

U.S. Greenhouse Gas Emissions

- In 1994, U.S. GHG emissions were about 1.65 billion metric tons of carbon (measured on a carbon equivalent basis)
 - Represents about 20% of the global total
- Emissions of CO₂ accounted for the largest share of U.S. greenhouse gas emissions -- about 85% of the total
- Fossil fuel combustion is main source of CO₂ emissions
- Utilities, transportation, and industrial sectors are major sources of fossil fuel CO₂ emissions
- Future growth in CO₂ emissions expected to be higher for developing countries

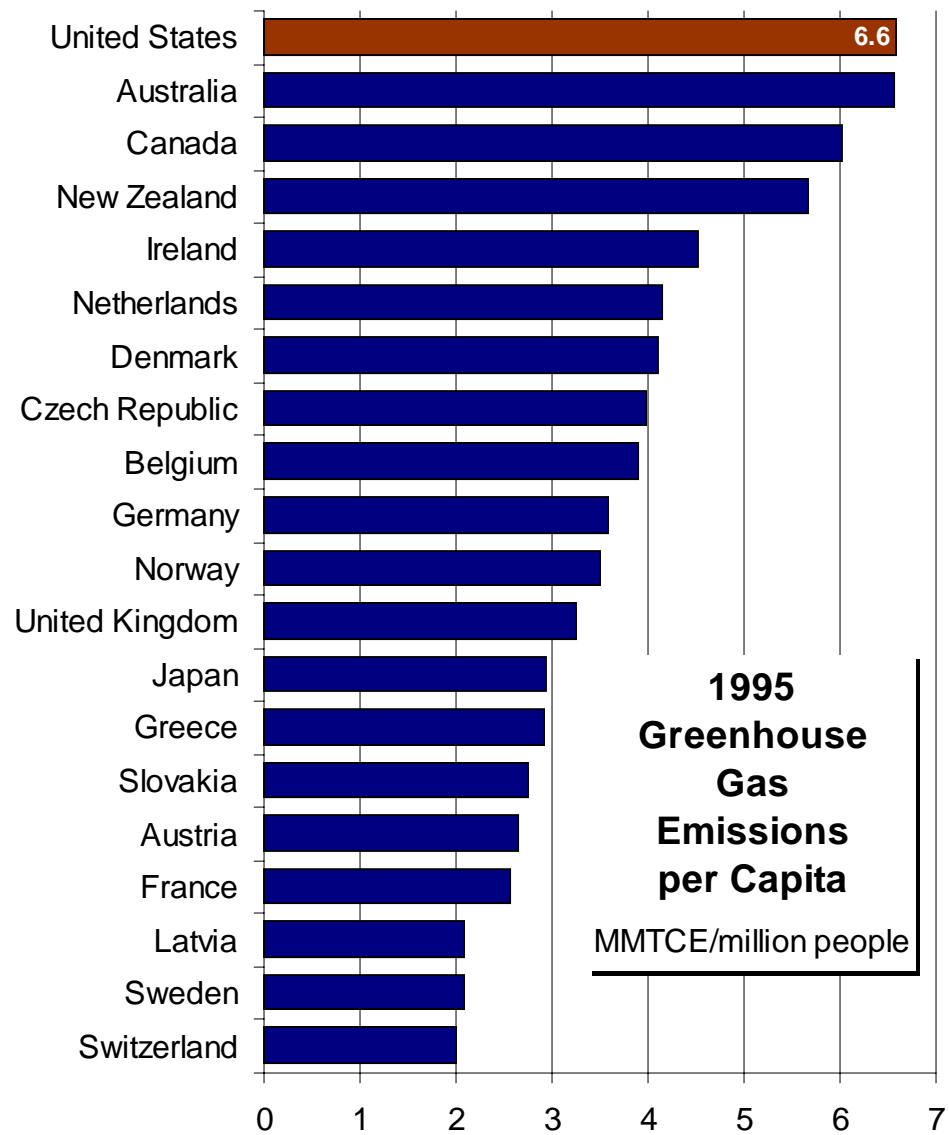

Total U.S. Greenhouse Gas Emissions by Gas: 1995 (MMTCE)

* Sinks not included.
