

STRONGYLOIDIASIS (*Strongyloides stercoralis*)

Drug	Adult dosage	Pediatric dosage
Drug of choice: ¹ Ivermectin ²	200 mcg/kg/d PO x 2d	200 mcg/kg/d PO x 2d
Alternative: Albendazole ^{3,4}	400 mg PO bid x 7d	400 mg PO bid x 7d

- In immunocompromised patients or disseminated disease, it may be necessary to prolong or repeat therapy, or to use other agents. Veterinary parenteral and enema formulations of ivermectin have been used in severely ill patients with hyperinfection who were unable to take or reliably absorb oral medications (J Orem et al, Clin Infect Dis 2003; 37:152; PE Tarr Am J Trop Med Hyg 2003; 68:453; FM Marty et al, Clin Infect Dis 2005; 41:e5). In disseminated strongyloidiasis, combination therapy with albendazole and ivermectin has been suggested (S Lim et al, CMAJ 2004; 171:479).
- Safety of ivermectin in young children (<15 kg) and pregnant women remains to be established. Ivermectin should be taken on an empty stomach with water.
- Not FDA-approved for this indication.
- Albendazole must be taken with food; a fatty meal increases oral bioavailability.
