to *strftime*( ) was frequently assumed to be a four-digit year, but
63760 the ISO C standard does not specify that %Y is restricted to any subset of allowed values from the
63761 *tm_year* field. Similarly, the %C conversion specification was assumed to be a two-digit field and
63762 the first part of the output from the %F conversion specification was assumed to be a four-digit
63763 field. With *tm_year* being a signed 32 or more-bit **int** and with many current implementations
63764 supporting 64-bit **time_t** types in one or more programming environments, these assumptions
63765 are clearly wrong.

63766 POSIX.1-200x now allows the format specifications %0xC, %0xF, %0xG, and %0xY (where 'x' is
63767 a string of decimal digits used to specify printing and scanning of a string of *x* decimal digits)
63768 with leading zero fill characters. Allowing applications to set the field width enables them to
63769 agree on the number of digits to be printed and scanned in the ISO 8601:2004 standard
63770 expanded representation of a year (for %F, %G, and %Y) or all but the last two digits of the year
63771 (for %C). This is based on a feature in some versions of GNU **libc**'s *strftime*( ). The GNU version
63772 allows specifying space, zero, or no-fill characters in *strftime*( ) format strings, but does not allow
63773 any flags to be specified in *strptime*( ) format strings. These implementations also allow these
63774 flags to be specified for any numeric field. POSIX.1-200x only requires the zero fill flag ('0') and
63775 only requires that it be recognized when processing %C, %F, %G, and %Y specifications when a
63776 minimum field width is also specified. The '0' flag is the only flag needed to produce and scan
63777 the ISO 8601:2004 standard year fields using the extended format forms. POSIX.1-200x also
63778 allows applications to specify the same flag and field width specifiers to be used in both
63779 *strftime*( ) and *strptime*( ) format strings for symmetry. Systems may provide other flag characters
63780 and may accept flags in conjunction with conversion specifiers other than %C, %F, %G, and %Y;
63781 but portable applications cannot depend on such extensions.

63782 POSIX.1-200x now also allows the format specifications %+xC, %+xF, %+xG, and %+xY (where
63783 'x' is a string of decimal digits used to specify printing and scanning of a string of 'x' decimal
63784 digits) with leading zero fill characters and a leading '+' sign character if the year being
63785 converted is more than four digits or a minimum field width is specified that allows room for
63786 more than four digits for the year. This allows date providers and consumers to agree on a
63787 specific number of digits to represent a year as required by the ISO 8601:2004 standard
63788 expanded representation formats. The expanded representation formats all require the year to
63789 begin with a leading '+' or '−' sign. (All of these specifiers can also provide a leading '−'
63790 sign for negative years. Since negative years and the year 0 don't fit well with the Gregorian or
63791 Julian calendars, the normal ranges of dates start with year 1. The ISO C standard allows *tm_year*
63792 to assume values corresponding to years before year 1, but the use of such years provided
63793 unspecified results.)

63794 Some earlier version of this standard specified that applications wanting to use *strptime*( ) to scan
63795 dates and times printed by *strftime*( ) should provide non-digit characters between fields to

separate years from months and days. It also supported %F to print and scan the ISO 8601:2004 standard extended format, complete representation date for years 1 through 9999 (i.e., YYYY-MM-DD). However, many applications were written to print (using *strftime*( )) and scan (using *strptime*( )) dates written using the basic format complete representation (four-digit years) and truncated representation (two-digit years) specified by the ISO 8601:2004 standard representation of dates and times which do not have any separation characters between fields. The ISO 8601:2004 standard also specifies basic format expanded representation where the creator and consumer of these fields agree beforehand to represent years as leading zero-filled strings of an agreed length of more than four digits to represent a year (again with no separation characters when year, month, and day are all displayed). Applications producing and consuming expanded representations are encouraged to use the '+' flag and an appropriate maximum field width to scan the year including the leading sign. Note that even without the '+' flag, years less than zero may be represented with a leading minus-sign for %F, %G, and %Y conversion specifications. Using negative years results in unspecified behavior.

If a format specification %+*x*F with the field width *x* greater than 11 is specified and the width is large enough to display the full year, the output string produced will match the ISO 8601:2004 standard subclause 4.1.2.4 expanded representation, extended format date representation for a specific day. (For years in the range [1,99 999], %+12F is sufficient for an agreed five-digit year with a leading sign using the ISO 8601:2004 standard expanded representation, extended format for a specific day "<+/->YYYYY-MM-DD".) Note also that years less than 0 may produce a leading minus-sign ('−') when using %Y or %C whether or not the '0' or '+' flags are used.

The difference between the '0' flag and the '+' flag is whether the leading '+' character will be provided for years >9999 as required for the ISO 8601:2004 standard extended representation format containing a year. For example:

Year	Conversion Specification	*strftime*() Output	*strptime*() Scan Back
1970	%Y	1970	1970
1970	%+4Y	1970	1970
27	%Y	27 or 0027	27
270	%Y	270 or 0270	270
270	%+4Y	0270	270
17	%C%y	0017	17
270	%C%y	0270	270
12345	%Y	12345	1234*
12345	%+4Y	+12345	123*
12345	%05%Y	12345	12345
270	%+5Y or %+3C%y	+0270	270
12345	%+5Y or %+3C%y1+12345	1234*	
12345	%06Y or %04C%y	012345	12345
12345	%+6Y or %+4C%y	+12345	12345
123456	%08Y or %06C%y	00123456	123456
123456	%+8Y or %+6C%y	+0123456	123456

In the cases above marked with a * in the *strptime*( ) scan back field, the implied or specified number of characters scanned by *strptime*( ) was less than the number of characters output by *strftime*( ) using the same format; so the remaining digits of the year were dropped when the output date produced by *strftime*( ) was scanned back in by *strptime*( ).

FUTURE DIRECTIONS

None.

XBD Section 7.3.5 (on page 158), **<time.h>**

CHANGE HISTORY

First released in Issue 3.

Issue 5

The description of %OV is changed to be consistent with %V and defines Monday as the first day of the week.

The description of %Oy is clarified.

Issue 6

Extensions beyond the ISO C standard are marked.

The Open Group Corrigendum U033/8 is applied. The %V conversion specifier is changed from "Otherwise, it is week 53 of the previous year, and the next week is week 1" to "Otherwise, it is the last week of the previous year, and the next week is week 1".

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The %C, %D, %e, %h, %n, %r, %R, %t, and %T conversion specifiers are added.
- The modified conversion specifiers are added for consistency with the ISO POSIX-2 standard *date* utility.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The *strftime*( ) prototype is updated.
- The DESCRIPTION is extensively revised.
- The %z conversion specifier is added.

An example is added.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/60 is applied.

Issue 7

Austin Group Interpretation 1003.1-2001 #163 is applied.

The *strftime_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

63874 **NAME**

63875 strlen, strnlen — get length of fixed size string

63876 **SYNOPSIS**

63877
```
#include <string.h>
```

63878
```
size_t strlen(const char *s);
```

63879 CX
```
size_t strnlen(const char *s, size_t maxlen);
```

63880 **DESCRIPTION**

63881 CX For *strlen*(): The functionality described on this reference page is aligned with the ISO C
63882 standard. Any conflict between the requirements described here and the ISO C standard is
63883 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

63884 The *strlen*() function shall compute the number of bytes in the string to which *s* points, not
63885 including the terminating NUL character.

63886 CX The *strnlen*() function shall compute the smaller of the number of bytes in the array to which *s*
63887 points, not including the terminating NUL character, or the value of the *maxlen* argument. The
63888 *strnlen*() function shall never examine more than *maxlen* bytes of the array pointed to by *s*.

63889 **RETURN VALUE**

63890 The *strlen*() function shall return the length of *s*; no return value shall be reserved to indicate an
63891 error.

63892 CX The *strnlen*() function shall return an integer containing the smaller of either the length of the
63893 string pointed to by *s* or *maxlen*.

63894 **ERRORS**

63895 No errors are defined.

63896 **EXAMPLES**

63897 **Getting String Lengths**

63898 The following example sets the maximum length of *key* and *data* by using *strlen*() to get the
63899 lengths of those strings.

63900
```
#include <string.h>
```
63901
```
...
```
63902
```
struct element {
```
63903
```
    char *key;
```
63904
```
    char *data;
```
63905
```
};
```
63906
```
...
```
63907
```
char *key, *data;
```
63908
```
int len;
```

63909
```
*keylength = *datalength = 0;
```
63910
```
...
```
63911
```
if ((len = strlen(key)) > *keylength)
```
63912
```
    *keylength = len;
```
63913
```
if ((len = strlen(data)) > *datalength)
```
63914
```
    *datalength = len;
```
63915
```
...
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The RETURN VALUE section is updated to indicate that *strlen*( ) returns the length of *s*, and not *s* itself as was previously stated.

Issue 7

The *strnlen*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

63933 **NAME**

63934 strncasecmp, strncasecmp_l — case-insensitive string comparisons

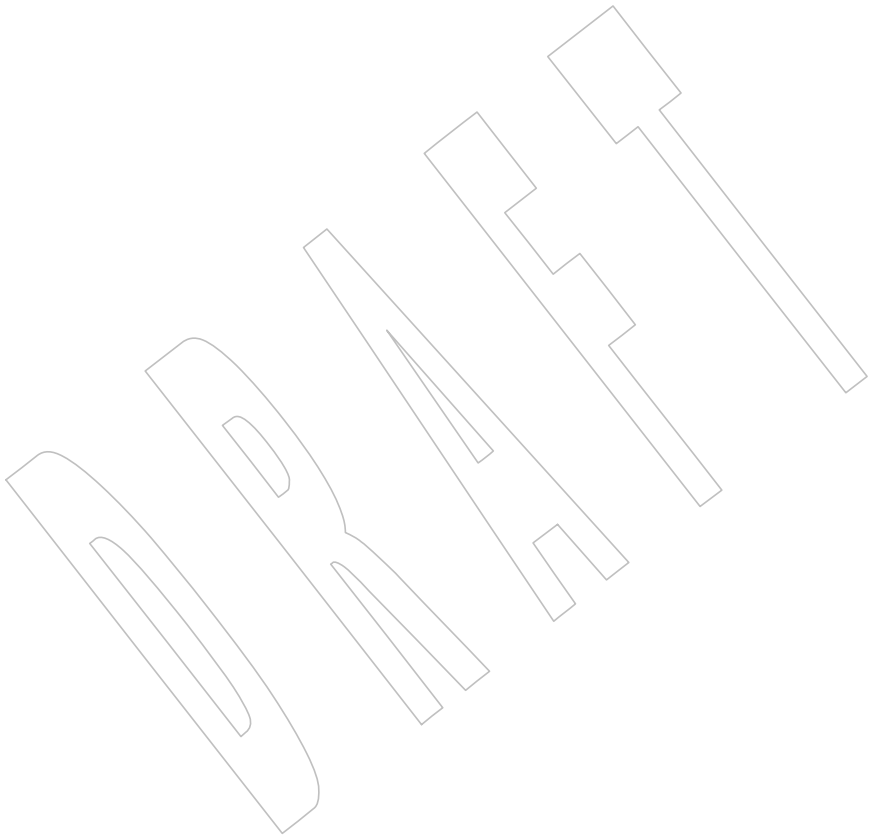
63935 **SYNOPSIS**

63936
```
#include <strings.h>
```

63937
```
int strncasecmp(const char *s1, const char *s2, size_t n);
```
63938
```
int strncasecmp_l(const char *s1, const char *s2,
```
63939
```
    size_t n, locale_t locale);
```

63940 **DESCRIPTION**

63941 Refer to *strcasecmp*( ).



63942 **NAME**

63943 strncat — concatenate a string with part of another

63944 **SYNOPSIS**

63945
```
#include <string.h>
```

63946
```
char *strncat(char *restrict s1, const char *restrict s2, size_t n);
```

63947 **DESCRIPTION**

63948 CX The functionality described on this reference page is aligned with the ISO C standard. Any
63949 conflict between the requirements described here and the ISO C standard is unintentional. This
63950 volume of POSIX.1-200x defers to the ISO C standard.

63951 The *strncat*( ) function shall append not more than *n* bytes (a NUL character and bytes that
63952 follow it are not appended) from the array pointed to by *s2* to the end of the string pointed to by
63953 *s1*. The initial byte of *s2* overwrites the NUL character at the end of *s1*. A terminating NUL
63954 character is always appended to the result. If copying takes place between objects that overlap,
63955 the behavior is undefined.

63956 **RETURN VALUE**

63957 The *strncat*( ) function shall return *s1*; no return value shall be reserved to indicate an error.

63958 **ERRORS**

63959 No errors are defined.

63960 **EXAMPLES**

63961 None.

63962 **APPLICATION USAGE**

63963 None.

63964 **RATIONALE**

63965 None.

63966 **FUTURE DIRECTIONS**

63967 None.

63968 **SEE ALSO**

63969 *strcat*( )

63970 XBD **<string.h>**

63971 **CHANGE HISTORY**

63972 First released in Issue 1. Derived from Issue 1 of the SVID.

63973 **Issue 6**

63974 The *strncat*( ) prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.

63975 **NAME**

63976 strncmp — compare part of two strings

63977 **SYNOPSIS**

63978 ```
#include <string.h>
```

63979 ```
int strncmp(const char *s1, const char *s2, size_t n);
```

63980 **DESCRIPTION**

63981 CX The functionality described on this reference page is aligned with the ISO C standard. Any
63982 conflict between the requirements described here and the ISO C standard is unintentional. This
63983 volume of POSIX.1-200x defers to the ISO C standard.

63984 The *strncmp*( ) function shall compare not more than *n* bytes (bytes that follow a NUL character
63985 are not compared) from the array pointed to by *s1* to the array pointed to by *s2*.

63986 The sign of a non-zero return value is determined by the sign of the difference between the
63987 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings
63988 being compared.

63989 **RETURN VALUE**

63990 Upon successful completion, *strncmp*( ) shall return an integer greater than, equal to, or less than
63991 0, if the possibly null-terminated array pointed to by *s1* is greater than, equal to, or less than the
63992 possibly null-terminated array pointed to by *s2* respectively.

63993 **ERRORS**

63994 No errors are defined.

63995 **EXAMPLES**

63996 None.

63997 **APPLICATION USAGE**

63998 None.

63999 **RATIONALE**

64000 None.

64001 **FUTURE DIRECTIONS**

64002 None.

64003 **SEE ALSO**

64004 *strcmp*( )

64005 XBD **<string.h>**

64006 **CHANGE HISTORY**

64007 First released in Issue 1. Derived from Issue 1 of the SVID.

64008 **Issue 6**

64009 Extensions beyond the ISO C standard are marked.

64010 **NAME**

64011 stpncpy, strncpy — copy fixed length string, returning a pointer to the array end

64012 **SYNOPSIS**

64013
```
#include <string.h>
```

64014 CX
```
char *stpncpy(char *restrict s1, const char *restrict s2, size_t n);
```
64015
```
char *strncpy(char *restrict s1, const char *restrict s2, size_t n);
```

64016 **DESCRIPTION**

64017 CX For *strncpy*( ): The functionality described on this reference page is aligned with the ISO C
64018 standard. Any conflict between the requirements described here and the ISO C standard is
64019 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

64020 CX The *stpncpy*( ) and *strncpy*( ) functions shall copy not more than *n* bytes (bytes that follow a NUL
64021 character are not copied) from the array pointed to by *s2* to the array pointed to by *s1*.

64022 If the array pointed to by *s2* is a string that is shorter than *n* bytes, NUL characters shall be
64023 appended to the copy in the array pointed to by *s1*, until *n* bytes in all are written.

64024 If copying takes place between objects that overlap, the behavior is undefined.

64025 **RETURN VALUE**

64026 CX If a NUL character is written to the destination, the *stpncpy*( ) function shall return the address of
64027 the first such NUL character. Otherwise, it shall return *&s2*[*n*].

64028 The *strncpy*( ) function shall return *s1*.

64029 No return values are reserved to indicate an error.

64030 **ERRORS**

64031 No errors are defined.

64032 **EXAMPLES**

64033 None.

64034 **APPLICATION USAGE**

64035 Applications must provide the space in *s1* for the *n* bytes to be transferred, as well as ensure that
64036 the *s2* and *s1* arrays do not overlap.

64037 Character movement is performed differently in different implementations. Thus, overlapping
64038 moves may yield surprises.

64039 If there is no NUL character byte in the first *n* bytes of the array pointed to by *s2*, the result is not
64040 null-terminated.

64041 **RATIONALE**

64042 None.

64043 **FUTURE DIRECTIONS**

64044 None.

64045 **SEE ALSO**

64046 *strcpy*( ), *wcsncpy*( )

64049 First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The *strncpy*( ) prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

The *stpncpy*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

NAME

strndup — duplicate a specific number of bytes from a string

SYNOPSIS

CX

```
#include <string.h>

char *strndup(const char *s, size_t size);
```

DESCRIPTION

Refer to *strdup( )*.

strnlen( )

NAME

strnlen — get length of fixed size string

SYNOPSIS

CX

```
#include <string.h>

size_t strnlen(const char *s, size_t maxlen);
```

DESCRIPTION

Refer to *strlen( )*.

64069 **NAME**

64070 strpbrk — scan a string for a byte

64071 **SYNOPSIS**

64072
```
#include <string.h>
```

64073
```
char *strpbrk(const char *s1, const char *s2);
```

64074 **DESCRIPTION**

64075 CX The functionality described on this reference page is aligned with the ISO C standard. Any
64076 conflict between the requirements described here and the ISO C standard is unintentional. This
64077 volume of POSIX.1-200x defers to the ISO C standard.

64078 The *strpbrk*( ) function shall locate the first occurrence in the string pointed to by *s1* of any byte
64079 from the string pointed to by *s2*.

64080 **RETURN VALUE**

64081 Upon successful completion, *strpbrk*( ) shall return a pointer to the byte or a null pointer if no
64082 byte from *s2* occurs in *s1*.

64083 **ERRORS**

64084 No errors are defined.

64085 **EXAMPLES**

64086 None.

64087 **APPLICATION USAGE**

64088 None.

64089 **RATIONALE**

64095 XBD **<string.h>**

64096 **CHANGE HISTORY**

64097 First released in Issue 1. Derived from Issue 1 of the SVID.

64098 **NAME**

64099 strptime — date and time conversion

64100 **SYNOPSIS**

64101 XSI
```
#include <time.h>

char *strptime(const char *restrict buf, const char *restrict format,
    struct tm *restrict tm);
```

64104 **DESCRIPTION**

64105 The *strptime*( ) function shall convert the character string pointed to by *buf* to values which are
64106 stored in the **tm** structure pointed to by *tm*, using the format specified by *format*.

64107 The format is composed of zero or more directives. Each directive is composed of one of the
64108 following: one or more white-space characters (as specified by *isspace*( )); an ordinary character
64109 (neither '%' nor a white-space character); or a conversion specification.

64110 Each conversion specification is introduced by the '%' character after which the following
64111 appear in sequence:

64112 • An optional flag, the zero character ('0') or the <plus-sign> character ('+'), which is
64113 ignored.

64114 • An optional field width. If a field width is specified, it shall be interpreted as a string of
64115 decimal digits that will determine the maximum number of bytes converted for the
64116 conversion rather than the number of bytes specified below in the description of the
64117 conversion specifiers.

64118 • An optional E or O modifier.

64119 • A terminating conversion specifier character that indicates the type of conversion to be
64120 applied.

64121 The conversions are determined using the *LC_TIME* category of the current locale. The
64122 application shall ensure that there is white-space or other non-alphanumeric characters between
64123 any two conversion specifications unless all of the adjacent conversion specifications convert a
64124 known, fixed number of characters. In the following list, the maximum number of characters
64125 scanned (excluding the one matching the next directive) is as follows:

64126 • If a maximum field width is specified, then that number

64127 • Otherwise, the pattern "{x}" indicates that the maximum is *x*

64128 • Otherwise, the pattern "[x,y]" indicates that the value shall fall within the range given
64129 (both bounds being inclusive), and the maximum number of characters scanned shall be
64130 the maximum required to represent any value in the range without leading zeros and
64131 without a leading <plus-sign>

64132 The following conversion specifiers are supported.

64133 The results are unspecified if a modifier is specified with a flag or with a minimum field width,
64134 or if a field width is specified for any conversion specifier other than C, F, or Y.

64135 a The day of the week, using the locale's weekday names; either the abbreviated or full
64136 name may be specified.

64137 A Equivalent to %a.

64138 `b` The month, using the locale's month names; either the abbreviated or full name may be
64139 specified.

64140 `B` Equivalent to `%b`.

64141 `c` Replaced by the locale's appropriate date and time representation.

64142 `C` All but the last two digits of the year {2}; leading zeros shall be permitted but shall not
64143 be required. A leading `'+'` or `'−'` character shall be permitted before any leading zeros
64144 but shall not be required.

64145 `d` The day of the month [01,31]; leading zeros shall be permitted but shall not be required.

64146 `D` The date as `%m/%d/%y`.

64147 `e` Equivalent to `%d`.

64148 `h` Equivalent to `%b`.

64149 `H` The hour (24-hour clock) [00,23]; leading zeros shall be permitted but shall not be
64150 required.

64151 `I` The hour (12-hour clock) [01,12]; leading zeros shall be permitted but shall not be
64152 required.

64153 `j` The day number of the year [001,366]; leading zeros shall be permitted but shall not be
64154 required.

64155 `m` The month number [01,12]; leading zeros shall be permitted but shall not be required.

64156 `M` The minute [00,59]; leading zeros shall be permitted but shall not be required.

64157 `n` Any white space.

64158 `p` The locale's equivalent of a.m. or p.m.

64159 `r` 12-hour clock time using the AM/PM notation if **t_fmt_ampm** is not an empty string in
64160 the *LC_TIME* portion of the current locale; in the POSIX locale, this shall be equivalent
64161 to `%I:%M:%S %p`.

64162 `R` The time as `%H:%M`.

64163 `S` The seconds [00,60]; leading zeros shall be permitted but shall not be required.

64164 `t` Any white space.

64165 `T` The time as `%H:%M:%S`.

64166 `U` The week number of the year (Sunday as the first day of the week) as a decimal
64167 number [00,53]; leading zeros shall be permitted but shall not be required.

64168 `w` The weekday as a decimal number [0,6], with 0 representing Sunday.

64169 `W` The week number of the year (Monday as the first day of the week) as a decimal
64170 number [00,53]; leading zeros shall be permitted but shall not be required.

64171 `x` The date, using the locale's date format.

64172 `X` The time, using the locale's time format.

64173 `y` The last two digits of the year. When *format* contains neither a `C` conversion specifier
64174 nor a `Y` conversion specifier, values in the range [69,99] shall refer to years 1969 to 1999
64175 inclusive and values in the range [00,68] shall refer to years 2000 to 2068 inclusive;
64176 leading zeros shall be permitted but shall not be required. A leading `'+'` or `'−'`

64177 character shall be permitted before any leading zeros but shall not be required.

64178 **Note:** It is expected that in a future version of this standard the default century inferred
64179 from a 2-digit year will change. (This would apply to all commands accepting a
64180 2-digit year as input.)

64181 `Y` The full year {4}; leading zeros shall be permitted but shall not be required. A leading
64182 `'+'` or `'−'` character shall be permitted before any leading zeros but shall not be
64183 required.

64184 `%` Replaced by %.

64185 **Modified Conversion Specifiers**

64186 Some conversion specifiers can be modified by the `E` and `O` modifier characters to indicate that
64187 an alternative format or specification should be used rather than the one normally used by the
64188 unmodified conversion specifier. If the alternative format or specification does not exist in the
64189 current locale, the behavior shall be as if the unmodified conversion specification were used.

64190 `%Ec` The locale's alternative appropriate date and time representation.

64191 `%EC` The name of the base year (period) in the locale's alternative representation.

64192 `%Ex` The locale's alternative date representation.

64193 `%EX` The locale's alternative time representation.

64194 `%Ey` The offset from `%EC` (year only) in the locale's alternative representation.

64195 `%EY` The full alternative year representation.

64196 `%Od` The day of the month using the locale's alternative numeric symbols; leading zeros
64197 shall be permitted but shall not be required.

64198 `%Oe` Equivalent to `%Od`.

64199 `%OH` The hour (24-hour clock) using the locale's alternative numeric symbols.

64200 `%OI` The hour (12-hour clock) using the locale's alternative numeric symbols.

64201 `%Om` The month using the locale's alternative numeric symbols.

64202 `%OM` The minutes using the locale's alternative numeric symbols.

64203 `%OS` The seconds using the locale's alternative numeric symbols.

64204 `%OU` The week number of the year (Sunday as the first day of the week) using the locale's
64205 alternative numeric symbols.

64206 `%Ow` The number of the weekday (Sunday=0) using the locale's alternative numeric
64207 symbols.

64208 `%OW` The week number of the year (Monday as the first day of the week) using the locale's
64209 alternative numeric symbols.

64210 `%Oy` The year (offset from `%C`) using the locale's alternative numeric symbols.

64211 A conversion specification composed of white-space characters is executed by scanning input up
64212 to the first character that is not white-space (which remains unscanned), or until no more
64213 characters can be scanned.

64214 A conversion specification that is an ordinary character is executed by scanning the next
64215 character from the buffer. If the character scanned from the buffer differs from the one
64216 comprising the directive, the directive fails, and the differing and subsequent characters remain

unscanned.

A series of conversion specifications composed of `%n`, `%t`, white-space characters, or any combination is executed by scanning up to the first character that is not white space (which remains unscanned), or until no more characters can be scanned.

Any other conversion specification is executed by scanning characters until a character matching the next directive is scanned, or until no more characters can be scanned. These characters, except the one matching the next directive, are then compared to the locale values associated with the conversion specifier. If a match is found, values for the appropriate **tm** structure members are set to values corresponding to the locale information. Case is ignored when matching items in *buf* such as month or weekday names. If no match is found, *strptime*( ) fails and no more characters are scanned.

RETURN VALUE

Upon successful completion, *strptime*( ) shall return a pointer to the character following the last character parsed. Otherwise, a null pointer shall be returned.

ERRORS

No errors are defined.

EXAMPLES

Convert a Data-Plus-Time String to Broken-Down Time and Then into Seconds

The following example demonstrates the use of *strptime*( ) to convert a string into broken-down time. The broken-down time is then converted into seconds since the Epoch using *mktime*( ).

