| $\begin{aligned} & \text { SPACE } \\ & \text { REQUIREMENTS } \end{aligned}$ | Adequate space must be provided for all animals. [3.6, 3.28, 3.53, 3.80, 3.104, 3.128, Policy \#6, Policy \#24]] |
| :---: | :---: |
| Criteria | Adequate space must provide for: freedom of movement normal postural adjustment |
| Species Specific | Dogs \& Cats [3.6] <br> Adequate space must allow each dog and cat: [3.6(a)(2)(xi)] <br> - to turn about freely <br> - to sit, stand and lie in a comfortable manner <br> - to walk in a normal manner <br> No more than 12 adult nonconditioned dogs or cats may be housed in the same primary enclosure. [3.6(b)(2), 3.6(c)(3)] <br> Food \& Water Bowls <br> Floor space taken up by food and/or water bowls must be subtracted from the available floor space. <br> Dogs only <br> Interior height of the primary enclosure must be at least 6 inches higher than the head of the tallest dog in the enclosure. <br> [3.6(c)(1)(iii] <br> Floor space for each dog and weaned puppy is calculated as follows: [3.6(c)(1)(i)] <br> 1) measure the dog in inches from tip of nose to base of tail (see page 11.4.22) <br> 2) add 6 inches to this number <br> 3) multiply the number in line two by itself (i.e., square it). This is required floor space in square inches. <br> 4) divide by 144 to calculate square feet (see <br> www.aphis.usda.gov/ac/dealer/dogpicture.pdf for more information) |

Example:
For a dog measuring 14 inches:

1) 14 inches $+6=20$ inches
2) $20 \times 20=400$ square inches
3) 400 sq. in. divided by 144 sq. in./sq. ft. $=2.8$ sq. ft.

Additional floor space for each bitch with nursing puppies is determined by: [3.6(c)(1)(ii)]

- bitch's breed, such as:
- rottweilers
- boxers
- dalmations
- bitch's behavioral characteristics, such as:
- extreme nervousness
- high strung
- overly protective
- the attending veterinarian, and
- the minimum space formula shown below

The minimum space requirement is calculated as follows:

1) determine the required floor space in square inches for the bitch as shown above
2) multiply this number by 0.05
3) multiply the number obtained in line two by the number of puppies. This is the amount of additional floor space required.
4) add the additional floor space for the puppies to the required floor space for the bitch
5) divide by 144 to calculate square feet

Example:
For a bitch measuring 14 inches with 5 puppies:

1) 14 inches $+6=20$ inches
2) 20 inches $x 20$ inches $=400$ square inches (bitch's floor space)
3) 400 sq. in. $x 0.05=20$ sq. in. (additional floor space per puppy)
4) 20 sq. in./puppy x 5 puppies $=100$ sq in (total additional floor space)
5) 400 sq. in. +100 sq. in. $=500$ sq. in.
6) 500 sq in divided by $144 \mathrm{sq} \mathrm{in} / \mathrm{sq} \mathrm{ft}=3.5 \mathrm{sq}$. ft. (total floor space for bitch and puppies)

If the available floor space does not meet the minimum required as
calculated for the bitch and her nursing puppies, then the housing must be approved by the APHIS Administrator. [3.6(c)(1)(ii)]

Innovative primary enclosures which do not precisely meet the height and floor space requirements for dogs may be used if they: [3.6(d)]

- provide the dog with an adequate volume of space, and
- provide the opportunity to express species-typical behavior, and
- are approved by the APHIS Administrator

## Cats only

Interior height of primary enclosure containing cats and/or weaned kittens must be at least 24 inches high. [3.6(b)(1)(ii)(A)]

Floor space for cats and weaned kittens is determined as follows:

1) cats up to and including $8.8 \mathrm{lbs}(4 \mathrm{~kg})$ require at least 3.0 sq .
ft .
[3.6(b)(1)(ii)(B)]
2) cats over $8.8 \mathrm{lbs}(4 \mathrm{~kg})$ require 4.0 sq. ft. [3.6(b)(1)(ii)(C)]

