## Data Formats from DSP to L2 \& L3

## 1. L3 Alignment Constants

One current proposal is to attach "module-wise" alignment constants to the header of each event. Module-wise alignment constants would be the offset of one or a few measured reference coordinates ( $\mathrm{x}, \mathrm{y}, \mathrm{z}$, theta, phi) for each module (PDT; quarter-plane of MDT's; octant of scintillator pixels serviced by one SFE crate) with respect to the nominal reference coordinates defined in the permanent detector geometry file. The geometry file would also hold the information required to translate the reference coordinates into the coordinates of each individual channel (PDT wire; MDT wire; scintillator pixel). The number of reference points will be picked to suit each type of module; e.g.:

- 1 reference point per PDT
- 2 reference points per MDT module ( 1 per MDT octant-plane)
- 1 reference point per set of scintillator channels served by one SFE (= 5-8 reference points per module; alignment constants would be attached to the SFE "sub-header" containing SFE address and ADC information, and only attached for events in which a given SFE had a hit).

Another proposal is to attach no alignment constants in the DSP.

## 2. TZeroes

T0's are defined as the reported time in a given detector component for a relativistic particle emanating from the IP on a given crossing. They include particle propagation time (i.e., path length), and signal propagation through electronics, cables, etc. They do not include propagation time through detectors. In particular:

- A PDT's T0 will be defined as the leading edge of a distribution of all prompt muons in that PDT. PDT drift time and signal propagation time along wires will thus not be subtracted as part of the T0. They will be measured and used to calculate axial and radial positions with respect to wires.
- A MDT's T0 will be defined as the leading edge of a distribution of all prompt muons in that MDT. MDT drift time will thus not be subtracted as part of the T0. It will be used to calculate radial position with respect to wires. Signal propagation time along wires will be considered negligible at this level; in principle, once the axial position of the track within the tube is known, the signal propagation time along the wire could be corrected for.
- A scintillator pixel's T0 will be defined as the mean of a distribution of prompt muons in the center of that pixel. Once the position of a track within the pixel is known, light propagation time through the scintillator can be corrected for.
I.e., the T0-subtracted time for a relativistic particle should ideally be zero, modulo propagation time through detectors.

These are described in more detail in the note on calibration constants.

## Common Header Format

Common to L2 and L3 data from all muon subsystems.

| Word Count |
| :--- |
| Module ID |
| Crossing \# |
| Turn \# |
| Event Status Register |
| Event Status Register |

r coord: $\quad$ A-layer $=0$
B-layer $=1$
C-layer $=2$
$\eta$ coord: PDT $=0-4$ (north to south)
CMSC $=5$
MDT north $=6$
FMSC north $=7$
MDT south $=8$
FMSC south $=9$
$\phi$ coord: $\quad$ PDT $=0-7$
MDT $=0,2,4,6$
CMSC \& FMSC east $=8$
CMSC \& FMSC west $=9$
MCEN $=8$

## Crossing \#:

Local crossing \# from readout controller (compared with TFW crossing \#; error flag set if they differ).

## Turn \#:

Local turn \# from readout controller.

## Event Status Register:

Includes:

- Error flags.
- Data type: e.g., "normal"; "all channels"; "calibration"; etc.
- Calibration const. set ID: 11 bits -> up to 2047 sets ( $\sim 2 /$ day for 3 years).
- alignment const. set ID: 6 bits -> up to 63 sets ( $\sim 10$ alignment sets in run
1).
- DSP code version \#.
- Other?

Status: bit 8: $0=$ single hit; $1=$ multi-hit bit 9: $1=$ missing wire signal bit 10: $1=$ missing pad signal etc.

## Radial Distance:

Drift distance perpendicular to wire with respect to wire position; includes T0 subtraction.
1.2 ns TMC bin width over $\sim 500 \mathrm{~ns}$-> 9 bits.

9 bits over $\sim 5 \mathrm{~cm}$-> $100 \mu \mathrm{~m}$ resolution.

## Wire Position ( $\theta$ ):

Fixed position of wire in terms of theta in global coordinates.
1 mrad resolution over $\pi->12$ bits.

## Longitudinal Position ( $\phi$ ):

| 15 | 14 | 13 | 12 | 11 | 10 |
| :--- | :--- | :--- | :--- | :--- | :--- | spare $\begin{array}{lll}7 & 6 & 5 \\ \text { angle (mrad) }\end{array}$

Position along wire in terms of phi in global coordinates.
1.2 ns TMC bin width -> $\sim 20 \mathrm{~cm}$ resolution -> $\sim 2$ mrad max. resolution; units of mrad to avoid truncating significant figures.
$2 \pi$ coverage -> 13 bits.

