NASA STI Program ... in Profile

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA scientific and technical information (STI) program plays a key part in helping NASA maintain this important role.

The NASA STI program operates under the auspices of the Agency Chief Information Officer. It collects, organizes, provides for archiving, and disseminates NASA's STI. The NASA STI program provides access to the NASA Aeronautics and Space Database and its public interface, the NASA Technical Report Server, thus providing one of the largest collections of aeronautical and space science STI in the world. Results are published in both non-NASA channels and by NASA in the NASA STI Report Series, which includes the following report types:

- **TECHNICAL PUBLICATION.** Reports of completed research or a major significant phase of research that present the results of NASA Programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA counterpart of peer-reviewed formal professional papers but has less stringent limitations on manuscript length and extent of graphic presentations.
- **TECHNICAL MEMORANDUM.** Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.
- **CONTRACTOR REPORT.** Scientific and technical findings by NASA-sponsored contractors and grantees.

- **CONFERENCE PUBLICATION.** Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or co-sponsored by NASA.
- **SPECIAL PUBLICATION.** Scientific, technical, or historical information from NASA programs, projects, and missions, often concerned with subjects having substantial public interest.
- **TECHNICAL TRANSLATION.** English-language translations of foreign scientific and technical material pertinent to NASA's mission.

Specialized services also include creating custom thesauri, building customized databases, and organizing and publishing research results.

For more information about the NASA STI program, see the following:

- Access the NASA STI program home page at <http://www.sti.nasa.gov>
- E-mail your question via the Internet to help@sti.nasa.gov
- Fax your question to the NASA STI Help Desk at 443-757-5803
- Phone the NASA STI Help Desk at 443-757-5802

Introduction

The *NASA Video Catalog* cites video and motion picture productions listed in the NASA scientific and technical information database.

The videos were developed by the NASA centers, covering space shuttle mission press conferences; fly-bys of planets; flight vehicle design, testing, and performance; environmental pollution; lunar and planetary exploration; and many other subjects related to manned and unmanned space exploration.

The collection of motion pictures recently digitized from original 16mm films, document some aerodynamics testing and other research performed at Langley Research Center from 1958 through 1979. High-resolution QuickTime® format DVDs are now available for purchase. Citations include links to online low- and medium-resolution previews.

Each entry in the catalog consists of a standard bibliographic citation accompanied by an abstract. The table of contents lists the subject matter covered according to the *NASA Scope and Subject Category Guide*. In addition, a title index is included, along with a subject term index based on the *NASA Thesaurus*. Guidelines, terms and conditions for usage of NASA audio/visual materials, and ordering information are also included.

Usage Guidelines and Conditions

Purchase or receipt of materials in the *NASA Video Catalog* indicates the customer's acceptance of the following terms and conditions:

- NASA does not grant exclusive rights in materials in the *NASA Video Catalog*. The sale of materials in the *NASA Video Catalog* shall not be construed as a grant of exclusive rights in the materials.
- WITH RESPECT TO NASA IMAGERY MATERIALS, INCLUDING STILL PHOTOGRAPHS AND AUDIO, VIDEO, AND MOTION PICTURE RECORDINGS PROVIDED THROUGH THE *NASA VIDEO CATALOG*, NEITHER THE U.S. GOVERNMENT, NASA, NOR ANY OF ITS EMPLOYEES OR CONTRACTORS MAKE ANY REPRESENTATIONS OR WARRANTIES, EXPRESS, IMPLIED, OR STATUTORY, AS TO THE VALIDITY, ACCURACY, COMPLETENESS, OR FITNESS FOR A PARTICULAR PURPOSE; NOR REPRESENT THAT USE WOULD NOT INFRINGE PRIVATELY OWNED RIGHTS; NOR ASSUME ANY LIABILITY RESULTING FROM THE USE OF SUCH MATERIALS AND SHALL IN NO WAY BE LIABLE FOR ANY COSTS, EXPENSES, CLAIMS, OR DEMANDS ARISING OUT OF THE USE OF SUCH MATERIALS.
- The U.S. Government does not provide release from or indemnify against any possible copyright infringement of materials in the *NASA Video Catalog*.
- The U.S. Government does not endorse any commercial product, service, or activity identified or portrayed in materials provided in the *NASA Video Catalog*. Reference to or appearance of any specific commercial products, services, or activities by trade name, trademark, manufacturer, or otherwise, in materials provided does not constitute or imply its endorsement or recommendation by the U.S. Government. The purchaser of materials agrees that it shall not represent that its products are endorsed by NASA or the U.S. Government and shall not use materials provided to state or imply the endorsement of a commercial product, service, or activity by NASA or the U.S. Government or by any employees of NASA or the U.S. Government.
- NASA should be acknowledged as the source of its material.
- It is unlawful to falsely claim copyright or other rights in NASA material.
- Video recordings (video tape and motion picture recordings), including audio recordings therein, are not protected by copyright unless noted. If not copyrighted, video recording may be reproduced and distributed, without further permission from NASA. However, it is unlawful to falsely claim copyright or other rights in NASA material. If a video recording is copyrighted in its entirety, or a portion of a recording contains copyrighted material, such as music or video footage, permission should be obtained from the copyright owner prior to use (e.g., modification, reproduction, or distribution).
- While in most instances using non-copyrighted segments of a video recording is permitted, use for a commercial purpose of any portion or segment that displays a recognizable person, or talent (such as a performance or narration) of a known individual may infringe on a right of privacy or publicity, and permission should be obtained from the recognizable person or known individual.
- Material in the *NASA Video Catalog* may include visible NASA identifiers (e.g., the NASA Insignia or Logotype and the name of the vehicle in photographs or film footage of Space Shuttle vehicles). Use of such materials is generally non-objectionable, provided the NASA identifiers appear in their factual context. Other uses of the NASA Insignia, Seal, Logotype, or Program Identifiers require approval under 14 C.F.R. Part 1221. Use of the NASA name and initials is protected under 42 U.S.C. 2459b.

Ordering Information

Customer Identification Information

Please give your name, organization, phone number, fax number, and complete shipping address, including number and street. Registered users with deposit accounts should also fill in their CASI customer identification number.

Videotapes

All videos are distributed in the U.S. Standard, NTSC, and formatted in VHS or Betacam SP. Alternative formats SVHS and Hi8 are also available at increased cost.

To receive videos in international broadcast standards or formats, PAL or SECAM, please contact the NASA STI Help Desk at 443-757-5802 for separate pricing.

Digitized Motion Picture Films

Digitized motion picture films are distributed on standard DVD in high-resolution QuickTime® format.

Items Ordered

The document identification number and title are required to accurately identify each item requested.

Method of Payment

Payment method should be designated at time of order by credit card, check, or money order. Deposit account holders should enter their customer identification number in the customer information at the top of the form.

Shipping

Most orders are processed within 3 business days and then shipped.

Standard shipping and handling via UPS is \$4.00 per item for U.S. addresses only.

Federal Express Standard Overnight Service is \$7.00 per item for U.S. addresses.

Federal Express International Priority Service is \$17.00 per item for addresses outside the United States.

You may use your own Federal Express account number to pay for the shipping fee, however, the user's negotiated rates with FedEx (not the CASI rates above) will apply.

A Publication of the National Aeronautics and Space Administration

OCTOBER 2008

01 AERONAUTICS (GENERAL)

Includes general research topics related to manned and unmanned aircraft and the problems of flight within the Earth's atmosphere. Also includes manufacturing, maintenance, and repair of aircraft. For specific topics in aeronautics, see categories 02 through 09. For information related to space vehicles see 12 Astronautics.

19950004297 NASA Dryden Flight Research Center, Edwards, CA, USA

Dryden and transonic research

May 27, 1992; In English; 20th Anniversary F-8 Digital Fly-By-Wire (DFBW) and Supercritical Wing (SCW) Symposium, 1995

Report No(s): NASA-TM-104281; NONP-NASA-VT-94-23629; No Copyright; Avail: CASI: [B02](#), Videotape-Beta: [V02](#), Videotape-VHS

This video on transonic research is given by Dryden engineer Ed Saltzman as part of the 20th Anniversary F-8 Digital Fly-By-Wire (DFBW) and Supercritical Wing (SCW) Symposium.

STS-121: Discovery Post Landing Press Conference

July 17, 2006; In English; 48 min., 38 sec. playing time, in color, with sound; No Copyright; Avail: CASI: [V03](#), Videotape-VHS: [B03](#), Videotape-Beta

On July 17, 2006 Dean Acosta (NASA Press Secretary), Mike Griffin (Administrator), Bill Gerstenmaier (Associate Administrator of Space Operations), and Mike Leinbach (NASA Launch Director) expressed how proud they were to be a part of the STS-121/Discovery team. They also explained how flawlessly the mission performed and how it was the best mission ever flown. They proceeded to answer numerous questions from the press.

CASI

Launching; Conferences; Space Transportation System

02 AERODYNAMICS

Includes aerodynamics of flight vehicles, test bodies, airframe components and combinations, wings, and control surfaces. Also includes aerodynamics of rotors, stators, fans, and other elements of turbomachinery. For related information see also 34 Fluid Mechanics and Thermodynamics.