3 ) area taken up by food and water pans is not considered part of the minimum required floor space [3.6(b)(1)(ii)(A)]
4) litter pans may be considered part of the minimum floor space
if kept cleaned and sanitized [3.6(b)(1)(iv)]
5) resting surfaces that do not allow the space under them to be used by the cat are counted as floor space but may not be counted as elevated resting surfaces [3.6(b)(4)]

Additional floor space for queens and nursing kittens is determined by: [3.6(b)(1)(iii)]

- the queen's breed
- the queen's behavioral characteristics, such as:
- extreme nervousness
- high strung
- overly protective
- minimum space formula as shown below

The minimum space requirement is calculated as follows:

1) determine the required floor space for the queen as above
2) multiply this number by 0.05
3) multiply the number obtained in line two by the number of kittens. This is the amount of additional floor space required.
4) add the required floor space for the kittens to the required floor
space for the queen

## Example

For an 8 pound queen with 5 kittens:

1) queen requires 3 sq . ft .
2) 3 sq. ft. x $0.05=0.02$ sq. ft. (additional floor space per kitten)
3) 0.02 sq. ft. x 5 kittens $=0.1 \mathrm{sq}$. ft. (total additional floor space)
4) $3.0 \mathrm{sq} \mathrm{ft}+0.1 \mathrm{sq}$. ft. $=3.1 \mathrm{sq}$. ft. (total floor space for queen and kittens)

If the available floor space does not meet the minimum required as
calculated, then the housing must be approved by the APHIS
Administrator. [3.6(b)(1)(iii)]
Innovative primary enclosures which do not precisely meet the height and floor space requirements for cats may be used if they: [3.6(d)]

- provide the cat with an adequate volume of space, and
- provide the opportunity to express species typical behavior, and
- are approved by the APHIS Administrator

Mobile housing for dogs \& cats [3.6(b)(5), 3.6(c)(4)]
While traveling, dog/cat primary enclosures must meet all the transportation requirements (see Transportation Section)

When not traveling, dog/cat primary enclosures must meet all minimum requirements for space.

## Guinea Pigs \& Hamsters

Guinea Pigs [3.28(b)]
Primary enclosures acquired before August 15, 1990:
Interior height of primary enclosures must be at least 6.5 inches. [3.28(b)(2)(i)]

Minimum floor space for each guinea pig is determined as follows:
[3.28(b)(2)(ii)]
Weaning to 350 grams.................. 60 sq in
350 grams or more....................... 90 sq in
Breeders..................................... 180 sq in
Primary enclosures acquired on or after August 15, 1990:
Interior height of primary enclosures must be at least 7.0 inches.
[3.28(c)(1)(ii)]
Minimum floor space for each guinea pig is determined as follows:
[3.28(c)(1)(iii]
Weaning to 350 grams.................. 60 sq in
350 grams or more...................... 101 sq in
Nursing female with litter........... 101 sq in
Innovative primary enclosures which do not precisely meet the height and floor space requirements may be used if they:
[3.28(c)(3)]

- provide the guinea pig with an adequate volume of space, and
- provide the opportunity to express species typical behavior, and
- are approved by the APHIS Administrator

## Hamsters

Primary enclosures acquired before August 15, 1990:
Interior height of primary enclosures for dwarf hamsters must be at least 5.0 inches. [3.28(c)(3)(i)]

Interior height of primary enclosures for other hamsters must be at least 5.5 inches. [3.28(c)(3)(i)]

Nursing female hamsters with litters may not be housed with any other hamsters. [3.28(c)(3)(ii)]

