Strategic Approach

Energy STAR

- Guidelines for Energy
 Management
 - steps to achieving continuous improvement
 - based upon best practices of ENERGY STAR partners
 - www.energystar.gov

So You've Rated Your Buildings—Now What?

- Check your work
- Set realistic goals
- Review your Ratings
- Examine key facilities
- Develop action plan
- Train and educate
- Re-assess performance
- Recognize success

Rating Accuracy

- Use actual data (not default values) for accurate rating
- Common mistakes
 - Was every meter included?
 - Have you counted all fuels/sources of energy?
 - Oil, Gas, Steam, electric, etc.
 - Are space types and building attributes accurate?
- Some ratings outside the range is normal

Set Realistic Goals

- Goals drive performance
 - goal-setting process varies by organization
- One approach
 - Use Portfolio Manager
 - Review average rating
 - How much can you improve?
 - Set a timetable
- Tie into other (e.g., financial) goals
 - Financial Value Calculator (commercial sector)
 - Cash Flow Opportunity Calculator (public sector)

Review Ratings & Identify Key Facilities

Building Portfolio by ENERGY STAR Rating

Identify Key Facilities

Plot Building Performance

ENERGY STAR

Prioritize facilities

 Create matrix to compare building energy performance across multiple factors

 Create view in PM

PORTFOLIO MANAGER

Examine Key Facilities

Examine Key Facilities

- Walk-through versus full-scale audit
- Simple walk-through
 - Identify obvious energy drains
 - Open windows
 - Space heaters
 - Lights/appliances left on at night
 - Running motors
 - Collect data from major equipment/controls
 - Develop ideas, assess costs and savings

Examine Key Facilities

- Comprehensive energy assessment
 - Performed by a qualified energy professional
 - Monitor and measure
 - Air temperatures
 - Water flow rates and temperatures
 - Electric demand of mechanical equipment
 - Run times of lighting
 - Assess O&M strategies, interview maintenance staff
 - Develop detailed energy conservation measures
 - Onsite renewable energy opportunities
 - Detailed cost/savings estimates for improvements

Common Findings

- Oversized or outdated equipment
- Unnecessary/inefficient lighting
- Excess loads
 - Ventilation in areas that aren't occupied
 - Kitchen/office equipment on when not needed
 - Heat loss/solar gain through windows/envelope
- Insufficient monitoring and/or controls
- Miscalibrated energy management system
- Poorly maintained HVAC

Key Components Staging Improvements

Key Components

- Technical steps and targets
- Roles and resources
 - Identify internal managers/champions
 - Set performance goals for managers, contractors, and individual buildings
 - Estimate cost/paybacks to secure resources
- Monitor/track progress
 - Benchmark regularly
 - Ratings can change

Eastman Kodak's largest U.S. facility held brainstorming events with a mix of employees that helped uncover \$2.5 million in energy savings.

Staging Improvements

- Existing building commissioning
- Lighting
- Supplementary load reduction
- Fan/motor system upgrades
- Heating/cooling system upgrades

Details about the staged approach to energy management can be found in the ENERGY STAR Building Manual, available online at www.energystar.gov

Existing Building Commissioning

- Does building perform as intended?
 - Especially new, well-designed underperformers
- Revisit temperature setpoints
- Boiler combustion efficiency and waste heat
- Building envelope
 - Insulation/infiltration
 - Roofing material
- Light sources and quality
- This step alone can significantly impact the rating

Lighting

- Take space use into account
 - Use natural light where possible
 - Position task lighting only where needed
 - Check light levels against industry standards
- Automatic controls
 - Occupancy sensors
 - Timers
 - Dimmers
- Retrofit
 - ENERGY STAR-labeled products
 - Lights use two-thirds less energy, 10X longer

- High efficiency 4-lamp T8 fixture: –40% fewer Watts than T12 –40% less heat output –10% greater light output
- -2-4 year simple payback

Reducing Loads

- Ventilation systems
 - Economizer cycle, occupancy sensors cut loads
 - New ASHRAE 62 standard for auditoriums, etc.
- Equipment
 - ENERGY STAR-labeled products power down
 - Vending machine lights on timers/dimmers
 - Domestic hot water tanks' heat loss
- Building envelope
 - Window films/shading to reduce solar gain
 - Insulation, weathersealing to reduce infiltration

System Upgrades

- Variable air volume/speed fans/motors
 - Motors operate 98% of the time at part-load
 - VAV air systems: 30% less energy than constant
- Heating/cooling systems
 - New chillers 15% to 50% more efficient
 - Replacement cost-effective if chiller
 10+ years old
- Ongoing maintenance
 - Clean coils, ducts, fan blades
 - Calibrate sensors, adjust boilers
 - Replace filters
 - Treat scale buildup on towers

St. Francis Hospital in Minneapolis: –Improved rating from 51 to 91 –Used \$ saved from right-sizing water pump to buy new boilers –Used \$ saved from new boilers to fund new DDC controls

Every one percent reduction in energy consumption increases the energy performance rating by approximately one point.

Training and Motivating Staff Encouraging Occupants

Training Staff

energy STAR

• Training

- Provide training for:
 - appropriate use of technologies
 - approaches to energy management
 - concept of continuous improvement
- Ensure staff has required knowledge of building performance
 - Actual energy use, rating, costs
 - Equally important as technical knowledge

Hines Energy Manager Skill-Sets

--Understand energy management

--Understand building operating dynamics

--Aware of new technologies

- --Think outside the box
- --Calculate payback
- --Incorporate change

Motivating Staff

- Education and Outreach
 - Use posters, tip sheets, newsletters, etc.
- Awards, recognition, friendly competition
- Financial rewards
 - Hilton Hotels & Food Lion offer a bonus
- Employee responsibility
 - GM saved \$57 million

Involving Occupants

- Identify energy champions
- Educate tenants
 - Email newsletters
 - Lobby posters
- Every Watt counts
 - Put computers in "sleep" mode
 - Turn machines off when not in use
 - Shut off lights when you leave
 - Request janitorial contractors minimize lights

Each year, Americans use 4 billion kWh to brew 30 billion pots of coffee.

Ongoing Assessment

 Continuous improvement requires ongoing assessment

Ongoing Assessment

- Re-assess building performance
 - Update utility data monthly
 - Continuous if possible
 - Spot trends and address issues
 - Conduct an annual review of goals and achievements (including financial)
 - Calculate portfolio-wide improvements vs. goal
 - Set new goals

Achieving Success

- Financial benefits
- Environmental benefits
- Demonstrate stewardship

Earn recognition from EPA

Building level

– ENERGY STAR Label

- Existing buildings rating 75 or higher
- Designed to earn ENERGY STAR
 - Buildings in design phase
- Organization-wide
 - ENERGY STAR Leaders
 - 10, 20, or 30 point increase portfolio-wide
 - ENERGY STAR Partner of the Year awards

NEW BUILDING DESIGN

Help protect our environment by designing buildings with superior energy performance. Top performing facilities that are designed to earn the ENERGY STAR require less money to operate and are responsible for fewer greenhouse gas emissions from power plants. Take advantage of tools and resources from EPA, and join building design professionals from around the country who are demonstrating their commitment to creating sustainable architecture.