```
#include <time.h>
...

struct tm tm;
time_t t;

if (strptime("6 Dec 2001 12:33:45", "%d %b %Y %H:%M:%S", &tm) == NULL)
    /* Handle error */;

printf("year: %d; month: %d; day: %d;\n",
        tm.tm_year, tm.tm_mon, tm.tm_mday);
printf("hour: %d; minute: %d; second: %d\n",
        tm.tm_hour, tm.tm_min, tm.tm_sec);
printf("week day: %d; year day: %d\n", tm.tm_wday, tm.tm_yday);

tm.tm_isdst = -1;      /* Not set by strptime(); tells mktime()
                          to determine whether daylight saving time
                          is in effect */
t = mktime(&tm);
if (t == -1)
    /* Handle error */;
printf("seconds since the Epoch: %ld\n", (long) t);"
```

APPLICATION USAGE

Several "equivalent to" formats and the special processing of white-space characters are provided in order to ease the use of identical *format* strings for *strftime*( ) and *strptime*( ).

It should be noted that dates constructed by the *strftime*( ) function with the `%Y` or `%C%y` conversion specifiers may have values larger than 9 999. If the *strptime*( ) function is used to read such values using `%C%y` or `%Y`, the year values will be truncated to four digits. Applications

should use %+*w*%y or %+*x*Y with *w* and *x* set large enough to contain the full value of any years that will be printed or scanned.

See also the APPLICATION USAGE section in *strftime*( ).

It is unspecified whether multiple calls to *strptime*( ) using the same **tm** structure will update the current contents of the structure or overwrite all contents of the structure. Conforming applications should make a single call to *strptime*( ) with a format and all data needed to completely specify the date and time being converted.

RATIONALE

See the RATIONALE section for *strftime*( ).

FUTURE DIRECTIONS

None.

SEE ALSO

fprintf( ), *fscanf*( ), *strftime*( ), *time*( )

XBD **<time.h>**

CHANGE HISTORY

First released in Issue 4.

Issue 5

Moved from ENHANCED I18N to BASE.

The [ENOSYS] error is removed.

The exact meaning of the %y and %0y specifiers is clarified in the DESCRIPTION.

Issue 6

The Open Group Corrigendum U033/5 is applied. The %r specifier description is reworded.

The normative text is updated to avoid use of the term "must" for application requirements.

The **restrict** keyword is added to the *strptime*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

The Open Group Corrigendum U047/2 is applied.

The DESCRIPTION is updated to use the terms "conversion specifier" and "conversion specification" for consistency with *strftime*( ).

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/133 is applied, adding the example to the EXAMPLES section.

Issue 7

Austin Group Interpretation 1003.1-2001 #041 is applied, updating the DESCRIPTION and APPLICATION USAGE sections.

Austin Group Interpretation 1003.1-2001 #163 is applied.

SD5-XSH-ERN-67 is applied, correcting the APPLICATION USAGE to remove the impression that %Y is 4-digit years.

64297 **NAME**

64298 strrchr — string scanning operation

64299 **SYNOPSIS**

64300
```
#include <string.h>
```

64301
```
char *strrchr(const char *s, int c);
```

64302 **DESCRIPTION**

64303 CX The functionality described on this reference page is aligned with the ISO C standard. Any
64304 conflict between the requirements described here and the ISO C standard is unintentional. This
64305 volume of POSIX.1-200x defers to the ISO C standard.

64306 The *strrchr*( ) function shall locate the last occurrence of *c* (converted to a **char**) in the string
64307 pointed to by *s*. The terminating NUL character is considered to be part of the string.

64308 **RETURN VALUE**

64309 Upon successful completion, *strrchr*( ) shall return a pointer to the byte or a null pointer if *c* does
64310 not occur in the string.

64311 **ERRORS**

64312 No errors are defined.

64313 **EXAMPLES**

64314 **Finding the Base Name of a File**

64315 The following example uses *strrchr*( ) to get a pointer to the base name of a file. The *strrchr*( )
64316 function searches backwards through the name of the file to find the last `'/'` character in *name*.
64317 This pointer (plus one) will point to the base name of the file.

64318
```
#include <string.h>
...
const char *name;
char *basename;
...
basename = strrchr(name, '/') + 1;
...
```

64325 **APPLICATION USAGE**

64326 None.

64327 **RATIONALE**

64328 None.

64329 **FUTURE DIRECTIONS**

64330 None.

64331 **SEE ALSO**

64332 *strchr*( )

64333 XBD **<string.h>**

64334 **CHANGE HISTORY**

64335 First released in Issue 1. Derived from Issue 1 of the SVID.

64336 **NAME**

64337 strsignal — get name of signal

64338 **SYNOPSIS**

64339 CX
```
#include <string.h>

char *strsignal(int signum);
```
64340

64341 **DESCRIPTION**

64342 The *strsignal*( ) function shall map the signal number in *signum* to an implementation-defined
64343 string and shall return a pointer to it. It shall use the same set of messages as the *psignal*( )
64344 function.

64345 The string pointed to shall not be modified by the application, but may be overwritten by a
64346 subsequent call to *strsignal*( ) or *setlocale*( ).

64347 The contents of the message strings returned by *strsignal*( ) should be determined by the setting
64348 of the *LC_MESSAGES* category in the current locale.

64349 The implementation shall behave as if no function defined in this standard calls *strsignal*( ).

64350 Since no return value is reserved to indicate an error, an application wishing to check for error
64351 situations should set *errno* to 0, then call *strsignal*( ), then check *errno*.

64352 The *strsignal*( ) function need not be thread-safe.

64353 **RETURN VALUE**

64354 Upon successful completion, *strsignal*( ) shall return a pointer to a string. Otherwise, if *signum* is
64355 not a valid signal number, the return value is unspecified.

64356 **ERRORS**

64357 No errors are defined.

64358 **EXAMPLES**

64359 None.

64360 **APPLICATION USAGE**

64361 None.

64362 **RATIONALE**

64363 If *signum* is not a valid signal number, some implementations return NULL, while for others the
64364 *strsignal*( ) function returns a pointer to a string containing an unspecified message denoting an
64365 unknown signal. POSIX.1-200x leaves this return value unspecified.

64366 **FUTURE DIRECTIONS**

64367 None.

64368 **SEE ALSO**

64369 *psiginfo*( ), *setlocale*( )

64370 XBD **<string.h>**

64371 **CHANGE HISTORY**

64372 First released in Issue 7.

64373 **NAME**

64374 strspn — get length of a substring

64375 **SYNOPSIS**

64376
```
#include <string.h>
```

64377
```
size_t strspn(const char *s1, const char *s2);
```

64378 **DESCRIPTION**

64379 CX The functionality described on this reference page is aligned with the ISO C standard. Any
64380 conflict between the requirements described here and the ISO C standard is unintentional. This
64381 volume of POSIX.1-200x defers to the ISO C standard.

64382 The *strspn*( ) function shall compute the length (in bytes) of the maximum initial segment of the
64383 string pointed to by *s1* which consists entirely of bytes from the string pointed to by *s2*.

64384 **RETURN VALUE**

64385 The *strspn*( ) function shall return the computed length; no return value is reserved to indicate an
64386 error.

64387 **ERRORS**

64388 No errors are defined.

64389 **EXAMPLES**

64390 None.

64391 **APPLICATION USAGE**

64392 None.

64393 **RATIONALE**

64394 None.

64399 XBD **<string.h>**

64400 **CHANGE HISTORY**

64401 First released in Issue 1. Derived from Issue 1 of the SVID.

64402 **Issue 5**

64403 The RETURN VALUE section is updated to indicate that *strspn*( ) returns the length of *s*, and not
64404 *s* itself as was previously stated.

64405 **Issue 7**

64406 SD5-XSH-ERN-182 is applied.

64407 **NAME**

64408 strstr — find a substring

64409 **SYNOPSIS**

64410 ```
#include <string.h>
```

64411 ```
char *strstr(const char *s1, const char *s2);
```

64412 **DESCRIPTION**

64413 CX The functionality described on this reference page is aligned with the ISO C standard. Any
64414 conflict between the requirements described here and the ISO C standard is unintentional. This
64415 volume of POSIX.1-200x defers to the ISO C standard.

64416 The *strstr*( ) function shall locate the first occurrence in the string pointed to by *s1* of the
64417 sequence of bytes (excluding the terminating NUL character) in the string pointed to by *s2*.

64418 **RETURN VALUE**

64419 Upon successful completion, *strstr*( ) shall return a pointer to the located string or a null pointer
64420 if the string is not found.

64421 If *s2* points to a string with zero length, the function shall return *s1*.

64422 **ERRORS**

64423 No errors are defined.

64424 **EXAMPLES**

64425 None.

64426 **APPLICATION USAGE**

64427 None.

64428 **RATIONALE**

64435 **CHANGE HISTORY**

64436 First released in Issue 3. Included for alignment with the ANSI C standard.

NAME

strtod, strtof, strtold — convert a string to a double-precision number

SYNOPSIS

```
#include <stdlib.h>

double strtod(const char *restrict nptr, char **restrict endptr);
float strtof(const char *restrict nptr, char **restrict endptr);
long double strtold(const char *restrict nptr, char **restrict endptr);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall convert the initial portion of the string pointed to by *nptr* to **double**, **float**, and **long double** representation, respectively. First, they decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace*( ))
2. A subject sequence interpreted as a floating-point constant or representing infinity or NaN
3. A final string of one or more unrecognized characters, including the terminating NUL character of the input string

Then they shall attempt to convert the subject sequence to a floating-point number, and return the result.

The expected form of the subject sequence is an optional `'+'` or `'−'` sign, then one of the following:

- A non-empty sequence of decimal digits optionally containing a radix character; then an optional exponent part consisting of the character `'e'` or the character `'E'`, optionally followed by a `'+'` or `'−'` character, and then followed by one or more decimal digits
- A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix character; then an optional binary exponent part consisting of the character `'p'` or the character `'P'`, optionally followed by a `'+'` or `'−'` character, and then followed by one or more decimal digits
- One of INF or INFINITY, ignoring case
- One of NAN or NAN($n\text{-}char\text{-}sequence_{opt}$), ignoring case in the NAN part, where:

```
n-char-sequence:
    digit
    nondigit
    n-char-sequence digit
    n-char-sequence nondigit
```

The subject sequence is defined as the longest initial subsequence of the input string, starting with the first non-white-space character, that is of the expected form. The subject sequence contains no characters if the input string is not of the expected form.

If the subject sequence has the expected form for a floating-point number, the sequence of characters starting with the first digit or the decimal-point character (whichever occurs first) shall be interpreted as a floating constant of the C language, except that the radix character shall be used in place of a period, and that if neither an exponent part nor a radix character appears in

a decimal floating-point number, or if a binary exponent part does not appear in a hexadecimal floating-point number, an exponent part of the appropriate type with value zero is assumed to follow the last digit in the string. If the subject sequence begins with a minus-sign, the sequence shall be interpreted as negated. A character sequence INF or INFINITY shall be interpreted as an infinity, if representable in the return type, else as if it were a floating constant that is too large for the range of the return type. A character sequence NAN or NAN(*n-char-sequence*$_{opt}$) shall be interpreted as a quiet NaN, if supported in the return type, else as if it were a subject sequence part that does not have the expected form; the meaning of the *n*-char sequences is implementation-defined. A pointer to the final string is stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

If the subject sequence has the hexadecimal form and FLT_RADIX is a power of 2, the value resulting from the conversion is correctly rounded.

CX The radix character is defined in the locale of the process (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a <period> (`'.'`).

CX In other than the C or POSIX locales, other implementation-defined subject sequences may be accepted.

If the subject sequence is empty or does not have the expected form, no conversion shall be performed; the value of *str* is stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

CX The *strtod*( ) function shall not change the setting of *errno* if successful.

Since 0 is returned on error and is also a valid return on success, an application wishing to check for error situations should set *errno* to 0, then call *strtod*( ), *strtof*( ), or *strtold*( ), then check *errno*.

RETURN VALUE

Upon successful completion, these functions shall return the converted value. If no conversion could be performed, 0 shall be returned, and *errno* may be set to [EINVAL].

If the correct value is outside the range of representable values, ±HUGE_VAL, ±HUGE_VALF, or ±HUGE_VALL shall be returned (according to the sign of the value), and *errno* shall be set to [ERANGE].

If the correct value would cause an underflow, a value whose magnitude is no greater than the smallest normalized positive number in the return type shall be returned and *errno* set to [ERANGE].

ERRORS

These functions shall fail if:

CX [ERANGE] The value to be returned would cause overflow or underflow.

These functions may fail if:

CX [EINVAL] No conversion could be performed.

EXAMPLES

None.

APPLICATION USAGE

If the subject sequence has the hexadecimal form and FLT_RADIX is not a power of 2, and the result is not exactly representable, the result should be one of the two numbers in the appropriate internal format that are adjacent to the hexadecimal floating source value, with the extra stipulation that the error should have a correct sign for the current rounding direction.

If the subject sequence has the decimal form and at most DECIMAL_DIG (defined in **<float.h>**) significant digits, the result should be correctly rounded. If the subject sequence *D* has the decimal form and more than DECIMAL_DIG significant digits, consider the two bounding, adjacent decimal strings *L* and *U*, both having DECIMAL_DIG significant digits, such that the values of *L*, *D*, and *U* satisfy *L* <= *D* <= *U*. The result should be one of the (equal or adjacent) values that would be obtained by correctly rounding *L* and *U* according to the current rounding direction, with the extra stipulation that the error with respect to *D* should have a correct sign for the current rounding direction.

The changes to *strtod*( ) introduced by the ISO/IEC 9899:1999 standard can alter the behavior of well-formed applications complying with the ISO/IEC 9899:1990 standard and thus earlier versions of this standard. One such example would be:

```
int
what_kind_of_number (char *s)
{
    char *endp;
    double d;
    long l;

    d = strtod(s, &endp);
    if (s != endp && *endp == '\0')
        printf("It's a float with value %g\n", d);
    else
    {
        l = strtol(s, &endp, 0);
        if (s != endp && *endp == '\0')
            printf("It's an integer with value %ld\n", 1);
        else
            return 1;
    }
    return 0;
}
```

If the function is called with:

```
what_kind_of_number ("0x10")
```

an ISO/IEC 9899:1990 standard-compliant library will result in the function printing:

```
It's an integer with value 16
```

With the ISO/IEC 9899:1999 standard, the result is:

```
It's a float with value 16
```

The change in behavior is due to the inclusion of floating-point numbers in hexadecimal notation without requiring that either a decimal point or the binary exponent be present.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The *strtod*( ) function is updated.
- The *strtof*( ) and *strtold*( ) functions are added.
- The DESCRIPTION is extensively revised.

ISO/IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/61 is applied, correcting the second paragraph in the RETURN VALUE section. This change clarifies the sign of the return value.

Issue 7

Austin Group Interpretation 1003.1-2001 #015 is applied.

NAME

strtoimax, strtoumax — convert string to integer type

SYNOPSIS

```
#include <inttypes.h>

intmax_t strtoimax(const char *restrict nptr, char **restrict endptr,
    int base);
uintmax_t strtoumax(const char *restrict nptr, char **restrict endptr,
    int base);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall be equivalent to the *strtol*( ), *strtoll*( ), *strtoul*( ), and *strtoull*( ) functions, except that the initial portion of the string shall be converted to **intmax_t** and **uintmax_t** representation, respectively.

RETURN VALUE

These functions shall return the converted value, if any.

If no conversion could be performed, zero shall be returned.

If the correct value is outside the range of representable values, {INTMAX_MAX}, {INTMAX_MIN}, or {UINTMAX_MAX} shall be returned (according to the return type and sign of the value, if any), and *errno* shall be set to [ERANGE].

ERRORS

These functions shall fail if:

[ERANGE] The value to be returned is not representable.

These functions may fail if:

[EINVAL] The value of *base* is not supported.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

NAME

strtok, strtok_r — split string into tokens

SYNOPSIS

```
#include <string.h>

char *strtok(char *restrict s1, const char *restrict s2);
CX char *strtok_r(char *restrict s, const char *restrict sep,
        char **restrict lasts);
```

DESCRIPTION

CX For *strtok*(): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

A sequence of calls to *strtok*( ) breaks the string pointed to by *s1* into a sequence of tokens, each of which is delimited by a byte from the string pointed to by *s2*. The first call in the sequence has *s1* as its first argument, and is followed by calls with a null pointer as their first argument. The separator string pointed to by *s2* may be different from call to call.

The first call in the sequence searches the string pointed to by *s1* for the first byte that is *not* contained in the current separator string pointed to by *s2*. If no such byte is found, then there are no tokens in the string pointed to by *s1* and *strtok*( ) shall return a null pointer. If such a byte is found, it is the start of the first token.

The *strtok*( ) function then searches from there for a byte that *is* contained in the current separator string. If no such byte is found, the current token extends to the end of the string pointed to by *s1*, and subsequent searches for a token shall return a null pointer. If such a byte is found, it is overwritten by a NUL character, which terminates the current token. The *strtok*( ) function saves a pointer to the following byte, from which the next search for a token shall start.

Each subsequent call, with a null pointer as the value of the first argument, starts searching from the saved pointer and behaves as described above.

The implementation shall behave as if no function defined in this volume of POSIX.1-200x calls *strtok*( ).

CX The *strtok*( ) function need not be thread-safe.

The *strtok_r*( ) function considers the null-terminated string *s* as a sequence of zero or more text tokens separated by spans of one or more characters from the separator string *sep*. The argument *lasts* points to a user-provided pointer which points to stored information necessary for *strtok_r*( ) to continue scanning the same string.

In the first call to *strtok_r*( ), *s* points to a null-terminated string, *sep* to a null-terminated string of separator characters, and the value pointed to by *lasts* is ignored. The *strtok_r*( ) function shall return a pointer to the first character of the first token, write a null character into *s* immediately following the returned token, and update the pointer to which *lasts* points.

In subsequent calls, *s* is a null pointer and *lasts* shall be unchanged from the previous call so that subsequent calls shall move through the string *s*, returning successive tokens until no tokens remain. The separator string *sep* may be different from call to call. When no token remains in *s*, a null pointer shall be returned.

RETURN VALUE

Upon successful completion, *strtok*( ) shall return a pointer to the first byte of a token. Otherwise, if there is no token, *strtok*( ) shall return a null pointer.

CX The *strtok_r*( ) function shall return a pointer to the token found, or a null pointer when no token is found.

ERRORS

No errors are defined.

EXAMPLES

Searching for Word Separators

The following example searches for tokens separated by <space> characters.

```
#include <string.h>
...
char *token;
char line[] = "LINE TO BE SEPARATED";
char *search = " ";

/* Token will point to "LINE". */
token = strtok(line, search);

/* Token will point to "TO". */
token = strtok(NULL, search);
```

Breaking a Line

The following example uses *strtok*( ) to break a line into two character strings separated by any combination of <space>, <tab>, or <newline> characters.

```
#include <string.h>
...
struct element {
    char *key;
    char *data;
};
...
char line[LINE_MAX];
char *key, *data;
...
key = strtok(line, " \n");
data = strtok(NULL, " \n");
...
```

APPLICATION USAGE

The *strtok_r*( ) function is thread-safe and stores its state in a user-supplied buffer instead of possibly using a static data area that may be overwritten by an unrelated call from another thread.

RATIONALE

The *strtok*( ) function searches for a separator string within a larger string. It returns a pointer to the last substring between separator strings. This function uses static storage to keep track of the current string position between calls. The new function, *strtok_r*( ), takes an additional argument, *lasts*, to keep track of the current position in the string.

FUTURE DIRECTIONS

None.

SEE ALSO

XBD **<string.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The *strtok_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *strtok*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

Extensions beyond the ISO C standard are marked.

The *strtok_r*( ) function is marked as part of the Thread-Safe Functions option.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The **restrict** keyword is added to the *strtok*( ) and *strtok_r*( ) prototypes for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XSH-ERN-235 is applied, correcting an example. +

The *strtok_r*( ) function is moved from the Thread-Safe Functions option to the Base.

NAME

strtol, strtoll — convert a string to a long integer

SYNOPSIS

```
#include <stdlib.h>

long strtol(const char *restrict str, char **restrict endptr, int base);
long long strtoll(const char *restrict str, char **restrict endptr,
    int base)
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall convert the initial portion of the string pointed to by *str* to a type **long** and **long long** representation, respectively. First, they decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace*( ))
2. A subject sequence interpreted as an integer represented in some radix determined by the value of *base*
3. A final string of one or more unrecognized characters, including the terminating NUL character of the input string.

Then they shall attempt to convert the subject sequence to an integer, and return the result.

If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant, or hexadecimal constant, any of which may be preceded by a `'+'` or `'−'` sign. A decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal constant consists of the prefix `'0'` optionally followed by a sequence of the digits `'0'` to `'7'` only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the decimal digits and letters `'a'` (or `'A'`) to `'f'` (or `'F'`) with values 10 to 15 respectively.

If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence of letters and digits representing an integer with the radix specified by *base*, optionally preceded by a `'+'` or `'−'` sign. The letters from `'a'` (or `'A'`) to `'z'` (or `'Z'`) inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and digits, following the sign if present.

The subject sequence is defined as the longest initial subsequence of the input string, starting with the first non-white-space character that is of the expected form. The subject sequence shall contain no characters if the input string is empty or consists entirely of white-space characters, or if the first non-white-space character is other than a sign or a permissible letter or digit.

If the subject sequence has the expected form and the value of *base* is 0, the sequence of characters starting with the first digit shall be interpreted as an integer constant. If the subject sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the base for conversion, ascribing to each letter its value as given above. If the subject sequence begins with a minus-sign, the value resulting from the conversion shall be negated. A pointer to the final string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

CX In other than the C or POSIX locales, other implementation-defined subject sequences may be accepted.

If the subject sequence is empty or does not have the expected form, no conversion is performed;

the value of *str* is stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

CX The *strtol*( ) function shall not change the setting of *errno* if successful.

Since 0, {LONG_MIN} or {LLONG_MIN}, and {LONG_MAX} or {LLONG_MAX} are returned on error and are also valid returns on success, an application wishing to check for error situations should set *errno* to 0, then call *strtol*( ) or *strtoll*( ), then check *errno*.

RETURN VALUE

Upon successful completion, these functions shall return the converted value, if any. If no CX conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

If the correct value is outside the range of representable values, {LONG_MIN}, {LONG_MAX}, {LLONG_MIN}, or {LLONG_MAX} shall be returned (according to the sign of the value), and *errno* set to [ERANGE].

ERRORS

These functions shall fail if:

[ERANGE] The value to be returned is not representable.

These functions may fail if:

CX [EINVAL] The value of *base* is not supported.

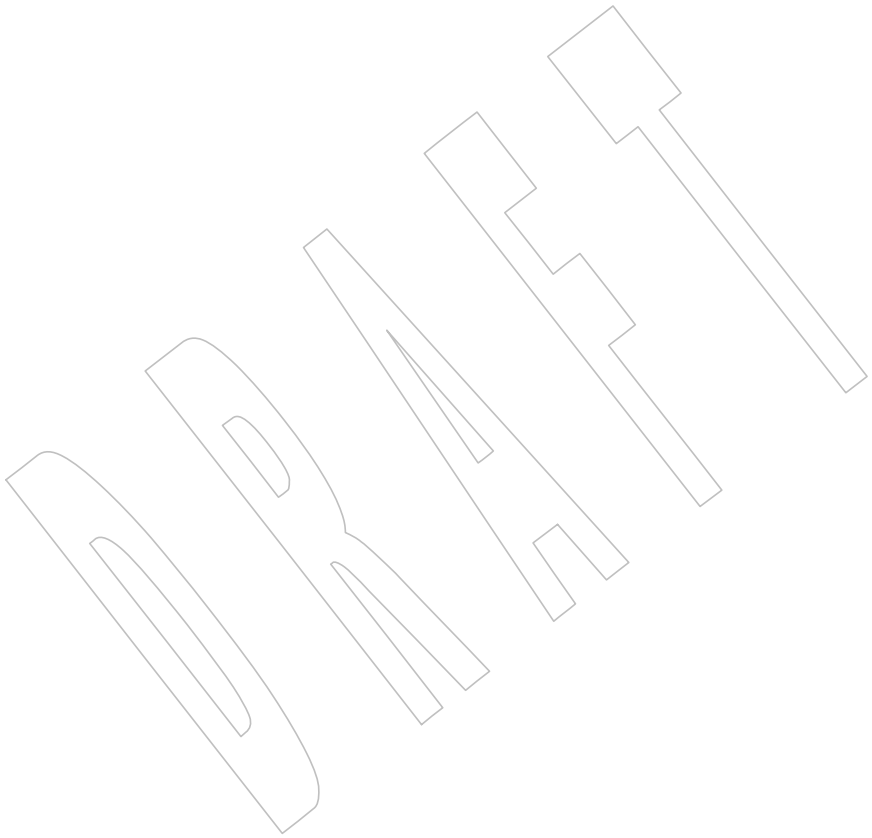
64833 **DESCRIPTION**

64834 Refer to *strtol( )*.



```

NAME

strtoul, strtoull — convert a string to an unsigned long

SYNOPSIS

```
#include <stdlib.h>

unsigned long strtoul(const char *restrict str,
    char **restrict endptr, int base);
unsigned long long strtoull(const char *restrict str,
    char **restrict endptr, int base);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall convert the initial portion of the string pointed to by *str* to a type **unsigned long** and **unsigned long long** representation, respectively. First, they decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace*( ))
2. A subject sequence interpreted as an integer represented in some radix determined by the value of *base*
3. A final string of one or more unrecognized characters, including the terminating NUL character of the input string

Then they shall attempt to convert the subject sequence to an unsigned integer, and return the result.

If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant, or hexadecimal constant, any of which may be preceded by a `'+'` or `'−'` sign. A decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal constant consists of the prefix `'0'` optionally followed by a sequence of the digits `'0'` to `'7'` only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the decimal digits and letters `'a'` (or `'A'`) to `'f'` (or `'F'`) with values 10 to 15 respectively.

If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence of letters and digits representing an integer with the radix specified by *base*, optionally preceded by a `'+'` or `'−'` sign. The letters from `'a'` (or `'A'`) to `'z'` (or `'Z'`) inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and digits, following the sign if present.

The subject sequence is defined as the longest initial subsequence of the input string, starting with the first non-white-space character that is of the expected form. The subject sequence shall contain no characters if the input string is empty or consists entirely of white-space characters, or if the first non-white-space character is other than a sign or a permissible letter or digit.

If the subject sequence has the expected form and the value of *base* is 0, the sequence of characters starting with the first digit shall be interpreted as an integer constant. If the subject sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the base for conversion, ascribing to each letter its value as given above. If the subject sequence begins with a minus-sign, the value resulting from the conversion shall be negated. A pointer to the final string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

64880 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
64881 accepted.

64882 If the subject sequence is empty or does not have the expected form, no conversion shall be
64883 performed; the value of *str* shall be stored in the object pointed to by *endptr*, provided that *endptr*
64884 is not a null pointer.

64885 CX The *strtoul*( ) function shall not change the setting of *errno* if successful.

64886 Since 0, {ULONG_MAX}, and {ULLONG_MAX} are returned on error and are also valid returns
64887 on success, an application wishing to check for error situations should set *errno* to 0, then call
64888 *strtoul*( ) or *strtoull*( ), then check *errno*.

64889 **RETURN VALUE**

64890 Upon successful completion, these functions shall return the converted value, if any. If no
64891 CX conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL]. If the
64892 correct value is outside the range of representable values, {ULONG_MAX} or {ULLONG_MAX}
64893 shall be returned and *errno* set to [ERANGE].

64894 **ERRORS**

64895 These functions shall fail if:

64896 CX [EINVAL] The value of *base* is not supported.

64897 [ERANGE] The value to be returned is not representable.

64898 These functions may fail if:

64899 CX [EINVAL] No conversion could be performed.

NAME

strxfrm, strxfrm_l — string transformation

SYNOPSIS

```
#include <string.h>

size_t strxfrm(char *restrict s1, const char *restrict s2, size_t n);
CX size_t strxfrm_l(char *restrict s1, const char *restrict s2,
        size_t n, locale_t locale);
```

DESCRIPTION

CX For *strxfrm*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *strxfrm*( ) and *strxfrm_l*( ) functions shall transform the string pointed to by *s2* and place the resulting string into the array pointed to by *s1*. The transformation is such that if *strcmp*( ) is applied to two transformed strings, it shall return a value greater than, equal to, or less than 0, CX corresponding to the result of *strcoll*( ) or *strcoll_l*( ), respectively, applied to the same two CX original strings with the same locale. No more than *n* bytes are placed into the resulting array pointed to by *s1*, including the terminating NUL character. If *n* is 0, *s1* is permitted to be a null pointer. If copying takes place between objects that overlap, the behavior is undefined.

CX The *strxfrm*( ) and *strxfrm_l*( ) functions shall not change the setting of *errno* if successful.

Since no return value is reserved to indicate an error, an application wishing to check for error CX situations should set *errno* to 0, then call *strxfrm*( ) or *strxfrm_l*( ), then check *errno*.

RETURN VALUE

CX Upon successful completion, *strxfrm*( ) and *strxfrm_l*( ) shall return the length of the transformed string (not including the terminating NUL character). If the value returned is *n* or more, the contents of the array pointed to by *s1* are unspecified.

CX On error, *strxfrm*( ) and *strxfrm_l*( ) may set *errno* but no return value is reserved to indicate an error.

ERRORS

These functions may fail if:

CX [EINVAL] The string pointed to by the *s2* argument contains characters outside the domain of the collating sequence.

The *strxfrm_l*( ) function may fail if:

CX [EINVAL] *locale* is not a valid locale object.

EXAMPLES

None.

APPLICATION USAGE

The transformation function is such that two transformed strings can be ordered by *strcmp*( ) as appropriate to collating sequence information in the locale of the process (category *LC_COLLATE*).

The fact that when *n* is 0 *s1* is permitted to be a null pointer is useful to determine the size of the *s1* array prior to making the transformation.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the ISO C standard.

Issue 5

The DESCRIPTION is updated to indicate that *errno* does not change if the function is successful.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.

The *strxfrm( )* prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

The *strxfrm_l( )* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

swab — swap bytes

SYNOPSIS

XSI

```
#include <unistd.h>

void swab(const void *restrict src, void *restrict dest,
    ssize_t nbytes);
```

DESCRIPTION

The *swab*( ) function shall copy *nbytes* bytes, which are pointed to by *src*, to the object pointed to by *dest*, exchanging adjacent bytes. The *nbytes* argument should be even. If *nbytes* is odd, *swab*( ) copies and exchanges *nbytes*–1 bytes and the disposition of the last byte is unspecified. If copying takes place between objects that overlap, the behavior is undefined. If *nbytes* is negative, *swab*( ) does nothing.

RETURN VALUE

None.

ERRORS

No errors are defined.

SYNOPSIS

```
#include <unistd.h>

int symlink(const char *path1, const char *path2);
int symlinkat(const char *path1, int fd, const char *path2);
```

DESCRIPTION

The *symlink*( ) function shall create a symbolic link called *path2* that contains the string pointed to by *path1* (*path2* is the name of the symbolic link created, *path1* is the string contained in the symbolic link).

The string pointed to by *path1* shall be treated only as a character string and shall not be validated as a pathname.

If the *symlink*( ) function fails for any reason other than [EIO], any file named by *path2* shall be unaffected.

The symbolic link's user ID shall be set to the process' effective user ID. The symbolic link's group ID shall be set to the group ID of the parent directory or to the effective group ID of the process. Implementations shall provide a way to initialize the symbolic link's group ID to the group ID of the parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the symbolic link's group ID to the effective group ID of the calling process.

The values of the file mode bits for the created symbolic link are unspecified. All interfaces specified by POSIX.1-200x shall behave as if the contents of symbolic links can always be read, except that the value of the file mode bits returned in the *st_mode* field of the **stat** structure is unspecified.

Upon successful completion, *symlink*( ) shall mark for update the last data access, last data modification, and last file status change timestamps of the symbolic link. Also, the last data modification and last file status change timestamps of the directory that contains the new entry shall be marked for update.

The *symlinkat*( ) function shall be equivalent to the *symlink*( ) function except in the case where *path2* specifies a relative path. In this case the symbolic link is created relative to the directory associated with the file descriptor *fd* instead of the current working directory. If the file descriptor was opened without O_SEARCH, the function shall check whether directory searches are permitted using the current permissions of the directory underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function shall not perform the check.

If *symlinkat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working directory is used and the behavior shall be identical to a call to *symlink*( ).

RETURN VALUE

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return –1 and set *errno* to indicate the error.

ERRORS

These functions shall fail if:

[EACCES] Write permission is denied in the directory where the symbolic link is being created, or search permission is denied for a component of the path prefix of *path2*.

[EEXIST] The *path2* argument names an existing file or symbolic link.

[EIO] An I/O error occurs while reading from or writing to the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path2* argument.

[ENAMETOOLONG]
The length of a component of the pathname specified by the *path2* argument is longer than {NAME_MAX} or the length of the *path1* argument is longer than {SYMLINK_MAX}.

[ENOENT] A component of *path2* does not name an existing file or *path2* is an empty string.

[ENOSPC] The directory in which the entry for the new symbolic link is being placed cannot be extended because no space is left on the file system containing the directory, or the new symbolic link cannot be created because no space is left on the file system which shall contain the link, or the file system is out of file-allocation resources.

[ENOTDIR] A component of the path prefix of *path2* is not a directory.

[EROFS] The new symbolic link would reside on a read-only file system.

The *symlinkat*( ) function shall fail if:

[EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path2* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

These functions may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path2* argument.

[ENAMETOOLONG]
The length of the *path2* argument exceeds {PATH_MAX} or pathname resolution of a symbolic link in the *path2* argument produced an intermediate result with a length that exceeds {PATH_MAX}.

The *symlinkat*( ) function may fail if:

[ENOTDIR] The *path2* argument is not an absolute path and *fd* is neither AT_FDCWD nor a file descriptor associated with a directory.

EXAMPLES

None.

APPLICATION USAGE

Like a hard link, a symbolic link allows a file to have multiple logical names. The presence of a hard link guarantees the existence of a file, even after the original name has been removed. A symbolic link provides no such assurance; in fact, the file named by the *path1* argument need not exist when the link is created. A symbolic link can cross file system boundaries.

Normal permission checks are made on each component of the symbolic link pathname during its resolution.

RATIONALE

Since POSIX.1-200x does not require any association of file times with symbolic links, there is no requirement that file times be updated by *symlink*( ).