Minimum floor space for each hamster is determined as follows:
[3.28(c)(3)(ii) and (iii)]

| Dwarf | Other | Max \# |
| :---: | :---: | :---: |
| /enc |  |  |
| Weaning to 5 wks............... 5.0 sq in | 10.0 sq in | 20 |
| 5 to 10 wks.......................7.5 sq in | 12.5 sq in | 16 |
| 10 wks or more................. 9.0 sq in | 15.0 sq in | 13 |
| Nursing female with litter... 25 sq in(total) | 121 sq in ( | otal) -- |

Primary enclosures acquired on or after August 15, 1990:
Interior height of primary enclosures must be at least 6.0 inches.
[3.28(c)(2)(ii)]
Minimum floor space for each hamster is determined as follows:
[3.28(c)(2)(iii) and (iv)]
<60 grams.................................... 10 sq in
60 to 80 grams............................. 13 sq in
80 to 100 grams........................... 16 sq in
$>100$ grams.
19 sq in
Nursing female with litter.
.25 sq in total for dwarf
121 sq in total for other

Nursing female hamsters with litters may not be housed with any other hamsters. [3.28(c)(2)(iv)]

Innovative primary enclosures which do not precisely meet the height and floor space requirements may be used if they: [3.28(c)(3)]

- provide the hamster with an adequate volume of space, and
- provide the opportunity to express species typical behavior, and are approved by the APHIS Administrator

Rabbits [3.53]
Primary enclosures acquired before August 15, 1990
Minimum floor space for each rabbit, exclusive of space taken
up by food and water receptacles, is determined as follows:
\{3.53(b)]

| Weight |  | Space/rabbit |  |  |
| ---: | ---: | ---: | ---: | ---: |
| lbs | kgs | $\mathrm{in}^{2}$ | $\mathrm{ft}^{2}$ |  |
| Groups......................3-5 | $1.2-2.6$ | 144 | 1.0 |  |
| $6-8$ | $2.7-4.0$ | 288 | 2.0 |  |
| Individual Adults.......3-5 | $1.2-2.6$ | 180 | 1.25 |  |
| $6-8$ | $2.7-4.0$ | 360 | 2.5 |  |
| $9-11$ | $4.1-5.4$ | 540 | 3.75 |  |
| Nursing Females........3-5 | $1.2-2.6$ | 720 | 5.0 |  |
| $6-8$ | $2.7-4.0$ | 720 | 4.0 |  |
| $9-11$ | $4.1-5.4$ | 864 | 6.0 |  |
|  | $\geq 12$ | $\geq 5.5$ | 1080 | 7.5 |

Primary enclosures acquired on or after August 15, 1990
Interior height of primary enclosures must be at least 14 inches.
[3.53(c)(2)]
Minimum floor space for each rabbit, exclusive of space taken up by food and water receptacles, is determined as follows:
[3.53(c)(2)]

to:
Group 1 - marmosets, tamarins, and infants <6 months of age of various species
Group 2 - capuchins, squirrel monkeys and similar size species, and juveniles 6 months to 3 years of age of various species Group 3 - macaques and African species
Group 4-male macaques and large African species
Group 5 - baboons and nonbrachiating species larger than 33.0 lbs
Group 6 - great apes over 55.0 lbs and brachiating species
NOTE: Great apes weighing over 110.0 lbs must be provided an additional volume of space to allow for normal postural adjustments. [3.80(b)(2)(ii)]

Mothers with infants less than 6 months of age may be housed together in primary enclosures that meet the floor space and height requirements for the mother. [3.80(b)(2)(iv)]

Low perches and ledges that do not allow the space underneath them to be occupied by the nonhuman primate must be counted as part of the floor space. [3.80(b)]

Any exemptions from the floor space requirements must be: [3.80(b)(2)(iii)]

- necessary in the judgment of the attending veterinarian
- approved by the APHIS Administrator

Innovative primary enclosures which do not precisely meet the
height and floor space requirements may be used if they:
[3.80(c)]

- provide the nonhuman primate with an adequate volume of space, and
- provide the opportunity to express species typical behavior, and are approved by the APHIS Administrator

## Marine Mammals [3.104]

Space requirements for marine mammals are based on the following factors:

- species
- horizontal and vertical distances
- normal postural adjustments in and out of the water
- normal social adjustments in and out of the water
- training requirements
- veterinary requirements

Each marine mammal requires its own minimum space regardless of age.