19950013580 NASA Dryden Flight Research Center, Edwards, CA, USA

F-16XL interview with Marta Bohn-Meyer

Jul 27, 1992; In English

Report No(s): NASA-TM-110505; NONP-NASA-VT-95-41117; No Copyright; Avail: CASI: [B02](#), Videotape-Beta: [V02](#), Videotape-VHS

Marta Bohn-Meyer discusses the cooperative research between Rockwell Industries and NASA research facilities in their effort to optimize and maintain the supersonic laminar flow on the F-16XL aircraft. Research on the airfoil design, chord optimization, introduction of a suction feature to maintain pressure distribution, and CFD, both theoretical and actual phenomena, are discussed. Bohn-Meyer discusses the difference between supersonic and subsonic laminar flow, cross flow, reasons behind using this particular F-16 aircraft for this research, and the future of this ongoing research, including the data base that investigators are building from wind tunnel data and in-flight validation.

20070030947 NASA Langley Research Center, Hampton, VA USA

Tests of Vortex-Ring Parachute at Supersonic Speed in the Langley Unitary Plan Wind Tunnel

July 18, 1960; In English; Originally recorded in 16mm, Silent, Black & White, 306ft., 8.5min.; DVD produced from the original 16mm recording

Report No(s): L-560; No Copyright; Avail: CASI: [C01](#), DVD; Movie/Video (High Res)

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

For the test, the 12-inch-diameter 'Vortex-Ring' parachute was towed behind a conical-nosed cylindrical body 2.25 inches in diameter. The tow-cable length was 24 inches, and was attached to the cylindrical body through a large swivel and to the parachute through a smaller swivel. The attachment between the large swivel and the cylindrical body failed after about 1 minute's operation. Mach number was approximately 2.2, dynamic pressure was approximately 150 pounds per square foot, and camera speed was approximately 3000 frames per second.

20070030960 NASA Langley Research Center, Hampton, VA USA
Unitary Plan Wind Tunnel Tests of Cook Technological Center Parachutes in the Wake of a Conical-Nosed Cylindrical Body Having a Base Diameter of 2.375-Inches (Part 5 of 6)

May 09, 1962; In English; Originally recorded in 16mm, Silent, Black & White, 17.5 min.; DVD produced from the original 16mm recording

Report No(s): L-729; No Copyright; Avail: CASI: [C01](#), DVD; Movie/Video (High Res)

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

The film depicts two tests of a flat roof, conical inlet canopy parachute. The first test is a series of wind tunnel trials with a flat circular ribbon roof of 22 percent porosity. The second test is a single series of wind tunnel trials with a flat circular ribbon roof of 25 percent porosity. Variables for both trials include Mach number, dynamic pressure, longitudinal separation distances (x/d), and drag coefficient $C_{(sub d)}$.

20070030962 NASA Langley Research Center, Hampton, VA USA, NASA Ames Research Center, Moffett Field, CA, USA
Aerodynamic Heating and Deceleration During Entry into Planetary Atmospheres

Chapman, Dean R.; April 10, 1962; In English; Originally recorded in 16mm, Sound, Black & White, 1100ft., 29min.; DVD produced from the original 16mm recording

Report No(s): L-713; HQ-5; No Copyright; Avail: CASI: [C01](#), DVD; Movie/Video (High Res)

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

Dr. Chapman's lecture examines the physics behind spacecraft entry into planetary atmospheres. He explains how

scientists determine if a planet has an atmosphere and how scientists can compute deceleration when the atmospheric conditions are unknown. Symbols and equations used for calculations for aerodynamic heating and deceleration are provided. He also explains heat transfer in bodies approaching an atmosphere, deceleration, and the use of ablation in protecting spacecraft from high temperatures during atmospheric entry.

Aerodynamic Heating; Atmospheric Entry; Deceleration

20070030965 NASA Langley Research Center, Hampton, VA USA

Unitary Wind Tunnel Tests of 30-Degree Conical Ribbon Parachute and a Rotofoil Parachute Towed in the Wake of a Conical Nosed Cylindrical Body

March 02, 1962; In English; Originally recorded in 16mm, Silent, Black & White, 880ft., 24.5min.; DVD produced from the original 16mm recording

Report No(s): L-683; No Copyright; Avail: CASI: [C01](#), DVD; Movie/Video (High Res)

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

Multiple wind tunnel test trials were conducted on a 30 degree conical ribbon parachute with porosities of 30, 27, and 24 percent. Variables were Mach number, dynamic pressure, towline length, and coefficient of drag. A Rotofoil parachute having a porosity of approximately 24 percent was tested, but failed after about 30 seconds of operation at a Mach number of 1.8 All of the parachutes had a nominal diameter and shroud line length of 10 inches. Drag coefficients were based on the area of a circle having a diameter two-thirds of the nominal parachute diameter.

20070030967 NASA Langley Research Center, Hampton, VA USA

Wind Tunnel Investigation of a Balloon as Decelerator at Mach Numbers from 1.47 to 2.50

McShera, John T.; Keyes, J. Wayne; August 1961; In English; See also 19980227793; See also NASA-TN-D-919; Originally recorded in 16mm, Silent, Black & White, 190ft., 5.5min.; DVD produced from the original 16mm recording

Report No(s): L-628; No Copyright; Avail: CASI: [C01](#), DVD; Movie/Video (High Res)

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

A wind-tunnel investigation was conducted to study the characteristics of a towed spherical balloon as a drag device at Mach numbers from 1.47 to 2.50, Reynolds numbers from 0.36×10^6 to 1.0×10^6 , and angles of attack from -15 to 15 degrees. Tow-cable length was approximately 24 inches from asymmetric body to cone on the upstream side of the balloon. As the tow cable was lengthened the balloon reached a point in the test section where wall-reflected shocks intersected the balloon and caused severe oscillations. As a result, the tow cable broke and the inflatable balloon model was destroyed. Further tests used a model rigid plastic sphere 6.75 inches in diameter. Tow cable length was approximately 24 inches from asymmetric body to the upstream side of the sphere.

20070030970 NASA Langley Research Center, Hampton, VA USA

Aerodynamic Characteristics of Parachutes at Mach Numbers from 1.6 to 3

Maynard, J. D.; February 1961; In English; See also 20010024158; See also NASA-TN-D-752; Originally recorded in 16mm, Silent, Black & White, 1000ft., 31min.; DVD produced from the original 16mm recording

Report No(s): L-598; No Copyright; Avail: CASI: [C01](#), DVD; Movie/Video (High Res)

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

A wind-tunnel investigation was conducted to determine the parameters affecting the aerodynamic performance of drogue parachutes in the Mach number range from 1.6 to 3. Flow studies of both rigid and flexible-parachute models were made by means of high-speed schlieren motion pictures and drag coefficients of the flexible-parachute models were measured at simulated altitudes from about 50,000 to 120,000 feet.

High-Speed Schlieren Movies of Decelerators at Supersonic Speeds

August 10, 1960; In English; Originally recorded in 16mm, Silent, Black & White, 245ft., 7min.; DVD produced from the original 16mm recording

Report No(s): L-569; No Copyright; Avail: CASI: [C01](#), DVD; Movie/Video (High Res)

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

Tests were conducted on several types of porous parachutes, a paraglider, and a simulated retrorocket. Mach numbers ranged from 1.8-3.0, porosity from 20-80 percent, and camera speeds from 1680-3000 feet per second (fps) in trials with porous parachutes. Trials of reefed parachutes were conducted at Mach number 2.0 and reefing of 12-33 percent at camera speeds of 600 fps. A flexible parachute with an inflatable ring in the periphery of the canopy was tested at Reynolds number 750,000 per foot, Mach number 2.85, porosity of 28 percent, and camera speed of 3600 fps. A vortex-ring parachute was tested at Mach number 2.2 and camera speed of 3000 fps. The paraglider, with a sweepback of 45 degrees at an angle of attack of 45 degrees was tested at Mach number 2.65, drag coefficient of 0.200, and lift coefficient of 0.278 at a camera speed of 600 fps. A cold air jet exhausting upstream from the center of a bluff body was used to simulate a retrorocket. The free-stream Mach number was 2.0, free-stream dynamic pressure was 620 lb/sq ft, jet-exit static pressure ratio was 10.9, and camera speed was 600 fps.

Inflation and drag characteristics of a 54.4-foot (16.6 meter) nominal-diameter cross parachute, deployed at a Mach number of 1.65 and a dynamic pressure of 12.68 lb/sq ft (607.1 N/m^2), were obtained from the fourth balloon-launched flight test of the Planetary Entry Parachute Program (PEPP). After deployment, the parachute quickly inflated to a full condition, partially collapsed, and then gradually reinflated while undergoing rapid oscillations between over-inflation and under-inflation. The oscillations began while the parachute was still at supersonic speeds and continued to low subsonic speeds well below an altitude of 90,000 feet (27.4 km). These canopy instabilities produced large cyclic variations in the parachute's drag coefficient. The average value of drag coefficient was about 0.8 to 0.9 at subsonic speeds and slightly lower at supersonic speeds. These drag coefficient values were based on the actual fabric surface area of the parachute canopy. The parachute sustained minor damage consisting of two canopy tears and abrasions and tears on the riser line. It is believed that this damage did not produce a significant change in the performance of the parachute.

