

Hi,

First I want to notice I am a Linux newbie and my English is not that good.

Now straight to the point!

I've noticed some inaccuracy in [Fedora 17 "Power Management Guide" \(Fedora Documentation\)](#), particularly in section "[2.5. Tuned and ktune](#)" including "[2.5.1. The tuned.conf file](#)" and "[2.5.2 Tuned-adm](#)".

In section "[2.5. Tuned and ktune](#)" right bellow the "[yum install tuned](#)" command it's written:

"[Installing the tuned package also sets up a sample configuration file at /etc/tuned.conf and activates the default profile.](#)"

There is no such file in /etc. I found a /etc/tuned/active\_profile file containing the following: "/usr/lib/tuned/balanced/tuned.conf". I'm not sure this file (/etc/tuned.conf) is missing only on my system or it has a new location by default for each profile - /usr/lib/tuned/profileX/tuned.conf.

Bellow in this section and in "[2.5.1. The tuned.conf file](#)" it is pointed again that the default location for the tuned.conf file is /etc/tuned.conf.

In section "[2.5.2 Tuned-adm](#)" in the first paragraph it is written "[Fedora 17 includes a number of predefined profiles for typical use cases...](#)". Just to be precise it is good to be mentioned that these profiles are not installed by default with "[yum install tuned](#)" command (tuned-2.0.1-1.fc17 package), but can be found in tuned-profile-compat-2.0.1-1.fc17 package (I found it in Gnome Package Manager).

Another thing in this section is in the last third of the page where it is written:

"[All the profiles are stored in separate subdirectories under /etc/tune-profiles. So /etc/tune-profiles/desktop-powersave contains all the necessary files and settings for that profile. Each of these directories contains up to four files:](#)"

There /etc/tune-profiles directory does not exist. Instead I found the profiles stored in /run/lib/tuned.

Each directory for the corresponding profile typically contains only 2 files - script.sh and tuned.conf. The presence of script.sh is not mentioned in the directories contains description – it is mentioned ktune.sh instead.

That's all. I hope this is helpful. Sorry if I got something in the wrong way.

Best regards

Vasil Draganov

Fedora 17 3.4.0-1.fc17.x86\_64

P.S. "[Power Management Guide](#)" is great. It's really useful. The moment i run tuned service i noticed how quieter my laptop became (less heat – less fan needed :). The first thing I noticed about new Fedora installation was that the laptop was noisier in comparison to Win7 (I dual-boot with Win7). Tuned just fixed that :)

Many thanks to the creators of Fedora Documentation!!!