NOTE: When calculating the minimum space requirements for a marine mammal, do not measure the actual animal. Use the average adult lengths listed in Table III.

Cetaceans [3.104(b)]
Cetaceans require only a pool and no dry resting surface.
POOL AREA
The minimum space requirement is based on:

- species
- minimum horizontal dimension (MHD)
- depth
- volume
- surface area

Species
Cetaceans are divided into Group I cetaceans and Group II cetaceans as shown in Table III.

Minimum Horizontal Dimension (MHD) [3.104(b)(1)]
The MHD is the diameter of a circular pool of water.
Group I cetaceans require an MHD of: [3.104(b)(1)(i)]

- 24 feet OR
- two times the average adult length of the longest species housed in the pool, whichever is greater (see Tables I and III)

Group II cetaceans require an MHD of: [3.104(b)(1)(ii)]

- 24 feet OR
- four times the average adult length of the longest species housed in the pool, whichever is greater (see Tables II and III)

In a pool containing both Group I and Group II cetaceans, the MHD must be the longest length required for any cetacean housed therein. [3.104(b)(1)(iii)]

In irregularly shaped or rectangular pools, the MHD may be reduced $20 \%$ in one direction if it is enlarged $20 \%$ in the other direction at a 90 degree angle. [3.104(b)(1)(i)]

EXAMPLE: MHD for a cetacean has been calculated to be 24 ft .
If the pool were round, a pool 24 ft in diameter would meet this requirement. To determine the minimum size of a rectangularshaped pool, increase the calculated MHD by $20 \%$ to find the length and decrease the calculated MHD by $20 \%$ to find the width:
$20 \% \quad 24 \mathrm{ft} \times 0.2=4.8 \mathrm{ft}$
Length $\quad 24 \mathrm{ft}+4.8 \mathrm{ft}=28.8 \mathrm{ft}$
Width $\quad 24 \mathrm{ft}-4.8 \mathrm{ft}=19.2 \mathrm{ft}$
Pool must be 28.8 ft by 19.2 ft .
Depth [3.104(b)(2)]
The minimum depth for both Group I and Group II cetaceans is:

- 6 feet OR
- $\quad 1 / 2$ the average adult length of the longest species in the pool, whichever is greater (see Tables I, II, and III)

Any part of the pool which does not meet the minimum depth requirement cannot be included in the minimum space requirement calculation.

Volume [3.104(b)(3)]
If the pool meets the MHD and the depth requirements, then the pool will have sufficient volume to house:

- two Group I cetaceans, or
- four Group II cetaceans

Volume of the pool is calculated using the following formula: Volume $=($ MHD/2 $)$ squared $\times 3.14 \times$ depth

If the pool houses more than two Group I cetaceans, see Table I for the volume of water required for each additional cetacean.

If the pool houses more than four Group II cetaceans, see Table II for the volume of water required for each additional cetacean.

Surface Area [3.104(b)(4)(i)]
A pool containing up to 2 Group I or 4 Group II cetaceans that meets the required MHD and depth will have the required amount of surface area.

In a mixture of Group I and Group II cetaceans:

1) the MHD, depth and volume must be met, AND
2) any additional surface area required must be met using Table IV

Sirenians [3.104(c)]
Sirenians require only a pool and no dry resting surface.