The purpose of the *symlinkat*( ) function is to create symbolic links in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *symlink*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *symlinkat*( ) function it can be guaranteed that the created symbolic link is located relative to the desired directory.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The following changes were made to align with the IEEE P1003.1a draft standard:

- The DESCRIPTION text is updated.
- The [ELOOP] optional error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *symlinkat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Additions have been made describing how *symlink*( ) sets the user and group IDs and file mode of the symbolic link, and its effect on timestamps.

Changes are made to allow a directory to be opened for searching.

65157 **NAME**

65158 sync — schedule file system updates

65159 **SYNOPSIS**

65160 XSI
```
#include <unistd.h>

void sync(void);
```
65161

65162 **DESCRIPTION**

65163 The *sync*( ) function shall cause all information in memory that updates file systems to be
65164 scheduled for writing out to all file systems.

65165 The writing, although scheduled, is not necessarily complete upon return from *sync*( ).

65166 **RETURN VALUE**

65167 The *sync*( ) function shall not return a value.

65168 **ERRORS**

65169 No errors are defined.

NAME

sysconf — get configurable system variables

SYNOPSIS

```
#include <unistd.h>

long sysconf(int name);
```

DESCRIPTION

The *sysconf*( ) function provides a method for the application to determine the current value of a configurable system limit or option (*variable*). The implementation shall support all of the variables listed in the following table and may support others.

The *name* argument represents the system variable to be queried. The following table lists the minimal set of system variables from **<limits.h>** or **<unistd.h>** that can be returned by *sysconf*( ), and the symbolic constants defined in **<unistd.h>** that are the corresponding values used for *name*.

Variable	Value of Name
{AIO_LISTIO_MAX}	_SC_AIO_LISTIO_MAX
{AIO_MAX}	_SC_AIO_MAX
{AIO_PRIO_DELTA_MAX}	_SC_AIO_PRIO_DELTA_MAX
{ARG_MAX}	_SC_ARG_MAX
{ATEXIT_MAX}	_SC_ATEXIT_MAX
{BC_BASE_MAX}	_SC_BC_BASE_MAX
{BC_DIM_MAX}	_SC_BC_DIM_MAX
{BC_SCALE_MAX}	_SC_BC_SCALE_MAX
{BC_STRING_MAX}	_SC_BC_STRING_MAX
{CHILD_MAX}	_SC_CHILD_MAX
Clock ticks/second	_SC_CLK_TCK
{COLL_WEIGHTS_MAX}	_SC_COLL_WEIGHTS_MAX
{DELAYTIMER_MAX}	_SC_DELAYTIMER_MAX
{EXPR_NEST_MAX}	_SC_EXPR_NEST_MAX
{HOST_NAME_MAX}	_SC_HOST_NAME_MAX
{IOV_MAX}	_SC_IOV_MAX
{LINE_MAX}	_SC_LINE_MAX
{LOGIN_NAME_MAX}	_SC_LOGIN_NAME_MAX
{NGROUPS_MAX}	_SC_NGROUPS_MAX
Initial size of *getgrgid_r*( ) and *getgrnam_r*( ) data buffers	_SC_GETGR_R_SIZE_MAX
Initial size of *getpwuid_r*( ) and *getpwnam_r*( ) data buffers	_SC_GETPW_R_SIZE_MAX

	_XOPEN_VERSION	_SC_XOPEN_VERSION

RETURN VALUE

If *name* is an invalid value, *sysconf*( ) shall return –1 and set *errno* to indicate the error. If the variable corresponding to *name* is described in **<limits.h>** as a maximum or minimum value and the variable has no limit, *sysconf*( ) shall return –1 without changing the value of *errno*. Note that indefinite limits do not imply infinite limits; see **<limits.h>**.

Otherwise, *sysconf*( ) shall return the current variable value on the system. The value returned

shall not be more restrictive than the corresponding value described to the application when it was compiled with the implementation's **<limits.h>** or **<unistd.h>**. The value shall not change during the lifetime of the calling process, except that *sysconf*(_SC_OPEN_MAX) may return different values before and after a call to *setrlimit*( ) which changes the RLIMIT_NOFILE soft limit.

XSI

If the variable corresponding to *name* is dependent on an unsupported option, the results are unspecified.

ERRORS

The *sysconf*( ) function shall fail if:

[EINVAL] The value of the *name* argument is invalid.

EXAMPLES

None.

APPLICATION USAGE

As –1 is a permissible return value in a successful situation, an application wishing to check for error situations should set *errno* to 0, then call *sysconf*( ), and, if it returns –1, check to see if *errno* is non-zero.

Application developers should check whether an option, such as _POSIX_TRACE, is supported prior to obtaining and using values for related variables, such as _POSIX_TRACE_NAME_MAX.

RATIONALE

This functionality was added in response to requirements of application developers and of system vendors who deal with many international system configurations. It is closely related to *pathconf*( ) and *fpathconf*( ).

Although a conforming application can run on all systems by never demanding more resources than the minimum values published in this volume of POSIX.1-200x, it is useful for that application to be able to use the actual value for the quantity of a resource available on any given system. To do this, the application makes use of the value of a symbolic constant in **<limits.h>** or **<unistd.h>**.

However, once compiled, the application must still be able to cope if the amount of resource available is increased. To that end, an application may need a means of determining the quantity of a resource, or the presence of an option, at execution time.

Two examples are offered:

1. Applications may wish to act differently on systems with or without job control. Applications vendors who wish to distribute only a single binary package to all instances of a computer architecture would be forced to assume job control is never available if it were to rely solely on the **<unistd.h>** value published in this volume of POSIX.1-200x.
2. International applications vendors occasionally require knowledge of the number of clock ticks per second. Without these facilities, they would be required to either distribute their applications partially in source form or to have 50 Hz and 60 Hz versions for the various countries in which they operate.

It is the knowledge that many applications are actually distributed widely in executable form that leads to this facility. If limited to the most restrictive values in the headers, such applications would have to be prepared to accept the most limited environments offered by the smallest microcomputers. Although this is entirely portable, there was a consensus that they should be able to take advantage of the facilities offered by large systems, without the restrictions associated with source and object distributions.

During the discussions of this feature, it was pointed out that it is almost always possible for an application to discern what a value might be at runtime by suitably testing the various functions themselves. And, in any event, it could always be written to adequately deal with error returns from the various functions. In the end, it was felt that this imposed an unreasonable level of complication and sophistication on the application developer.

This runtime facility is not meant to provide ever-changing values that applications have to check multiple times. The values are seen as changing no more frequently than once per system initialization, such as by a system administrator or operator with an automatic configuration program. This volume of POSIX.1-200x specifies that they shall not change within the lifetime of the process.

Some values apply to the system overall and others vary at the file system or directory level. The latter are described in *fpathconf( )*.

Note that all values returned must be expressible as integers. String values were considered, but the additional flexibility of this approach was rejected due to its added complexity of implementation and use.

Some values, such as {PATH_MAX}, are sometimes so large that they must not be used to, say, allocate arrays. The *sysconf( )* function returns a negative value to show that this symbolic constant is not even defined in this case.

Similar to *pathconf( )*, this permits the implementation not to have a limit. When one resource is infinite, returning an error indicating that some other resource limit has been reached is conforming behavior.

FUTURE DIRECTIONS

None.

XBD **<limits.h>**, **<unistd.h>**

XCU *getconf*

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

The _XBS_ variables and name values are added to the table of system variables in the DESCRIPTION. These are all marked EX.

Issue 6

The symbol CLK_TCK is obsolescent and removed. It is replaced with the phrase “clock ticks per second”.

The symbol {PASS_MAX} is removed.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Table entries are added for the following variables: _SC_REGEXP, _SC_SHELL, _SC_REGEX_VERSION, _SC_SYMLOOP_MAX.

The following *sysconf( )* variables and their associated names are added for alignment with IEEE Std 1003.1d-1999:

65422 _POSIX_ADVISORY_INFO
65423 _POSIX_CPUTIME
65424 _POSIX_SPAWN
65425 _POSIX_SPORADIC_SERVER
65426 _POSIX_THREAD_CPUTIME
65427 _POSIX_THREAD_SPORADIC_SERVER
65428 _POSIX_TIMEOUTS

65429 The following changes are made to the DESCRIPTION for alignment with IEEE Std 1003.1j-2000:

65430 • A statement expressing the dependency of support for some system variables on
65431 implementation options is added.

65432 • The following system variables are added:

65433 _POSIX_BARRIERS
65434 _POSIX_CLOCK_SELECTION
65435 _POSIX_MONOTONIC_CLOCK
65436 _POSIX_READER_WRITER_LOCKS
65437 _POSIX_SPIN_LOCKS
65438 _POSIX_TYPED_MEMORY_OBJECTS

65439 The following system variables are added for alignment with IEEE Std 1003.2d-1994:

65440 _POSIX2_PBS
65441 _POSIX2_PBS_ACCOUNTING
65442 _POSIX2_PBS_LOCATE
65443 _POSIX2_PBS_MESSAGE
65444 _POSIX2_PBS_TRACK

65445 The following *sysconf*( ) variables and their associated names are added for alignment with
65446 IEEE Std 1003.1q-2000:

65447 _POSIX_TRACE
65448 _POSIX_TRACE_EVENT_FILTER
65449 _POSIX_TRACE_INHERIT
65450 _POSIX_TRACE_LOG

65451 The macros associated with the *c89* programming models are marked LEGACY, and new
65452 equivalent macros associated with *c99* are introduced.

65453 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/62 is applied, updating the
65454 DESCRIPTION to denote that the _PC* and _SC* symbols are now required to be supported. A
65455 corresponding change has been made in the Base Definitions volume of POSIX.1-200x. The
65456 deletion in the second paragraph removes some duplicated text. Additional symbols that were
65457 erroneously omitted from this reference page have been added.

65458 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/63 is applied, making it clear in the
65459 RETURN VALUE section that the value returned for *sysconf*(_SC_OPEN_MAX) may change if a
65460 call to *setrlimit*( ) adjusts the RLIMIT_NOFILE soft limit.

65461 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/134 is applied, updating the
65462 DESCRIPTION to remove an erroneous entry for _POSIX_SYMLOOP_MAX. This corrects an
65463 error in IEEE Std 1003.1-2001/Cor 1-2002.

65464 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/135 is applied, removing

_POSIX_FILE_LOCKING, _POSIX_MULTI_PROCESS, _POSIX2_C_VERSION, and _XOPEN_XCU_VERSION (and their associated _SC_* variables) from the DESCRIPTION and APPLICATION USAGE sections.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/136 is applied, adding the following constants (and their associated _SC_* variables) to the DESCRIPTION:

_POSIX_SS_REPL_MAX
_POSIX_TRACE_EVENT_NAME_MAX
_POSIX_TRACE_NAME_MAX
_POSIX_TRACE_SYS_MAX
_POSIX_TRACE_USER_EVENT_MAX

The RETURN VALUE and APPLICATION USAGE sections are updated to note that if variables are dependent on unsupported options, the results are unspecified.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/137 is applied, removing _REGEX_VERSION and _SC_REGEX_VERSION.

Issue 7

Austin Group Interpretation 1003.1-2001 #160 is applied.

SD5-XSH-ERN-166 is applied, changing "Maximum size" to "Initial size" for the "Maximum size of ..." entries in the table in the DESCRIPTION.

The variables for the supported programming environments are updated to be V7 and the LEGACY variables are removed.

The following constants are added:

_POSIX_THREAD_ROBUST_PRIO_INHERIT
_POSIX_THREAD_ROBUST_PRIO_PROTECT

The _XOPEN_UUCP variable and its associated _SC_XOPEN_UUCP value is added to the table of system variables. +

NAME

syslog — log a message

SYNOPSIS

XSI

```
#include <syslog.h>

void syslog(int priority, const char *message, ... /* argument */);
```

DESCRIPTION

Refer to *closelog( )*.

NAME

system — issue a command

SYNOPSIS

```
#include <stdlib.h>

int system(const char *command);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

If *command* is a null pointer, the *system*( ) function shall determine whether the host environment has a command processor. If *command* is not a null pointer, the *system*( ) function shall pass the string pointed to by *command* to that command processor to be executed in an implementation-defined manner; this might then cause the program calling *system*( ) to behave in a non-conforming manner or to terminate.

CX The *system*( ) function shall behave as if a child process were created using *fork*( ), and the child process invoked the *sh* utility using *execl*( ) as follows:

```
execl(<shell path>, "sh", "-c", command, (char *)0);
```

where <*shell path*> is an unspecified pathname for the *sh* utility. It is unspecified whether the handlers registered with *pthread_atfork*( ) are called as part of the creation of the child process.

The *system*( ) function shall ignore the SIGINT and SIGQUIT signals, and shall block the SIGCHLD signal, while waiting for the command to terminate. If this might cause the application to miss a signal that would have killed it, then the application should examine the return value from *system*( ) and take whatever action is appropriate to the application if the command terminated due to receipt of a signal.

The *system*( ) function shall not affect the termination status of any child of the calling processes other than the process or processes it itself creates.

The *system*( ) function shall not return until the child process has terminated.

The *system*( ) function need not be thread-safe.

RETURN VALUE

If *command* is a null pointer, *system*( ) shall return non-zero to indicate that a command processor CX is available, or zero if none is available. The *system*( ) function shall always return non-zero when *command* is NULL.

CX If *command* is not a null pointer, *system*( ) shall return the termination status of the command language interpreter in the format specified by *waitpid*( ). The termination status shall be as defined for the *sh* utility; otherwise, the termination status is unspecified. If some error prevents the command language interpreter from executing after the child process is created, the return value from *system*( ) shall be as if the command language interpreter had terminated using *exit*(127) or *_exit*(127). If a child process cannot be created, or if the termination status for the command language interpreter cannot be obtained, *system*( ) shall return –1 and set *errno* to indicate the error.

ERRORS

CX The *system*( ) function may set *errno* values as described by *fork*( ).

In addition, *system*( ) may fail if:

CX [ECHILD] The status of the child process created by *system*( ) is no longer available.

EXAMPLES

None.

APPLICATION USAGE

If the return value of *system*( ) is not –1, its value can be decoded through the use of the macros described in **<sys/wait.h>**. For convenience, these macros are also provided in **<stdlib.h>**.

Note that, while *system*( ) must ignore SIGINT and SIGQUIT and block SIGCHLD while waiting for the child to terminate, the handling of signals in the executed command is as specified by *fork*( ) and *exec*. For example, if SIGINT is being caught or is set to SIG_DFL when *system*( ) is called, then the child is started with SIGINT handling set to SIG_DFL.

Ignoring SIGINT and SIGQUIT in the parent process prevents coordination problems (two processes reading from the same terminal, for example) when the executed command ignores or catches one of the signals. It is also usually the correct action when the user has given a command to the application to be executed synchronously (as in the `'!'` command in many interactive applications). In either case, the signal should be delivered only to the child process, not to the application itself. There is one situation where ignoring the signals might have less than the desired effect. This is when the application uses *system*( ) to perform some task invisible to the user. If the user typed the interrupt character (`"^C"`, for example) while *system*( ) is being used in this way, one would expect the application to be killed, but only the executed command is killed. Applications that use *system*( ) in this way should carefully check the return status from *system*( ) to see if the executed command was successful, and should take appropriate action when the command fails.

Blocking SIGCHLD while waiting for the child to terminate prevents the application from catching the signal and obtaining status from *system*( )'s child process before *system*( ) can get the status itself.

The context in which the utility is ultimately executed may differ from that in which *system*( ) was called. For example, file descriptors that have the FD_CLOEXEC flag set are closed, and the process ID and parent process ID are different. Also, if the executed utility changes its environment variables or its current working directory, that change is not reflected in the caller's context.

There is no defined way for an application to find the specific path for the shell. However, *confstr*( ) can provide a value for *PATH* that is guaranteed to find the *sh* utility.

Using the *system*( ) function in more than one thread in a process or when the SIGCHLD signal is being manipulated by more than one thread in a process may produce unexpected results.

RATIONALE

The *system*( ) function should not be used by programs that have set user (or group) ID privileges. The *fork*( ) and *exec* family of functions (except *execlp*( ) and *execvp*( )), should be used instead. This prevents any unforeseen manipulation of the environment of the user that could cause execution of commands not anticipated by the calling program.

There are three levels of specification for the *system*( ) function. The ISO C standard gives the most basic. It requires that the function exists, and defines a way for an application to query whether a command language interpreter exists. It says nothing about the command language or the environment in which the command is interpreted.

POSIX.1-200x places additional restrictions on *system*( ). It requires that if there is a command language interpreter, the environment must be as specified by *fork*( ) and *exec*. This ensures, for

example, that close-on-*exec* works, that file locks are not inherited, and that the process ID is different. It also specifies the return value from *system*( ) when the command line can be run, thus giving the application some information about the command's completion status.

Finally, POSIX.1-200x requires the command to be interpreted as in the shell command language defined in the Shell and Utilities volume of POSIX.1-200x.

Note that, *system*(NULL) is required to return non-zero, indicating that there is a command language interpreter. At first glance, this would seem to conflict with the ISO C standard which allows *system*(NULL) to return zero. There is no conflict, however. A system must have a command language interpreter, and is non-conforming if none is present. It is therefore permissible for the *system*( ) function on such a system to implement the behavior specified by the ISO C standard as long as it is understood that the implementation does not conform to POSIX.1-200x if *system*(NULL) returns zero.

It was explicitly decided that when *command* is NULL, *system*( ) should not be required to check to make sure that the command language interpreter actually exists with the correct mode, that there are enough processes to execute it, and so on. The call *system*(NULL) could, theoretically, check for such problems as too many existing child processes, and return zero. However, it would be inappropriate to return zero due to such a (presumably) transient condition. If some condition exists that is not under the control of this application and that would cause any *system*( ) call to fail, that system has been rendered non-conforming.

Early drafts required, or allowed, *system*( ) to return with *errno* set to [EINTR] if it was interrupted with a signal. This error return was removed, and a requirement that *system*( ) not return until the child has terminated was added. This means that if a *waitpid*( ) call in *system*( ) exits with *errno* set to [EINTR], *system*( ) must reissue the *waitpid*( ). This change was made for two reasons:

1. There is no way for an application to clean up if *system*( ) returns [EINTR], short of calling *wait*( ), and that could have the undesirable effect of returning the status of children other than the one started by *system*( ).
2. While it might require a change in some historical implementations, those implementations already have to be changed because they use *wait*( ) instead of *waitpid*( ).

Note that if the application is catching SIGCHLD signals, it will receive such a signal before a successful *system*( ) call returns.

To conform to POSIX.1-200x, *system*( ) must use *waitpid*( ), or some similar function, instead of *wait*( ).

The following code sample illustrates how *system*( ) might be implemented on an implementation conforming to POSIX.1-200x.

```
#include <signal.h>
int system(const char *cmd)
{
    int stat;
    pid_t pid;
    struct sigaction sa, savintr, savequit;
    sigset_t saveblock;
    if (cmd == NULL)
        return(1);
    sa.sa_handler = SIG_IGN;
    sigemptyset(&sa.sa_mask);
    sa.sa_flags = 0;
```

```
        sigemptyset(&savintr.sa_mask);
        sigemptyset(&savequit.sa_mask);
        sigaction(SIGINT, &sa, &savintr);
        sigaction(SIGQUIT, &sa, &savequit);
        sigaddset(&sa.sa_mask, SIGCHLD);
        sigprocmask(SIG_BLOCK, &sa.sa_mask, &saveblock);
        if ((pid = fork()) == 0) {
            sigaction(SIGINT, &savintr, (struct sigaction *)0);
            sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
            sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
            execl("/bin/sh", "sh", "-c", cmd, (char *)0);
            _exit(127);
        }
        if (pid == -1) {
            stat = -1; /* errno comes from fork() */
        } else {
            while (waitpid(pid, &stat, 0) == -1) {
                if (errno != EINTR){
                    stat = -1;
                    break;
                }
            }
        }
        sigaction(SIGINT, &savintr, (struct sigaction *)0);
        sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
        sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
        return(stat);
    }
```

Note that, while a particular implementation of *system*( ) (such as the one above) can assume a particular path for the shell, such a path is not necessarily valid on another system. The above example is not portable, and is not intended to be.

One reviewer suggested that an implementation of *system*( ) might want to use an environment variable such as *SHELL* to determine which command interpreter to use. The supposed implementation would use the default command interpreter if the one specified by the environment variable was not available. This would allow a user, when using an application that prompts for command lines to be processed using *system*( ), to specify a different command interpreter. Such an implementation is discouraged. If the alternate command interpreter did not follow the command line syntax specified in the Shell and Utilities volume of POSIX.1-200x, then changing *SHELL* would render *system*( ) non-conforming. This would affect applications that expected the specified behavior from *system*( ), and since the Shell and Utilities volume of POSIX.1-200x does not mention that *SHELL* affects *system*( ), the application would not know that it needed to unset *SHELL*.

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XSH-ERN-30 is applied.

NAME

tan, tanf, tanl — tangent function

SYNOPSIS

```
#include <math.h>

double tan(double x);
float tanf(float x);
long double tanl(long double x);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the tangent of their argument *x*, measured in radians.

An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the tangent of *x*.

If the correct value would cause underflow, and is not representable, a range error may occur, and MX either 0.0 (if supported), or an implementation-defined value shall be returned.

MX If *x* is NaN, a NaN shall be returned.

If *x* is ±0, *x* shall be returned.

If *x* is subnormal, a range error may occur and *x* should be returned.

If *x* is ±Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

XSI If the correct value would cause overflow, a range error shall occur and *tan*( ), *tanf*( ), and *tanl*( ) shall return ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL, respectively, with the same sign as the correct value of the function.

ERRORS

These functions shall fail if:

MX

Domain Error	The value of *x* is ±Inf.
	If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

XSI

Range Error	The result overflows
	If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

MX Range Error The result underflows, or the value of *x* is subnormal.

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

Taking the Tangent of a 45-Degree Angle

```
#include <math.h>
...
double radians = 45.0 * M_PI / 180;
double result;
...
result = tan (radians);
```

APPLICATION USAGE

There are no known floating-point representations such that for a normal argument, *tan*(*x*) is either overflow or underflow.

These functions may lose accuracy when their argument is near a multiple of $\pi/2$ or is far from 0.0.

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

Issue 5

The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes in previous issues.

Issue 6

The *tanf*( ) and *tanl*( ) functions are added for alignment with the ISO/IEC 9899: 1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899: 1999 standard.

IEC 60559: 1989 standard floating-point extensions over the ISO/IEC 9899: 1999 standard are marked.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/64 is applied, correcting the last paragraph in the RETURN VALUE section.

65772 **NAME**

65773 tanh, tanhf, tanhl — hyperbolic tangent functions

65774 **SYNOPSIS**

65775
```
#include <math.h>
```

65776
```
double tanh(double x);
```
65777
```
float tanhf(float x);
```
65778
```
long double tanhl(long double x);
```

65779 **DESCRIPTION**

65780 CX The functionality described on this reference page is aligned with the ISO C standard. Any
65781 conflict between the requirements described here and the ISO C standard is unintentional. This
65782 volume of POSIX.1-200x defers to the ISO C standard.

65783 These functions shall compute the hyperbolic tangent of their argument *x*.

65784 An application wishing to check for error situations should set *errno* to zero and call
65785 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
65786 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
65787 zero, an error has occurred.

65788 **RETURN VALUE**

65789 Upon successful completion, these functions shall return the hyperbolic tangent of *x*.

65790 MX If *x* is NaN, a NaN shall be returned.

65791 If *x* is ±0, *x* shall be returned.

65792 If *x* is ±Inf, ±1 shall be returned.

65793 If *x* is subnormal, a range error may occur and *x* should be returned.

65794 **ERRORS**

65795 These functions may fail if:

65796 MX Range Error The value of *x* is subnormal.

65797 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
65798 then *errno* shall be set to [ERANGE]. If the integer expression
65799 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
65800 floating-point exception shall be raised.

65801 **EXAMPLES**

65802 None.

65803 **APPLICATION USAGE**

65804 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
65805 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

65806 **RATIONALE**

65807 None.

```

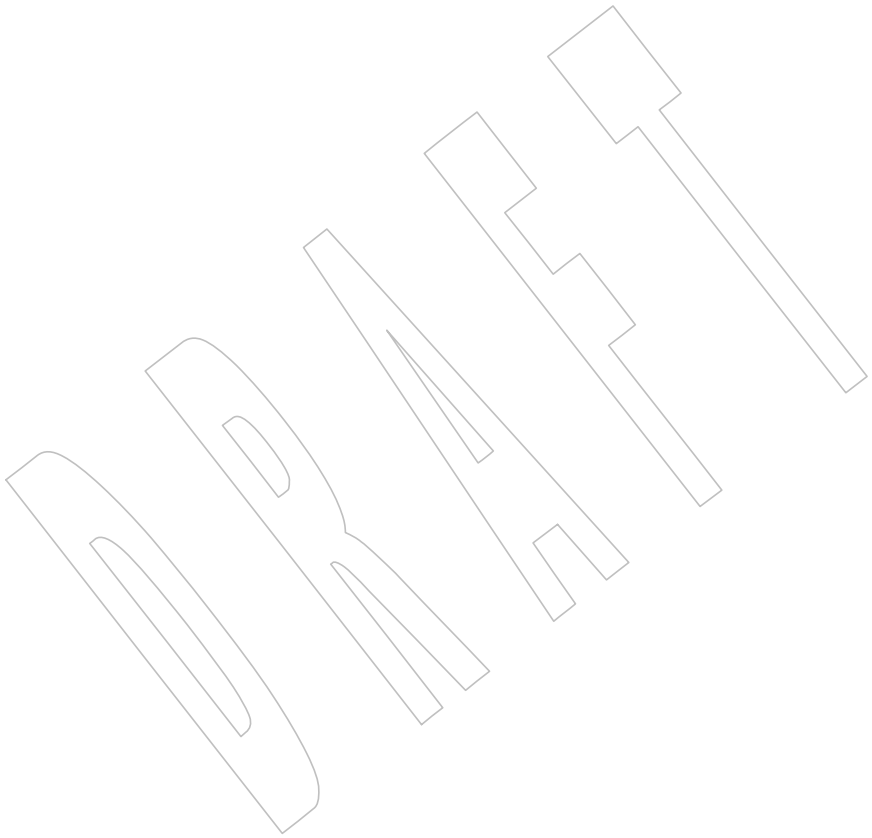
65829 **DESCRIPTION**

65830 Refer to *tan( )*.



NAME

tcdrain — wait for transmission of output

SYNOPSIS

```
#include <termios.h>

int tcdrain(int fildes);
```

DESCRIPTION

The *tcdrain*( ) function shall block until all output written to the object referred to by *fildes* is transmitted. The *fildes* argument is an open file descriptor associated with a terminal.

Any attempts to use *tcdrain*( ) from a process which is a member of a background process group on a *fildes* associated with its controlling terminal, shall cause the process group to be sent a SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *tcdrain*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

[EINTR] A signal interrupted *tcdrain*( ).

[ENOTTY] The file associated with *fildes* is not a terminal.

The *tcdrain*( ) function may fail if:

[EIO] The process group of the writing process is orphaned, and the writing process is not ignoring or blocking SIGTTOU.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the final paragraph is no longer conditional on _POSIX_JOB_CONTROL. This is a FIPS requirement.
- The [EIO] error is added.

65873 **NAME**

65874 tcflow — suspend or restart the transmission or reception of data

65875 **SYNOPSIS**

65876 `#include <termios.h>`

65877 `int tcflow(int fildes, int action);`

65878 **DESCRIPTION**

65879 The *tcflow*( ) function shall suspend or restart transmission or reception of data on the object
65880 referred to by *fildes*, depending on the value of *action*. The *fildes* argument is an open file
65881 descriptor associated with a terminal.

65882 • If *action* is TCOOFF, output shall be suspended.

65883 • If *action* is TCOON, suspended output shall be restarted.

65884 • If *action* is TCIOFF and *fildes* refers to a terminal device, the system shall transmit a STOP
65885 character, which is intended to cause the terminal device to stop transmitting data to the
65886 system. If *fildes* is associated with a pseudo-terminal, the STOP character need not be
65887 transmitted.

65888 • If *action* is TCION and *fildes* refers to a terminal device, the system shall transmit a START
65889 character, which is intended to cause the terminal device to start transmitting data to the
65890 system. If *fildes* is associated with a pseudo-terminal, the START character need not be
65891 transmitted.

65892 The default on the opening of a terminal file is that neither its input nor its output are
65893 suspended.

65894 Attempts to use *tcflow*( ) from a process which is a member of a background process group on a
65895 *fildes* associated with its controlling terminal, shall cause the process group to be sent a
65896 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process
65897 shall be allowed to perform the operation, and no signal is sent.

65898 **RETURN VALUE**

65899 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
65900 indicate the error.

65901 **ERRORS**

65902 The *tcflow*( ) function shall fail if:

65903 [EBADF] The *fildes* argument is not a valid file descriptor.

65904 [EINVAL] The *action* argument is not a supported value.

65905 [ENOTTY] The file associated with *fildes* is not a terminal.

65906 The *tcflow*( ) function may fail if:

65907 [EIO] The process group of the writing process is orphaned, and the writing process
65908 is not ignoring or blocking SIGTTOU.

SD5-XSH-ERN-190 is applied, clarifying in the DESCRIPTION the transmission of START and STOP characters.

NAME

tcflush — flush non-transmitted output data, non-read input data, or both

SYNOPSIS

