

I would like to express my interest in the above proceeding 04-186. As a member of Bigtube Wireless LLC I must say we have had good success in providing Wireless Internet services in parts of Michigan that had limited or no broadband options available to the local communities. We are now becoming more challenged every day by rough terrain, trees, distances and the rising interference levels in the current unlicensed bands. We have also been denied tower locations due to restrictions in various townships with constrictive zoning laws and other local laws. If new lower frequency unlicensed bands were to be opened up to the WISP industry we could keep enlarging the areas we can get signal into with many of the existing tower locations we already have in place. This service is drastically needed in many more communities and areas in the country. I also believe that these frequencies could be better used by the WISP industry because of the ability to quickly deploy new equipment into areas that don't support the big numbers of subscribers that the large providers want. We would love to keep this industry growing for everyone involved and hope you can help provide the WISP industry with the ability to play on a level playing field.

Thank You

Richard S. Jones