POOL AREA
The minimum space requirement is based on:

- minimum horizontal dimension (MHD)
- depth
- volume
- surface area

Minimum Horizontal Dimension [3.104(c)(1)]
The MHD is the diameter of a circular pool of water.
The required MHD is two times the average adult length of the longest species housed in the pool. (see Table III)

Depth [3.104(c)(2)]
The minimum depth of the pool must be:

- 5 feet OR
- $\quad 1 / 2$ the average adult length of the longest species housed therein, whichever is greater (see Table III)

Volume [3.104(c)(3)]
If the pool meets the MHD and the depth requirements, then the pool will have sufficient volume to house one or two sirenians

The volume requirement for additional animals is calculated using the following formula:

Volume $=(\mathrm{MHD} / 2)$ squared $\times 3.14 \mathrm{x}$ depth [see above
for depth requirement]
Surface Area [3.104(c)(3)]
If the pool meets the MHD and the depth requirements, then the pool will have sufficient surface area for one or two sirenians.

The surface area requirement for additional animals is calculated using the following formula:

Surface Area $=($ average adult body length/2)squared x
3.14 x depth [see above for depth requirement]

Pinnipeds [3.104(d)]
Pinnipeds require a pool and a dry resting or social activity area which is close enough to the surface of the water to allow easy access to and from the pool. [3.104(d)(1)]

## POOL AREA

Minimum Horizontal Dimension [3.104(d)(3)(ii)]
MHD $=1.5 \times$ average adult length of the longest species
of
pinniped housed in the enclosure
NOTE: The MHD may be reduced up to $20 \%$ if the amount of the reduction is added to the MHD at the 90 -degree angle.

EXAMPLE: MHD for a pinniped has been calculated to be 24 ft .
If the pool were round, a pool 24 ft in diameter would meet this requirement. To determine the minimum size of a rectangularshaped pool, increase the calculated MHD by $20 \%$ to find the length and decrease the calculated MHD by $20 \%$ to find the width:
$20 \% \quad 24 \mathrm{ft} \times 0.2=4.8 \mathrm{ft}$
Length $\quad 24 \mathrm{ft}+4.8 \mathrm{ft}=28.8 \mathrm{ft}$
Width $\quad 24 \mathrm{ft}-4.8 \mathrm{ft}=19.2 \mathrm{ft}$
Pool must be 28.8 ft by 19.2 ft .

Depth [3.104(d)(3)(iii)]
Depth of the pool must be at least 3.0 feet or $1 / 2$ the average adult length of the longest pinniped in the pool, whichever is greater.

NOTE: Any part of the pool which meets the depth requirement may be used in calculating the required dry resting/social area, or as part of the MHD or required surface area.

Surface Area [3.104(d)(3)(i)]
The surface area of the pool must be at least equal to the required dry resting/social area

DRY RESTING AREA (DRA) [3.104(d)(2)]
Group I Pinnipeds (see Table III) - [3.104(d)(2)(i)]
Single-housed animal -
DRA $=2 \mathrm{x}$ (average adult length)squared

Group-housed animals-
DRA = sum of the [(average adult length)squared] for
each
pinniped in the enclosure
Group II Pinnipeds (see Table III) [3.104(d)(2)(ii)]
Single-housed animal-
Dry resting area must be computed for a minimum of two pinnipeds:

DRA $=[($ average adult length $)$ squared $\times 1.5]+[$ (average adult length)squared x 1.4]

Group-housed animals-
The dry resting area is calculated as follows:

1) list all the pinnipeds in the enclosure by average adult length in descending order from the longest to the shortest
2) square the average adult length of each pinniped
3) multiply the squared average length of the longest pinniped by 1.5
4) multiply the squared average length of the second longest pinniped by 1.4
5) multiply the squared average length of the third longest pinniped by 1.3
6) multiply the squared average length of the fourth longest pinniped by 1.2
7) multiply the squared average length of the fifth longest pinniped by 1.1
8) for the 6th and additional pinnipeds only square the average adult length as instructed in Step 2.
9) add the figures obtained above

NOTE: If two or more sexually mature males are housed together in the same primary enclosure, the dry resting/social area must be divided into two or more separate areas with sufficient visual barriers, such as fences, rocks, or foliage, to provide relief from aggressive animals.