```
#include <termios.h>

int tcflush(int fildes, int queue_selector);
```

DESCRIPTION

Upon successful completion, *tcflush*( ) shall discard data written to the object referred to by *fildes* (an open file descriptor associated with a terminal) but not transmitted, or data received but not read, depending on the value of *queue_selector*:

- If *queue_selector* is TCIFLUSH, it shall flush data received but not read.
- If *queue_selector* is TCOFLUSH, it shall flush data written but not transmitted.
- If *queue_selector* is TCIOFLUSH, it shall flush both data received but not read and data written but not transmitted.

Attempts to use *tcflush*( ) from a process which is a member of a background process group on a *fildes* associated with its controlling terminal shall cause the process group to be sent a SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *tcflush*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

[EINVAL] The *queue_selector* argument is not a supported value.

[ENOTTY] The file associated with *fildes* is not a terminal.

The *tcflush*( ) function may fail if:

[EIO] The process group of the writing process is orphaned, and the writing process is not ignoring or blocking SIGTTOU.

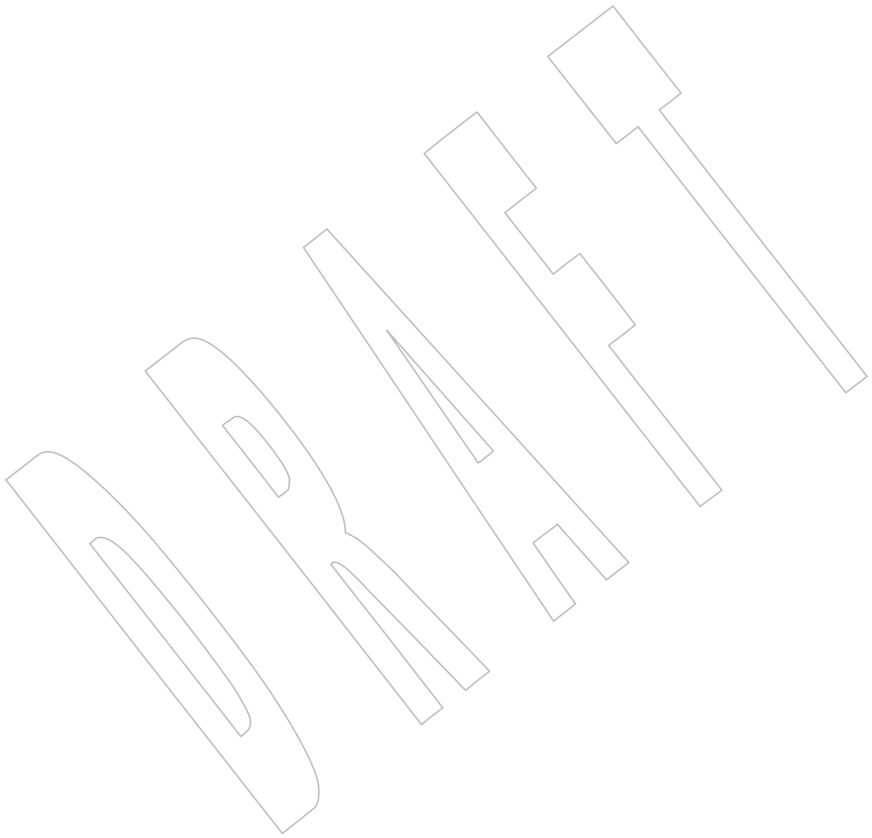
Issue 6

The Open Group Corrigendum U035/1 is applied. In the ERRORS and APPLICATION USAGE sections, references to *tcflow*( ) are replaced with *tcflush*( ).

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the final paragraph is no longer conditional on _POSIX_JOB_CONTROL. This is a FIPS requirement.
- The [EIO] error is added.



65978 **NAME**

65979 tcgetattr — get the parameters associated with the terminal

65980 **SYNOPSIS**

65981 `#include <termios.h>`

65982 `int tcgetattr(int fildes, struct termios *termios_p);`

65983 **DESCRIPTION**

65984 The *tcgetattr*( ) function shall get the parameters associated with the terminal referred to by *fildes*
65985 and store them in the **termios** structure referenced by *termios_p*. The *fildes* argument is an open
65986 file descriptor associated with a terminal.

65987 The *termios_p* argument is a pointer to a **termios** structure.

65988 The *tcgetattr*( ) operation is allowed from any process.

65989 If the terminal device supports different input and output baud rates, the baud rates stored in
65990 the **termios** structure returned by *tcgetattr*( ) shall reflect the actual baud rates, even if they are
65991 equal. If differing baud rates are not supported, the rate returned as the output baud rate shall
65992 be the actual baud rate. If the terminal device does not support split baud rates, the input baud
65993 rate stored in the **termios** structure shall be the output rate (as one of the symbolic values).

65994 **RETURN VALUE**

65995 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
65996 indicate the error.

65997 **ERRORS**

65998 The *tcgetattr*( ) function shall fail if:

65999 [EBADF] The *fildes* argument is not a valid file descriptor.

66000 [ENOTTY] The file associated with *fildes* is not a terminal.

66001 **EXAMPLES**

66002 None.

66003 **APPLICATION USAGE**

66004 None.

66005 **RATIONALE**

66006 Care must be taken when changing the terminal attributes. Applications should always do a
66007 *tcgetattr*( ), save the **termios** structure values returned, and then do a *tcsetattr*( ), changing only
66008 the necessary fields. The application should use the values saved from the *tcgetattr*( ) to reset the
66009 terminal state whenever it is done with the terminal. This is necessary because terminal
66010 attributes apply to the underlying port and not to each individual open instance; that is, all
66011 processes that have used the terminal see the latest attribute changes.

66012 A program that uses these functions should be written to catch all signals and take other
66013 appropriate actions to ensure that when the program terminates, whether planned or not, the
66014 terminal device's state is restored to its original state.

66015 Existing practice dealing with error returns when only part of a request can be honored is based
66016 on calls to the *ioctl*( ) function. In historical BSD and System V implementations, the
66017 corresponding *ioctl*( ) returns zero if the requested actions were semantically correct, even if
66018 some of the requested changes could not be made. Many existing applications assume this
66019 behavior and would no longer work correctly if the return value were changed from zero to –1
66020 in this case.

66021 Note that either specification has a problem. When zero is returned, it implies everything

succeeded even if some of the changes were not made. When –1 is returned, it implies everything failed even though some of the changes were made.

Applications that need all of the requested changes made to work properly should follow *tcsetattr*( ) with a call to *tcgetattr*( ) and compare the appropriate field values.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

In the DESCRIPTION, the rate returned as the input baud rate shall be the output rate. Previously, the number zero was also allowed but was obsolescent.

66036 **NAME**

66037 tcgetpgrp — get the foreground process group ID

66038 **SYNOPSIS**

66039 `#include <unistd.h>`

66040 `pid_t tcgetpgrp(int fildes);`

66041 **DESCRIPTION**

66042 The *tcgetpgrp*( ) function shall return the value of the process group ID of the foreground process
66043 group associated with the terminal.

66044 If there is no foreground process group, *tcgetpgrp*( ) shall return a value greater than 1 that does
66045 not match the process group ID of any existing process group.

66046 The *tcgetpgrp*( ) function is allowed from a process that is a member of a background process
66047 group; however, the information may be subsequently changed by a process that is a member of
66048 a foreground process group.

66049 **RETURN VALUE**

66050 Upon successful completion, *tcgetpgrp*( ) shall return the value of the process group ID of the
66051 foreground process associated with the terminal. Otherwise, –1 shall be returned and *errno* set to
66052 indicate the error.

66053 **ERRORS**

66054 The *tcgetpgrp*( ) function shall fail if:

66055 [EBADF] The *fildes* argument is not a valid file descriptor.

66056 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the
66057 controlling terminal.

66058 **EXAMPLES**

66059 None.

66060 **APPLICATION USAGE**

66061 None.

66062 **RATIONALE**

66063 None.

66068 XBD **<sys/types.h>**, **<unistd.h>**

66069 **CHANGE HISTORY**

66070 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

66071 **Issue 6**

66072 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

66073 The following new requirements on POSIX implementations derive from alignment with the
66074 Single UNIX Specification:

66075 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
66076 required for conforming implementations of previous POSIX specifications, it was not
66077 required for UNIX applications.

66078 • In the DESCRIPTION, text previously conditional on support for _POSIX_JOB_CONTROL
66079 is now mandatory. This is a FIPS requirement.

66080 **NAME**

66081 tcgetsid — get the process group ID for the session leader for the controlling terminal

66082 **SYNOPSIS**

66083 `#include <termios.h>`

66084 `pid_t tcgetsid(int fildes);`

66085 **DESCRIPTION**

66086 The *tcgetsid*( ) function shall obtain the process group ID of the session for which the terminal
66087 specified by *fildes* is the controlling terminal.

66088 **RETURN VALUE**

66089 Upon successful completion, *tcgetsid*( ) shall return the process group ID of the session
66090 associated with the terminal. Otherwise, a value of (**pid_t**)–1 shall be returned and *errno* set to
66091 indicate the error.

66092 **ERRORS**

66093 The *tcgetsid*( ) function shall fail if:

66094 [EBADF] The *fildes* argument is not a valid file descriptor.

66095 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the
66096 controlling terminal.

66097 **EXAMPLES**

66098 None.

66099 **APPLICATION USAGE**

66100 None.

66107 **CHANGE HISTORY**

66108 First released in Issue 4, Version 2.

66109 **Issue 5**

66110 Moved from X/OPEN UNIX extension to BASE.

66111 The [EACCES] error has been removed from the list of mandatory errors, and the description of
66112 [ENOTTY] has been reworded.

66113 **Issue 7**

66114 SD5-XSH-ERN-180 is applied, clarifying the RETURN VALUE section.

66115 The *tcgetsid*( ) function is moved from the XSI option to the Base.

66116 **NAME**

66117 tcsendbreak — send a break for a specific duration

66118 **SYNOPSIS**

66119 ```
#include <termios.h>
```

66120 ```
int tcsendbreak(int fildes, int duration);
```

66121 **DESCRIPTION**

66122 If the terminal is using asynchronous serial data transmission, *tcsendbreak*( ) shall cause
66123 transmission of a continuous stream of zero-valued bits for a specific duration. If *duration* is 0, it
66124 shall cause transmission of zero-valued bits for at least 0.25 seconds, and not more than 0.5
66125 seconds. If *duration* is not 0, it shall send zero-valued bits for an implementation-defined period
66126 of time.

66127 The *fildes* argument is an open file descriptor associated with a terminal.

66128 If the terminal is not using asynchronous serial data transmission, it is implementation-defined
66129 whether *tcsendbreak*( ) sends data to generate a break condition or returns without taking any
66130 action.

66131 Attempts to use *tcsendbreak*( ) from a process which is a member of a background process group
66132 on a *fildes* associated with its controlling terminal shall cause the process group to be sent a
66133 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process
66134 shall be allowed to perform the operation, and no signal is sent.

66135 **RETURN VALUE**

66136 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
66137 indicate the error.

66138 **ERRORS**

66139 The *tcsendbreak*( ) function shall fail if:

66140 [EBADF] The *fildes* argument is not a valid file descriptor.

66141 [ENOTTY] The file associated with *fildes* is not a terminal.

66142 The *tcsendbreak*( ) function may fail if:

66143 [EIO] The process group of the writing process is orphaned, and the writing process
66144 is not ignoring or blocking SIGTTOU.

66145 **EXAMPLES**

66146 None.

66147 **APPLICATION USAGE**

66148 None.

66149 **RATIONALE**

66150 None.

66151 **FUTURE DIRECTIONS**

66152 None.

66153 **SEE ALSO**

66154 XBD Chapter 11 (on page 199), **<termios.h>**

66155 **CHANGE HISTORY**

66156 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text previously conditional on _POSIX_JOB_CONTROL is now mandated. This is a FIPS requirement.
- The [EIO] error is added.

NAME

tcsetattr — set the parameters associated with the terminal

SYNOPSIS

```
#include <termios.h>

int tcsetattr(int fildes, int optional_actions,
    const struct termios *termios_p);
```

DESCRIPTION

The *tcsetattr*( ) function shall set the parameters associated with the terminal referred to by the open file descriptor *fildes* (an open file descriptor associated with a terminal) from the **termios** structure referenced by *termios_p* as follows:

- If *optional_actions* is TCSANOW, the change shall occur immediately.
- If *optional_actions* is TCSADRAIN, the change shall occur after all output written to *fildes* is transmitted. This function should be used when changing parameters that affect output.
- If *optional_actions* is TCSAFLUSH, the change shall occur after all output written to *fildes* is transmitted, and all input so far received but not read shall be discarded before the change is made.

If the output baud rate stored in the **termios** structure pointed to by *termios_p* is the zero baud rate, B0, the modem control lines shall no longer be asserted. Normally, this shall disconnect the line.

If the input baud rate stored in the **termios** structure pointed to by *termios_p* is 0, the input baud rate given to the hardware is the same as the output baud rate stored in the **termios** structure.

The *tcsetattr*( ) function shall return successfully if it was able to perform any of the requested actions, even if some of the requested actions could not be performed. It shall set all the attributes that the implementation supports as requested and leave all the attributes not supported by the implementation unchanged. If no part of the request can be honored, it shall return –1 and set *errno* to [EINVAL]. If the input and output baud rates differ and are a combination that is not supported, neither baud rate shall be changed. A subsequent call to *tcgetattr*( ) shall return the actual state of the terminal device (reflecting both the changes made and not made in the previous *tcsetattr*( ) call). The *tcsetattr*( ) function shall not change the values found in the **termios** structure under any circumstances.

The effect of *tcsetattr*( ) is undefined if the value of the **termios** structure pointed to by *termios_p* was not derived from the result of a call to *tcgetattr*( ) on *fildes*; an application should modify only fields and flags defined by this volume of POSIX.1-200x between the call to *tcgetattr*( ) and *tcsetattr*( ), leaving all other fields and flags unmodified.

No actions defined by this volume of POSIX.1-200x, other than a call to *tcsetattr*( ), a close of the last file descriptor in the system associated with this terminal device, or an open of the first file descriptor in the system associated with this terminal device (using the O_TTY_INIT flag if it is non-zero and the device is not a pseudo-terminal), shall cause any of the terminal attributes defined by this volume of POSIX.1-200x to change.

If *tcsetattr*( ) is called from a process which is a member of a background process group on a *fildes* associated with its controlling terminal:

- If the calling process is blocking or ignoring SIGTTOU signals, the operation completes normally and no signal is sent.

- Otherwise, a SIGTTOU signal shall be sent to the process group.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *tcsetattr*( ) function shall fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

[EINTR] A signal interrupted *tcsetattr*( ).

[EINVAL] The *optional_actions* argument is not a supported value, or an attempt was made to change an attribute represented in the **termios** structure to an unsupported value.

[ENOTTY] The file associated with *fildes* is not a terminal.

The *tcsetattr*( ) function may fail if:

[EIO] The process group of the writing process is orphaned, and the writing process is not ignoring or blocking SIGTTOU.

EXAMPLES

None.

APPLICATION USAGE

If trying to change baud rates, applications should call *tcsetattr*( ) then call *tcgetattr*( ) in order to determine what baud rates were actually selected.

In general, there are two reasons for an application to change the parameters associated with a terminal device:

1. The device already has working parameter settings but the application needs a different behavior, such as non-canonical mode instead of canonical mode. The application sets (or clears) only a few flags or *c_cc*[ ] values. Typically, the terminal device in this case is either the controlling terminal for the process or a pseudo-terminal.
2. The device is a modem or similar piece of equipment connected by a serial line, and it was not open before the application opened it. In this case, the application needs to initialize all of the parameter settings "from scratch". However, since the **termios** structure may include both standard and non-standard parameters, the application cannot just initialize the whole structure in an arbitrary way (e.g., using *memset*( )) as this may cause some of the non-standard parameters to be set incorrectly, resulting in non-conforming behavior of the terminal device. Conversely, the application cannot just set the standard parameters, assuming that the non-standard parameters will already have suitable values, as the device might previously have been used with non-conforming parameter settings (and some implementations retain the settings from one use to the next). The solution is to open the terminal device using the O_TTY_INIT flag to initialize the terminal device to have conforming parameter settings, obtain those settings using *tcgetattr*( ), and then set all of the standard parameters to the desired settings.

RATIONALE

The *tcsetattr*( ) function can be interrupted in the following situations:

- It is interrupted while waiting for output to drain.

66248 • It is called from a process in a background process group and SIGTTOU is caught.

66249 See also the RATIONALE section in *tcgetattr( )*.

66250 **FUTURE DIRECTIONS**

66251 Using an input baud rate of 0 to set the input rate equal to the output rate may not necessarily be
66252 supported in a future version of this volume of POSIX.1-200x.

66253 **SEE ALSO**

66255 XBD Chapter 11 (on page 199), **<termios.h>**

66256 **CHANGE HISTORY**

66257 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

66258 **Issue 6**

66259 The following new requirements on POSIX implementations derive from alignment with the
66260 Single UNIX Specification:

66261 • In the DESCRIPTION, text previously conditional on _POSIX_JOB_CONTROL is now
66262 mandated. This is a FIPS requirement.

66263 • The [EIO] error is added.

66264 In the DESCRIPTION, the text describing use of *tcsetattr( )* from a process which is a member of
66265 a background process group is clarified.

66266 **Issue 7**

66267 Austin Group Interpretation 1003.1-2001 #144 is applied.

66268 **NAME**

66269 tcsetpgrp — set the foreground process group ID

66270 **SYNOPSIS**

66271 `#include <unistd.h>`

66272 `int tcsetpgrp(int fildes, pid_t pgid_id);`

66273 **DESCRIPTION**

66274 If the process has a controlling terminal, *tcsetpgrp*( ) shall set the foreground process group ID
66275 associated with the terminal to *pgid_id*. The application shall ensure that the file associated with
66276 *fildes* is the controlling terminal of the calling process and the controlling terminal is currently
66277 associated with the session of the calling process. The application shall ensure that the value of
66278 *pgid_id* matches a process group ID of a process in the same session as the calling process.

66279 Attempts to use *tcsetpgrp*( ) from a process which is a member of a background process group on
66280 a *fildes* associated with its controlling terminal shall cause the process group to be sent a
66281 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process
66282 shall be allowed to perform the operation, and no signal is sent.

66283 **RETURN VALUE**

66284 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
66285 indicate the error.

66286 **ERRORS**

66287 The *tcsetpgrp*( ) function shall fail if:

66288 [EBADF] The *fildes* argument is not a valid file descriptor.

66289 [EINVAL] This implementation does not support the value in the *pgid_id* argument.

66290 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the
66291 controlling terminal, or the controlling terminal is no longer associated with
66292 the session of the calling process.

66293 [EPERM] The value of *pgid_id* is a value supported by the implementation, but does not
66294 match the process group ID of a process in the same session as the calling
66295 process.

66296 **EXAMPLES**

66297 None.

66298 **APPLICATION USAGE**

66299 None.

66300 **RATIONALE**

66306 XBD **<sys/types.h>**, **<unistd.h>**

66307 **CHANGE HISTORY**

66308 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the DESCRIPTION and ERRORS sections, text previously conditional on _POSIX_JOB_CONTROL is now mandated. This is a FIPS requirement.

The normative text is updated to avoid use of the term "must" for application requirements.

The Open Group Corrigendum U047/4 is applied.

NAME

tdelete, tfind, tsearch, twalk — manage a binary search tree

SYNOPSIS

XSI

```
#include <search.h>

void *tdelete(const void *restrict key, void **restrict rootp,
    int(*compar)(const void *, const void *));
void *tfind(const void *key, void *const *rootp,
    int(*compar)(const void *, const void *));
void *tsearch(const void *key, void **rootp,
    int (*compar)(const void *, const void *));
void twalk(const void *root,
    void (*action)(const void *, VISIT, int));
```

DESCRIPTION

The *tdelete*( ), *tfind*( ), *tsearch*( ), and *twalk*( ) functions manipulate binary search trees. Comparisons are made with a user-supplied routine, the address of which is passed as the *compar* argument. This routine is called with two arguments, which are the pointers to the elements being compared. The application shall ensure that the user-supplied routine returns an integer less than, equal to, or greater than 0, according to whether the first argument is to be considered less than, equal to, or greater than the second argument. The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

The *tsearch*( ) function shall build and access the tree. The *key* argument is a pointer to an element to be accessed or stored. If there is a node in the tree whose element is equal to the value pointed to by *key*, a pointer to this found node shall be returned. Otherwise, the value pointed to by *key* shall be inserted (that is, a new node is created and the value of *key* is copied to this node), and a pointer to this node returned. Only pointers are copied, so the application shall ensure that the calling routine stores the data. The *rootp* argument points to a variable that points to the root node of the tree. A null pointer value for the variable pointed to by *rootp* denotes an empty tree; in this case, the variable shall be set to point to the node which shall be at the root of the new tree.

Like *tsearch*( ), *tfind*( ) shall search for a node in the tree, returning a pointer to it if found. However, if it is not found, *tfind*( ) shall return a null pointer. The arguments for *tfind*( ) are the same as for *tsearch*( ).

The *tdelete*( ) function shall delete a node from a binary search tree. The arguments are the same as for *tsearch*( ). The variable pointed to by *rootp* shall be changed if the deleted node was the root of the tree. The *tdelete*( ) function shall return a pointer to the parent of the deleted node, or an unspecified non-null pointer if the deleted node was the root node, or a null pointer if the node is not found.

If *tsearch*( ) adds an element to a tree, or *tdelete*( ) successfully deletes an element from a tree, the concurrent use of that tree in another thread, or use of pointers produced by a previous call to *tfind*( ) or *tsearch*( ), produces undefined results.

The *twalk*( ) function shall traverse a binary search tree. The *root* argument is a pointer to the root node of the tree to be traversed. (Any node in a tree may be used as the root for a walk below that node.) The argument *action* is the name of a routine to be invoked at each node. This routine is, in turn, called with three arguments. The first argument shall be the address of the node being visited. The structure pointed to by this argument is unspecified and shall not be modified by the application, but it shall be possible to cast a pointer-to-node into a pointer-to-pointer-to-

element to access the element stored in the node. The second argument shall be a value from an enumeration data type:

```
typedef enum { preorder, postorder, endorder, leaf } VISIT;
```

(defined in **<search.h>**), depending on whether this is the first, second, or third time that the node is visited (during a depth-first, left-to-right traversal of the tree), or whether the node is a leaf. The third argument shall be the level of the node in the tree, with the root being level 0.

If the calling function alters the pointer to the root, the result is undefined.

If the functions pointed to by *action* or *compar* (for any of these binary search functions) change the tree, the results are undefined.

These functions are thread-safe only as long as multiple threads do not access the same tree.

RETURN VALUE

If the node is found, both *tsearch*( ) and *tfind*( ) shall return a pointer to it. If not, *tfind*( ) shall return a null pointer, and *tsearch*( ) shall return a pointer to the inserted item.

A null pointer shall be returned by *tsearch*( ) if there is not enough space available to create a new node.

A null pointer shall be returned by *tdelete*( ), *tfind*( ), and *tsearch*( ) if *rootp* is a null pointer on entry.

The *tdelete*( ) function shall return a pointer to the parent of the deleted node, or an unspecified non-null pointer if the deleted node was the root node, or a null pointer if the node is not found.

The *twalk*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

The following code reads in strings and stores structures containing a pointer to each string and a count of its length. It then walks the tree, printing out the stored strings and their lengths in alphabetical order.

```
#include <search.h>
#include <string.h>
#include <stdio.h>

#define STRSZ    10000
#define NODSZ    500

struct node {      /* Pointers to these are stored in the tree. */
    char    *string;
    int     length;
};

char   string_space[STRSZ];  /* Space to store strings. */
struct node nodes[NODSZ];    /* Nodes to store. */
void  *root = NULL;          /* This points to the root. */

int main(int argc, char *argv[])
{
    char   *strptr = string_space;
    struct node    *nodeptr = nodes;
    void   print_node(const void *, VISIT, int);
```

```
        int    i = 0, node_compare(const void *, const void *);

        while (gets(strptr) != NULL && i++ < NODSZ)  {
            /* Set node. */
            nodeptr->string = strptr;
            nodeptr->length = strlen(strptr);
            /* Put node into the tree. */
            (void) tsearch((void *)nodeptr, (void **)&root,
                node_compare);
            /* Adjust pointers, so we do not overwrite tree. */
            strptr += nodeptr->length + 1;
            nodeptr++;
        }
        twalk(root, print_node);
        return 0;
    }

    /*
     *  This routine compares two nodes, based on an
     *  alphabetical ordering of the string field.
     */
    int
    node_compare(const void *node1, const void *node2)
    {
        return strcmp(((const struct node *) node1)->string,
            ((const struct node *) node2)->string);
    }

    /*
     *  This routine prints out a node, the second time
     *  twalk encounters it or if it is a leaf.
     */
    void
    print_node(const void *ptr, VISIT order, int level)
    {
        const struct node *p = *(const struct node **) ptr;

        if (order == postorder || order == leaf)  {
            (void) printf("string = %s,  length = %d\n",
                p->string, p->length);
        }
    }
```

APPLICATION USAGE

The *root* argument to *twalk*( ) is one level of indirection less than the *rootp* arguments to *tdelete*( ) and *tsearch*( ).

There are two nomenclatures used to refer to the order in which tree nodes are visited. The *tsearch*( ) function uses **preorder**, **postorder**, and **endorder** to refer respectively to visiting a node before any of its children, after its left child and before its right, and after both its children. The alternative nomenclature uses **preorder**, **inorder**, and **postorder** to refer to the same visits, which could result in some confusion over the meaning of **postorder**.

Since the return value of *tdelete*( ) is an unspecified non-null pointer in the case that the root of the tree has been deleted, applications should only use the return value of *tdelete*( ) as indication

of success or failure and should not assume it can be dereferenced. Some implementations in this case will return a pointer to the new root of the tree (or to an empty tree if the deleted root node was the only node in the tree); other implementations return arbitrary non-null pointers.

RATIONALE

None.

FUTURE DIRECTIONS

None.

66484 telldir — current location of a named directory stream

66485 **SYNOPSIS**

66486 XSI
```
#include <dirent.h>

long telldir(DIR *dirp);
```

66487

66488 **DESCRIPTION**

66489 The *telldir*( ) function shall obtain the current location associated with the directory stream
66490 specified by *dirp*.

66491 If the most recent operation on the directory stream was a *seekdir*( ), the directory position
66492 returned from the *telldir*( ) shall be the same as that supplied as a *loc* argument for *seekdir*( ).

66493 **RETURN VALUE**

66494 Upon successful completion, *telldir*( ) shall return the current location of the specified directory
66495 stream.

66496 **ERRORS**

66497 No errors are defined.

66498 **EXAMPLES**

66499 None.

66500 **APPLICATION USAGE**

66501 None.

66502 **RATIONALE**

66503 None.

66504 **FUTURE DIRECTIONS**

66505 None.

NAME

tempnam — create a name for a temporary file

SYNOPSIS

OB XSI
```
#include <stdio.h>

char *tempnam(const char *dir, const char *pfx);
```

DESCRIPTION

The *tempnam*( ) function shall generate a pathname that may be used for a temporary file.

The *tempnam*( ) function allows the user to control the choice of a directory. The *dir* argument points to the name of the directory in which the file is to be created. If *dir* is a null pointer or points to a string which is not a name for an appropriate directory, the path prefix defined as P_tmpdir in the **<stdio.h>** header shall be used. If that directory is not accessible, an implementation-defined directory may be used.

Many applications prefer their temporary files to have certain initial letter sequences in their names. The *pfx* argument should be used for this. This argument may be a null pointer or point to a string of up to five bytes to be used as the beginning of the filename.

Some implementations of *tempnam*( ) may use *tmpnam*( ) internally. On such implementations, if called more than {TMP_MAX} times in a single process, the behavior is implementation-defined.

RETURN VALUE

Upon successful completion, *tempnam*( ) shall allocate space for a string, put the generated pathname in that space, and return a pointer to it. The pointer shall be suitable for use in a subsequent call to *free*( ). Otherwise, it shall return a null pointer and set *errno* to indicate the error.

ERRORS

The *tempnam*( ) function shall fail if:

[ENOMEM] Insufficient storage space is available.

EXAMPLES

Generating a Pathname

The following example generates a pathname for a temporary file in directory **/tmp**, with the prefix *file*. After the filename has been created, the call to *free*( ) deallocates the space used to store the filename.

```
#include <stdio.h>
#include <stdlib.h>
...
char *directory = "/tmp";
char *fileprefix = "file";
char *file;

file = tempnam(directory, fileprefix);
free(file);
```

APPLICATION USAGE

This function only creates pathnames. It is the application's responsibility to create and remove the files. Between the time a pathname is created and the file is opened, it is possible for some other process to create a file with the same name. Applications may find *tmpfile*( ) more useful.

Applications should use the *tmpfile*( ), *mkdtemp*( ), or *mkstemp*( ) functions instead of the

obsolescent *tempnam*( ) function.

RATIONALE

None.

FUTURE DIRECTIONS

The *tempnam*( ) function may be removed in a future version.

SEE ALSO

fopen( ), *free*( ), *open*( ), *tmpfile*( ), *tmpnam*( ), *unlink*( )

XBD **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in previous issues.

Issue 7

The *tempnam*( ) function is marked obsolescent.

NAME

tfind — search binary search tree

SYNOPSIS

XSI

```
#include <search.h>

void *tfind(const void *key, void *const *rootp,
    int (*compar)(const void *, const void *));
```

DESCRIPTION

Refer to *tdelete( )*.

66577 **NAME**

66578 tgamma, tgammaf, tgammal — compute gamma( ) function

66579 **SYNOPSIS**

66580
```
#include <math.h>
```

66581
```
double tgamma(double x);
```
66582
```
float tgammaf(float x);
```
66583
```
long double tgammal(long double x);
```

66584 **DESCRIPTION**

66585 CX The functionality described on this reference page is aligned with the ISO C standard. Any
66586 conflict between the requirements described here and the ISO C standard is unintentional. This
66587 volume of POSIX.1-200x defers to the ISO C standard.

66588 These functions shall compute the *gamma*( ) function of *x*.

66589 An application wishing to check for error situations should set *errno* to zero and call
66590 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
66591 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
66592 zero, an error has occurred.

66593 **RETURN VALUE**

66594 Upon successful completion, these functions shall return *Gamma*(*x*).

66595 CX If *x* is a negative integer, a domain error may occur and either a NaN (if supported) or an
66596 MX implementation-defined value shall be returned. On systems that support the IEC 60559
66597 Floating-Point option, a domain error shall occur and a NaN shall be returned.

66598 If *x* is ±0, *tgamma*( ), *tgammaf*( ), and *tgammal*( ) shall return ±HUGE_VAL, ±HUGE_VALF, and
66599 MX ±HUGE_VALL, respectively. On systems that support the IEC 60559 Floating-Point option, a
66600 pole error shall occur;
66601 CX otherwise, a pole error may occur.

66602 If the correct value would cause overflow, a range error shall occur and *tgamma*( ), *tgammaf*( ),
66603 and *tgammal*( ) shall return ±HUGE_VAL, ±HUGE_VALF, or ±HUGE_VALL, respectively, with
66604 the same sign as the correct value of the function.

66605 MX If *x* is NaN, a NaN shall be returned.

66606 If *x* is +Inf, *x* shall be returned.

66607 If *x* is –Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-
66608 defined value shall be returned.

66609 **ERRORS**

66610 These functions shall fail if:

66611 MX Domain Error — The value of *x* is a negative integer, or *x* is –Inf.

66612 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
66613 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
66614 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
66615 shall be raised.

66616 MX Pole Error — The value of *x* is zero.

66617 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
66618 then *errno* shall be set to [ERANGE]. If the integer expression
66619 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
66620 floating-point exception shall be raised.

66621 Range Error — The value overflows.

66622 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
66623 then *errno* shall be set to [ERANGE]. If the integer expression
66624 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
66625 floating-point exception shall be raised.

66626 These functions may fail if:

66627 Domain Error — The value of *x* is a negative integer.

66628 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
66629 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
66630 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
66631 shall be raised.

66632 Pole Error — The value of *x* is zero.

66633 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
66634 then *errno* shall be set to [ERANGE]. If the integer expression
66635 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
66636 floating-point exception shall be raised.

66637 **EXAMPLES**

66638 None.

66639 **APPLICATION USAGE**

66640 For IEEE Std 754-1985 **double**, overflow happens when $0 < x < 1/\text{DBL\_MAX}$, and $171.7 < x$.

66641 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
66642 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

66643 **RATIONALE**

66644 This function is named *tgamma*( ) in order to avoid conflicts with the historical *gamma*( ) and
66645 *lgamma*( ) functions.

66646 **FUTURE DIRECTIONS**

66647 It is possible that the error response for a negative integer argument may be changed to a pole
66648 error and a return value of ±Inf.

66649 **SEE ALSO**

66650 *feclearexcept*( ), *fetestexcept*( ), *lgamma*( )

66651 XBD Section 4.19 (on page 116), **<math.h>**

66652 **CHANGE HISTORY**

66653 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

66654 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/65 is applied, correcting the third
66655 paragraph in the RETURN VALUE section.

66656 **Issue 7**

66657 ISO/IEC 9899: 1999 standard, Technical Corrigendum 2 #52 (SD5-XSH-ERN-85) is applied.

66658 **NAME**

66659 time — get time

66660 **SYNOPSIS**

66661
```
#include <time.h>
```

66662
```
time_t time(time_t *tloc);
```

66663 **DESCRIPTION**

66664 CX The functionality described on this reference page is aligned with the ISO C standard. Any
66665 conflict between the requirements described here and the ISO C standard is unintentional. This
66666 volume of POSIX.1-200x defers to the ISO C standard.

66667 CX The *time*( ) function shall return the value of time in seconds since the Epoch.

66668 The *tloc* argument points to an area where the return value is also stored. If *tloc* is a null pointer,
66669 no value is stored.

66670 **RETURN VALUE**

66671 Upon successful completion, *time*( ) shall return the value of time. Otherwise, (**time_t**)–1 shall be
66672 returned.

66673 **ERRORS**

66674 No errors are defined.

66675 **EXAMPLES**

66676 **Getting the Current Time**

66677 The following example uses the *time*( ) function to calculate the time elapsed, in seconds, since
66678 the Epoch, *localtime*( ) to convert that value to a broken-down time, and *asctime*( ) to convert the
66679 broken-down time values into a printable string.

66680
```
#include <stdio.h>
#include <time.h>
```

66682
```
int main(void)
{
time_t result;
```

66685
```
    result = time(NULL);
    printf("%s%ju secs since the Epoch\n",
        asctime(localtime(&result)),
            (uintmax_t)result);
    return(0);
}
```

66691 This example writes the current time to *stdout* in a form like this:

66692
```
Wed Jun 26 10:32:15 1996
835810335 secs since the Epoch
```

66694 **Timing an Event**

66695 The following example gets the current time, prints it out in the user's format, and prints the
66696 number of minutes to an event being timed.