Inflation, drag, and stability characteristics of a 54.5 -foot nominal-diameter (16.6-meter) modified ringsail parachute deployed in the wake of a 15-foot-diameter (4.6-meter) spacecraft traveling at a Mach number of 1.6 and a dynamic pressure equal to 11.6 psf (555 N/m(exp 2)) were obtained from the third balloon-launched flight test of the Planetary Entry Parachute Program. After deployment, the parachute inflated rapidly to a full condition, partially collapsed, and reinflated to a stable configuration. After reinflation, an average drag coefficient near 0.6 based on nominal surface area was obtained. During descent, an aerodynamic trim angle was observed in a plane near several torn sails. Amplitude of the trim was approximately 15 degrees and oscillation about trim was less than 11 degrees.

Inflation and drag characteristics of a 64.7-foot (19.7-meter) nominal-diameter disk-gap-band parachute deployed at a Mach number of 1.59 and a dynamic pressure of 11.6 psf (555 newtons per m(exp 2)) were obtained from the second balloon-launched flight test of the Planetary Entry Parachute Program. In addition, parachute stability characteristics during the subsonic descent portion of the test are presented. After deployment, the parachute rapidly inflated to a full condition, partially collapsed, and then reinflated to a stable configuration. After reinflation, an average drag coefficient of about 0.55 based on nominal surface area was obtained. The parachute exhibited good stability characteristics during descent. The only major damage to the parachute during the test was the tearing of two canopy panels; a loss of less than 0.5 percent of nominal surface area resulted.

A ringsail parachute, which had a nominal diameter of 40 feet (12.2 meters) and reference area of 1256 square feet (117 m(exp 2)) and was modified to provide a total geometric porosity of 15 percent of the reference area, was flight tested as part of the rocket launch portion of the NASA Planetary Entry Parachute Program. The payload for the flight test was an instrumented capsule from which the test parachute was ejected by a deployment mortar when the system was at a Mach number of 1.64 and a dynamic pressure of 9.1 pounds per square foot (43.6 newtons per m(exp 2)). The parachute deployed to suspension line stretch in 0.45 second with a resulting snatch force of 1620 pounds (7200 newtons). Canopy inflation began 0.07 second later and the parachute projected area increased slowly to a maximum of 20 percent of that expected for full

inflation. During this test, the suspension lines twisted, primarily because the partially inflated canopy could not restrict the twisting to the attachment bridle and risers. This twisting of the suspension lines hampered canopy inflation at a time when velocity and dynamic-pressure conditions were more favorable.

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

A 30-foot (9.1 meter) nominal-diameter disk-gap-band parachute (reference area 707 sq ft (65.7 m²)) was flight tested with a 200-pound (90.7 kg) instrumented payload as part of the NASA Planetary Entry Parachute Program. A deployment mortar ejected the test parachute when the payload was at a Mach number of 1.56 and a dynamic pressure of 11.4 lb/sq ft (546 newtons per m²) at an altitude of 127,500 feet (38.86 km). The parachute reached suspension line stretch in 0.37 second resulting in a snatch force loading of 1270 pounds (5650 N). Canopy inflation began 0.10 second after line stretch. A delay in the opening process occurred and was apparently due to a momentary interference of the glass-fiber shroud used in packing the parachute bag in the mortar. Continuous canopy inflation began 0.73 second after initiation of deployment and 0.21 second later full inflation was attained for a total elapsed time from mortar fire of 0.94 second. The maximum opening load of 3915 pounds (17,400 newtons) occurred at the time the canopy was first fully opened. The parachute exhibited an average drag coefficient of 0.52 during the deceleration period and pitch-yaw oscillations of the canopy were less than 5 degrees. During the steady-state descent portion of the test period, the average effective drag coefficient was about 0.47 (based on vertical descent velocity and total system weight).

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

A 31.2-foot (9.51 meter) nominal diameter (reference area 764 ft² (exp 2) (71.0 m² (exp 2))) ringsail parachute modified to provide 15-percent geometric porosity was flight tested while attached to a 201-pound mass (91.2 kilogram) instrumented payload as part of the rocket launch portion of the NASA Planetary Entry Parachute Program (PEPP). The parachute deployment was initiated by the firing of a mortar at a Mach number of 1.39 and a dynamic pressure of 11.0 lb/ft² (exp 2) (527 newtons/m² (exp 2)) at an altitude of 122,500 feet (37.3 kilometers). The parachute deployed to suspension-line stretch (snatch force) in 0.35 second, and 0.12 second later the drag force increase associated with parachute inflation began. The parachute inflated in 0.24 second to the full-open condition for a total elapsed opening time of 0.71 second. The maximum opening load of 3970 pounds (17,700 newtons) came at the time the parachute was just fully opened. During the deceleration period, the parachute exhibited an average drag coefficient of 0.52 and oscillations of the parachute canopy were less than 5 degrees. During the steady-state terminal descent portion of the test period, the average effective drag coefficient (based on vertical descent velocity) was 0.52.

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

Inflation, drag, and stability characteristics of an 85.3-foot (26-meter) nominal diameter ringsail parachute deployed at a Mach number of 1.15 and at an altitude of 132,600 feet (40.42 kilometers) were obtained from the first flight test of the Planetary Entry Parachute Program. After deployment, the parachute inflated to the reefed condition. However, the canopy was unstable and produced low drag in the reefed condition. Upon disreefing and opening to full inflation, a slight instability in the canopy mouth was observed initially. After a short time, the fluctuations diminished and a stable configuration was attained. Results indicate a loss in drag during the fluctuation period prior to stable inflation. During descent, stability characteristics of the system were such that the average pitch-yaw angle from the local vertical was less than 10 degrees. Rolling motion between the payload and parachute canopy quickly damped to small amplitude.

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

A 40-foot-nominal-diameter (12.2-meter) modified ringsail parachute was flight tested as part of the NASA Supersonic High Altitude Parachute Experiment (SHAPE) program. The 41-pound (18.6-kg) test parachute system was deployed from a 239.5-pound (108.6-kg) instrumented payload by means of a deployment mortar when the payload was at an altitude of 171,400 feet (52.3 km), a Mach number of 2.95, and a free-stream dynamic pressure of 9.2 lb/sq ft (440 N/m(exp 2)). The parachute deployed properly, suspension line stretch occurring 0.54 second after mortar firing with a resulting snatch-force loading of 932 pounds (4146 newtons). The maximum loading due to parachute opening was 5162 pounds (22 962 newtons) at 1.29 seconds after mortar firing. The first near full inflation of the canopy at 1.25 seconds after mortar firing was followed immediately by a partial collapse and subsequent oscillations of frontal area until the system had decelerated to a Mach number of about 1.5. The parachute then attained a shape that provided full drag area. During the supersonic part of the test, the average axial-force coefficient varied from a minimum of about 0.24 at a Mach number of 2.7 to a maximum of 0.54 at a Mach number of 1.1. During descent under subsonic conditions, the average effective drag coefficient was 0.62 and parachute-payload oscillation angles averaged about $\pm 100^\circ$ with excursions to $\pm 20^\circ$ degrees. The recovered parachute was found to have slight damage in the vent area caused by the attached deployment bag and mortar lid.

Report No(s): L-1106; No Copyright; Avail: CASI: [C01](#), DVD; Movie/Video (High Res)

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

A reefed 12.2-meter nominal-diameter (40-ft) disk-gap-band parachute was flight tested as part of the NASA Supersonic High Altitude Parachute Experiment (SHAPE) program. A three-stage rocket was used to drive the instrumented payload to an altitude of 43.6 km (143,000 ft), a Mach number of 2.58, and a dynamic pressure of 972 N/m(exp 2) (20.3 lb/ft(exp 2)) where the parachute was deployed by means of a mortar. The parachute deployed satisfactorily and reached a partially inflated

condition characterized by irregular variations in parachute projected area. A full, stable reefed inflation was achieved when the system had decelerated to a Mach number of about 1.5. The steady, reefed projected area was 49 percent of the steady, unreefed area and the average drag coefficient was 0.30. Disreefing occurred at a Mach number of 0.99 and a dynamic pressure of 81 N/m(exp 2) (1.7 lb/ft(exp 2)). The parachute maintained a steady inflated shape for the remainder of the deceleration portion of the flight and throughout descent. During descent, the average effective drag coefficient was 0.57. There was little, if any, coning motion, and the amplitude of planar oscillations was generally less than 10 degrees. The film also shows a wind tunnel test of a 1.7-meter-diameter parachute inflating at Mach number 2.0.

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

A 40-foot-nominal-diameter (12.2 meter) disk-gap-band parachute was flight tested as part of the NASA Supersonic Planetary Entry Decelerator (SPED-I) Program. The test parachute was deployed from an instrumented payload by means of a deployment mortar when the payload was at an altitude of 158,500 feet (48.2 kilometers), a Mach number of 2.72, and a free-stream dynamic pressure of 9.7 pounds per foot(exp 2) (465 newtons per meter(exp 2)). Suspension line stretch occurred 0.46 second after mortar firing and the resulting snatch force loading was -8.1g. The maximum acceleration experienced by the payload due to parachute opening was -27.2g at 0.50 second after the snatch force peak for a total elapsed time from mortar firing of 0.96 second. Canopy-shape variations occurred during the higher Mach number portion of the flight test (M greater than 1.4) and the payload was subjected to large amplitude oscillatory loads. A calculated average nominal axial-force coefficient ranged from about 0.25 immediately after the first canopy opening to about 0.50 as the canopy attained a steady inflated shape. One gore of the test parachute was damaged when the deployment bag with mortar lid passed through it from behind approximately 2 seconds after deployment was initiated. Although the canopy damage caused by the deployment bag penetration had no apparent effect on the functional capability of the test parachute, it may have affected parachute performance since the average effective drag coefficient of 0.48 was 9 percent less than that of a previously tested parachute of the same configuration.