Mixed Group I and II Pinnipeds [3.104(d)(2)(iii)]
Dry resting area is calculated as for Group II pinnipeds.

The dry resting/social area must be divided into two or more separate areas with sufficient visual barriers, such as fences, rocks, or foliage, to provide relief from aggressive animals.

NOTE: A small portion of the dry resting area may have up to 4 inches of water.

Polar Bears [3.104(e)]
Primary enclosures housing polar bears must consist of :

- a pool of water
- a dry resting/social activity area
- a den

POOL AREA [3.104(e)]
Minimum Horizontal Dimension
The MHD of the pool must be 8.0 feet or greater.
Depth
The minimum depth of the pool must be 5.0 feet with the exception of any entry or exit area.

Surface Area
The minimum surface area for one or two polar bears must be at least 96.0 square feet.

For each additional polar bear, the surface area must be
increased by 40.0 square feet.
NOTE: Any part of the pool which meets the depth requirement may be counted in the surface area measurement.

## DRY RESTING AREA [3.104(e)]

The dry resting/social activity area must provide:

- at least 400 square feet of area for up to 2 polar bears
- at least 40 square feet of surface area for each additional polar bear
- enough shade to accommodate all the polar bears in the enclosure at the same time

DEN [3.104(e)]
The den must be:

- at least 6.0 feet in width and depth
- at least 5.0 feet in height
- positioned so that the viewing public is not visible from the interior of the den

A separate den must be provided for each adult female of breeding age which is permanently housed in the same enclosure with an adult male of breeding age.

Sea Otters [3.104(f)]
The primary enclosures housing sea otters must consist of:

- a pool of water
- a dry resting area

POOL AREA [3.104(f)]
Minimum Horizontal Dimension [3.104(f)(1)]
The MHD must be at least 3 times the average adult length of the sea otter housed therein.

Depth [3.104(f)(1)]
The minimum depth of the pool must be 3.0 feet.
Volume [3.104(f)(2)]
For one or two sea otters:
Volume $=[3.14 \times$ (average adult length)squared $] \times 3.0 \mathrm{ft}$
NOTE: Average adult length of a sea otter is 4.1 feet.
For each additional sea otter in excess two, add 79.17 cubic
feet to the above total.

DRY RESTING AREA [3.104(f)(3)]
For one or two sea otters:
DRA $=3.14 x$ (average adult length)squared
NOTE: Average adult length of a sea otter is 4.1 feet.

For each additional sea otter in excess of two, add 6.44 square feet to the above total.

Other Animals [3.128, Policy \#6, Policy \#24]
Primary enclosures must be large enough to allow each animal to make normal postural and social adjustments with adequate freedom of movement.

Criteria for determining adequate space include, but are not limited to:

- all animals must be able to lie down with limbs extended in a normal manner without obstruction from enclosure sides or having to extend feet through bars or feeder doors [Policy \#6]
- animals that normally engage in occasional vertical postures, such as bears and many felines, must have
sufficient vertical space available to accommodate these postures [Policy \#6]
- elephants housed on chains must have chains of sufficient length and arrangement to be able to comfortably lie down, get up, self-groom, and move about within a reasonable distance [Policy \#6]
- flying species must have sufficient unobstructed volume to enable movement by flying and sufficient roosting space to allow all animals to rest simultaneously [Policy \#24]
- species that, under natural conditions, spend a significant portion of time in water, such as capybaras, beavers, river otters, hippopotami, and tapirs, must have both dry and aquatic portions of the primary enclosure. Each portion must provide, at a minimum, sufficient space for normal postural and social adjustments. [Policy \#24]

Signs of inadequate space include, but are not limited to: [3.128]

- malnutrition
- poor condition
- debility
- stress
- abnormal behavior patterns