```
66697 #include <time.h>
66698 #include <stdio.h>
66699 ...
66700 time_t now;
66701 int minutes_to_event;
66702 ...
66703 time(&now);
66704 minutes_to_event = ...;
66705 printf("The time is ");
66706 puts(asctime(localtime(&now)));
66707 printf("There are %d minutes to the event.\n",
66708     minutes_to_event);
66709 ...
```

66710 ## APPLICATION USAGE

66711 None.

66712 ## RATIONALE

66713 The *time*( ) function returns a value in seconds (type **time_t**) while *times*( ) returns a set of values
66714 in clock ticks (type **clock_t**). Some historical implementations, such as 4.3 BSD, have
66715 mechanisms capable of returning more precise times (see below). A generalized timing scheme
66716 to unify these various timing mechanisms has been proposed but not adopted.

66717 Implementations in which **time_t** is a 32-bit signed integer (many historical implementations)
66718 fail in the year 2038. POSIX.1-200x does not address this problem. However, the use of the **time_t**
66719 type is mandated in order to ease the eventual fix.

66720 The use of the **<time.h>** header instead of **<sys/types.h>** allows compatibility with the ISO C
66721 standard.

66722 Many historical implementations (including Version 7) and the 1984 /usr/group standard use
66723 **long** instead of **time_t**. This volume of POSIX.1-200x uses the latter type in order to agree with
66724 the ISO C standard.

66725 4.3 BSD includes *time*( ) only as an alternate function to the more flexible *gettimeofday*( ) function.

66726 ## FUTURE DIRECTIONS

66727 In a future version of this volume of POSIX.1-200x, **time_t** is likely to be required to be capable
66728 of representing times far in the future. Whether this will be mandated as a 64-bit type or a
66729 requirement that a specific date in the future be representable (for example, 10000 AD) is not yet
66730 determined. Systems purchased after the approval of this volume of POSIX.1-200x should be
66731 evaluated to determine whether their lifetime will extend past 2038.

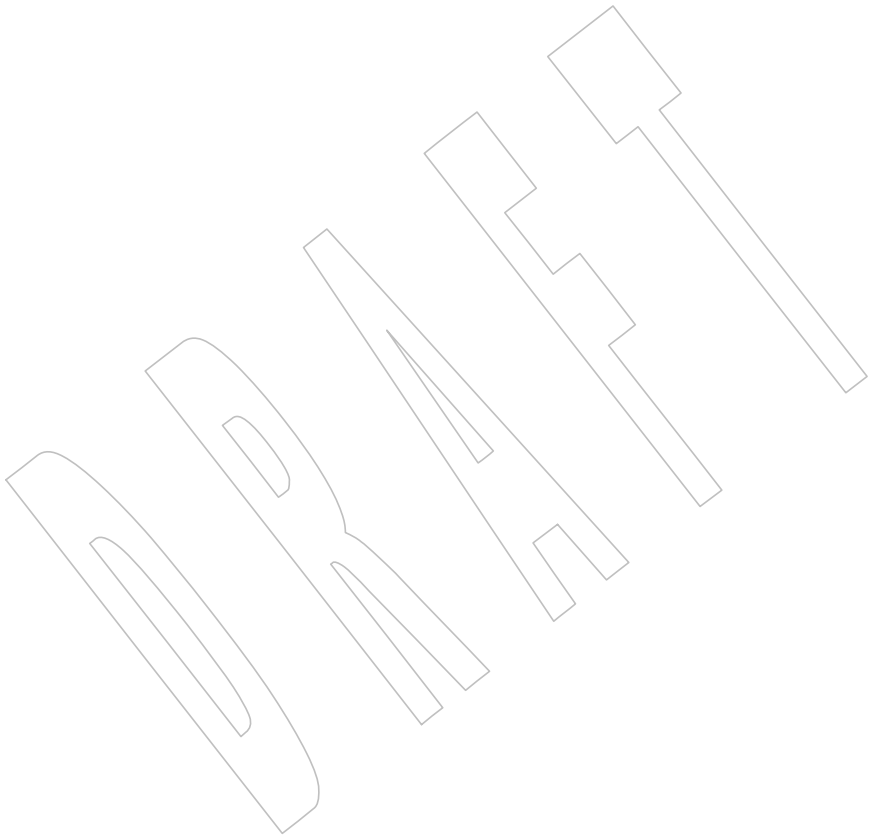
66736 **CHANGE HISTORY**

66737 First released in Issue 1. Derived from Issue 1 of the SVID.

66738 **Issue 6**

66739 Extensions beyond the ISO C standard are marked.

66740 The EXAMPLES, RATIONALE, and FUTURE DIRECTIONS sections are added.



NAME

timer_create — create a per-process timer

SYNOPSIS

CX
```
#include <signal.h>
#include <time.h>

int timer_create(clockid_t clockid, struct sigevent *restrict evp,
    timer_t *restrict timerid);
```

DESCRIPTION

The *timer_create*( ) function shall create a per-process timer using the specified clock, *clock_id*, as the timing base. The *timer_create*( ) function shall return, in the location referenced by *timerid*, a timer ID of type **timer_t** used to identify the timer in timer requests. This timer ID shall be unique within the calling process until the timer is deleted. The particular clock, *clock_id*, is defined in **<time.h>**. The timer whose ID is returned shall be in a disarmed state upon return from *timer_create*( ).

The *evp* argument, if non-NULL, points to a **sigevent** structure. This structure, allocated by the application, defines the asynchronous notification to occur as specified in Section 2.4.1 (on page 484) when the timer expires. If the *evp* argument is NULL, the effect is as if the *evp* argument pointed to a **sigevent** structure with the *sigev_notify* member having the value SIGEV_SIGNAL, the *sigev_signo* having a default signal number, and the *sigev_value* member having the value of the timer ID.

Each implementation shall define a set of clocks that can be used as timing bases for per-process timers. All implementations shall support a *clock_id* of CLOCK_REALTIME. MON If the Monotonic Clock option is supported, implementations shall support a *clock_id* of CLOCK_MONOTONIC.

Per-process timers shall not be inherited by a child process across a *fork*( ) and shall be disarmed and deleted by an *exec*.

CPT If _POSIX_CPUTIME is defined, implementations shall support *clock_id* values representing the CPU-time clock of the calling process.

TCT If _POSIX_THREAD_CPUTIME is defined, implementations shall support *clock_id* values representing the CPU-time clock of the calling thread.

CPT | TCT It is implementation-defined whether a *timer_create*( ) function will succeed if the value defined by *clock_id* corresponds to the CPU-time clock of a process or thread different from the process or thread invoking the function.

TSA If *evp*–>*sigev_sigev_notify* is SIGEV_THREAD and *sev*–>*sigev_notify_attributes* is not NULL, if the attribute pointed to by *sev*–>*sigev_notify_attributes* has a thread stack address specified by a call to *pthread_attr_setstack*( ), the results are unspecified if the signal is generated more than once.

RETURN VALUE

If the call succeeds, *timer_create*( ) shall return zero and update the location referenced by *timerid* to a **timer_t**, which can be passed to the per-process timer calls. If an error occurs, the function shall return a value of –1 and set *errno* to indicate the error. The value of *timerid* is undefined if an error occurs.

ERRORS

The *timer_create*( ) function shall fail if:

[EAGAIN] The system lacks sufficient signal queuing resources to honor the request.

[EAGAIN] The calling process has already created all of the timers it is allowed by this implementation.

[EINVAL] The specified clock ID is not defined.

CPT | TCT [ENOTSUP] The implementation does not support the creation of a timer attached to the CPU-time clock that is specified by *clock_id* and associated with a process or thread different from the process or thread invoking *timer_create*( ).

EXAMPLES

None.

APPLICATION USAGE

If a timer is created which has *evp–>sigev_sigev_notify* set to SIGEV_THREAD and the attribute pointed to by *evp–>sigev_notify_attributes* has a thread stack address specified by a call to *pthread_attr_setstack*( ), the memory dedicated as a thread stack cannot be recovered. The reason for this is that the threads created in response to a timer expiration are created detached, or in an unspecified way if the thread attribute's *detachstate* is PTHREAD_CREATE_JOINABLE. In neither case is it valid to call *pthread_join*( ), which makes it impossible to determine the lifetime of the created thread which thus means the stack memory cannot be reused.

RATIONALE

Periodic Timer Overrun and Resource Allocation

The specified timer facilities may deliver realtime signals (that is, queued signals) on implementations that support this option. Since realtime applications cannot afford to lose notifications of asynchronous events, like timer expirations or asynchronous I/O completions, it must be possible to ensure that sufficient resources exist to deliver the signal when the event occurs. In general, this is not a difficulty because there is a one-to-one correspondence between a request and a subsequent signal generation. If the request cannot allocate the signal delivery resources, it can fail the call with an [EAGAIN] error.

Periodic timers are a special case. A single request can generate an unspecified number of signals. This is not a problem if the requesting process can service the signals as fast as they are generated, thus making the signal delivery resources available for delivery of subsequent periodic timer expiration signals. But, in general, this cannot be assured—processing of periodic timer signals may "overrun"; that is, subsequent periodic timer expirations may occur before the currently pending signal has been delivered.

Also, for signals, according to the POSIX.1-1990 standard, if subsequent occurrences of a pending signal are generated, it is implementation-defined whether a signal is delivered for each occurrence. This is not adequate for some realtime applications. So a mechanism is required to allow applications to detect how many timer expirations were delayed without requiring an indefinite amount of system resources to store the delayed expirations.

The specified facilities provide for an overrun count. The overrun count is defined as the number of extra timer expirations that occurred between the time a timer expiration signal is generated and the time the signal is delivered. The signal-catching function, if it is concerned with overruns, can retrieve this count on entry. With this method, a periodic timer only needs one "signal queuing resource" that can be allocated at the time of the *timer_create*( ) function call.

A function is defined to retrieve the overrun count so that an application need not allocate static storage to contain the count, and an implementation need not update this storage asynchronously on timer expirations. But, for some high-frequency periodic applications, the overhead of an additional system call on each timer expiration may be prohibitive. The functions, as defined, permit an implementation to maintain the overrun count in user space,

66830 associated with the *timerid*. The *timer_getoverrun*( ) function can then be implemented as a macro
66831 that uses the *timerid* argument (which may just be a pointer to a user space structure containing
66832 the counter) to locate the overrun count with no system call overhead. Other implementations,
66833 less concerned with this class of applications, can avoid the asynchronous update of user space
66834 by maintaining the count in a system structure at the cost of the extra system call to obtain it.

66835 **Timer Expiration Signal Parameters**

66836 The Realtime Signals Extension option supports an application-specific datum that is delivered
66837 to the extended signal handler. This value is explicitly specified by the application, along with
66838 the signal number to be delivered, in a **sigevent** structure. The type of the application-defined
66839 value can be either an integer constant or a pointer. This explicit specification of the value, as
66840 opposed to always sending the timer ID, was selected based on existing practice.

66841 It is common practice for realtime applications (on non-POSIX systems or realtime extended
66842 POSIX systems) to use the parameters of event handlers as the case label of a switch statement or
66843 as a pointer to an application-defined data structure. Since *timer_id*s are dynamically allocated
66844 by the *timer_create*( ) function, they can be used for neither of these functions without additional
66845 application overhead in the signal handler; for example, to search an array of saved timer IDs to
66846 associate the ID with a constant or application data structure.

66847 **FUTURE DIRECTIONS**

66848 None.

66851 XBD **<signal.h>**, **<time.h>**

66852 **CHANGE HISTORY**

66853 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

66854 **Issue 6**

66855 The *timer_create*( ) function is marked as part of the Timers option.

66856 The [ENOSYS] error condition has been removed as stubs need not be provided if an
66857 implementation does not support the Timers option.

66858 CPU-time clocks are added for alignment with IEEE Std 1003.1d-1999.

66859 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding the
66860 requirement for the CLOCK_MONOTONIC clock under the Monotonic Clock option.

66861 The **restrict** keyword is added to the *timer_create*( ) prototype for alignment with the
66862 ISO/IEC 9899:1999 standard.

66863 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/138 is applied, updating the
66864 DESCRIPTION and APPLICATION USAGE sections to describe the case when a timer is created
66865 with the notification method set to SIGEV_THREAD.

66866 **Issue 7**

66867 The *timer_create*( ) function is moved from the Timers option to the Base.

66868 **NAME**

66869 timer_delete — delete a per-process timer

66870 **SYNOPSIS**

66871 CX
```
#include <time.h>
```

66872
```
int timer_delete(timer_t timerid);
```

66873 **DESCRIPTION**

66874 The *timer_delete*( ) function deletes the specified timer, *timerid*, previously created by the
66875 *timer_create*( ) function. If the timer is armed when *timer_delete*( ) is called, the behavior shall be
66876 as if the timer is automatically disarmed before removal. The disposition of pending signals for
66877 the deleted timer is unspecified.

66878 **RETURN VALUE**

66879 If successful, the *timer_delete*( ) function shall return a value of zero. Otherwise, the function shall
66880 return a value of –1 and set *errno* to indicate the error.

66881 **ERRORS**

66882 The *timer_delete*( ) function may fail if:

66883 [EINVAL] The timer ID specified by *timerid* is not a valid timer ID.

66884 **EXAMPLES**

66885 None.

66886 **APPLICATION USAGE**

66887 None.

66888 **RATIONALE**

66889 None.

66890 **FUTURE DIRECTIONS**

66895 **CHANGE HISTORY**

66896 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

66897 **Issue 6**

66898 The *timer_delete*( ) function is marked as part of the Timers option.

66899 The [ENOSYS] error condition has been removed as stubs need not be provided if an
66900 implementation does not support the Timers option.

66901 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/139 is applied, updating the ERRORS
66902 section so that the [EINVAL] error becomes optional.

66903 **Issue 7**

66904 The *timer_delete*( ) function is moved from the Timers option to the Base.

NAME

timer_getoverrun, timer_gettime, timer_settime — per-process timers

SYNOPSIS

CX
```
#include <time.h>

int timer_getoverrun(timer_t timerid);
int timer_gettime(timer_t timerid, struct itimerspec *value);
int timer_settime(timer_t timerid, int flags,
    const struct itimerspec *restrict value,
    struct itimerspec *restrict ovalue);
```

DESCRIPTION

The *timer_gettime*( ) function shall store the amount of time until the specified timer, *timerid*, expires and the reload value of the timer into the space pointed to by the *value* argument. The *it_value* member of this structure shall contain the amount of time before the timer expires, or zero if the timer is disarmed. This value is returned as the interval until timer expiration, even if the timer was armed with absolute time. The *it_interval* member of *value* shall contain the reload value last set by *timer_settime*( ).

The *timer_settime*( ) function shall set the time until the next expiration of the timer specified by *timerid* from the *it_value* member of the *value* argument and arm the timer if the *it_value* member of *value* is non-zero. If the specified timer was already armed when *timer_settime*( ) is called, this call shall reset the time until next expiration to the *value* specified. If the *it_value* member of *value* is zero, the timer shall be disarmed. The effect of disarming or resetting a timer with pending expiration notifications is unspecified.

If the flag TIMER_ABSTIME is not set in the argument *flags*, *timer_settime*( ) shall behave as if the time until next expiration is set to be equal to the interval specified by the *it_value* member of *value*. That is, the timer shall expire in *it_value* nanoseconds from when the call is made. If the flag TIMER_ABSTIME is set in the argument *flags*, *timer_settime*( ) shall behave as if the time until next expiration is set to be equal to the difference between the absolute time specified by the *it_value* member of *value* and the current value of the clock associated with *timerid*. That is, the timer shall expire when the clock reaches the value specified by the *it_value* member of *value*. If the specified time has already passed, the function shall succeed and the expiration notification shall be made.

The reload value of the timer shall be set to the value specified by the *it_interval* member of *value*. When a timer is armed with a non-zero *it_interval*, a periodic (or repetitive) timer is specified.

Time values that are between two consecutive non-negative integer multiples of the resolution of the specified timer shall be rounded up to the larger multiple of the resolution. Quantization error shall not cause the timer to expire earlier than the rounded time value.

If the argument *ovalue* is not NULL, the *timer_settime*( ) function shall store, in the location referenced by *ovalue*, a value representing the previous amount of time before the timer would have expired, or zero if the timer was disarmed, together with the previous timer reload value. Timers shall not expire before their scheduled time.

Only a single signal shall be queued to the process for a given timer at any point in time. When a timer for which a signal is still pending expires, no signal shall be queued, and a timer overrun shall occur. When a timer expiration signal is delivered to or accepted by a process, the *timer_getoverrun*( ) function shall return the timer expiration overrun count for the specified timer. The overrun count returned contains the number of extra timer expirations that occurred between the time the signal was generated (queued) and when it was delivered or accepted, up

to but not including an implementation-defined maximum of {DELAYTIMER_MAX}. If the number of such extra expirations is greater than or equal to {DELAYTIMER_MAX}, then the overrun count shall be set to {DELAYTIMER_MAX}. The value returned by *timer_getoverrun*( ) shall apply to the most recent expiration signal delivery or acceptance for the timer. If no expiration signal has been delivered for the timer, the return value of *timer_getoverrun*( ) is unspecified.

RETURN VALUE

If the *timer_getoverrun*( ) function succeeds, it shall return the timer expiration overrun count as explained above.

If the *timer_gettime*( ) or *timer_settime*( ) functions succeed, a value of 0 shall be returned.

If an error occurs for any of these functions, the value –1 shall be returned, and *errno* set to indicate the error.

ERRORS

The *timer_settime*( ) function shall fail if:

[EINVAL] A *value* structure specified a nanosecond value less than zero or greater than or equal to 1 000 million, and the *it_value* member of that structure did not specify zero seconds and nanoseconds.

These functions may fail if:

[EINVAL] The *timerid* argument does not correspond to an ID returned by *timer_create*( ) but not yet deleted by *timer_delete*( ).

The *timer_settime*( ) function may fail if:

[EINVAL] The *it_interval* member of *value* is not zero and the timer was created with notification by creation of a new thread (*sigev_sigev_notify* was SIGEV_THREAD) and a fixed stack address has been set in the thread attribute pointed to by *sigev_notify_attributes*.

EXAMPLES

None.

APPLICATION USAGE

Using fixed stack addresses is problematic when timer expiration is signaled by the creation of a new thread. Since it cannot be assumed that the thread created for one expiration is finished before the next expiration of the timer, it could happen that two threads use the same memory as a stack at the same time. This is invalid and produces undefined results.

RATIONALE

Practical clocks tick at a finite rate, with rates of 100 hertz and 1 000 hertz being common. The inverse of this tick rate is the clock resolution, also called the clock granularity, which in either case is expressed as a time duration, being 10 milliseconds and 1 millisecond respectively for these common rates. The granularity of practical clocks implies that if one reads a given clock twice in rapid succession, one may get the same time value twice; and that timers must wait for the next clock tick after the theoretical expiration time, to ensure that a timer never returns too soon. Note also that the granularity of the clock may be significantly coarser than the resolution of the data format used to set and get time and interval values. Also note that some implementations may choose to adjust time and/or interval values to exactly match the ticks of the underlying clock.

This volume of POSIX.1-200x defines functions that allow an application to determine the implementation-supported resolution for the clocks and requires an implementation to

document the resolution supported for timers and *nanosleep*( ) if they differ from the supported clock resolution. This is more of a procurement issue than a runtime application issue.

FUTURE DIRECTIONS

None.

XBD **<time.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *timer_getoverrun*( ), *timer_gettime*( ), and *timer_settime*( ) functions are marked as part of the Timers option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.

The [EINVAL] error condition is updated to include the following: "and the *it_value* member of that structure did not specify zero seconds and nanoseconds." This change is for IEEE PASC Interpretation 1003.1 #89.

The DESCRIPTION for *timer_getoverrun*( ) is updated to clarify that "If no expiration signal has been delivered for the timer, or if the Realtime Signals Extension is not supported, the return value of *timer_getoverrun*( ) is unspecified".

The **restrict** keyword is added to the *timer_settime*( ) prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/140 is applied, updating the ERRORS section so that the mandatory [EINVAL] error ("The *timerid* argument does not correspond to an ID returned by *timer_create*( ) but not yet deleted by *timer_delete*( )") becomes optional.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/141 is applied, updating the ERRORS section to include an optional [EINVAL] error for the case when a timer is created with the notification method set to SIGEV_THREAD. APPLICATION USAGE text is also added.

Issue 7

The *timer_getoverrun*( ), *timer_gettime*( ), and *timer_settime*( ) functions are moved from the Timers option to the Base.

Functionality relating to the Realtime Signals Extension option is moved to the Base.

67029 **NAME**

67030 times — get process and waited-for child process times

67031 **SYNOPSIS**

67032 `#include <sys/times.h>`

67033 `clock_t times(struct tms *buffer);`

67034 **DESCRIPTION**

67035 The *times*( ) function shall fill the **tms** structure pointed to by *buffer* with time-accounting
67036 information. The **tms** structure is defined in **<sys/times.h>**.

67037 All times are measured in terms of the number of clock ticks used.

67038 The times of a terminated child process shall be included in the *tms_cutime* and *tms_cstime*
67039 elements of the parent when *wait*( ), *waitid*( ), or *waitpid*( ) returns the process ID of this
67040 terminated child. If a child process has not waited for its children, their times shall not be
67041 included in its times.

67042 • The *tms_utime* structure member is the CPU time charged for the execution of user
67043 instructions of the calling process.

67044 • The *tms_stime* structure member is the CPU time charged for execution by the system on
67045 behalf of the calling process.

67046 • The *tms_cutime* structure member is the sum of the *tms_utime* and *tms_cutime* times of the
67047 child processes.

67048 • The *tms_cstime* structure member is the sum of the *tms_stime* and *tms_cstime* times of the
67049 child processes.

67050 **RETURN VALUE**

67051 Upon successful completion, *times*( ) shall return the elapsed real time, in clock ticks, since an
67052 arbitrary point in the past (for example, system start-up time). This point does not change from
67053 one invocation of *times*( ) within the process to another. The return value may overflow the
67054 possible range of type **clock_t**. If *times*( ) fails, (**clock_t**)–1 shall be returned and *errno* set to
67055 indicate the error.

67056 **ERRORS**

67057 No errors are defined.

67058 **EXAMPLES**

67059 **Timing a Database Lookup**

67060 The following example defines two functions, *start_clock*( ) and *end_clock*( ), that are used to time
67061 a lookup. It also defines variables of type **clock_t** and **tms** to measure the duration of
67062 transactions. The *start_clock*( ) function saves the beginning times given by the *times*( ) function.
67063 The *end_clock*( ) function gets the ending times and prints the difference between the two times.

```
67064 #include <sys/times.h>
67065 #include <stdio.h>
67066 ...
67067 void start_clock(void);
67068 void end_clock(char *msg);
67069 ...
67070 static clock_t st_time;
67071 static clock_t en_time;
67072 static struct tms st_cpu;
```

```
67073       static struct tms en_cpu;
67074       ...
67075       void
67076       start_clock()
67077       {
67078           st_time = times(&st_cpu);
67079       }

67080       /* This example assumes that the result of each subtraction
67081          is within the range of values that can be represented in
67082          an integer type. */
67083       void
67084       end_clock(char *msg)
67085       {
67086           en_time = times(&en_cpu);

67087           fputs(msg,stdout);
67088           printf("Real Time: %jd, User Time %jd, System Time %jd\n",
67089               (intmax_t)(en_time - st_time),
67090               (intmax_t)(en_cpu.tms_utime - st_cpu.tms_utime),
67091               (intmax_t)(en_cpu.tms_stime - st_cpu.tms_stime));
67092       }
```

67093 **APPLICATION USAGE**

67094 Applications should use *sysconf*(_SC_CLK_TCK) to determine the number of clock ticks per
67095 second as it may vary from system to system.

67096 **RATIONALE**

67097 The accuracy of the times reported is intentionally left unspecified to allow implementations
67098 flexibility in design, from uniprocessor to multi-processor networks.

67099 The inclusion of times of child processes is recursive, so that a parent process may collect the
67100 total times of all of its descendants. But the times of a child are only added to those of its parent
67101 when its parent successfully waits on the child. Thus, it is not guaranteed that a parent process
67102 can always see the total times of all its descendants; see also the discussion of the term
67103 "realtime" in *alarm*( ).

67104 If the type **clock_t** is defined to be a signed 32-bit integer, it overflows in somewhat more than a
67105 year if there are 60 clock ticks per second, or less than a year if there are 100. There are individual
67106 systems that run continuously for longer than that. This volume of POSIX.1-200x permits an
67107 implementation to make the reference point for the returned value be the start-up time of the
67108 process, rather than system start-up time.

67109 The term "charge" in this context has nothing to do with billing for services. The operating
67110 system accounts for time used in this way. That information must be correct, regardless of how
67111 that information is used.

67112 **FUTURE DIRECTIONS**

67113 None.

67114 **SEE ALSO**

67115 *alarm*( ), *exec*, *fork*( ), *sysconf*( ), *time*( ), *wait*( ), *waitid*( )

NAME

tmpfile — create a temporary file

SYNOPSIS

```
#include <stdio.h>

FILE *tmpfile(void);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *tmpfile*( ) function shall create a temporary file and open a corresponding stream. The file shall be automatically deleted when all references to the file are closed. The file is opened as in *fopen*( ) for update (*w*+), except that implementations may restrict the permissions, either by clearing the file mode bits or setting them to the value S_IRUSR | S_IWUSR.

CX In some implementations, a permanent file may be left behind if the process calling *tmpfile*( ) is killed while it is processing a call to *tmpfile*( ).

An error message may be written to standard error if the stream cannot be opened.

RETURN VALUE

Upon successful completion, *tmpfile*( ) shall return a pointer to the stream of the file that is created. Otherwise, it shall return a null pointer CX and set *errno* to indicate the error.

ERRORS

The *tmpfile*( ) function shall fail if:

CX [EINTR] A signal was caught during *tmpfile*( ).

CX [EMFILE] All file descriptors available to the process are currently open.

CX [EMFILE] {STREAM_MAX} streams are currently open in the calling process.

CX [ENFILE] The maximum allowable number of files is currently open in the system.

CX [ENOSPC] The directory or file system which would contain the new file cannot be expanded.

CX [EOVERFLOW] The file is a regular file and the size of the file cannot be represented correctly in an object of type **off_t**.

The *tmpfile*( ) function may fail if:

CX [EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

CX [ENOMEM] Insufficient storage space is available.

EXAMPLES

Creating a Temporary File

The following example creates a temporary file for update, and returns a pointer to a stream for the created file in the *fp* variable.

```
#include <stdio.h>
...
FILE *fp;

fp = tmpfile ();
```

67166 **APPLICATION USAGE**

67167 It should be possible to open at least {TMP_MAX} temporary files during the lifetime of the
67168 program (this limit may be shared with *tmpnam*( )) and there should be no limit on the number
67169 simultaneously open other than this limit and any limit on the number of open file descriptors
67170 or streams ({OPEN_MAX}, {FOPEN_MAX}, {STREAM_MAX}).

67171 **RATIONALE**

67172 None.

67173 **FUTURE DIRECTIONS**

67174 None.

67175 **SEE ALSO**

67176 *fopen*( ), *mkdtemp*( ), *tmpnam*( ), *unlink*( )

67177 XBD **<stdio.h>**

67178 **CHANGE HISTORY**

67179 First released in Issue 1. Derived from Issue 1 of the SVID.

67180 **Issue 5**

67181 Large File Summit extensions are added.

67182 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes
67183 in previous issues.