An investigation has been made to determine the possibility of using toroid-membrane and wide-angle conical shapes as towed decelerators. Parameter variations were investigated which might render toroid-membrane models and wide-angle-cone models stable without loss of the high drag coefficients obtainable with sting-mounted models. The parameters varied included location of center of gravity, location of the pivot between the towline and the model, and configuration modifications of the aft end as the addition of a corner radius and the addition of a skirt. The toroid membrane can be made into a stable towed decelerator with a suitable configuration modification of the aft end.

Several years of NASA research have produced the concept for air traffic management called 'Distributed Air/Ground Traffic Management,' a major operational advancement that should significantly increase the capacity of the National Airspace System. A key component, 'Autonomous Flight Management,' introduces a new class of aircraft operations in which pilots are authorized to freely maneuver and execute optimal trajectories independent from air traffic controllers. These aircraft operators would benefit from significant increases in flexibility to optimize all flight operations and from avoiding most of the delays associated with ground-controlled operations. Responsibilities for aircraft separation and arrival flow conformance are transferred to the flight deck, and the pilots use computerized decision-support tools to accomplish these tasks. A research prototype of these tools called the 'Autonomous Operations Planner' is being developed at the NASA Langley Research Center. This 14-minute video illustrates Autonomous Flight Management from the airline pilot's perspective.

Report No(s): NONP-NASA-VT-2000043976; No Copyright; Avail: CASI: [B01](#), Videotape-Beta: [V01](#), Videotape-VHS

Live footage shows the Hyper-X program modeling at NASA Langley Research Center. The Hyper-X craft is shown on top of a Pegasus booster in a 20' Mach 6 Wind Tunnel. Visualization data runs are performed in the wind tunnel. Also seen is a brief interview with Vincent Rausch the Hyper-X Program Manager. Animation includes the flight model of the Hyper-X vehicle.

To Boldly Go: The Universe Now and Beyond

[2004]; 2 pp.; In English; 2 hrs., 1 min. playing time, in color, with sound; No Copyright; Avail: CASI: [V04](#), Videotape-VHS

Dr. France Cordova, NASA's Chief Scientist opened this, the third session in the NASA Administrator's Seminar Series, by asking the following question: 'What would be a bold and aspiring agenda for America's next era in space?' It aimed at answering the following questions: What do we know about the universe? How do we know it? (Dr. Cordova also mentioned that the first seminar was about the definition of cellular life and how to recognize it, and featured as speakers, Dr. Lynn Margoles and Dr. Leslie Orgle.) Administrator Daniel S. Goldin was introduced; he welcomed the attendees, and remarked that NASA personnel have a critical need to explain to Congress and the public why a space program is important. Congress and the public pay for the space programs. Therefore the programs' importance cannot remain in the sole domain of scientists. The first speaker, Dr. Vera Ruben of the Department of Terrestrial Magnetism at the Carnegie Institute of Washington, was introduced as an art historian expert in cosmology and an observational astronomer. Dr. Ruben brought up a number of questions regarding the substance, location, and origin of dark matter, radiation, galaxies, and the lumpy structure of galaxies in space, as well as the age and density of our universe. The next speaker was Dr. Bohdan Paczynski, a theoretical astrophysicist from Princeton University's Department of Astrophysical Sciences. The final speaker, Dr. Linda Schale is a cosmologist from the University of Texas at Austin. She was said to be a 'paleontologist of the human mind' who tries 'to understand mechanisms people use to understand the world'. The concluding discussion centered on why NASA scientists don't communicate better with people who are not highly educated. This is a big concern because to continue its work, NASA needs to communicate the importance of its goals to the average person. Additional information is included in the original extended abstract.

Apollo-Lunar Orbital Rendezvous Technique

January 1963; In English; Originally recorded in 16mm, Sound, Color, 219ft., 5.5min.; DVD produced from the original 16mm recording

Report No(s): L-762; No Copyright; Avail: CASI: [C01](#), DVD; Movie/Video (High Res)

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

The film shows artists rendition of the spacecrafts, boosters, and flight of the Apollo lunar missions. The Apollo spacecraft will consist of three modules: the manned Command Module; the Service Module, which contains propulsion systems; and the Lunar Excursion Module (LEM) to carry astronauts to the moon and back to the Command and Service Modules. The spacecraft will be launched via a three-stage Saturn booster. The first stage will provide 7.5 million pounds of thrust from five F-1 engines for liftoff and initial powered flight. The second stage will develop 1 million pounds of thrust from five J-2 engines to boost the spacecraft almost into Earth orbit. Immediately after ignition of the second stage, the Launch Escape System will be jettisoned. A single J-2 engine in the S4B stage will provide 200,000 pounds of thrust to place the spacecraft in an earth parking orbit. It also will be used to propel the spacecraft into a translunar trajectory, then it will separate from the Apollo Modules. Onboard propulsion systems will be used to insert the spacecraft into lunar orbit. Two astronauts will enter the LEM, which will separate from the command and service modules. The LEM will go into elliptical orbit and prepare for landing. The LEM will lift off of the Moon's surface to return to the Command and Service Modules, and most likely be left in lunar orbit. After leaving the Moon's orbit, and shortly before entering Earth's orbit, the Service Module will be ejected. The

Command Module will be oriented for reentry into the Earth's atmosphere. A drogue parachute will deploy at approximately 50,000 feet, followed by the main parachute system for touchdown.

The film was made using the Lunar Orbit and Landing Approach Simulator (LOLA). It represents the view an astronaut would see if he were looking toward the lunar horizon just prior to and during retrofire for orbit establishment. During this period the astronaut is essentially flying backward, therefore the lunar surface features appear to be moving away during the flight.

USA Space Explorations 1958

April 03, 1962; In English; Originally recorded in 16mm, Sound, Color, 690ft., 19min.; DVD produced from the original 16mm recording

Report No(s): L-703; HQ-8; No Copyright; Avail: CASI: [C01](#), DVD; Movie/Video (High Res)

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

The film describes preparation and launch of five satellites and two space probes during 1958. On January 31, a Jupiter vehicle launched Explorer I into space. Data from this satellite was used to identify the van Allen radiation belts. On March 17, a Vanguard I rocket launched an Earth satellite with solar batteries. Data from the mission was used to determine that the Earth is slightly pear-shaped. On March 26, Explorer III was launched to further study the van Allen belts, micrometeoroid impacts, and internal and external temperatures. Explorer IV, launched on July 26, was intended to study radiation and temperature data. A lunar probe, ABLE I, was intended to measure radiation, magnetic fields of Earth and the Moon, density of micrometeoritic matter, and internal temperatures. A four-stage rocket was used in the launch. However, a turbo-pump failed and the liquid oxygen pump stopped, resulting in a failed mission. On October 10, Pioneer I was launched by an ABLE vehicle. First and second stage velocity was less than desired and the probe did not leave Earth orbit. Attempts to attain escape velocity were unsuccessful. On December, a Jupiter boost vehicle was used to launch Juno II, with Pioneer III as the payload. Escape velocity was reached and Pioneer III left Earth's atmosphere. Failed launches, such as those of Vanguard boost vehicles and several Explorer satellites, also added to scientific knowledge.

X-33, X-34, X-37 Press Conference (Tape 2)

Aug. 24, 1999; In English; Videotape: 34 min. playing time, in color, with sound

Report No(s): NONP-NASA-VT-2000043974; No Copyright; Avail: CASI: [B03](#), Videotape-Beta: [V03](#), Videotape-VHS

Live footage shows Project Managers Susan Turner, MSFC and David Manley, Boeing Co. participating in the X-37 Briefing. NASA's Public Affairs June Malone introduced these panelists who went on to discuss the vehicle and its secondary payload. Manley mentions the X-37 capabilities, main propulsion system, its lithium iron batteries, hot control surfaces, and its fly by wire system. Turner mentions the on-board operations, the deployment of the solar arrays, and the autonomous navigation and landing system. Also included is an animation of the X-37 vehicle during flight and the secondary payload release into orbit.

STS-121: Discovery Post Flight Readiness Review Briefing

June 17, 2006; In English; 50 min. playing time, in color, with sound; No Copyright; Avail: CASI: [V03](#), Videotape-VHS: [B03](#), Videotape-Beta

This post Flight Readiness Review (FRR) briefing begins with NASA Press Secretary Dean Acosta, introducing the panel who consist of: NASA Administrator, Dr. Michael Griffin; Associate Administrator for Space Operations, Bill Gerstenmaier; Space Shuttle Program Manager, Wayne Hale; and NASA Launch director, Mike Leinbach. The discussion begins with Dr. Michael Griffin, who expresses his gladness to be a part of the FRR. Bill Gerstenmaier talks about how they were very thorough about the subjects reviewed and that they wanted to make sure that they were ready to fly. He discusses and presents two slides. The first slide is a description of the LO2 intertank and LH2 ice/frost ramps staging location and the second are the top ten LH2 Ice/Frost Ramp Foam Loss events. Wayne Hale gives his thoughts on the human element that came into play during the FRRs. He talks about the willingness of everyone to speak their mind, instead of giving short comments. He expressed that this element is a huge step forward for NASA. Mike Leinbach reports on the processing of the vehicle and expresses that everything is going well and there is nothing to prohibit the launch. He also gives a good report on Atlantis, in case there is a need to use the vehicle. This FRR briefing ends with a short question and answer period from the press on topics such as debris, foam loss, ice/frost ramp redesign, crew risks, and launch date.