## PDT L3 Data Format

| COMMON HEADER |
| :--- |
| Reference $\mathrm{x} / \mathrm{y}$ Offsets |
| Reference z Offset |
| Reference $\theta / \phi$ Offsets |
| Hit Channel Count |
| Wire \# / Status |
| Time Data Word Count |
| Time 0 |
| Time 1 |
| $\ldots$ |
| Pad Signal A |
| Pad Signal B |
| Wire \# / Status |
| ... |

## Reference $\mathbf{x} / \mathbf{y}$ Offsets:

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| sign | y offset distance ( $100 \mu \mathrm{~m}$ ) |  |  |  |  |  |  | sign | x offset distance ( $100 \mu \mathrm{~m}$ ) |  |  |  |  |  |  |

Distance of reference point for this PDT from its nominal position (as defined by geometry constants).
7 bits +1 sign bit $->0.1 \mathrm{~mm}$ resolution over up to +/- 12.7 mm .

## Reference z Offset:

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| spare |  |  |  |  |  |  |  | sign | z offset distance ( $100 \mu \mathrm{~m}$ ) |  |  |  |  |  |  |

Distance of reference point for this PDT from its nominal position (as defined by geometry constants).
7 bits +1 sign bit $->0.1 \mathrm{~mm}$ resolution over up to +/- 12.7 mm .

## Reference Theta/Phi Offsets:

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 55theta offset ( $10 \mu \mathrm{rad}$ ) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| sign | phi offset ( $10 \mu \mathrm{rad}$ ) |  |  |  |  |  |  | sign |  |  |  |  |  |  |  |

Theta offset: angle of PDT theta reference with respect to its nominal angle (as defined by geometry constants).
Phi offset: angle of PDT phi reference with respect to its nominal angle (as defined by geometry constants).
7 bits +1 sign bit -> 0.01 mrad resolution over up to +/- 1.27 mrad .

## Hit Channel Count:

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 |  |  | hit | hann | cou |  |  | 0 |  |  | re hit | han | co |  |  |  |

Number of channels with hits.
Max. $\#$ of wire/pad channels $=(3 \mathrm{CB} ’ \mathrm{~s})^{*}(32$ channels $)=96->7$ bits.

## Wire \# / Status: Same as for L2.

Time Data Word Count:

Number of time data words following this word for this wire.
$<8$ hits recorded per wire -> 3 bits.

Time:

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | sign | time ( 100 ps ) |  |  |  |  |  |  |  |  |  |  |  |  |  |

T0-subtracted time.
1.2 ns bin width -> units of 0.1 ns to avoid truncating significant figures. $\sim 500$ ns max drift time -> 13 bits.

## Pad Signal:

| 15 | 14 |
| :--- | :--- |

| 13 | 12 | 11 | 10 | 9 | 8 | 7 |  | 6 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| spare |  |  |  |  |  |  |  |  |

| 6 | 5 | 4 | 3 |
| :--- | :--- | :--- | :--- |

Pedestal-subtracted signal.
10 bits of ADC information for $\sim 10 \mathrm{pC}$ max. integrated charge -> units of 10 fC . Empty or otherwise flagged word for missing pad signals (i.e., 2 pad words will always appear for PDT's with pads).

## Notes:

- For PDT's with no pad connections, the pad signal words will be omitted.
- For PDT's with no hits, the common header, alignment words and hit channel count will still be sent to L3, with hit channel count $=0$.

## L2 Scintillator Data Format

| COMMON HEADER |
| :--- |
| Data Word Count |
| PMT \# |
| $\theta / \phi$ Position |
| Time |
| PMT $\#$ |
| .. |

## Data Word Count:

| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| spare |  |  |  |  | data word count |  |  |  |  |  |  |  |  |  |  |  |

Number of words following this word.
11 bits to code max \# of words: ( 8 SFE's)*(48 channels)*(3 words) $=1152$

Theta/Phi Position:

Position of pixel center in terms of theta and phi in global coordinates.
8 bits over $2 \pi$-> units of 25 mrad.

Time:

T0-subtracted time.
1.2 ns bins -> units of $0.1 \mathrm{~ns} ; 132 \mathrm{~ns}$ max. time -> 11 bits.

PMT \#:
Different for 1- and 2-phototube counters:

1-phototube pixels:

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | spare |  |  |  | octant |  | z coord. (CMSC) or r <br> coord. (FMSC) | $\phi$ coordinate |  |  |  |  |  |  |  |

Phototube readout order and numbering for full CMSC A-layer octant (similar for bottom A-layer, with last 4 phi segments omitted):

Decimal:

| z - > |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## L3 Scintillator Data Format

| COMMON HEADER |
| :--- |
| Hit Channel Count |
| SFE Address |
| Reference x/y Offsets |
| Reference z Offset |
| ADC_A Data |
| ADC_B Data |
| ADC_C Data |
| PMT \# |
| Time |
| PMT \# |
| $\ldots$ |
| SFE Address |
| $\ldots$ |

## Hit Channel Count:

Hit channel count: number of phototube channels with hits.
Max. \# of channels $=(8 \mathrm{SFE} \text { 's })^{*}(48$ channels $)=384->9$ bits.
Number of hit SFE's gives of \# of words of ADC data.
Up to 8 SFE's / crate -> 3 bits.

SFE Address:

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| spare ${ }^{\text {a }}$ SFE address |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Max. 8 SFE's / crate -> 3 bits.