67184 **Issue 6**

67185 Extensions beyond the ISO C standard are marked.

67186 The following new requirements on POSIX implementations derive from alignment with the
67187 Single UNIX Specification:

67188 • In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support
67189 large files.

67190 • The [EMFILE] optional error condition is added.

67191 The APPLICATION USAGE section is added for alignment with the ISO/IEC 9899:1999
67192 standard.

67193 **Issue 7**

67194 Austin Group Interpretation 1003.1-2001 #025 is applied, clarifying that implementations may
67195 restrict the permissions of the file created.

67196 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

67197 SD5-XSH-ERN-149 is applied, adding the mandatory [EMFILE] error condition for
67198 {STREAM_MAX} streams open.

NAME

tmpnam — create a name for a temporary file

SYNOPSIS

OB
```
#include <stdio.h>

char *tmpnam(char *s);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *tmpnam*( ) function shall generate a string that is a valid filename and that is not the same as the name of an existing file. The function is potentially capable of generating {TMP_MAX} different strings, but any or all of them may already be in use by existing files and thus not be suitable return values.

The *tmpnam*( ) function generates a different string each time it is called from the same process, up to {TMP_MAX} times. If it is called more than {TMP_MAX} times, the behavior is implementation-defined.

The implementation shall behave as if no function defined in this volume of POSIX.1-200x, except *tempnam*( ), calls *tmpnam*( ).

CX The *tmpnam*( ) function need not be thread-safe if called with a NULL parameter.

RETURN VALUE

Upon successful completion, *tmpnam*( ) shall return a pointer to a string. If no suitable string can be generated, the *tmpnam*( ) function shall return a null pointer.

If the argument *s* is a null pointer, *tmpnam*( ) shall leave its result in an internal static object and return a pointer to that object. Subsequent calls to *tmpnam*( ) may modify the same object. If the argument *s* is not a null pointer, it is presumed to point to an array of at least L_tmpnam **char**s; *tmpnam*( ) shall write its result in that array and shall return the argument as its value.

ERRORS

No errors are defined.

EXAMPLES

Generating a Filename

The following example generates a unique filename and stores it in the array pointed to by *ptr*.

```
#include <stdio.h>
...
char filename[L_tmpnam+1];
char *ptr;

ptr = tmpnam(filename);
```

APPLICATION USAGE

This function only creates filenames. It is the application's responsibility to create and remove the files.

Between the time a pathname is created and the file is opened, it is possible for some other process to create a file with the same name. Applications may find *tmpfile*( ) more useful.

Applications should use the *tmpfile*( ), *mkstemp*( ), or *mkdtemp*( ) functions instead of the

obsolescent *tmpnam*( ) function.

RATIONALE

None.

FUTURE DIRECTIONS

The *tmpnam*( ) function may be removed in a future version.

SEE ALSO

NAME

tolower, tolower_l — transliterate uppercase characters to lowercase

SYNOPSIS

```
#include <ctype.h>

int tolower(int c);
CX int tolower_l(int c, locale_t locale);
```

DESCRIPTION

CX For *tolower*(): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *tolower*() and *tolower_l*() functions have as a domain a type **int**, the value of which is representable as an **unsigned char** or the value of EOF. If the argument has any other value, the behavior is undefined. If the argument of *tolower*() or *tolower_l*() represents an uppercase letter, and there exists a corresponding lowercase letter as defined by character type information in the program locale or in the locale represented by *locale*, respectively (category *LC_CTYPE*), the result shall be the corresponding lowercase letter. All other arguments in the domain are returned unchanged.

RETURN VALUE

CX Upon successful completion, the *tolower*() and *tolower_l*() functions shall return the lowercase letter corresponding to the argument passed; otherwise, they shall return the argument unchanged.

ERRORS

The *tolower_l*() function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Issue 7

The *tolower_l*() function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

67331 **NAME**

67332 toupper, toupper_l — transliterate lowercase characters to uppercase

67333 **SYNOPSIS**

67334
```
#include <ctype.h>
```

67335
```
int toupper(int c);
```

67336 CX
```
int toupper_l(int c, locale_t locale);
```

67337 **DESCRIPTION**

67338 CX For *toupper*( ): The functionality described on this reference page is aligned with the ISO C
67339 standard. Any conflict between the requirements described here and the ISO C standard is
67340 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

67341 CX The *toupper*( ) and *toupper_l*( ) functions have as a domain a type **int**, the value of which is
67342 representable as an **unsigned char** or the value of EOF. If the argument has any other value, the
67343 behavior is undefined.

67344 CX If the argument of *toupper*( ) or *toupper_l*( ) represents a lowercase letter, and there exists a
67345 CX corresponding uppercase letter as defined by character type information in the program locale
67346 or in the locale represented by *locale*, respectively (category *LC_CTYPE*), the result shall be the
67347 corresponding uppercase letter.

67348 All other arguments in the domain are returned unchanged.

67349 **RETURN VALUE**

67350 CX Upon successful completion, *toupper*( ) and *toupper_l*( ) shall return the uppercase letter
67351 corresponding to the argument passed; otherwise, they shall return the argument unchanged.

67352 **ERRORS**

67353 The *toupper_l*( ) function may fail if:

67354 CX [EINVAL] *locale* is not a valid locale object handle.

67355 **EXAMPLES**

67356 None.

67357 **APPLICATION USAGE**

67358 None.

67359 **RATIONALE**

67360 None.

67369 Extensions beyond the ISO C standard are marked.

67370 **Issue 7**

67371 SD5-XSH-ERN-181 is applied, clarifying the RETURN VALUE section.

67372 The *toupper_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API
67373 Set Part 4.

NAME

towctrans, towctrans_l — wide-character transliteration

SYNOPSIS

```
#include <wctype.h>

wint_t towctrans(wint_t wc, wctrans_t desc);
wint_t towctrans_l(wint_t wc, wctrans_t desc,
    locale_t locale);
```

DESCRIPTION

For *towctrans*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *towctrans*( ) and *towctrans_l*( ) functions shall transliterate the wide-character code *wc* using the mapping described by *desc*.

The current setting of the *LC_CTYPE* category in the current locale of the process or in the locale represented by *locale*, respectively, should be the same as during the call to *wctrans*( ) or *wctrans_l*( ) that returned the value *desc*.

If the value of *desc* is invalid (that is, not obtained by a call to *wctrans*( ) or *desc* is invalidated by a subsequent call to *setlocale*( ) that has affected category *LC_CTYPE*), the result is unspecified.

If the value of *desc* is invalid (that is, not obtained by a call to *wctrans_l*( ) with the same locale object *locale*) the result is unspecified.

An application wishing to check for error situations should set *errno* to 0 before calling *towctrans*( ) or *towctrans_l*( ).

If *errno* is non-zero on return, an error has occurred.

RETURN VALUE

If successful, the *towctrans*( ) and *towctrans_l*( ) functions shall return the mapped value of *wc* using the mapping described by *desc*. Otherwise, they shall return *wc* unchanged.

ERRORS

These functions may fail if:

[EINVAL] *desc* contains an invalid transliteration descriptor.

The *towctrans_l*( ) function may fail if:

[EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

The strings `"tolower"` and `"toupper"` are reserved for the standard mapping names. In the table below, the functions in the left column are equivalent to the functions in the right column.

```
towlower(wc)            towctrans(wc, wctrans("tolower"))
towlower_l(wc, locale)  towctrans_l(wc, wctrans("tolower"), locale)
towupper(wc)            towctrans(wc, wctrans("toupper"))
towupper_l(wc, locale)  towctrans_l(wc, wctrans("toupper"), locale)
```

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

XBD **<wctype.h>**

CHANGE HISTORY

First released in Issue 5. Derived from ISO/IEC 9899: 1990/Amendment 1: 1995 (E).

Issue 6

Extensions beyond the ISO C standard are marked.

Issue 7

The *towctrans_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

towlower, towlower_l — transliterate uppercase wide-character code to lowercase

SYNOPSIS

```
#include <wctype.h>

wint_t towlower(wint_t wc);
CX wint_t towlower_l(wint_t wc, locale_t locale);
```

DESCRIPTION

CX For *towlower*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *towlower*( ) and *towlower_l*( ) functions have as a domain a type **wint_t**, the value of which the application shall ensure is a character representable as a **wchar_t**, and a wide-character code corresponding to a valid character in the current locale or the value of WEOF. If the argument CX has any other value, the behavior is undefined. If the argument of *towlower*( ) or *towlower_l*( ) represents an uppercase wide-character code, and there exists a corresponding lowercase wide- CX character code as defined by character type information in the locale of the process or in the locale represented by *locale*, respectively (category *LC_CTYPE*), the result shall be the corresponding lowercase wide-character code. All other arguments in the domain are returned unchanged.

RETURN VALUE

CX Upon successful completion, the *towlower*( ) and *towlower_l*( ) functions shall return the lowercase letter corresponding to the argument passed; otherwise, they shall return the argument unchanged.

ERRORS

The *towlower_l*( ) function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 4.

Issue 5

The following change has been made in this version for alignment with ISO/IEC 9899: 1990/Amendment 1: 1995 (E):

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

The *towlower_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

NAME

towupper, towupper_l — transliterate lowercase wide-character code to uppercase

SYNOPSIS

```
#include <wctype.h>

wint_t towupper(wint_t wc);
CX wint_t towupper_l(wint_t wc, locale_t locale);
```

DESCRIPTION

CX For *towupper*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *towupper*( ) and *towupper_l*( ) functions have as a domain a type **wint_t**, the value of which the application shall ensure is a character representable as a **wchar_t**, and a wide-character code corresponding to a valid character in the current locale or the value of WEOF. If the argument CX has any other value, the behavior is undefined. If the argument of *towupper*( ) or *towupper_l*( ) represents a lowercase wide-character code, and there exists a corresponding uppercase wide- CX character code as defined by character type information in the locale of the process or in the locale represented by *locale*, respectively (category *LC_CTYPE*), the result shall be the corresponding uppercase wide-character code. All other arguments in the domain are returned unchanged.

RETURN VALUE

CX Upon successful completion, the *towupper*( ) and *towupper_l*( ) functions shall return the uppercase letter corresponding to the argument passed. Otherwise, they shall return the argument unchanged.

ERRORS

The *towupper_l*( ) function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

67526 **NAME**

67527 trunc, truncf, truncl — round to truncated integer value

67528 **SYNOPSIS**

67529
```
#include <math.h>
```

67530
```
double trunc(double x);
```
67531
```
float truncf(float x);
```
67532
```
long double truncl(long double x);
```

67533 **DESCRIPTION**

67534 CX The functionality described on this reference page is aligned with the ISO C standard. Any
67535 conflict between the requirements described here and the ISO C standard is unintentional. This
67536 volume of POSIX.1-200x defers to the ISO C standard.

67537 These functions shall round their argument to the integer value, in floating format, nearest to but
67538 no larger in magnitude than the argument.

67539 **RETURN VALUE**

67540 Upon successful completion, these functions shall return the truncated integer value.

67541 MX If *x* is NaN, a NaN shall be returned.

67542 If *x* is ±0 or ±Inf, *x* shall be returned.

67543 **ERRORS**

67544 No errors are defined.

67545 **EXAMPLES**

67546 None.

67547 **APPLICATION USAGE**

67548 None.

67549 **RATIONALE**

67555 **CHANGE HISTORY**

67556 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

67557 **NAME**

67558 truncate — truncate a file to a specified length

67559 **SYNOPSIS**

67560
```
#include <unistd.h>
```

67561
```
int truncate(const char *path, off_t length);
```

67562 **DESCRIPTION**

67563 The *truncate*( ) function shall cause the regular file named by *path* to have a size which shall be
67564 equal to *length* bytes.

67565 If the file previously was larger than *length*, the extra data is discarded. If the file was previously
67566 shorter than *length*, its size is increased, and the extended area appears as if it were zero-filled.

67567 The application shall ensure that the process has write permission for the file.

67568 XSI If the request would cause the file size to exceed the soft file size limit for the process, the
67569 request shall fail and the implementation shall generate the SIGXFSZ signal for the process.

67570 The *truncate*( ) function shall not modify the file offset for any open file descriptions associated
67571 with the file. Upon successful completion, if the file size is changed, *truncate*( ) shall mark for
67572 update the last data modification and last file status change timestamps of the file, and the
67573 S_ISUID and S_ISGID bits of the file mode may be cleared.

67574 **RETURN VALUE**

67575 Upon successful completion, *truncate*( ) shall return 0. Otherwise, –1 shall be returned, and *errno*
67576 set to indicate the error.

67577 **ERRORS**

67578 The *truncate*( ) function shall fail if:

67579 [EINTR] A signal was caught during execution.

67580 [EINVAL] The *length* argument was less than 0.

67581 [EFBIG] or [EINVAL]
67582 The *length* argument was greater than the maximum file size.

67583 [EIO] An I/O error occurred while reading from or writing to a file system.

67584 [EACCES] A component of the path prefix denies search permission, or write permission
67585 is denied on the file.

67586 [EISDIR] The named file is a directory.

67587 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
67588 argument.

67589 [ENAMETOOLONG]
67590 The length of a component of a pathname is longer than {NAME_MAX}.

67591 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

67592 [ENOTDIR] A component of the path prefix is not a directory, or the *path* argument
67593 contains at least one non-<slash> character and ends with one or more trailing
67594 <slash> characters and the last pathname component names an existing file
67595 that is neither a directory nor a symbolic link to a directory.

67596 [EROFS] The named file resides on a read-only file system.

The *truncate*( ) function may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

XBD **<unistd.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Large File Summit extensions are added.

Issue 6

This reference page is split out from the *ftruncate*( ) reference page.

The normative text is updated to avoid use of the term "must" for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *truncate*( ) function is moved from the XSI option to the Base.

Changes are made related to support for finegrained timestamps.

The [ENOTDIR] error condition is clarified to cover the condition where the last component of a pathname exists but is not a directory or a symbolic link to a directory. +

truncf( )

67631 **NAME**

67632 truncf, truncl — round to truncated integer value

67633 **SYNOPSIS**

67634 ```
#include <math.h>
```

67635 ```
float truncf(float x);
```

67636 ```
long double truncl(long double x);
```

67637 **DESCRIPTION**

67638 Refer to *trunc( )*.
```

67639 **NAME**

67640 tsearch — search a binary search tree

67641 **SYNOPSIS**

67642 XSI
```
#include <search.h>

void *tsearch(const void *key, void **rootp,
    int (*compar)(const void *, const void *));
```

67645 **DESCRIPTION**

67646 Refer to *tdelete( )*.

NAME

ttyname, ttyname_r — find the pathname of a terminal

SYNOPSIS

```
#include <unistd.h>

char *ttyname(int fildes);
int ttyname_r(int fildes, char *name, size_t namesize);
```

DESCRIPTION

The *ttyname*( ) function shall return a pointer to a string containing a null-terminated pathname of the terminal associated with file descriptor *fildes*. The return value may point to static data whose content is overwritten by each call.

The *ttyname*( ) function need not be thread-safe.

The *ttyname_r*( ) function shall store the null-terminated pathname of the terminal associated with the file descriptor *fildes* in the character array referenced by *name*. The array is *namesize* characters long and should have space for the name and the terminating null character. The maximum length of the terminal name shall be {TTY_NAME_MAX}.

RETURN VALUE

Upon successful completion, *ttyname*( ) shall return a pointer to a string. Otherwise, a null pointer shall be returned and *errno* set to indicate the error.

If successful, the *ttyname_r*( ) function shall return zero. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The *ttyname*( ) function may fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

[ENOTTY] The file associated with the *fildes* argument is not a terminal.

The *ttyname_r*( ) function may fail if:

[EBADF] The *fildes* argument is not a valid file descriptor.

[ENOTTY] The file associated with the *fildes* argument is not a terminal.

[ERANGE] The value of *namesize* is smaller than the length of the string to be returned including the terminating null character.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The term “terminal” is used instead of the historical term “terminal device” in order to avoid a reference to an undefined term.

The thread-safe version places the terminal name in a user-supplied buffer and returns a non-zero value if it fails. The non-thread-safe version may return the name in a static data area that may be overwritten by each call.

FUTURE DIRECTIONS

None.

SEE ALSO

XBD **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The *ttyname_r*( ) function is included for alignment with the POSIX Threads Extension.

A note indicating that the *ttyname*( ) function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *ttyname_r*( ) function is marked as part of the Thread-Safe Functions option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The statement that *errno* is set on error is added.
- The [EBADF] and [ENOTTY] optional error conditions are added.

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

The *ttyname_r*( ) function is moved from the Thread-Safe Functions option to the Base.

67706 **NAME**

67707 twalk — traverse a binary search tree

67708 **SYNOPSIS**

67709 XSI
```
#include <search.h>

void twalk(const void *root,
    void (*action)(const void *, VISIT, int ));
```

67712 **DESCRIPTION**

67713 Refer to *tdelete( )*.

NAME

daylight, timezone, tzname, tzset — set timezone conversion information

SYNOPSIS

```
#include <time.h>

XSI  extern int daylight;
     extern long timezone;
CX   extern char *tzname[2];
     void tzset(void);
```

DESCRIPTION

The *tzset*( ) function shall use the value of the environment variable *TZ* to set time conversion information used by *ctime*( ), *localtime*( ), *mktime*( ), and *strftime*( ). If *TZ* is absent from the environment, implementation-defined default timezone information shall be used.

The *tzset*( ) function shall set the external variable *tzname* as follows:

```
tzname[0] = "std";
tzname[1] = "dst";
```

where *std* and *dst* are as described in XBD Chapter 8 (on page 173).

XSI The *tzset*( ) function also shall set the external variable *daylight* to 0 if Daylight Savings Time conversions should never be applied for the timezone in use; otherwise, non-zero. The external variable *timezone* shall be set to the difference, in seconds, between Coordinated Universal Time (UTC) and local standard time.

RETURN VALUE

The *tzset*( ) function shall not return a value.

ERRORS

No errors are defined.

EXAMPLES

Example *TZ* variables and their timezone differences are given in the table below:

TZ	*timezone*
EST5EDT	5*60*60
GMT0	0*60*60
JST-9	–9*60*60
MET-1MEST	–1*60*60
MST7MDT	7*60*60
PST8PDT	8*60*60

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The example is corrected.

NAME

ulimit — get and set process limits

SYNOPSIS

OB XSI

```
#include <ulimit.h>

long ulimit(int cmd, ...);
```

DESCRIPTION

The *ulimit*( ) function shall control process limits. The process limits that can be controlled by this function include the maximum size of a single file that can be written (this is equivalent to using *setrlimit*( ) with RLIMIT_FSIZE). The *cmd* values, defined in **<ulimit.h>**, include:

UL_GETFSIZE Return the file size limit (RLIMIT_FSIZE) of the process. The limit shall be in units of 512-byte blocks and shall be inherited by child processes. Files of any size can be read. The return value shall be the integer part of the soft file size limit divided by 512. If the result cannot be represented as a **long**, the result is unspecified.

UL_SETFSIZE Set the file size limit for output operations of the process to the value of the second argument, taken as a **long**, multiplied by 512. If the result would overflow an **rlim_t**, the actual value set is unspecified. Any process may decrease its own limit, but only a process with appropriate privileges may increase the limit. The return value shall be the integer part of the new file size limit divided by 512.

The *ulimit*( ) function shall not change the setting of *errno* if successful.

As all return values are permissible in a successful situation, an application wishing to check for error situations should set *errno* to 0, then call *ulimit*( ), and, if it returns –1, check to see if *errno* is non-zero.

RETURN VALUE

Upon successful completion, *ulimit*( ) shall return the value of the requested limit. Otherwise, –1 shall be returned and *errno* set to indicate the error.

ERRORS

The *ulimit*( ) function shall fail and the limit shall be unchanged if:

[EINVAL] The *cmd* argument is not valid.

[EPERM] A process not having appropriate privileges attempts to increase its file size limit.

EXAMPLES

None.

APPLICATION USAGE

Since the *ulimit*( ) function uses type **long** rather than **rlim_t**, this function is not sufficient for file sizes on many current systems. Applications should use the *getrlimit*( ) or *setrlimit*( ) functions instead of the obsolescent *ulimit*( ) function.

RATIONALE

None.

FUTURE DIRECTIONS

The *ulimit*( ) function may be removed in a future version.

SEE ALSO

exec, *getrlimit*( ), *write*( )

XBD **<ulimit.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

In the description of UL_SETFSIZE, the text is corrected to refer to **rlim_t** rather than the spurious **rlimit_t**.

The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

Issue 7

The *ulimit*( ) function is marked obsolescent.

NAME

umask — set and get the file mode creation mask

SYNOPSIS

```
#include <sys/stat.h>

mode_t umask(mode_t cmask);
```

DESCRIPTION

The *umask*( ) function shall set the file mode creation mask of the process to *cmask* and return the previous value of the mask. Only the file permission bits of *cmask* (see **<sys/stat.h>**) are used; the meaning of the other bits is implementation-defined.

The file mode creation mask of the process is used to turn off permission bits in the *mode* argument supplied during calls to the following functions:

- *open*( ), *openat*( ), *creat*( ), *mkdir*( ), *mkdirat*( ), *mkfifo*( ), and *mkfifoat*( )
- XSI *mknod*( ), *mknodat*( )
- MSG *mq_open*( )
- *sem_open*( )

Bit positions that are set in *cmask* are cleared in the mode of the created file.

RETURN VALUE

The file permission bits in the value returned by *umask*( ) shall be the previous value of the file mode creation mask. The state of any other bits in that value is unspecified, except that a subsequent call to *umask*( ) with the returned value as *cmask* shall leave the state of the mask the same as its state before the first call, including any unspecified use of those bits.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Unsigned argument and return types for *umask*( ) were proposed. The return type and the argument were both changed to **mode_t**.

Historical implementations have made use of additional bits in *cmask* for their implementation-defined purposes. The addition of the text that the meaning of other bits of the field is implementation-defined permits these implementations to conform to this volume of POSIX.1-200x.

FUTURE DIRECTIONS

None.

SEE ALSO

creat( ), *exec*, *mkdir*( ), *mkfifo*( ), *mknod*( ), *mq_open*( ), *open*( ), *sem_open*( )

XBD **<sys/stat.h>**, **<sys/types.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/143 is applied, adding the *mknod*( ), *mq_open*( ), and *sem_open*( ) functions to the DESCRIPTION and SEE ALSO sections.

67863 **NAME**

67864 uname — get the name of the current system

67865 **SYNOPSIS**

67866 `#include <sys/utsname.h>`

67867 `int uname(struct utsname *`*`name`*`);`

67868 **DESCRIPTION**

67869 The *uname*( ) function shall store information identifying the current system in the structure
67870 pointed to by *name*.

67871 The *uname*( ) function uses the **utsname** structure defined in **<sys/utsname.h>**.

67872 The *uname*( ) function shall return a string naming the current system in the character array
67873 *sysname*. Similarly, *nodename* shall contain the name of this node within an implementation-
67874 defined communications network. The arrays *release* and *version* shall further identify the
67875 operating system. The array *machine* shall contain a name that identifies the hardware that the
67876 system is running on.

67877 The format of each member is implementation-defined.

67878 **RETURN VALUE**

67879 Upon successful completion, a non-negative value shall be returned. Otherwise, –1 shall be
67880 returned and *errno* set to indicate the error.

67881 **ERRORS**

67882 No errors are defined.

67883 **EXAMPLES**

67884 None.

67885 **APPLICATION USAGE**

67886 The inclusion of the *nodename* member in this structure does not imply that it is sufficient
67887 information for interfacing to communications networks.

67888 **RATIONALE**

67889 The values of the structure members are not constrained to have any relation to the version of
67890 this volume of POSIX.1-200x implemented in the operating system. An application should
67891 instead depend on _POSIX_VERSION and related constants defined in **<unistd.h>**.

67892 This volume of POSIX.1-200x does not define the sizes of the members of the structure and
67893 permits them to be of different sizes, although most implementations define them all to be the
67894 same size: eight bytes plus one byte for the string terminator. That size for *nodename* is not
67895 enough for use with many networks.

67896 The *uname*( ) function originated in System III, System V, and related implementations, and it
67897 does not exist in Version 7 or 4.3 BSD. The values it returns are set at system compile time in
67898 those historical implementations.

67899 4.3 BSD has *gethostname*( ) and *gethostid*( ), which return a symbolic name and a numeric value,
67900 respectively. There are related *sethostname*( ) and *sethostid*( ) functions that are used to set the
67901 values the other two functions return. The former functions are included in this specification, the
67902 latter are not.

67903 **FUTURE DIRECTIONS**

67904 None.

67905 **SEE ALSO**

67906 XBD **<sys/utsname.h>**

67907 **CHANGE HISTORY**

67908 First released in Issue 1. Derived from Issue 1 of the SVID.

NAME

ungetc — push byte back into input stream

SYNOPSIS

```
#include <stdio.h>

int ungetc(int c, FILE *stream);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *ungetc*( ) function shall push the byte specified by *c* (converted to an **unsigned char**) back onto the input stream pointed to by *stream*. The pushed-back bytes shall be returned by subsequent reads on that stream in the reverse order of their pushing. A successful intervening call (with the stream pointed to by *stream*) to a file-positioning function (*fseek*( ), *fsetpos*( ), or *rewind*( )) shall discard any pushed-back bytes for the stream. The external storage corresponding to the stream shall be unchanged.

One byte of push-back shall be provided. If *ungetc*( ) is called too many times on the same stream without an intervening read or file-positioning operation on that stream, the operation may fail.

If the value of *c* equals that of the macro EOF, the operation shall fail and the input stream shall be left unchanged.

A successful call to *ungetc*( ) shall clear the end-of-file indicator for the stream. The value of the file-position indicator for the stream after reading or discarding all pushed-back bytes shall be the same as it was before the bytes were pushed back. The file-position indicator is decremented by each successful call to *ungetc*( ); if its value was 0 before a call, its value is unspecified after the call.

RETURN VALUE

Upon successful completion, *ungetc*( ) shall return the byte pushed back after conversion. Otherwise, it shall return EOF.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

XBD **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

67951 **NAME**

67952 ungetwc — push wide-character code back into the input stream

67953 **SYNOPSIS**

67954 ```
#include <stdio.h>
```

67955 ```
#include <wchar.h>
```

67956 ```
wint_t ungetwc(wint_t wc, FILE *stream);
```

67957 **DESCRIPTION**

67958 CX The functionality described on this reference page is aligned with the ISO C standard. Any
67959 conflict between the requirements described here and the ISO C standard is unintentional. This
67960 volume of POSIX.1-200x defers to the ISO C standard.

67961 The *ungetwc*( ) function shall push the character corresponding to the wide-character code
67962 specified by *wc* back onto the input stream pointed to by *stream*. The pushed-back characters
67963 shall be returned by subsequent reads on that stream in the reverse order of their pushing. A
67964 successful intervening call (with the stream pointed to by *stream*) to a file-positioning function
67965 (*fseek*( ), *fsetpos*( ), or *rewind*( )) discards any pushed-back characters for the stream. The external
67966 storage corresponding to the stream is unchanged.

67967 At least one character of push-back shall be provided. If *ungetwc*( ) is called too many times on
67968 the same stream without an intervening read or file-positioning operation on that stream, the
67969 operation may fail.

67970 If the value of *wc* equals that of the macro WEOF, the operation shall fail and the input stream
67971 shall be left unchanged.

67972 A successful call to *ungetwc*( ) shall clear the end-of-file indicator for the stream. The value of the
67973 file-position indicator for the stream after reading or discarding all pushed-back characters shall
67974 be the same as it was before the characters were pushed back. The file-position indicator is
67975 decremented (by one or more) by each successful call to *ungetwc*( ); if its value was 0 before a
67976 call, its value is unspecified after the call.

67977 **RETURN VALUE**

67978 Upon successful completion, *ungetwc*( ) shall return the wide-character code corresponding to
67979 the pushed-back character. Otherwise, it shall return WEOF.

67980 **ERRORS**

67981 The *ungetwc*( ) function may fail if:

67982 CX [EILSEQ] An invalid character sequence is detected, or a wide-character code does not
67983 correspond to a valid character.

67984 **EXAMPLES**

67985 None.

67986 **APPLICATION USAGE**

67987 None.

67988 **RATIONALE**

67989 None.

67995 **CHANGE HISTORY**

67996 First released in Issue 4. Derived from the MSE working draft.

67997 **Issue 5**

67998 The Optional Header (OH) marking is removed from **<stdio.h>**.

67999 **Issue 6**

68000 The [EILSEQ] optional error condition is marked CX.

68001 **NAME**

68002 unlink, unlinkat — remove a directory entry relative to directory file descriptor

68003 **SYNOPSIS**

68004
```
#include <unistd.h>
```

68005
```
int unlink(const char *path);
```
68006
```
int unlinkat(int fd, const char *path, int flag);
```

68007 **DESCRIPTION**

68008 The *unlink*( ) function shall remove a link to a file. If *path* names a symbolic link, *unlink*( ) shall
68009 remove the symbolic link named by *path* and shall not affect any file or directory named by the
68010 contents of the symbolic link. Otherwise, *unlink*( ) shall remove the link named by the pathname
68011 pointed to by *path* and shall decrement the link count of the file referenced by the link.

68012 When the file's link count becomes 0 and no process has the file open, the space occupied by the
68013 file shall be freed and the file shall no longer be accessible. If one or more processes have the file
68014 open when the last link is removed, the link shall be removed before *unlink*( ) returns, but the
68015 removal of the file contents shall be postponed until all references to the file are closed.

68016 The *path* argument shall not name a directory unless the process has appropriate privileges and
68017 the implementation supports using *unlink*( ) on directories.

68018 Upon successful completion, *unlink*( ) shall mark for update the last data modification and last
68019 file status change timestamps of the parent directory. Also, if the file's link count is not 0, the last
68020 file status change timestamp of the file shall be marked for update.

68021 The *unlinkat*( ) function shall be equivalent to the *unlink*( ) or *rmdir*( ) function except in the case
68022 where *path* specifies a relative path. In this case the directory entry to be removed is determined
68023 relative to the directory associated with the file descriptor *fd* instead of the current working
68024 directory. If the file descriptor was opened without O_SEARCH, the function shall check
68025 whether directory searches are permitted using the current permissions of the directory
68026 underlying the file descriptor. If the file descriptor was opened with O_SEARCH, the function
68027 shall not perform the check.

68028 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined
68029 in **<fcntl.h>**:

68030 AT_REMOVEDIR
68031 Remove the directory entry specified by *fd* and *path* as a directory, not a normal file.

68032 If *unlinkat*( ) is passed the special value AT_FDCWD in the *fd* parameter, the current working
68033 directory is used and the behavior shall be identical to a call to *unlink*( ) or *rmdir*( ) respectively,
68034 depending on whether or not the AT_REMOVEDIR bit is set in *flag*.

68035 **RETURN VALUE**

68036 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
68037 return –1 and set *errno* to indicate the error. If –1 is returned, the named file shall not be changed.

68038 **ERRORS**

68039 These functions shall fail and shall not unlink the file if:

68040 [EACCES] Search permission is denied for a component of the path prefix, or write
68041 permission is denied on the directory containing the directory entry to be
68042 removed.

68043 [EBUSY] The file named by the *path* argument cannot be unlinked because it is being
68044 used by the system or another process and the implementation considers this
68045 an error.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix is not a directory, or the *path* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

[EPERM] The file named by *path* is a directory, and either the calling process does not have appropriate privileges, or the implementation prohibits using *unlink*( ) on directories.

XSI [EPERM] or [EACCES]
The S_ISVTX flag is set on the directory containing the file referred to by the *path* argument and the process does not satisfy the criteria specified in XBD Section 4.2 (on page 107).

[EROFS] The directory entry to be unlinked is part of a read-only file system.

The *unlinkat*( ) function shall fail if:

[EACCES] *fd* was not opened with O_SEARCH and the permissions of the directory underlying *fd* do not permit directory searches.

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither AT_FDCWD nor a valid file descriptor open for reading or searching.

[EEXIST] or [ENOTEMPTY]
The *flag* parameter has the AT_REMOVEDIR bit set and the *path* argument names a directory that is not an empty directory, or there are hard links to the directory other than dot or a single entry in dot-dot.

[ENOTDIR] The *flag* parameter has the AT_REMOVEDIR bit set and *path* does not name a directory.

These functions may fail and not unlink the file if:

XSI [EBUSY] The file named by *path* is a named STREAM.

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

[ETXTBSY] The entry to be unlinked is the last directory entry to a pure procedure (shared text) file that is being executed.

The *unlinkat*( ) function may fail if:

[EINVAL] The value of the *flag* argument is not valid.

[ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a file descriptor associated with a directory.

EXAMPLES

Removing a Link to a File

The following example shows how to remove a link to a file named **/home/cnd/mod1** by removing the entry named **/modules/pass1**.