STS-1: Columbia Complete Mission

April 1981; In English; 40 min. playing time, in color, with sound; No Copyright; Avail: CASI: [V03](#), Videotape-VHS: [B03](#), Videotape-Beta

A video presentation of the STS-1 Columbia Mission is shown. The video begins with footage of the STS-1 Columbia arriving at Kennedy Space Center on March 24, 1979. The various milestones that were shown include: 1) STS-1 Columbia Shuttle Rocket Booster (SRB) stacking; 2) External Tank (ET) lift and mating; 3) Move to VAB and Mating; 4) Rollout to pad 39A; 5) Flight Readiness Firing (FRF) on February 19, 1981; 6) Launch day; and 7) Return to Kennedy Space Center. John W. Young, Commander and Robert L. Crippen, Pilot are shown having a traditional breakfast before the suit up and drive out to the launch pad. Footage of the lift-off along with Shuttle Rocket Booster (SRB) separation is shown. After lift-off, there is a shot of the crew in the mid-deck and also a view of thunderstorms over the Amazon Basin. The video ends with a view of Columbia returning to Kennedy Space Center on April 25, 1981.

[2006]; In English; 1 hr., 24 min. playing time, in color, with sound; No Copyright; Avail: CASI: [V04](#), Videotape-VHS: [B04](#), Videotape-Beta

A video presentation on an update of the STS-1 Columbia Shuttle is shown. Hugh Harris is the moderator. He introduces Don Phillips, Chief STS Test OPS, who presents the status of the vehicle. Terry William, Chief of Mechanical Systems, discusses the debonding of the panels. A question and answer period from the news media is shown. The various topics of discussion from the news media include: 1) Repair of thermal tiles; 2) Launch dates; and 3) Landing and launch sites and 4) Low pressure/high pressure tanking tests. An audio presentation is given of questions from NASA Marshall Space Flight Center and NASA Washington. On March 12, 1981, another STS-1 Columbia update is shown. Bob Schick, Shuttle Test Director, and Bob Sieck, Flight Project Engineer answers questions about the actual repair time of the panels and a very detailed description of the three areas of debonding is presented. A brief launch date statement from Dr. Allen Lovelace, Acting NASA Administrator is given and John Lardley, Shuttle Associate Director, discusses the flight readiness review.

STS-121: Discovery End of Mission Crew Briefing

July 17, 2006; In English; 39 min., 11 sec. playing time, in color, with sound; No Copyright; Avail: CASI: [V03](#), Videotape-VHS: [B03](#), Videotape-Beta

The crew of the STS-121 Discovery mission is shown during this end of mission briefing. The crewmembers consist of: Stephanie Wilson, mission specialist; Steve Lindsey, commander; Lisa Nowak, mission specialist; Piers Sellers, mission specialist; Mike Fossum, mission specialist; and Mark Kelly, pilot. The briefing opens with Commander Lindsey describing the two major objectives of this mission, which are to accomplish the rest of the return to flight objectives started by STS-114, and to increase the ISS crew to three. He expresses that these objectives were fulfilled. A question and answer period from the news media follows. Lisa Nowak talks about robotics and her experiences during her first flight. Stephanie Wilson also discusses robotics and gives her thoughts about spaceflight. Steve Lindsey discusses the flying qualities of STS-121, spacecraft landing, and weather conditions while in space. Mark Kelly was responsible for the undocking of the Shuttle from the International Space Station, and he elaborates on this process. Spacewalkers Piers Sellers and Mike Fossum discuss testing of the Orbiter Boom Sensor System (OBSS). This system will be used as a platform to make repairs to the Space Shuttle.

Space Shuttle Status News Conference

October 14, 2005; In English; 55 min. playing time, in color, with sound; No Copyright; Avail: CASI: [V03](#), Videotape-VHS: [B03](#), Videotape-Beta

Richard Gilbech, External Tank 'Tiger Team' Lead, begins this space shuttle news conference with detailing the two major objectives of the team. The objectives include: 1) Finding the root cause of the foam loss on STS-114; and 2) Near and long term improvements for the external tank. Wayne Hale, Space Shuttle Program Manager, presents a chart to explain the external tank foam loss during STS-114. He gives a possible launch date for STS-121 after there has been a repair to the foam on the External Tank. He further discusses the changes that need to be made to the surrounding areas of the plant in New Orleans, due to Hurricane Katrina. Bill Gerstemaier, NASA Associate Administrator for Space Operations, elaborates on the testing of the external tank foam loss. The discussion ends with questions from the news media about a fix for the foam, replacement of the tiles, foam loss avoidance, the root cause of foam loss and a possible date for a new external tank to be shipped to NASA Kennedy Space Center.

STS-121/Discovery: Imagery Quick-Look Briefing

July 04, 2006; In English; 43 min., 29 sec. playing time, in color, with sound; No Copyright; Avail: CASI: [V03](#), Videotape-VHS: [B03](#), Videotape-Beta

Kyle Herring (NASA Public Affairs) introduced Wayne Hale (Space Shuttle Program Manager) who stated that the imagery for the Space shuttle external tank showed the tank performed very well. Image analysis showed small pieces of foam falling off the rocket booster and external tank. There was no risk involved in these minor incidents. Statistical models were built to assist in risk analysis. The orbiter performed excellently. Wayne also provided some close-up pictures of small pieces of foam separating from the external tank during launching. He said the crew will also perform a 100% inspection of the heat shield. This flight showed great improvement over previous flights.

Space Shuttle Program Update News Conference with Wayne Hale

February 28, 2006; In English; 1 hr., 1 min., 32 sec. playing time, in color, with sound; No Copyright; Avail: CASI: [V04](#), Videotape-VHS: [B04](#), Videotape-Beta

Jessica Rye from NASA Public Affairs introduces: Wayne Hale, Space Shuttle Deputy Program Manager; Mike Leinbach, NASA Launch Director; and Tim Wilson, from the NASA Engineering and Safety Center. Hale begins the discussion with a video showing the following processes: 1) Changing of gap fillers at Orbiter Processing Facility; 2) The Orbiter Boom Sensor System (OBSS) being loaded into Discovery payload bay; 3) Engine installation; 4) Spacecrew at Michoud Assembly observing the area where the PAL ramps were removed; 5) Test being performed to mitigate liquid air forming underneath foam; and 6) Roll out of ET119 from New Orleans. Hale also presents a slide of the ET debris Mitigation Activities and ET Ice/Frost Ramps. Mike Leinbach says that Kennedy Space Center is ready to receive the tank and that he is ready to get on with the mission. Tim Wilson heads the team to resolve foam loss issues which is his primary goal before this flight. A question and answer period follows.

Space Shuttle Program Update

May 31, 2006; In English; 1 hr., 1 min., 30 sec. playing time, in color, with sound; No Copyright; Avail: CASI: [V04](#), Videotape-VHS: [B04](#), Videotape-Beta

Bruce Buckingham, from NASA Public Affairs, introduces Wayne Hale, Space Shuttle Program Manager, and Mike Leinbach, NASA launch Director. Wayne Hale begins discussing the Flight Readiness Review (FRR) that has just occurred to see if they were ready to fly. He points out that the review was a debris verification review (DVR). This review was done to ascertain how well they have done to eliminate the potential for debris to come off of the External Tank (ET), or any other part of the launch vehicle. He expresses that they have made significant improvements to the ET. He gives a description of the ET that is presently on the launch pad. Mike Leinbach discusses hardware processing and the condition of the launch vehicle. Questions from the news media about possible modifications to the ice frost ramp, Solid Rocket Booster (SRB) electrical problems, ET foam loss, amount of debris loss expectation during ascent, and return to flight costs are all addressed.

STS-121: Discovery Pre-Flight Crew News Briefing

June 08, 2006; In English; 44 min., 41 sec. playing time, in color, with sound; No Copyright; Avail: CASI: [V03](#), Videotape-VHS: [B03](#), Videotape-Beta

The STS-121 crew is shown during this pre-flight news briefing. Steve Lindsey, Commander, begins with saying that they are only a few weeks from flight and the vehicle is in good shape. Mark Kelly, Pilot, is introduced by Lindsey and he discusses Kelly's main objective which is to direct the three spacewalks scheduled. Kelly introduces Mike Fossum, Mission Specialist. Kelly says that Fossum will be involved in three spacewalks. Fossum introduces Lisa Nowak, Mission Specialist, who is involved in robotics. Also Stephanie Wilson, Mission Specialist, will be involved in robotics. Piers Sellers, Mission Specialist, is introduced by Wilson, who is the lead spacewalker for this mission. Sellers then introduce Thomas Reiter, Mission Specialist, who is involved in spacewalks. The educational background of each crew member is given. Questions from the news media on the subjects of long term flights on the International Space Station, Ice frost ramp replacement, Orbiter Boom Sensor System (OBSS) stability, foam loss during STS-114 flight, duration of the mission, and mental preparation for test flights are addressed.