## Reference $\mathbf{x} / \mathbf{y}$ Offsets:

Distance of reference point for scintillator serviced by this SFE from its nominal position (as defined by geometry constants).
7 bits +1 sign bit -> 0.1 mm resolution over up to $+/-12.7 \mathrm{~mm}$.

## Reference z Offset:

Distance of reference point for scintillator serviced by this SFE from its nominal position (as defined by geometry constants).
7 bits +1 sign bit -> 0.1 mm resolution over up to $+/-12.7 \mathrm{~mm}$.

## ADC Data:

Pedestal-subtracted pulse height in fC ( max should be about 5 pC ).
10 bit ADC -> 12 bits for conversion without truncating significant figures.

PMT \#: Same as for L2.

## Time: Same as for L2.

Note:
For scintillator crates with no hits, the alignment and ADC data will still be sent to L3, with hit channel count $=0$.

## L2 MDT Data Format

| COMMON HEADER |
| :--- |
| Data Word Count |
| Wire \# |
| Wire $\theta / \phi$ Position |
| Wire $\#$ |
| $\ldots$ |

## Data Word Count:

Number of words following this word.
Up to 2688 words -> 12 bits.

Wire \#:

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| spare |  |  |  |  |  |  | oct | r coordinate |  |  |  |  |  | z coord |  |

2 octant-planes per module -> 1 bit for octant ID.
Wire readout order and numbering for a 4-deck layer (3-deck layers are similar, with $\mathrm{z}=3$ layer omitted):

## Decimal:

| 0 | 4 | 8 | 12 | 16 | 20 | 24 | 28 | $32 \ldots$ | $64 \ldots$ | $96 \ldots$ | $128 \ldots$ | $160 \ldots$ | $192 \ldots$ | $224 \ldots$ |

## Reference $1 \mathbf{x} / \mathbf{y}$ Offsets:

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| sign | y offset distance ( $100 \mu \mathrm{~m}$ ) |  |  |  |  |  |  | sign | x offset distance ( $100 \mu \mathrm{~m}$ ) |  |  |  |  |  |  |

Distance of reference point for first MDT octant-plane in this module from its nominal position (as defined by geometry constants).
7 bits +1 sign bit $->0.1 \mathrm{~mm}$ resolution over up to $+/-12.7 \mathrm{~mm}$.

## Reference 1 z/theta Offsets:

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| sign | theta offset $(10 \mu \mathrm{rad})$ |  |  |  |  |  |  | $\operatorname{sign}$ | z offset distance $(100 \mu \mathrm{~m})$ |  |  |  |  |  |  |

z offset: Distance of reference point for first MDT octant-plane in this module from its nominal position (as defined by geometry constants).
7 bits +1 sign bit -> 0.1 mm resolution over up to $+/-12.7 \mathrm{~mm}$.
theta offset: angle of theta reference for first MDT octant-plane in this module with respect to its nominal angle (as defined by geometry constants).
7 bits +1 sign bit $->0.01$ mrad resolution over up to $+/-1.27 \mathrm{mrad}$.

## Reference 1 phi / Reference $2 \times$ Offsets:

phi offset: angle of phi reference for first MDT octant-plane in this module with respect to its nominal angle (as defined by geometry constants).
7 bits +1 sign bit -> 0.01 mrad resolution over up to $+/-1.27 \mathrm{mrad}$.
x offset: Distance of reference point for second MDT octant-plane in this module from its nominal position (as defined by geometry constants). 7 bits +1 sign bit -> 0.1 mm resolution over up to $+/-12.7 \mathrm{~mm}$.

## Reference $2 \mathrm{y} / \mathrm{z}$ Offsets:

Distance of reference point for second MDT octant-plane in this module from its nominal position (as defined by geometry constants). 7 bits +1 sign bit -> 0.1 mm resolution over up to $+/-12.7 \mathrm{~mm}$.

## Reference 2 theta/phi Offsets:

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5theta offset ( $10 \mu \mathrm{rad}$ ) |  |  |  |  | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| sign | phi offset ( $10 \mu \mathrm{rad}$ ) |  |  |  |  |  |  | sign |  |  |  |  |  |  |  |

theta offset: angle of theta reference for second MDT octant-plane in this module with respect to its nominal angle (as defined by geometry constants).
phi offset: angle of phi reference for second MDT octant-plane in this module with respect to its nominal angle (as defined by geometry constants).
7 bits +1 sign bit -> 0.01 mrad resolution over up to +/- 1.27 mrad .

## Data Word Count:

Number of words following this word.
Up to $2688 * 2=5376$ words -> 13 bits.

Wire \#: Same as for L2.

## Drift Distance:

Drift distance perpendicular to wire, with respect to wire position.
3-bit time resolution over $\sim 1 \mathrm{~cm}$ drift distance -> distance in units of 0.1 mm , to avoid truncating significant figures -> 7 bits.

Note:
For MDT crates with no hits, the common header, alignment words and data word count will still be sent to L3, with data word count $=0$.
