### IMBA Organ and IREP Model Selection by ICD-9 Code

#### 1.0 Purpose

This Technical Information Bulletin provides guidance on selecting appropriate ICRP modeled organs/tissues in the Integrated Modules for Bioassay Analysis (IMBA) software program to estimate the internal dose for specific ICD-9 codes and the appropriate model in the Interactive RadioEpidemiological Program (IREP).

## 2.0 Background

Under EEOICPA, the organs/tissues for which doses must be estimated are those delineated by the specified ICD-9 code received from the Department of Labor (DOL). While many ICD-9 codes are clear in their intended organ/tissue, additional guidance is necessary to identify the appropriate IMBA and IREP model to use for the organ/tissue. This TIB designates the appropriate organ/tissue selection within IMBA to use for the various ICD-9 coded cancers, and the appropriate IREP model to use as well.

## 3.0 Guidance

The following table correlates ICD-9 codes to the appropriate organ/tissue selection in IMBA and the appropriate IREP model. Organs/tissues labeled "Highest non-met organ/tissue" indicate that dose to the highest non-metabolic organ is to be used to represent the dose to the ICD-9 Code designated organ/tissue. A discussion of this term is included in section 4.0 of this bulletin. The remaining regions are described by the term used in IMBA.

Table 1

Iable			
ICD-9		IMBA applicable	
Code	Cancer code explanation	organ/tissue	IREP model
140	MALIGANT NEOPLASM LIP		
140.0	MALIG NEO UPPER VERMILION	Highest non-met organ/tissue	Oral Cav and pharynx
140.1	MALIG NEO LOWER VERMILION	Highest non-met organ/tissue	Oral Cav and pharynx
140.3	MALIG NEO UPPER LIP, INNER	Highest non-met organ/tissue	Oral Cav and pharynx
140.4	MALIG NEO LOWER LIP, INNER	Highest non-met organ/tissue	Oral Cav and pharynx
140.5	MALIG NEO LIP, INNER NOS	Highest non-met organ/tissue	Oral Cav and pharynx
140.6	MALIG NEO LIP, COMMISSURE	Highest non-met organ/tissue	Oral Cav and pharynx
140.8	MALIG NEO LIP NEC	Highest non-met organ/tissue	Oral Cav and pharynx
140.9	MALIG NEO LIP/VERMIL NOS	Highest non-met organ/tissue	Oral Cav and pharynx
141	MALIG NEO TONGUE		
141.0	MALIG NEO TONGUE BASE	Highest non-met organ/tissue	Oral Cav and pharynx
141.1	MALIG NEO DORSAL TONGUE	Highest non-met organ/tissue	Oral Cav and pharynx
141.2	MALIG NEO TIP/LAT TONGUE	Highest non-met organ/tissue	Oral Cav and pharynx
141.3	MALIG NEO VENTRAL TONGUE	Highest non-met organ/tissue	Oral Cav and pharynx
141.4	MALIG NEO ANT 2/3 TONGUE	Highest non-met organ/tissue	Oral Cav and pharynx
141.5	MALIG NEO TONGUE JUNCTION	Highest non-met organ/tissue	Oral Cav and pharynx
141.6	MALIG NEO LINGUAL TONSIL	LNET	Oral Cav and pharynx
141.8	MALIG NEO TONGUE NEC	Highest non-met organ/tissue	Oral Cav and pharynx
141.9	MALIG NEO TONGUE NOS	Highest non-met organ/tissue	Oral Cav and pharynx

## 4.0 <u>Discussion</u>

# 4.1 <u>Highest Non-metabolic organ</u>

The dose estimate for a number of tissues is based on the highest non-metabolic organ dose, designated as "Highest non-met organ/tissue" in the table. Metabolic organs are those that are specifically modeled by the ICRP for a particular element. The biokinetic models are based on the

behavior of the particular element in the body, so the metabolic organs vary with the element of interest. The metabolic organs also include the gastrointestinal tract (ICRP 30) and, in the case of inhalation, the respiratory tract (ICRP 66).

For radionuclides that primarily emit alpha or beta radiation, the soft tissue compartment becomes the primary recipient of dose. This compartment contains all the organs not specifically accounted for in the metabolic model. This compartment accounts for the dose delivered by material actually deposited in that tissue. An additional source of exposure to the tissue is known as photon cross-irradiation. This cross-irradiation is the exposure to a tissue from photons originating in other tissues.

When the energy emitted by a radionuclide is primarily alpha or beta radiation, the soft tissue compartment becomes the primary source of dose. Under this scenario most of the non-metabolic organs receive the same dose. For radionuclides where photon emissions are a major source of energy emitted, the non-metabolic organ doses can vary due to their relative proximity to the metabolic organs in which the radionuclides concentrate. IMBA calculates the dose from both means of irradiation and sums them. For many radionuclides (predominately alpha and beta emitters) this will cause only minor differences in doses to non-metabolic organs, so choosing the highest is a realistic assumption with only minor (if any) overestimation.

It is conceivable that a situation could arise where a photon emitting radionuclide causes a large difference in doses delivered to non-metabolic organs. In accordance with the Internal Dose Reconstruction Implementation Guideline, it is acceptable in these situations to base the dose on an organ that is not the highest non-metabolic organ. The choice in these cases should be based on the proximity of the model organ to the actual organ of interest.

#### 4.2 Medical review

Due to the complexity of determining the appropriate organ/tissue for some ICD-9 code cancers, a medical review by an ORAU team physician is required to determine the organ/tissue to use in IMBA for those cancers. These cancers have been designated in the table as "Medical review." The ORAU team physician will recommend to the dose reconstructor the appropriate organ/tissue for dose estimation purposes.

#### 4.3 <u>Bladder</u>

When the term "Bladder" is used in the table with no modifier, this represents the urinary bladder. When the organ of interest is the gallbladder, "Gallbladder" is specified clearly in the table above.