Bruce Buckingham, NASA Public Affairs, introduces Jeff Spaulding, NASA Test Director; Debbie Hahn, STS-121 Payload Manager; and Kathy Winters, Shuttle Weather Officer. Spaulding gives his opening statement on this one day prior to the launching of the Space Shuttle Discovery. He discusses the following topics: 1) Launch of the Space Shuttle Discovery; 2) Weather; 3) Load over of onboard reactants; 4) Hold time for liquid hydrogen; 5) Stowage of Mid-deck completion; 6) Check-out of onboard and ground network systems; 7) Launch windows; 8) Mission duration; 9) Extravehicular (EVA) plans; 10) Space Shuttle landing day; and 11) Scrub turn-around plans. Hahn presents and discusses a short video of the STS-121 payload flow. Kathy Winters gives her weather forecast for launch. She then presents a slide presentation on the following weather conditions for the Space Shuttle Discovery: 1) STS-121 Tanking Forecast; 2) Launch Forecast; 3) SRB Recovery; 4) CONUS Launch; 5) TAL Launch; 6) 24 Hour Delay; 7) CONUS 24 Hour; 8) TAL 24 Hour; 9) 48 Hour Launch; 10) CONUS 48 Hour; and 11) TAL 48 Hour. The briefing ends with a question and answer period from the media.

STS-121: Discovery Mission Management Team Briefing

July 03, 2006; In English; 48 min., 41 sec. playing time, in color, with sound; No Copyright; Avail: CASI: [V03](#), Videotape-VHS: [B03](#), Videotape-Beta

The briefing opened with Bruce Buckingham (NASA Public Affairs) introducing John Shannon (Chairman, Mission Management Team, JSC), John Chapman (External Tank Project Manager), Mike Leinbach (Shuttle Launch Director), and 1st Lt. Kaleb Nordgren (USAF 45th Weather Squadron). John Shannon reported that the team for hydrogen loading was proceeding well and the external tank detanking was completed. During detanking the inspection team cracked foam caused by condensation and ice formation as the tank expanded and contracted. Aerothermal analysis and analysis for ice formation will be completed before launch. John Chapman explained the mechanics of the external tank design, the foam cracking, bracket design, etc. Mike Leinbach discussed the inspection teams and their inspection final inspection for ice formation before and after external tank filling. The inspection team of eight very experienced personnel also use telescopes with cameras to find any problems before launch. Kaleb Nordgren discussed weather and said there was a 40% chance of weather prohibiting launch. The floor was the opened for questions from the press.

STS-121: Discovery Spacewalk Overview Briefing

June 08, 2006; In English; 51 min., 57 sec. playing time, in color, with sound; No Copyright; Avail: CASI: [V03](#), Videotape-VHS: [B03](#), Videotape-Beta

The briefing began with the introduction of Tomas Gonzalez-Torres (Lead Extra Vehicular Activity Officer). The spacewalk team included Pierce Sellers (EV-1), Mike Fossum (EV-2) and Mark Kelly (coordinator and pilot). Three new

EMU's (space suits) were provided with hardware upgrades (warning systems). The 1st EVA would take place on flight day 5 and would include the exchange of the 3 EMU's. The 1st task was the installation of the blade locker, a device used to prevent severing of cables. The team will also install the Interface Umbilical System (IUS) which is an extension cord for the mobile transporter. EVA-2 task will be to replace the old Trailing Umbilical System (TUS) with a new one.

STS-121: Discovery Pre-Launch Mission Management Team Press Briefing

July 03, 2006; In English; 27 min., 54 sec. playing time, in color, with sound; No Copyright; Avail: CASI: [V02](#), Videotape-VHS: [B02](#), Videotape-Beta

The briefing began with Allard Buetel (NASA Public Affairs) introducing Bill Gerstenmaier (Associate Administrator for Space Operations) who provided an update of the Mission Management team meeting. The 3 criteria reviewed by the team were: a) ascent heating; b) ice formation and c) remaining foam still intact. The ascent heating had a safety factor of 5 and posed no concern. Ice formation was not a concern. In order to insure there was no damage to the remaining foam, an 8ft. pipe with a camera attached was used to provide pictures. The boroscope pictures showed there was no damage to the brackets or foam. The inspection went very well and the foam was acceptable and ready to fly. Then the floor was open to questions from the press.

Steve Poulos, Space Shuttle Orbiter Projects Office Manager, and John Chapman, Space Shuttle External Tank Project Manager is shown in this STS-121 Space Shuttle Discovery safety improvements briefing. A graphic presentation of the gap filler installation is shown. The graphics include: 1) Protruding gap fillers during STS-114 mission; 2) STS-114 gap fillers removed on orbiter; 3) Gap filler installation prior to STS-114; 4) Post-STS-114 installation techniques; 5) Gap filler installation post STS-114; 6) Gap filler priority areas; 7) Discovery gap filler installation table and status for STS-121; 8) Damaged blanket on STS-114; 9) On-orbit photography and post-landing photography on STS-114; and 10) STS-114 insulation tiles. Poulos presents imagery that was obtained on STS-114. The imagery includes: 1) The Enhanced Launch Vehicle Imaging System (ELVIS); 2) Liquid oxygen external tank view; 3) Hand-held imagery of the external tank falling into the ocean; 4) ELVIS on STS-121, short, medium and long range camera configurations; 5) Radar capability on the ground at Kennedy Space Center, and 6) STS-121 aft external tank door tiles. Poulos says that STS-121 will have even more imagery than STS-114. John Chapman presents video animation of the external tank where modifications were made along with the ice frost ramps with extensions. Chapman explains these areas using an external tank model. Questions are then answered from the media.

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

The film depicts an extravehicular activity (EVA) that involved the assembly of six 'space-weight' columns into a regular tetrahedral cell by a team of two 'space'-suited test subjects. This cell represents the fundamental 'element' of a tetrahedral truss structure. The tests were conducted under simulated zero-gravity conditions, achieved by neutral buoyancy in water. The cell was assembled on an 'outrigger' assembly aid off the side of a mockup of the Shuttle Orbiter cargo bay. Both manual and simulated remote manipulator system (RMS) modes were evaluated. The simulated RMS was used only to transfer stowed hardware from the cargo bay to the work sites. Articulation limits of the pressure suit and zero gravity could be accommodated by work stations with foot restraints. The results of this study have confirmed that astronaut EVA assembly of large, erectable space structure is well within man's capabilities.

TDRS-1 Going Strong at 20

April 03, 2003; In English; 10 mins., 19 sec. playing time, in color, with sound

Report No(s): G03-029; No Copyright; Avail: CASI: [V01](#), Videotape-VHS: [B01](#), Videotape-Beta

This video presents an overview of the first Tracking and Data Relay Satellite (TDRS-1) in the form of text, computer animations, footage, and an interview with its program manager. Launched by the Space Shuttle Challenger in 1983, TDRS-1 was the first of a network of satellites used for relaying data to and from scientific spacecraft. Most of this short video is silent, and consists of footage and animation of the deployment of TDRS-1, written and animated explanations of what TDRS satellites do, and samples of the astronomical and Earth science data they transmit. The program manager explains in the final segment of the video the improvement TDRS satellites brought to communication with manned space missions, including alleviation of blackout during reentry, and also the role TDRS-1 played in providing telemedicine for a breast cancer patient in Antarctica.

The Lunar Orbiter: A Spacecraft to Advance Lunar Exploration

[1966]; In English; Originally recorded in 16mm, Sound, Color, 300ft., 7.5min.; DVD produced from the original 16mm recording

Report No(s): L-1312; No Copyright; Avail: CASI: [C01](#), DVD; Movie/Video (High Res)

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

The film describes the Lunar Orbiter's mission to photograph landing areas on the Moon. The Orbiter will be launched from Cape Kennedy using an Atlas Agena booster rocket. Once it is boosted in a trajectory toward the Moon, the Orbiter will deploy two-way earth communication antennas and solar panels for electricity. Attitude control jets will position the solar panels toward the sun and a tracker for a fix on its navigational star. The Orbiter will be put in an off-center orbit around the Moon where it will circle from four to six days. Scientists on Earth will study the effects of the Moon's gravitational field on the spacecraft, then the orbit will be lowered to 28 miles above the Moon's surface. Engineers will control the Orbiter

manually or by computer to activate two camera lenses. The cameras will capture pictures of 12,000 square miles of lunar surface in 25 and 400 square mile increments. Pictures will be sent back to Earth using solar power to transmit electrical signals. The signals will be received by antennas at Goldstone, CA, and in Australia and Spain. Incoming photographic data will be electronically converted and processed to produce large-scale photographic images. The mission will be directed from the Space Flight Operations Facility in Pasadena, CA by NASA and Boeing engineers. After the photographic mission, the Orbiter will continue to circle the Moon providing information about micrometeoroids and radiation in the vicinity.

Starfire I/ Consort III Launch

May 16, 1990; In English; Videotape: 28 min. 11 sec. playing time, in color. with sound

Report No(s): NONP-NASA-VT-2000081529; No Copyright; Avail: CASI: **B02**, Videotape-Beta: **V02**, Videotape-VHS

The Consort 3 is a commercial suborbital rocket that carried 12 microgravity experiments. It was launched on a Starfire rocket on May 16, 1990, from the Naval Ordnance Missile Test Station facilities at the U.S. Army's White Sands Missile Range (WSMR), NM. The videotape opens with approximately 2 minutes of a man speaking into a microphone but there is no sound. This is followed by a brief summary of the payload, and the expected trajectory, a view of the launch vehicle, the countdown and the launch. The videotape then shows a film clip from the University of Alabama, with Dr. Francis Wessling, project manager for the Consort 3 project, speaking about the mission goals in the materials sciences experimentation. The video shows footage of the payload being assembled. The next section is a discussion by Dr. Roy Hammstedt, of Pennsylvania State University, who reviews the Penn State Bio Module, and the goal of learning about the effects of gravity on physiology. This is followed by George Maybee, from McDonald Douglas, who spoke about the payload integration

process while the video shows some of the construction. The last section of the videotape shows a press conference at the launch site. Ana Villamil answers questions from the press about the flight.