```
#include <unistd.h>

char *path = "/modules/pass1";
int   status;
...
status = unlink(path);
```

Checking for an Error

The following example fragment creates a temporary password lock file named **LOCKFILE**, which is defined as **/etc/ptmp**, and gets a file descriptor for it. If the file cannot be opened for writing, *unlink*( ) is used to remove the link between the file descriptor and **LOCKFILE**.

```
#include <sys/types.h>
#include <stdio.h>
#include <fcntl.h>
#include <errno.h>
#include <unistd.h>
#include <sys/stat.h>

#define LOCKFILE "/etc/ptmp"

int pfd;  /* Integer for file descriptor returned by open call. */
FILE *fpfd;  /* File pointer for use in putpwent(). */
...
/* Open password Lock file. If it exists, this is an error. */
if ((pfd = open(LOCKFILE, O_WRONLY| O_CREAT | O_EXCL, S_IRUSR
    | S_IWUSR | S_IRGRP | S_IROTH)) == -1)  {
    fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
    exit(1);
}

/* Lock file created; proceed with fdopen of lock file so that
   putpwent() can be used.
 */
if ((fpfd = fdopen(pfd, "w")) == NULL) {
    close(pfd);
    unlink(LOCKFILE);
    exit(1);
}
```

68125 **Replacing Files**

68126 The following example fragment uses *unlink*( ) to discard links to files, so that they can be
68127 replaced with new versions of the files. The first call removes the link to **LOCKFILE** if an error
68128 occurs. Successive calls remove the links to **SAVEFILE** and **PASSWDFILE** so that new links can
68129 be created, then removes the link to **LOCKFILE** when it is no longer needed.

```
68130 #include <sys/types.h>
68131 #include <stdio.h>
68132 #include <fcntl.h>
68133 #include <errno.h>
68134 #include <unistd.h>
68135 #include <sys/stat.h>

68136 #define LOCKFILE "/etc/ptmp"
68137 #define PASSWDFILE "/etc/passwd"
68138 #define SAVEFILE "/etc/opasswd"
68139 ...
68140 /* If no change was made, assume error and leave passwd unchanged. */
68141 if (!valid_change) {
68142     fprintf(stderr, "Could not change password for user %s\n", user);
68143     unlink(LOCKFILE);
68144     exit(1);
68145 }

68146 /* Change permissions on new password file. */
68147 chmod(LOCKFILE, S_IRUSR | S_IRGRP | S_IROTH);

68148 /* Remove saved password file. */
68149 unlink(SAVEFILE);

68150 /* Save current password file. */
68151 link(PASSWDFILE, SAVEFILE);

68152 /* Remove current password file. */
68153 unlink(PASSWDFILE);

68154 /* Save new password file as current password file. */
68155 link(LOCKFILE,PASSWDFILE);

68156 /* Remove lock file. */
68157 unlink(LOCKFILE);

68158 exit(0);
```

68159 **APPLICATION USAGE**

68160 Applications should use *rmdir*( ) to remove a directory.

68161 **RATIONALE**

68162 Unlinking a directory is restricted to the superuser in many historical implementations for
68163 reasons given in *link*( ) (see also *rename*( )).

68164 The meaning of [EBUSY] in historical implementations is "mount point busy". Since this volume
68165 of POSIX.1-200x does not cover the system administration concepts of mounting and
68166 unmounting, the description of the error was changed to "resource busy". (This meaning is used
68167 by some device drivers when a second process tries to open an exclusive use device.) The
68168 wording is also intended to allow implementations to refuse to remove a directory if it is the root
68169 or current working directory of any process.

The standard developers reviewed TR 24715-2006 and noted that LSB-conforming implementations may return [EISDIR] instead of [EPERM] when unlinking a directory. A change to permit this behavior by changing the requirement for [EPERM] to [EPERM] or [EISDIR] was considered, but decided against since it would break existing strictly conforming and conforming applications. Applications written for portability to both POSIX.1-200x and the LSB should be prepared to handle either error code.

The purpose of the *unlinkat*( ) function is to remove directory entries in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *unlink*( ), resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *unlinkat*( ) function it can be guaranteed that the removed directory entry is located relative to the desired directory.

FUTURE DIRECTIONS

None.

XBD Section 4.2 (on page 107), **<fcntl.h>**, **<unistd.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The [EBUSY] error is added to the optional part of the ERRORS section.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the effect is specified if *path* specifies a symbolic link.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

Austin Group Interpretation 1003.1-2001 #181 is applied, updating the requirements for operations when the S_ISVTX bit is set.

Text arising from the LSB Conflicts TR is added to the RATIONALE about the use of [EPERM] and [EISDIR].

The *unlinkat*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

Changes are made to allow a directory to be opened for searching.

68210 The [ENOTDIR] error condition is clarified to cover the condition where the last component of a +
68211 pathname exists but is not a directory or a symbolic link to a directory.

68212 **NAME**

68213 unlockpt — unlock a pseudo-terminal master/slave pair

68214 **SYNOPSIS**

68215 XSI
```
#include <stdlib.h>

int unlockpt(int fildes);
```
68216

68217 **DESCRIPTION**

68218 The *unlockpt*( ) function shall unlock the slave pseudo-terminal device associated with the master
68219 to which *fildes* refers.

68220 Conforming applications shall ensure that they call *unlockpt*( ) before opening the slave side of a
68221 pseudo-terminal device.

68222 **RETURN VALUE**

68223 Upon successful completion, *unlockpt*( ) shall return 0. Otherwise, it shall return –1 and set *errno*
68224 to indicate the error.

68225 **ERRORS**

68226 The *unlockpt*( ) function may fail if:

68227 [EBADF] The *fildes* argument is not a file descriptor open for writing.

68228 [EINVAL] The *fildes* argument is not associated with a master pseudo-terminal device.

68245 The normative text is updated to avoid use of the term “must” for application requirements.

NAME

unsetenv — remove an environment variable

SYNOPSIS

CX
```
#include <stdlib.h>

int unsetenv(const char *name);
```

DESCRIPTION

The *unsetenv*( ) function shall remove an environment variable from the environment of the calling process. The *name* argument points to a string, which is the name of the variable to be removed. The named argument shall not contain an `'='` character. If the named variable does not exist in the current environment, the environment shall be unchanged and the function is considered to have completed successfully.

If the application modifies *environ* or the pointers to which it points, the behavior of *unsetenv*( ) is undefined. The *unsetenv*( ) function shall update the list of pointers to which *environ* points.

The *unsetenv*( ) function need not be thread-safe.

RETURN VALUE

Upon successful completion, zero shall be returned. Otherwise, –1 shall be returned, *errno* set to indicate the error, and the environment shall be unchanged.

ERRORS

The *unsetenv*( ) function shall fail if:

[EINVAL] The *name* argument is a null pointer, points to an empty string, or points to a string containing an `'='` character.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Refer to the RATIONALE section in *setenv*( ).

Issue 7

Austin Group Interpretation 1003.1-2001 #156 is applied.

NAME

uselocale — use locale in current thread

SYNOPSIS

CX
```
#include <locale.h>

locale_t uselocale(locale_t newloc);
```

DESCRIPTION

The *uselocale*( ) function shall set the current locale for the current thread to the locale represented by *newloc*.

The value for the *newloc* argument shall be one of the following:

1. A value returned by the *newlocale*( ) or *duplocale*( ) functions
2. The special locale object descriptor *LC_GLOBAL_LOCALE*
3. (**locale_t**)0

Once the *uselocale*( ) function has been called to install a thread-local locale, the behavior of every interface using data from the current locale shall be affected for the calling thread. The current locale for other threads shall remain unchanged.

If the *newloc* argument is a null pointer, the object returned is the current locale or *LC_GLOBAL_LOCALE* if there has been no previous call to *uselocale*( ) for the current thread.

If the *newloc* argument is *LC_GLOBAL_LOCALE*, the thread shall use the global locale determined by the *setlocale*( ) function.

RETURN VALUE

The *uselocale*( ) function returns the locale handle from the previous call for the current thread. If there was no such previous call, the function shall return the value *LC_GLOBAL_LOCALE*.

ERRORS

The *uselocale*( ) function may fail if:

[EINVAL] *locale* is not a valid locale object.

EXAMPLES

None.

APPLICATION USAGE

Unlike the *setlocale*( ) function, the *uselocale*( ) function does not allow replacing some locale categories only. Applications that need to install a locale which differs only in a few categories must use *newlocale*( ) to change a locale object equivalent to the currently used locale and install it.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

68321 **CHANGE HISTORY**
68322 First released in Issue 7.

NAME

utime — set file access and modification times

SYNOPSIS

OB
```
#include <utime.h>

int utime(const char *path, const struct utimbuf *times);
```

DESCRIPTION

The *utime*( ) function shall set the access and modification times of the file named by the *path* argument.

If *times* is a null pointer, the access and modification times of the file shall be set to the current time. The effective user ID of the process shall match the owner of the file, or the process has write permission to the file or has appropriate privileges, to use *utime*( ) in this manner.

If *times* is not a null pointer, *times* shall be interpreted as a pointer to a **utimbuf** structure and the access and modification times shall be set to the values contained in the designated structure. Only a process with the effective user ID equal to the user ID of the file or a process with appropriate privileges may use *utime*( ) this way.

The **utimbuf** structure is defined in the **<utime.h>** header. The times in the structure **utimbuf** are measured in seconds since the Epoch.

Upon successful completion, the *utime*( ) function shall mark the last file status change timestamp for update; see **<sys/stat.h>**.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* shall be set to indicate the error, and the file times shall not be affected.

ERRORS

The *utime*( ) function shall fail if:

[EACCES] Search permission is denied by a component of the path prefix; or the *times* argument is a null pointer and the effective user ID of the process does not match the owner of the file, the process does not have write permission for the file, and the process does not have appropriate privileges.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG] The length of a component of a pathname is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix is not a directory, or the *path* argument contains at least one non-<slash> character and ends with one or more trailing <slash> characters and the last pathname component names an existing file that is neither a directory nor a symbolic link to a directory.

[EPERM] The *times* argument is not a null pointer and the effective user ID of the calling process does not match the owner of the file and the calling process does not have appropriate privileges.

[EROFS] The file system containing the file is read-only.

The *utime*( ) function may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

[ENAMETOOLONG]
The length of a pathname exceeds {PATH_MAX}, or pathname resolution of a symbolic link produced an intermediate result with a length that exceeds {PATH_MAX}.

EXAMPLES

None.

APPLICATION USAGE

Since the **utimbuf** structure only contains **time_t** variables and is not accurate to fractions of a second, applications should use the *utimensat*( ) function instead of the obsolescent *utime*( ) function.

RATIONALE

The *actime* structure member must be present so that an application may set it, even though an implementation may ignore it and not change the last data access timestamp on the file. If an application intends to leave one of the times of a file unchanged while changing the other, it should use *stat*( ) or *fstat*( ) to retrieve the file's *st_atim* and *st_mtim* parameters, set *actime* and *modtime* in the buffer, and change one of them before making the *utime*( ) call.

FUTURE DIRECTIONS

The *utime*( ) function may be removed in a future version.

SEE ALSO

fstat( ), *fstatat*( ), *futimens*( )

XBD **<sys/stat.h>**, **<utime.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #143 is applied.

The *utime*( ) function is marked obsolescent.

Changes are made related to support for finegrained timestamps.

68405 **NAME**

68406 utimensat, utimes — set file access and modification times relative to directory file descriptor

68407 **SYNOPSIS**

68408
```
#include <sys/stat.h>
```

68409
```
int utimensat(int fd, const char *path, const struct timespec times[2],
```
68410
```
    int flag);
```

68411 XSI
```
#include <sys/time.h>
```

68412
```
int utimes(const char *path, const struct timeval times[2]);
```

68413 **DESCRIPTION**

68414 Refer to *futimens( )*.

68415 **NAME**

68416 va_arg, va_copy, va_end, va_start — handle variable argument list

68417 **SYNOPSIS**

68418
```
#include <stdarg.h>
```

68419
```
type va_arg(va_list ap, type);
void va_copy(va_list dest, va_list src);
void va_end(va_list ap);
void va_start(va_list ap, argN);
```

68423 **DESCRIPTION**

68424 XBD **<stdarg.h>**

68425 **NAME**

68426 vdprintf, vfprintf, vprintf, vsnprintf, vsprintf — format output of a stdarg argument list

68427 **SYNOPSIS**

68428 ```
#include <stdarg.h>
```

68429 ```
#include <stdio.h>
```

68430 CX ```
int vdprintf(int fildes, const char *restrict format, va_list ap);
```

68431 ```
int vfprintf(FILE *restrict stream, const char *restrict format,
    va_list ap);
```

68432

68433 ```
int vprintf(const char *restrict format, va_list ap);
```

68434 ```
int vsnprintf(char *restrict s, size_t n, const char *restrict format,
```

68435 ```
    va_list ap);
```

68436 ```
int vsprintf(char *restrict s, const char *restrict format, va_list ap);
```

68437 **DESCRIPTION**

68438 CX The functionality described on this reference page is aligned with the ISO C standard. Any
68439 conflict between the requirements described here and the ISO C standard is unintentional. This
68440 volume of POSIX.1-200x defers to the ISO C standard.

68441 CX The *vdprintf*( ), *vfprintf*( ), *vprintf*( ), *vsnprintf*( ), and *vsprintf*( ) functions shall be equivalent to the
68442 CX *dprintf*( ), *fprintf*( ), *printf*( ), *snprintf*( ), and *sprintf*( ) functions respectively, except that instead of
68443 being called with a variable number of arguments, they are called with an argument list as
68444 defined by **<stdarg.h>**.

68445 These functions shall not invoke the *va_end* macro. As these functions invoke the *va_arg* macro,
68446 the value of *ap* after the return is unspecified.

68447 **RETURN VALUE**

68448 Refer to *fprintf*( ).

68449 **ERRORS**

68450 Refer to *fprintf*( ).

68451 **EXAMPLES**

68452 None.

68453 **APPLICATION USAGE**

68454 Applications using these functions should call *va_end*(*ap*) afterwards to clean up.

68455 **RATIONALE**

68456 None.

68457 **FUTURE DIRECTIONS**

68458 None.

68459 **SEE ALSO**

68460 *fprintf*( )

68461 XBD **<stdarg.h>**, **<stdio.h>**

68462 **CHANGE HISTORY**

68463 First released in Issue 1. Derived from Issue 1 of the SVID.

68464 **Issue 5**

68465 The *vsnprintf*( ) function is added.

Issue 6

The *vfprintf*( ), *vprintf*( ), *vsnprintf*( ), and *vsprintf*( ) functions are updated for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

The *vdprintf*( ) function is added to complement the *dprintf*( ) function from The Open Group Technical Standard, 2006, Extended API Set Part 1.

NAME

vfscanf, vscanf, vsscanf — format input of a stdarg argument list

SYNOPSIS

```
#include <stdarg.h>
#include <stdio.h>

int vfscanf(FILE *restrict stream, const char *restrict format,
    va_list arg);
int vscanf(const char *restrict format, va_list arg);
int vsscanf(const char *restrict s, const char *restrict format,
    va_list arg);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *vscanf*( ), *vfscanf*( ), and *vsscanf*( ) functions shall be equivalent to the *scanf*( ), *fscanf*( ), and *sscanf*( ) functions, respectively, except that instead of being called with a variable number of arguments, they are called with an argument list as defined in the **<stdarg.h>** header. These functions shall not invoke the *va_end* macro. As these functions invoke the *va_arg* macro, the value of *ap* after the return is unspecified.

RETURN VALUE

Refer to *fscanf*( ).

ERRORS

Refer to *fscanf*( ).

EXAMPLES

None.

APPLICATION USAGE

Applications using these functions should call *va_end*(*ap*) afterwards to clean up.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

wait, waitpid — wait for a child process to stop or terminate

SYNOPSIS

```
#include <sys/wait.h>

pid_t wait(int *stat_loc);
pid_t waitpid(pid_t pid, int *stat_loc, int options);
```

DESCRIPTION

The *wait*( ) and *waitpid*( ) functions shall obtain status information pertaining to one of the caller's child processes. Various options permit status information to be obtained for child processes that have terminated or stopped. If status information is available for two or more child processes, the order in which their status is reported is unspecified.

The *wait*( ) function shall suspend execution of the calling thread until status information for one of the terminated child processes of the calling process is available, or until delivery of a signal whose action is either to execute a signal-catching function or to terminate the process. If more than one thread is suspended in *wait*( ) or *waitpid*( ) awaiting termination of the same process, exactly one thread shall return the process status at the time of the target process termination. If status information is available prior to the call to *wait*( ), return shall be immediate.

The *waitpid*( ) function shall be equivalent to *wait*( ) if the *pid* argument is (**pid_t**)–1 and the *options* argument is 0. Otherwise, its behavior shall be modified by the values of the *pid* and *options* arguments.

The *pid* argument specifies a set of child processes for which *status* is requested. The *waitpid*( ) function shall only return the status of a child process from this set:

- If *pid* is equal to (**pid_t**)–1, *status* is requested for any child process. In this respect, *waitpid*( ) is then equivalent to *wait*( ).
- If *pid* is greater than 0, it specifies the process ID of a single child process for which *status* is requested.
- If *pid* is 0, *status* is requested for any child process whose process group ID is equal to that of the calling process.
- If *pid* is less than (**pid_t**)–1, *status* is requested for any child process whose process group ID is equal to the absolute value of *pid*.

The *options* argument is constructed from the bitwise-inclusive OR of zero or more of the following flags, defined in the **<sys/wait.h>** header:

XSI WCONTINUED The *waitpid*( ) function shall report the status of any continued child process specified by *pid* whose status has not been reported since it continued from a job control stop.

WNOHANG The *waitpid*( ) function shall not suspend execution of the calling thread if *status* is not immediately available for one of the child processes specified by *pid*.

WUNTRACED The status of any child processes specified by *pid* that are stopped, and whose status has not yet been reported since they stopped, shall also be reported to the requesting process.

XSI If the calling process has SA_NOCLDWAIT set or has SIGCHLD set to SIG_IGN, and the process has no unwaited-for children that were transformed into zombie processes, the calling thread shall block until all of the children of the process containing the calling thread terminate, and *wait*( ) and *waitpid*( ) shall fail and set *errno* to [ECHILD].

If *wait*( ) or *waitpid*( ) return because the status of a child process is available, these functions shall return a value equal to the process ID of the child process. In this case, if the value of the argument *stat_loc* is not a null pointer, information shall be stored in the location pointed to by *stat_loc*. The value stored at the location pointed to by *stat_loc* shall be 0 if and only if the status returned is from a terminated child process that terminated by one of the following means:

1. The process returned 0 from *main*( ).
2. The process called *_exit*( ) or *exit*( ) with a *status* argument of 0.
3. The process was terminated because the last thread in the process terminated.

Regardless of its value, this information may be interpreted using the following macros, which are defined in **<sys/wait.h>** and evaluate to integral expressions; the *stat_val* argument is the integer value pointed to by *stat_loc*.

WIFEXITED(*stat_val*)
: Evaluates to a non-zero value if *status* was returned for a child process that terminated normally.

WEXITSTATUS(*stat_val*)
: If the value of WIFEXITED(*stat_val*) is non-zero, this macro evaluates to the low-order 8 bits of the *status* argument that the child process passed to *_exit*( ) or *exit*( ), or the value the child process returned from *main*( ).

WIFSIGNALED(*stat_val*)
: Evaluates to a non-zero value if *status* was returned for a child process that terminated due to the receipt of a signal that was not caught (see **<signal.h>**).

WTERMSIG(*stat_val*)
: If the value of WIFSIGNALED(*stat_val*) is non-zero, this macro evaluates to the number of the signal that caused the termination of the child process.

WIFSTOPPED(*stat_val*)
: Evaluates to a non-zero value if *status* was returned for a child process that is currently stopped.

WSTOPSIG(*stat_val*)
: If the value of WIFSTOPPED(*stat_val*) is non-zero, this macro evaluates to the number of the signal that caused the child process to stop.

XSI WIFCONTINUED(*stat_val*)
: Evaluates to a non-zero value if *status* was returned for a child process that has continued from a job control stop.

SPN It is unspecified whether the *status* value returned by calls to *wait*( ) or *waitpid*( ) for processes created by *posix_spawn*( ) or *posix_spawnp*( ) can indicate a WIFSTOPPED(*stat_val*) before subsequent calls to *wait*( ) or *waitpid*( ) indicate WIFEXITED(*stat_val*) as the result of an error detected before the new process image starts executing.

It is unspecified whether the *status* value returned by calls to *wait*( ) or *waitpid*( ) for processes created by *posix_spawn*( ) or *posix_spawnp*( ) can indicate a WIFSIGNALED(*stat_val*) if a signal is sent to the parent's process group after *posix_spawn*( ) or *posix_spawnp*( ) is called.

If the information pointed to by *stat_loc* was stored by a call to *waitpid*( ) that specified the
XSI WUNTRACED flag and did not specify the WCONTINUED flag, exactly one of the macros WIFEXITED(**stat_loc*), WIFSIGNALED(**stat_loc*), and WIFSTOPPED(**stat_loc*) shall evaluate to a non-zero value.

If the information pointed to by *stat_loc* was stored by a call to *waitpid*( ) that specified the WUNTRACED and WCONTINUED flags, exactly one of the macros WIFEXITED(**stat_loc*), WIFSIGNALED(**stat_loc*), WIFSTOPPED(**stat_loc*), and WIFCONTINUED(**stat_loc*) shall evaluate to a non-zero value.

If the information pointed to by *stat_loc* was stored by a call to *waitpid*( ) that did not specify the WUNTRACED or WCONTINUED flags, or by a call to the *wait*( ) function, exactly one of the macros WIFEXITED(**stat_loc*) and WIFSIGNALED(**stat_loc*) shall evaluate to a non-zero value.

If the information pointed to by *stat_loc* was stored by a call to *waitpid*( ) that did not specify the WUNTRACED flag and specified the WCONTINUED flag, or by a call to the *wait*( ) function, exactly one of the macros WIFEXITED(**stat_loc*), WIFSIGNALED(**stat_loc*), and WIFCONTINUED(**stat_loc*) shall evaluate to a non-zero value.

If _POSIX_REALTIME_SIGNALS is defined, and the implementation queues the SIGCHLD signal, then if *wait*( ) or *waitpid*( ) returns because the status of a child process is available, any pending SIGCHLD signal associated with the process ID of the child process shall be discarded. Any other pending SIGCHLD signals shall remain pending.

Otherwise, if SIGCHLD is blocked, if *wait*( ) or *waitpid*( ) return because the status of a child process is available, any pending SIGCHLD signal shall be cleared unless the status of another child process is available.

For all other conditions, it is unspecified whether child *status* will be available when a SIGCHLD signal is delivered.

There may be additional implementation-defined circumstances under which *wait*( ) or *waitpid*( ) report *status*. This shall not occur unless the calling process or one of its child processes explicitly makes use of a non-standard extension. In these cases the interpretation of the reported *status* is implementation-defined.

If a parent process terminates without waiting for all of its child processes to terminate, the remaining child processes shall be assigned a new parent process ID corresponding to an implementation-defined system process.

RETURN VALUE

If *wait*( ) or *waitpid*( ) returns because the status of a child process is available, these functions shall return a value equal to the process ID of the child process for which *status* is reported. If *wait*( ) or *waitpid*( ) returns due to the delivery of a signal to the calling process, –1 shall be returned and *errno* set to [EINTR]. If *waitpid*( ) was invoked with WNOHANG set in *options*, it has at least one child process specified by *pid* for which *status* is not available, and *status* is not available for any process specified by *pid*, 0 is returned. Otherwise, (**pid_t**)–1 shall be returned, and *errno* set to indicate the error.

ERRORS

The *wait*( ) function shall fail if:

[ECHILD] The calling process has no existing unwaited-for child processes.

[EINTR] The function was interrupted by a signal. The value of the location pointed to by *stat_loc* is undefined.

The *waitpid*( ) function shall fail if:

[ECHILD] The process specified by *pid* does not exist or is not a child of the calling process, or the process group specified by *pid* does not exist or does not have any member process that is a child of the calling process.

[EINTR] The function was interrupted by a signal. The value of the location pointed to by *stat_loc* is undefined.

[EINVAL] The *options* argument is not valid.

EXAMPLES

Waiting for a Child Process and then Checking its Status

The following example demonstrates the use of *waitpid*(), *fork*(), and the macros used to interpret the status value returned by *waitpid*() (and *wait*()). The code segment creates a child process which does some unspecified work. Meanwhile the parent loops performing calls to *waitpid*() to monitor the status of the child. The loop terminates when child termination is detected.

```
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <sys/wait.h>
...

pid_t child_pid, wpid;
int status;

child_pid = fork();
if (child_pid == -1) {      /* fork() failed */
    perror("fork");
    exit(EXIT_FAILURE);
}

if (child_pid == 0) {       /* This is the child */
    /* Child does some work and then terminates */
    ...

} else {                    /* This is the parent */
    do {
        wpid = waitpid(child_pid, &status, WUNTRACED
#ifdef WCONTINUED       /* Not all implementations support this */
        | WCONTINUED
#endif
        );
        if (wpid == -1) {
            perror("waitpid");
            exit(EXIT_FAILURE);
        }

        if (WIFEXITED(status)) {
            printf("child exited, status=%d\n", WEXITSTATUS(status));

        } else if (WIFSIGNALED(status)) {
            printf("child killed (signal %d)\n", WTERMSIG(status));

        } else if (WIFSTOPPED(status)) {
            printf("child stopped (signal %d)\n", WSTOPSIG(status));

#ifdef WIFCONTINUED     /* Not all implementations support this */
        } else if (WIFCONTINUED(status)) {
            printf("child continued\n");
```

```
#endif
        } else {    /* Non-standard case -- may never happen */
            printf("Unexpected status (0x%x)\n", status);
        }
    } while (!WIFEXITED(status) && !WIFSIGNALED(status));
}
```

Waiting for a Child Process in a Signal Handler for SIGCHLD

The following example demonstrates how to use *waitpid*() in a signal handler for SIGCHLD without passing –1 as the *pid* argument. (See the APPLICATION USAGE section below for the reasons why passing a *pid* of –1 is not recommended.) The method used here relies on the standard behavior of *waitpid*() when SIGCHLD is blocked. On historical non-conforming systems, the status of some child processes might not be reported.

```
#include <stdlib.h>
#include <stdio.h>
#include <signal.h>
#include <sys/types.h>
#include <sys/wait.h>
#include <unistd.h>

#define CHILDREN 10

static void
handle_sigchld(int signum, siginfo_t *sinfo, void *unused)
{
    int status;

    /*
     * Obtain status information for the child which
     * caused the SIGCHLD signal and write its exit code
     * to stdout.
     */
    if (sinfo->si_code != CLD_EXITED)
    {
        static char msg[] = "wrong si_code\n";
        write(2, msg, sizeof msg – 1);
    }
    else if (waitpid(sinfo->si_pid, &status, 0) == –1)
    {
        static char msg[] = "waitpid() failed\n";
        write(2, msg, sizeof msg – 1);
    }
    else if (!WIFEXITED(status))
    {
        static char msg[] = "WIFEXITED was false\n";
        write(2, msg, sizeof msg – 1);
    }
    else
    {
        int code = WEXITSTATUS(status);
        char buf[2];
        buf[0] = '0' + code;
```

```
            buf[1] = '\n';
            write(1, buf, 2);
        }
    }

    int
    main(void)
    {
        int i;
        pid_t pid;
        struct sigaction sa;

        sa.sa_flags = SA_SIGINFO;
        sa.sa_sigaction = handle_sigchld;
        sigemptyset(&sa.sa_mask);
        if (sigaction(SIGCHLD, &sa, NULL) == -1)
        {
            perror("sigaction");
            exit(EXIT_FAILURE);
        }

        for (i = 0; i < CHILDREN; i++)
        {
            switch (pid = fork())
            {
            case -1:
                perror("fork");
                exit(EXIT_FAILURE);
            case 0:
                sleep(2);
                _exit(i);
            }
        }

        /* Wait for all the SIGCHLD signals, then terminate on SIGALRM */
        alarm(3);
        for (;;)
            pause();
    }
```

APPLICATION USAGE

Calls to *wait*( ) will collect information about any child process. This may result in interactions with other interfaces that may be waiting for their own children (such as by use of *system*( )). For this and other reasons it is recommended that portable applications not use *wait*( ), but instead use *waitpid*( ). For these same reasons, the use of *waitpid*( ) with a *pid* argument of –1, and the use of *waitid*( ) with the *idtype* argument set to P_ALL, are also not recommended for portable applications.