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

The film shows experimental investigations to determine the landing-energy-dissipation characteristics for several types of landing gear for manned reentry vehicles. The landing vehicles are considered in two categories: those having essentially vertical-descent paths, the parachute-supported vehicles, and those having essentially horizontal paths, the lifting vehicles. The energy-dissipation devices include crushable materials such as foamed plastics and honeycomb for internal application in couch-support systems, yielding metal elements as part of the structure of capsules or as alternates for oleos in landing-gear struts, inflatable bags, braking rockets, and shaped surfaces for water impact.

Experimental and theoretical investigations have been made to determine the water-landing characteristics of a conical-shaped reentry capsule having a segment of a sphere as the bottom. For the experimental portion of the investigation, a 1/12-scale model capsule and a full-scale capsule were tested for nominal flight paths of 65 deg and 90 deg (vertical), a range of contact attitudes from -30 deg to 30 deg, and a full-scale vertical velocity of 30 feet per second at contact. Accelerations were measured by accelerometers installed at the centers of gravity of the model and full-scale capsules. For the model test the accelerations were measured along the X-axis (roll) and Z-axis (yaw) and for the full-scale test they were measured along the X-axis (roll), Y-axis (pitch), and Z-axis (yaw). Motions and displacements of the capsules that occurred after contact were determined from high-speed motion pictures. The theoretical investigation was conducted to determine the accelerations that might occur along the X-axis when the capsule contacted the water from a 90 deg flight path at a 0 deg attitude. Assuming a rigid body, computations were made from equations obtained by utilizing the principle of the conservation of momentum. The agreement among data obtained from the model test, the full-scale test, and the theory was very good. The accelerations along the X-axis, for a vertical flight path and 0 deg attitude, were in the order of 40g. For a 65 deg flight path and 0 deg attitude, the accelerations along the X-axis were in the order of 50g. Changes in contact attitude, in either the positive or negative direction from 0 deg attitude, considerably reduced the magnitude of the accelerations measured along the X-axis. Accelerations measured along the Y- and Z-axes were relatively small at all test conditions.

The film provides an introduction and overview of the Saturn launch vehicle. It is designed with stages to drop off as fuel is spent. There may be two, three, or four stages, depending on the payload. The Saturn rocket will be used to send Apollo missions to the Moon and back. Guidance systems and booster engine rockets are based on proven mechanisms. Scale models are used to test the engines. Hardware, airframes, guidance systems, instrumentation, and the rockets are produced at sites throughout the country. The engines go to Marshall Space Flight Center for further tests. After partial assembly, the vehicle is shipped to Cape Canaveral in large pieces where it is assembled using specially built equipment and structures. Further trials are performed to assure successful launches.

A limited investigation has been conducted to determine the jet-blast effect of twin variable-cant supersonic nozzles. These tests were made to examine the result of using canted main rocket engines to sweep the blast debris outward from the proposed landing area of a rocket-powered vehicle making a vertical approach to a touchdown. Cant angles from 0 degrees to 75 degrees, at intervals of 15 degrees, were tested at low ambient pressure and at atmospheric ambient pressure. Nozzle chamber pressures used were 400 psi and 2000 psi.

An experimental investigation was made to determine the landing characteristics of a 1/4-scale dynamic model of the Apollo spacecraft command module using two different active (heat shield deployed prior to landing) landing systems for impact attenuation. One landing system (configuration 1) consisted of six hydraulic struts and eight crushable honeycomb struts. The other landing system (configuration 2), consisted of four hydraulic struts and six strain straps. Tests made on water and the hard clay-gravel composite landing surfaces simulated parachute letdown (vertical) velocities of 23 ft/sec (7.0 m/s) (full scale). Landings made on the sand landing surface simulated vertical velocities of 30 ft/sec (9.1 m/s). Horizontal

velocities of from 0 to 50 ft/sec (15 m/s) were simulated. Landing attitudes ranged from -30 degrees to 20 degrees, and the roll attitudes were 0 degrees, 90 degrees, and 180 degrees. For configuration 1, maximum normal accelerations at the vehicle center of gravity for landings on water, sand, and the hard clay-gravel composite surface were 9g, 20g, and 18g, respectively. The maximum normal center-of-gravity acceleration for configuration 2 which was landed only on the hard clay-gravel landing surface was approximately 19g. Accelerations for configuration 2 were generally equal to or lower than accelerations for configuration 1 and normal.

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

An investigation of a 1/6-scale dynamic model has been made to develop and evaluate a technique for conducting full-scale landing-impact tests at simulated lunar gravity. Landings were made at touchdown pitch attitudes of -15 degrees, 0 degrees, and 15 degrees. All landings were made with two gear pads forward and at a roll attitude of 0 degrees. Both roll and yaw attitudes were constrained. Vertical landing speed was varied from 5 to 15 feet per second (1.5 to 4.6 m/s) and horizontal speed was varied from 0 to 10 feet per second (0 to 3.0 m/s). Most of the landings were made at a vertical and horizontal speed of 10 feet per second or 3.0 m/s (45 degree flight-path angle) while pitch attitude and surface characteristics, friction and topography, were varied. These parameters were investigated with the free-body earth-gravity and the simulated lunar-gravity test techniques. The landings were made at a model mass corresponding to a full-scale lunar weight (force due to gravity) of 1,440 pounds (6.41 kN) or an earth weight of 8,640 pounds (38.4 kN).

Investigations were made to study the water-landing and certain ground-surface landing characteristics of a Gemini spacecraft model. The water landing experiments were made by simulating paraglider and parachute letdowns with two 1/6-scale model configurations. Parameters included various combinations of attitude, horizontal speed, vertical speed, and landing skids extended and retracted. Investigations were made in calm water and in waves. The paraglider landings at horizontal speeds of 63 feet per second (19.8 m/sec) which resulted in a noseover or tumbling shortly after initial water contact. The maximum longitudinal acceleration of the model in calm water was about 14g units, and the maximum angular acceleration was 66 radians per second squared. In the parachute landings with the heat shield forward, the model skidded along the water surface on the heat shield. Parachute landings with the small end forward resulted in behavior similar to that of the paraglider landings. The ground-surface landings were made with a 1/3-scale model by simulating a parachute letdown with braking rockets, which were fired prior to touchdown to dissipate vertical velocity. In these landings, control of timing and aligning the rockets on the model was very critical, and violent behavior resulted when either rocket alignment or timing was in error. In the landings that were correctly controlled, the model either remained upright or slowly rolled over on its side.

The performance characteristics of a pre-formed elliptical parachute at altitudes between 200,000 and 100,000 feet were obtained by means of in-flight photography. The tests demonstrate that this type of parachute will open at altitudes of about 200,000 feet if conditions such as twisting of the suspension lines or draping of the suspension lines over the canopy do not occur. Drag-coefficient values between 0.6 and 0.8 were found to be reasonable for this type of parachute system in the altitude range between 200,000 and 100,000 feet.

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

An experimental investigation was made to determine the landing characteristics of a 1/8-scale dynamic model of a reentry vehicle using a passive landing system to alleviate the landing-impact loads. The passive landing system consisted of a flexible heat shield with a small section of aluminum honeycomb placed between the heat shield and the crew compartment at the point that would be the first to contact the landing surface. The model was landed on concrete and sand landing surfaces at parachute letdown velocities. The investigations simulated a vertical velocity of 30 ft/sec (full scale), horizontal velocities of 0, 15, 30, 40, and 50 ft/sec (full scale), and landing attitudes ranging from -30 degrees to 20 degrees. The model investigation indicated that stable landings could be made on a concrete surface at horizontal velocities up to about 30 ft/sec, but the stable landing-attitude range at these speeds was small. The aluminum honeycomb bottomed occasionally during landings on concrete. When bottoming did not occur, maximum normal and longitudinal accelerations at the center of gravity of the vehicle were approximately 50g and 30g, respectively.

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

An experimental investigation has been made of some lunar-landing characteristics of a 1/6-scale dynamic model of a landing module having multiple-leg landing-gear systems. Symmetric four-point and five-point systems and an asymmetric four-point system were investigated. The landing-gear legs were inverted tripod arrangements having a telescoping main strut which incorporated a yielding-metal strap for energy dissipation, hinged V-struts, and circular pads. The landing tests were made by launching a free model onto an impenetrable hard surface (concrete) and onto a powdered-pumice overlay of various

depths. Landing motion and acceleration data were obtained for a range of touchdown speeds, touchdown speeds, touch attitudes, and landing-surface conditions. Symmetric four-point and five-point systems and an Maximum normal acceleration experienced at the module center of gravity during landings on hard surface or pumice was 2g (full-scale lunar value in terms of earth's gravity) over a wide range of touchdown conditions. Maximum angular acceleration experienced was 12-1/2 radians/sec(exp 2) and maximum longitudinal acceleration was 1-3/4 g. The module was very stable with all gear configurations during landings on hard surface (coefficient of friction, microns=0.4) at all conditions tested. Some overturn instability occurred during landings on powdered pumice (microns=0.7 to 1.0) depending upon flight path, pitch and yaw attitude, depth of pumice, surface topography, and landing-gear configuration. The effect of stability of roll attitude for the limited amount of roll-attitude landing data obtained was insignificant. Compared with the four-point system, the five-point system with equal maximum gear radius increased landing stability slightly and improved the static stability for subsequent lunar launch. A considerable increase in landing stability in the direction of motion was obtained with an asymmetric four-point gear having two pads offset to increase gear radius by 33 percent in the direction of horizontal flight.