RATIONALE

A call to the *wait*( ) or *waitpid*( ) function only returns *status* on an immediate child process of the calling process; that is, a child that was produced by a single *fork*( ) call (perhaps followed by an *exec* or other function calls) from the parent. If a child produces grandchildren by further use of *fork*( ), none of those grandchildren nor any of their descendants affect the behavior of a *wait*( ) from the original parent process. Nothing in this volume of POSIX.1-200x prevents an implementation from providing extensions that permit a process to get *status* from a grandchild

or any other process, but a process that does not use such extensions must be guaranteed to see *status* from only its direct children.

The *waitpid*( ) function is provided for three reasons:

1. To support job control
2. To permit a non-blocking version of the *wait*( ) function
3. To permit a library routine, such as *system*( ) or *pclose*( ), to wait for its children without interfering with other terminated children for which the process has not waited

The first two of these facilities are based on the *wait3*( ) function provided by 4.3 BSD. The function uses the *options* argument, which is equivalent to an argument to *wait3*( ). The WUNTRACED flag is used only in conjunction with job control on systems supporting job control. Its name comes from 4.3 BSD and refers to the fact that there are two types of stopped processes in that implementation: processes being traced via the *ptrace*( ) debugging facility and (untraced) processes stopped by job control signals. Since *ptrace*( ) is not part of this volume of POSIX.1-200x, only the second type is relevant. The name WUNTRACED was retained because its usage is the same, even though the name is not intuitively meaningful in this context.

The third reason for the *waitpid*( ) function is to permit independent sections of a process to spawn and wait for children without interfering with each other. For example, the following problem occurs in developing a portable shell, or command interpreter:

```
stream = popen("/bin/true");
(void) system("sleep 100");
(void) pclose(stream);
```

On all historical implementations, the final *pclose*( ) fails to reap the *wait*( ) *status* of the *popen*( ).

The status values are retrieved by macros, rather than given as specific bit encodings as they are in most historical implementations (and thus expected by existing programs). This was necessary to eliminate a limitation on the number of signals an implementation can support that was inherent in the traditional encodings. This volume of POSIX.1-200x does require that a *status* value of zero corresponds to a process calling *_exit*(0), as this is the most common encoding expected by existing programs. Some of the macro names were adopted from 4.3 BSD.

These macros syntactically operate on an arbitrary integer value. The behavior is undefined unless that value is one stored by a successful call to *wait*( ) or *waitpid*( ) in the location pointed to by the *stat_loc* argument. An early proposal attempted to make this clearer by specifying each argument as **stat_loc* rather than *stat_val*. However, that did not follow the conventions of other specifications in this volume of POSIX.1-200x or traditional usage. It also could have implied that the argument to the macro must literally be **stat_loc*; in fact, that value can be stored or passed as an argument to other functions before being interpreted by these macros.

The extension that affects *wait*( ) and *waitpid*( ) and is common in historical implementations is the *ptrace*( ) function. It is called by a child process and causes that child to stop and return a *status* that appears identical to the *status* indicated by WIFSTOPPED. The *status* of *ptrace*( ) children is traditionally returned regardless of the WUNTRACED flag (or by the *wait*( ) function). Most applications do not need to concern themselves with such extensions because they have control over what extensions they or their children use. However, applications, such as command interpreters, that invoke arbitrary processes may see this behavior when those arbitrary processes misuse such extensions.

Implementations that support **core** file creation or other implementation-defined actions on termination of some processes traditionally provide a bit in the *status* returned by *wait*( ) to indicate that such actions have occurred.

Allowing the *wait*( ) family of functions to discard a pending SIGCHLD signal that is associated with a successfully waited-for child process puts them into the *sigwait*( ) and *sigwaitinfo*( ) category with respect to SIGCHLD.

This definition allows implementations to treat a pending SIGCHLD signal as accepted by the process in *wait*( ), with the same meaning of "accepted" as when that word is applied to the *sigwait*( ) family of functions.

Allowing the *wait*( ) family of functions to behave this way permits an implementation to be able to deal precisely with SIGCHLD signals.

In particular, an implementation that does accept (discard) the SIGCHLD signal can make the following guarantees regardless of the queuing depth of signals in general (the list of waitable children can hold the SIGCHLD queue):

1. If a SIGCHLD signal handler is established via *sigaction*( ) without the SA_RESETHAND flag, SIGCHLD signals can be accurately counted; that is, exactly one SIGCHLD signal will be delivered to or accepted by the process for every child process that terminates.
2. A single *wait*( ) issued from a SIGCHLD signal handler can be guaranteed to return immediately with status information for a child process.
3. When SA_SIGINFO is requested, the SIGCHLD signal handler can be guaranteed to receive a non-null pointer to a **siginfo_t** structure that describes a child process for which a wait via *waitpid*( ) or *waitid*( ) will not block or fail.
4. The *system*( ) function will not cause the SIGCHLD handler of a process to be called as a result of the *fork*( )/*exec* executed within *system*( ) because *system*( ) will accept the SIGCHLD signal when it performs a *waitpid*( ) for its child process. This is a desirable behavior of *system*( ) so that it can be used in a library without causing side-effects to the application linked with the library.

An implementation that does not permit the *wait*( ) family of functions to accept (discard) a pending SIGCHLD signal associated with a successfully waited-for child, cannot make the guarantees described above for the following reasons:

Guarantee #1
: Although it might be assumed that reliable queuing of all SIGCHLD signals generated by the system can make this guarantee, the counter-example is the case of a process that blocks SIGCHLD and performs an indefinite loop of *fork*( )/*wait*( ) operations. If the implementation supports queued signals, then eventually the system will run out of memory for the queue. The guarantee cannot be made because there must be some limit to the depth of queuing.

Guarantees #2 and #3
: These cannot be guaranteed unless the *wait*( ) family of functions accepts the SIGCHLD signal. Otherwise, a *fork*( )/*wait*( ) executed while SIGCHLD is blocked (as in the *system*( ) function) will result in an invocation of the handler when SIGCHLD is unblocked, after the process has disappeared.

Guarantee #4
: Although possible to make this guarantee, *system*( ) would have to set the SIGCHLD handler to SIG_DFL so that the SIGCHLD signal generated by its *fork*( ) would be discarded (the SIGCHLD default action is to be ignored), then restore it to its previous setting. This would have the undesirable side-effect of discarding all SIGCHLD signals pending to the process.

FUTURE DIRECTIONS

None.

exec, *exit*( ), *fork*( ), *system*( ), *waitid*( )

XBD Section 4.11 (on page 110), **<signal.h>**, **<sys/wait.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The processing of the SIGCHLD signal and the [ECHILD] error is clarified.

The semantics of WIFSTOPPED(*stat_val*), WIFEXITED(*stat_val*), and WIFSIGNALED(*stat_val*) are defined with respect to *posix_spawn*( ) or *posix_spawnp*( ) for alignment with IEEE Std 1003.1d-1999.

The DESCRIPTION is updated for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/145 is applied, adding the example to the EXAMPLES section.

Issue 7

SD5-XSH-ERN-202 is applied.

APPLICATION USAGE is added, recommending that the *wait*( ) function not be used.

An additional example for *waitpid*( ) is added.

NAME

waitid — wait for a child process to change state

SYNOPSIS

```
#include <sys/wait.h>

int waitid(idtype_t idtype, id_t id, siginfo_t *infop, int options);
```

DESCRIPTION

The *waitid*( ) function shall suspend the calling thread until one child of the process containing the calling thread changes state. It records the current state of a child in the structure pointed to by *infop*. The fields of the structure pointed to by *infop* are filled in as described for the SIGCHLD signal in **<signal.h>**. If a child process changed state prior to the call to *waitid*( ), *waitid*( ) shall return immediately. If more than one thread is suspended in *wait*( ), *waitid*( ), or *waitpid*( ) waiting for termination of the same process, exactly one thread shall return the process status at the time of the target process termination.

The *idtype* and *id* arguments are used to specify which children *waitid*( ) waits for.

If *idtype* is P_PID, *waitid*( ) shall wait for the child with a process ID equal to (**pid_t**)*id*.

If *idtype* is P_PGID, *waitid*( ) shall wait for any child with a process group ID equal to (**pid_t**)*id*.

If *idtype* is P_ALL, *waitid*( ) shall wait for any children and *id* is ignored.

The *options* argument is used to specify which state changes *waitid*( ) shall wait for. It is formed by OR'ing together the following flags:

WCONTINUED - Status shall be returned for any child that was stopped and has been continued.

WEXITED + Wait for processes that have exited.

WNOHANG | Do not hang if no status is available; return immediately.

WNOWAIT Keep the process whose status is returned in *infop* in a waitable state. This shall not affect the state of the process; the process may be waited for again after this call completes.

WSTOPPED + Status shall be returned for any child that has stopped upon receipt of a signal.

Applications shall specify at least one of the flags WEXITED, WSTOPPED, or WCONTINUED to be OR'ed in with the *options* argument.

The application shall ensure that the *infop* argument points to a **siginfo_t** structure. If *waitid*( ) returns because a child process was found that satisfied the conditions indicated by the arguments *idtype* and *options*, then the structure pointed to by *infop* shall be filled in by the system with the status of the process. The *si_signo* member shall always be equal to SIGCHLD.

RETURN VALUE

If WNOHANG was specified and status is not available for any process specified by *idtype* and *id*, 0 shall be returned. If *waitid*( ) returns due to the change of state of one of its children, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to indicate the error. |

ERRORS

The *waitid*( ) function shall fail if:

[ECHILD] The calling process has no existing unwaited-for child processes.

[EINTR] The *waitid*( ) function was interrupted by a signal.

[EINVAL] An invalid value was specified for *options*, or *idtype* and *id* specify an invalid set of processes.

EXAMPLES

None.

APPLICATION USAGE

Calls to *waitid*( ) with *idtype* equal to P_ALL will collect information about any child process. This may result in interactions with other interfaces that may be waiting for their own children (such as by use of *system*( )). For this reason it is recommended that portable applications not use *waitid*( ) with idtype of P_ALL. See also APPLICATION USAGE for *wait*( ).

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The normative text is updated to avoid use of the term "must" for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #060 is applied, updating the DESCRIPTION.

The *waitid*( ) function is moved from the XSI option to the Base.

APPLICATION USAGE is added, recommending that the *waitid*( ) function not be used with *idtype* equal to P_ALL.

The description of the WNOHANG flag is updated. +

69123 **NAME**

69124 waitpid — wait for a child process to stop or terminate

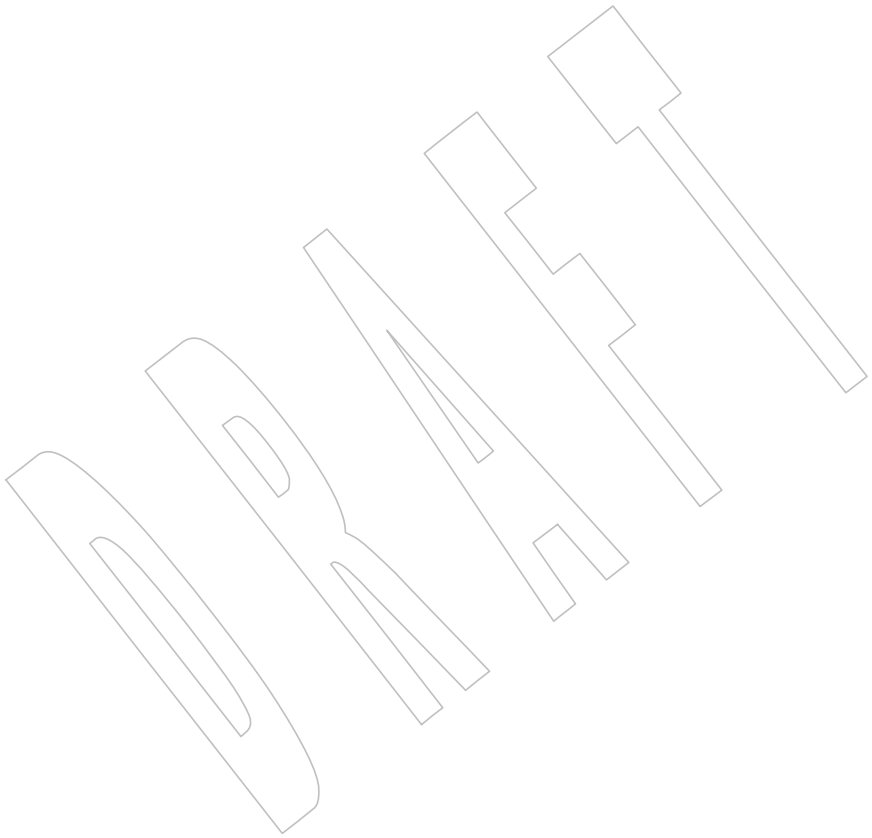
69125 **SYNOPSIS**

69126
```
#include <sys/wait.h>
```

69127
```
pid_t waitpid(pid_t pid, int *stat_loc, int options);
```

69128 **DESCRIPTION**

69129 Refer to *wait( )*.



69130 **NAME**

69131 wcpcpy — copy a wide-character string, returning a pointer to its end

69132 **SYNOPSIS**

69133 CX
```
#include <wchar.h>
```
69134
```
wchar_t *wcpcpy(wchar_t *restrict ws1, const wchar_t *restrict ws2);
```

69135 **DESCRIPTION**

69136 Refer to *wcscpy( )*.

wcpncpy( )

69137 **NAME**

69138 wcpncpy — copy a fixed-size wide-character string, returning a pointer to its end

69139 **SYNOPSIS**

69140 CX
```
#include <wchar.h>

wchar_t *wcpncpy(wchar_t restrict *ws1, const wchar_t *restrict ws2,
    size_t n);
```

69143 **DESCRIPTION**

69144 Refer to *wcsncpy( )*.

NAME

wcrtomb — convert a wide-character code to a character (restartable)

SYNOPSIS

```
#include <stdio.h>

size_t wcrtomb(char *restrict s, wchar_t wc, mbstate_t *restrict ps);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

If *s* is a null pointer, the *wcrtomb*( ) function shall be equivalent to the call:

```
wcrtomb(buf, L'\0', ps)
```

where *buf* is an internal buffer.

If *s* is not a null pointer, the *wcrtomb*( ) function shall determine the number of bytes needed to represent the character that corresponds to the wide character given by *wc* (including any shift sequences), and store the resulting bytes in the array whose first element is pointed to by *s*. At most {MB_CUR_MAX} bytes are stored. If *wc* is a null wide character, a null byte shall be stored, preceded by any shift sequence needed to restore the initial shift state. The resulting state described shall be the initial conversion state.

If *ps* is a null pointer, the *wcrtomb*( ) function shall use its own internal **mbstate_t** object, which is initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object pointed to by *ps* shall be used to completely describe the current conversion state of the associated character sequence. The implementation shall behave as if no function defined in this volume of POSIX.1-200x calls *wcrtomb*( ).

CX The *wcrtomb*( ) function need not be thread-safe if called with a NULL *ps* argument.

The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale.

RETURN VALUE

The *wcrtomb*( ) function shall return the number of bytes stored in the array object (including any shift sequences). When *wc* is not a valid wide character, an encoding error shall occur. In this case, the function shall store the value of the macro [EILSEQ] in *errno* and shall return (**size_t**)–1; the conversion state shall be undefined.

ERRORS

The *wcrtomb*( ) function shall fail if:

[EILSEQ] An invalid wide-character code is detected.

The *wcrtomb*( ) function may fail if:

CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

CHANGE HISTORY

First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).

Issue 6

In the DESCRIPTION, a note on using this function in a threaded application is added.

Extensions beyond the ISO C standard are marked.

The normative text is updated to avoid use of the term "must" for application requirements.

The *wcrtomb*( ) prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

Austin Group Interpretation 1003.1-2001 #148 is applied, clarifying that the *wcrtomb*( ) function need not be thread-safe if called with a NULL *ps* argument.

Austin Group Interpretation 1003.1-2001 #170 is applied.

NAME

wcscasecmp, wcscasecmp_l, wcsncasecmp, wcsncasecmp_l — case-insensitive wide-character string comparison

SYNOPSIS

CX
```
#include <wchar.h>

int wcscasecmp(const wchar_t *ws1, const wchar_t *ws2);
int wcscasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
    locale_t locale);
int wcsncasecmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);
int wcsncasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
    size_t n, locale_t locale);
```

DESCRIPTION

The *wcscasecmp*( ) and *wcsncasecmp*( ) functions are the wide-character equivalent of the *strcasecmp*( ) and *strncasecmp*( ) functions, respectively.

The *wcscasecmp*( ) and *wcscasecmp_l*( ) functions shall compare, while ignoring differences in case, the wide-character string pointed to by *ws1* to the wide-character string pointed to by *ws2*.

The *wcsncasecmp*( ) and *wcsncasecmp_l*( ) functions shall compare, while ignoring differences in case, not more than *n* wide-characters from the wide-character string pointed to by *ws1* to the wide-character string pointed to by *ws2*.

When the *LC_CTIME* category of the current locale is from the POSIX locale, these functions shall behave as if the strings had been converted to lowercase and then a byte comparison performed. Otherwise, the results are unspecified.

The information for *wcscasecmp_l*( ) and *wcsncasecmp_l*( ) about the case of the characters comes from the locale represented by *locale*.

RETURN VALUE

Upon completion, the *wcscasecmp*( ) and *wcscasecmp_l*( ) functions shall return an integer greater than, equal to, or less than 0 if the wide-character string pointed to by *ws1* is, ignoring case, greater than, equal to, or less than the wide-character string pointed to by *ws2*, respectively.

Upon completion, the *wcsncasecmp*( ) and *wcsncasecmp_l*( ) functions shall return an integer greater than, equal to, or less than 0 if the possibly null wide-character terminated string pointed to by *ws1* is, ignoring case, greater than, equal to, or less than the possibly null wide-character terminated string pointed to by *ws2*, respectively.

No return values are reserved to indicate an error.

ERRORS

The *wcscasecmp_l*( ) and *wcsncasecmp_l*( ) functions may fail if:

[EINVAL] *locale* is not a valid locale object handle.

NAME

wcschr — wide-character string scanning operation

SYNOPSIS

```
#include <wchar.h>

wchar_t *wcschr(const wchar_t *ws, wchar_t wc);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *wcschr*( ) function shall locate the first occurrence of *wc* in the wide-character string pointed to by *ws*. The application shall ensure that the value of *wc* is a character representable as a type **wchar_t** and a wide-character code corresponding to a valid character in the current locale. The terminating null wide-character code is considered to be part of the wide-character string.

RETURN VALUE

Upon completion, *wcschr*( ) shall return a pointer to the wide-character code, or a null pointer if the wide-character code is not found.

ERRORS

No errors are defined.

NAME

wcscmp — compare two wide-character strings

SYNOPSIS

```
#include <wchar.h>

int wcscmp(const wchar_t *ws1, const wchar_t *ws2);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *wcscmp*( ) function shall compare the wide-character string pointed to by *ws1* to the wide-character string pointed to by *ws2*.

The sign of a non-zero return value shall be determined by the sign of the difference between the values of the first pair of wide-character codes that differ in the objects being compared.

RETURN VALUE

Upon completion, *wcscmp*( ) shall return an integer greater than, equal to, or less than 0, if the wide-character string pointed to by *ws1* is greater than, equal to, or less than the wide-character string pointed to by *ws2*, respectively.

ERRORS

No errors are defined.

NAME

wcscoll, wcscoll_l — wide-character string comparison using collating information

SYNOPSIS

```
#include <wchar.h>

int wcscoll(const wchar_t *ws1, const wchar_t *ws2);
CX int wcscoll_l(const wchar_t *ws1, const wchar_t *ws2,
       locale_t locale);
```

DESCRIPTION

CX For *wcscoll*(): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

CX The *wcscoll*() and *wcscoll_l*() functions shall compare the wide-character string pointed to by *ws1* to the wide-character string pointed to by *ws2*, both interpreted as appropriate to the CX *LC_COLLATE* category of the current locale of the process, or the locale represented by *locale*, respectively.

CX The *wcscoll*() and *wcscoll_l*() functions shall not change the setting of *errno* if successful.

CX An application wishing to check for error situations should set *errno* to 0 before calling *wcscoll*() or *wcscoll_l*(). If *errno* is non-zero on return, an error has occurred.

RETURN VALUE

CX Upon successful completion, *wcscoll*() and *wcscoll_l*() shall return an integer greater than, equal to, or less than 0, according to whether the wide-character string pointed to by *ws1* is greater than, equal to, or less than the wide-character string pointed to by *ws2*, when both are CX interpreted as appropriate to the current locale, or to the locale represented by *locale*, CX respectively. On error, *wcscoll*() and *wcscoll_l*() shall set *errno*, but no return value is reserved to indicate an error.

ERRORS

These functions may fail if:

CX [EINVAL] The *ws1* or *ws2* arguments contain wide-character codes outside the domain of the collating sequence.

The *wcscoll_l*() function may fail if:

CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES

None.

APPLICATION USAGE

The *wcsxfrm*() and *wcscmp*() functions should be used for sorting large lists.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4. Derived from the MSE working draft.

Issue 5

Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

Issue 7

The *wcscoll_l*( ) function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

69402 **NAME**

69403 wcpcpy, wcscpy — copy a wide-character string, returning a pointer to its end

69404 **SYNOPSIS**

69405
```
#include <wchar.h>
```

69406 CX
```
wchar_t *wcpcpy(wchar_t *restrict ws1, const wchar_t *restrict ws2);
```
69407
```
wchar_t *wcscpy(wchar_t *restrict ws1, const wchar_t *restrict ws2);
```

69408 **DESCRIPTION**

69409 CX For *wcscpy*( ): The functionality described on this reference page is aligned with the ISO C
69410 standard. Any conflict between the requirements described here and the ISO C standard is
69411 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

69412 CX The *wcpcpy*( ) and *wcscpy*( ) functions shall copy the wide-character string pointed to by *ws2*
69413 (including the terminating null wide-character code) into the array pointed to by *ws1*.

69414 The application shall ensure that there is room for at least *wcslen*(*ws2*)+1 wide characters in the
69415 *ws1* array, and that the *ws2* and *ws1* arrays do not overlap.

69416 If copying takes place between objects that overlap, the behavior is undefined.

69417 **RETURN VALUE**

69418 CX The *wcpcpy*( ) function shall return a pointer to the terminating null wide-character code copied
69419 into the *ws1* buffer.

69420 The *wcscpy*( ) function shall return *ws1*.

69421 No return values are reserved to indicate an error.

69440 The *wcpcpy*( ) function is added from The Open Group Technical Standard, 2006, Extended API
69441 Set Part 1.

NAME

wcscspn — get the length of a complementary wide substring

SYNOPSIS

```
#include <wchar.h>

size_t wcscspn(const wchar_t *ws1, const wchar_t *ws2);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *wcscspn*( ) function shall compute the length (in wide characters) of the maximum initial segment of the wide-character string pointed to by *ws1* which consists entirely of wide-character codes *not* from the wide-character string pointed to by *ws2*.

RETURN VALUE

The *wcscspn*( ) function shall return the length of the initial substring of *ws1*; no return value is reserved to indicate an error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

XBD **<wchar.h>**

CHANGE HISTORY

First released in Issue 4. Derived from the MSE working draft.

Issue 5

The RETURN VALUE section is updated to indicate that *wcscspn*( ) returns the length of *ws1*, rather than *ws1* itself.

NAME

wcsdup — duplicate a wide-character string

SYNOPSIS

CX
```
#include <wchar.h>

wchar_t *wcsdup(const wchar_t *string);
```

DESCRIPTION

The *wcsdup*( ) function is the wide-character equivalent of the *strdup*( ) function.

The *wcsdup*( ) function shall return a pointer to a new wide-character string, allocated as if by a call to *malloc*( ), which is the duplicate of the wide-character string *string*. The returned pointer can be passed to *free*( ). A null pointer is returned if the new wide-character string cannot be created.

RETURN VALUE

Upon successful completion, the *wcsdup*( ) function shall return a pointer to the newly allocated wide-character string. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

ERRORS

The *wcsdup*( ) function shall fail if:

[ENOMEM] Memory large enough for the duplicate string could not be allocated.

EXAMPLES

None.

APPLICATION USAGE

For functions that allocate memory as if by *malloc*( ), the application should release such memory when it is no longer required by a call to *free*( ). For *wcsdup*( ), this is the return value.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

wcsftime — convert date and time to a wide-character string

SYNOPSIS

```
#include <wchar.h>

size_t wcsftime(wchar_t *restrict wcs, size_t maxsize,
    const wchar_t *restrict format, const struct tm *restrict timeptr);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *wcsftime*( ) function shall be equivalent to the *strftime*( ) function, except that:

- The argument *wcs* points to the initial element of an array of wide characters into which the generated output is to be placed.
- The argument *maxsize* indicates the maximum number of wide characters to be placed in the output array.
- The argument *format* is a wide-character string and the conversion specifications are replaced by corresponding sequences of wide characters.
- The return value indicates the number of wide characters placed in the output array.

If copying takes place between objects that overlap, the behavior is undefined.

RETURN VALUE

If the total number of resulting wide-character codes including the terminating null wide-character code is no more than *maxsize*, *wcsftime*( ) shall return the number of wide-character codes placed into the array pointed to by *wcs*, not including the terminating null wide-character code. Otherwise, zero is returned and the contents of the array are unspecified.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

CHANGE HISTORY

First released in Issue 4.

69545 **Issue 5**

69546 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

69547 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of the *format*
69548 argument is changed from **const char *** to **const wchar_t ***.

69549 **Issue 6**

69550 The *wcsftime*( ) prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

NAME

wcslen, wcsnlen — get length of a fixed-sized wide-character string

SYNOPSIS

```
#include <wchar.h>

size_t wcslen(const wchar_t *ws);
CX size_t wcsnlen(const wchar_t *ws, size_t maxlen);
```

DESCRIPTION

CX For *wcslen*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *wcslen*( ) function shall compute the number of wide-character codes in the wide-character string to which *ws* points, not including the terminating null wide-character code.

CX The *wcsnlen*( ) function shall compute the smaller of the number of wide characters in the string to which *ws* points, not including the terminating null wide-character code, and the value of *maxlen*. The *wcsnlen*( ) function shall never examine more than the first *maxlen* characters of the wide-character string pointed to by *ws*.

RETURN VALUE

The *wcslen*( ) function shall return the length of *ws*.

CX The *wcsnlen*( ) function shall return an integer containing the smaller of either the length of the wide-character string pointed to by *ws* or *maxlen*.

No return values are reserved to indicate an error.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

wcsncasecmp( )

NAME

wcsncasecmp, wcsncasecmp_l — case-insensitive wide-character string comparison

SYNOPSIS

CX

```
#include <wchar.h>

int wcsncasecmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);
int wcsncasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
    size_t n, locale_t locale);
```

DESCRIPTION

Refer to *wcscasecmp( )*.

69599 **NAME**

69600 wcsncat — concatenate a wide-character string with part of another

69601 **SYNOPSIS**

69602
```
#include <wchar.h>
```

69603
```
wchar_t *wcsncat(wchar_t *restrict ws1, const wchar_t *restrict ws2,
```
69604
```
    size_t n);
```

69605 **DESCRIPTION**

69606 CX The functionality described on this reference page is aligned with the ISO C standard. Any
69607 conflict between the requirements described here and the ISO C standard is unintentional. This
69608 volume of POSIX.1-200x defers to the ISO C standard.

69609 The *wcsncat*( ) function shall append not more than *n* wide-character codes (a null wide-
69610 character code and wide-character codes that follow it are not appended) from the array pointed
69611 to by *ws2* to the end of the wide-character string pointed to by *ws1*. The initial wide-character
69612 code of *ws2* shall overwrite the null wide-character code at the end of *ws1*. A terminating null
69613 wide-character code shall always be appended to the result. If copying takes place between
69614 objects that overlap, the behavior is undefined.

69615 **RETURN VALUE**

69616 The *wcsncat*( ) function shall return *ws1*; no return value is reserved to indicate an error.

69617 **ERRORS**

69618 No errors are defined.

69619 **EXAMPLES**

69620 None.

69621 **APPLICATION USAGE**

69622 None.

69623 **RATIONALE**

69630 **CHANGE HISTORY**

69631 First released in Issue 4. Derived from the MSE working draft.

69632 **Issue 6**

69633 The *wcsncat*( ) prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.

NAME

wcsncmp — compare part of two wide-character strings

SYNOPSIS

```
#include <wchar.h>

int wcsncmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *wcsncmp*( ) function shall compare not more than *n* wide-character codes (wide-character codes that follow a null wide-character code are not compared) from the array pointed to by *ws1* to the array pointed to by *ws2*.

The sign of a non-zero return value shall be determined by the sign of the difference between the values of the first pair of wide-character codes that differ in the objects being compared.

RETURN VALUE

Upon successful completion, *wcsncmp*( ) shall return an integer greater than, equal to, or less than 0, if the possibly null-terminated array pointed to by *ws1* is greater than, equal to, or less than the possibly null-terminated array pointed to by *ws2*, respectively.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

NAME

wcpncpy, wcsncpy — copy a fixed-size wide-character string, returning a pointer to its end

SYNOPSIS

```
#include <wchar.h>

wchar_t *wcpncpy(wchar_t restrict *ws1, const wchar_t *restrict ws2,
    size_t n);
wchar_t *wcsncpy(wchar_t *restrict ws1, const wchar_t *restrict ws2,
    size_t n);
```

DESCRIPTION

For *wcsncpy*( ): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The *wcpncpy*( ) and *wcsncpy*( ) functions shall copy not more than *n* wide-character codes (wide-character codes that follow a null wide-character code are not copied) from the array pointed to by *ws2* to the array pointed to by *ws1*. If copying takes place between objects that overlap, the behavior is undefined.

If the array pointed to by *ws2* is a wide-character string that is shorter than *n* wide-character codes, null wide-character codes shall be appended to the copy in the array pointed to by *ws1*, until *n* wide-character codes in all are written.

RETURN VALUE