The investigation was conducted in the Langley spin tunnel. The tunnel is an atmospheric wind tunnel with a vertically rising airstream in the test section and a maximum airspeed of approximately 90 feet per second. For this investigation, the model was hand launched into the vertically rising airstream. At times the model, both with and without a drogue parachute, was launched gently with as little disturbance as possible to determine what motions of the spacecraft were self-excited. At other times, the spacecraft with pre-deployed drogue parachute was launched into various spinning motions to determine the effectiveness of the drogue parachute in terminating these spinning motions. During drogue-parachute deployment tests, the spacecraft was launched into various spinning and tumbling motions and the drogue parachute was deployed. The motions of the model were photographed with a motion-picture camera, and some of the film records were read to obtain typical time histories of the model motion. The angles of attack indicated in the time histories presented are believed to be accurate within +/-1 degree. The mass and dimensional characteristics of the dynamic model are believed to be measured to an accuracy of: +/-1 percent for the weight, +/-1 percent for z(sub cg)/d, +/-15 percent for x (sub cg), and +/-5 percent for the moments of inertia. The towline and bridle-line lengths were simulated to an accuracy of +/-1 foot full scale.

An investigation was made to determine the landing-impact characteristics of a reentry vehicle having a multiple-air-bag load-alleviation system. A 1/16-scale dynamic model having four canted air bags was tested at flight-path angles of 90 degrees (vertical), 45 degrees, and 27 degrees for a parachute or paraglider vertical letdown velocity of 30 feet per second (full scale). Landings were made on concrete at attitudes ranging from -15 degrees to 20 degrees. The friction coefficient between the model heat shield and the concrete was approximately 0.4. An aluminum diaphragm, designed to rupture at 10.8 pounds per square inch gage, was used to maintain initial pressure in the air bags for a short time period.

Buffet and flutter characteristics of Saturn Apollo mission were studied using a dynamically scaled model. The model was built around a central aluminum tube for scaled stiffness distribution and strength to resist loads imposed during testing. Styrofoam sections attached to the core provided the correct external contours. Lead weights were added for correct mass distribution. An electromagnetic shaker was used to excite the model in its flexible modes of vibration during portions of the test. The model was supported on a sting, mounted by leaf springs, cables and torsion bars. The support system provided for simulating the full scale rigid body pitch frequency with minimum restraint imposed on elastic deflections. Bending moments recorded by sensors on the aluminum tube. Several modified nose configurations were tested: The basic configuration was tested with and without a flow separator disk on the escape rocket motor, tests also were made with the escape tower and rocket motor removed completely. For the final test, the Apollo capsule was replaced with a Jupiter nose cone. The test program consisted of determining model response throughout the transonic speed range at angles of attack up to 6 degrees and measuring the aerodynamic damping over the same range for the basic model and the modified configurations. Signals from the model pickup were recorded on tape for later analysis. The data obtained were used to estimate bending moments that would be produced on the full-scale vehicle by aerodynamic forces due to buffeting.

A ballute decelerator inflated by ram air was tested in free flight to determine the inflation, drag, and stability

characteristics. The decelerator had a 40-inch (101.6-cm) envelope equatorial diameter and a 10-percent burble fence. It was towed 13.5 feet (4.12 m) aft of a cone-cylinder-flare payload with a maximum diameter of 18.21 inches (46.25 cm). The decelerator was deployed at an altitude of 115,000 feet (35.1 km) at a velocity of 4400 ft/sec (1342 m/sec) and inflated at a Mach number of 4.2 and a freestream dynamic pressure of 163 lb/ft(exp 2) (7.8 kN/m(exp 2)).

A 40-foot (12.2 meter) nominal-diameter disk-gap-band parachute was flight tested as part of the NASA Supersonic Planetary Entry Decelerator Program (SPED-I). The test parachute was ejected by a deployment mortar from an instrumented payload at an altitude of 140,000 feet (42.5 kilometers). The payload was at a Mach number of 1.91 and the dynamic pressure was 11.6 pounds per square foot (555 newtons per square meter) at the time the parachute deployment mortar was fired. The parachute reached suspension line stretch in 0.43 second with a resultant snatch force loading of 1990 pounds (8850 newtons). The maximum parachute opening load of 6500 pounds (28,910 newtons) came 0.61 second later at a total elapsed time from mortar firing of 1.04 seconds. The first full inflation occurred at 1.12 seconds and stable inflation was achieved at approximately 1.60 seconds. The parachute had an average axial-force coefficient of 0.53 during the deceleration period. During the steady-state descent portion of the flight test, the average effective drag coefficient was also 0.53 and pitch-yaw oscillations of the canopy averaged less than 10 degrees in the altitude region above 100,000 feet (30.5 meters).

Attached inflatable decelerators (AID) were tested in an environmental chamber, a spin tunnel, and a wind tunnel. Deployment tests were conducted in environmental chamber to examine guided and unguided water alcohol vapor inflation. Subsonic performance tests were conducted in the spin tunnel. The full-scale wind tunnel was used for AID gust and supersonic performance tests. The supersonic tests were conducted at Mach number 3.0 with 12 ounces of fluid and Mach number 2.2 with six ounces of fluid.

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

A 30-foot (9.1-meter) nominal-diameter cross-type parachute with a cloth area (reference area) of 709 square feet (65.9 square meters) was flight tested in the rocket-launched portion of the NASA Planetary Entry Parachute Program (PEPP). The test parachute was ejected from an instrumented payload by means of a mortar when the system was at a Mach number of 1.57 and a dynamic pressure of 9.7 psf. The parachute deployed to suspension-line stretch in 0.44 second with a resulting snatch-force loading of 1100 pounds (4900 newtons), Canopy inflation began at 0.58 second and a first full inflation was achieved at approximately 0.77 second. The maximum opening load occurred at 0.81 second and was 4255 pounds (18,930 newtons). Thereafter, the test item exhibited a canopy-shape instability in that the four panel arms experienced fluctuations, a 'scissoring' type of motion predominating throughout the test period. Calculated values of axial-force coefficient during the deceleration portion of the test varied between 0.35 and 1.05, with an average value of 0.69. During descent, canopy-shape variations had reduced to small amplitudes and resultant pitch-yaw angles of the payload with respect to the local vertical averaged less than 10 degrees. The effective drag coefficient, based on the vertical components of velocity and acceleration during system descent, was 0.78.

An experimental investigation was made to determine impact water pressures, accelerations, and landing dynamics of a 1/4-scale dynamic model of the command module of the Apollo spacecraft. A scaled-stiffness aft heat shield was used on the model to simulate the structural deflections of the full-scale heat shield. Tests were made on water to obtain impact pressure data at a simulated parachute letdown (vertical) velocity component of approximately 30 ft/sec (9.1 m/sec) full scale. Additional tests were made on water, sand, and hard clay-gravel landing surfaces at simulated vertical velocity components of 23 ft/sec (7.0 m/sec) full scale. Horizontal velocity components investigated ranged from 0 to 50 ft/sec (15 m/sec) full scale and the pitch attitudes ranged from -40 degrees to 29 degrees. Roll attitudes were 0 degrees, 90 degrees, and 180 degrees, and the yaw attitude was 0 degrees.

The investigation was made to study the rough-water landing characteristics of a Gemini type of spacecraft. The investigations were made with a 1/6-scale dynamic model in a simulated sea state 4 rough water. Parachute letdown landings were simulated with the model at various yaw angles and horizontal velocities. The vertical velocity and landing attitude remained constant. The range of maximum lateral and longitudinal acceleration was from about 3-1/2g to 16g while that for the maximum normal acceleration was from 1g to 15g. The range of maximum angular acceleration was from about 0 to 190 radians per second(exp 2). The smoothest behavior and the lowest angular acceleration occurred at the 90 degree yaw angle. The normal acceleration was near minimum at this condition.

Deployment and Performance Characteristics of 5-Foot Diameter (1.5m) Attached Inflatable Decelerators from Mach Numbers 2.2-4.4

Bohon, Herman L.; Miserentino, Robert; May 1970; In English; See also 19700026642; See also NASA-TN-D5840; Originally recorded in 16mm, Silent, Color, 160ft., 4.5min.; DVD produced from the original 16mm recording

Report No(s): L-1080; No Copyright; Avail: CASI: [C01](#), DVD; Movie/Video (High Res)

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

Deployment characteristics and steady-state performance data were obtained over the Mach number range from 2.2 to 4.4 and at angles of attack from 0 degrees to 10 degrees. All attached inflatable decelerator (AID) models deployed successfully and exhibited flutter-free performance after deployment. Shock loads commonly associated with inflation of parachutes during deployment were not experienced. Force and moment data and ram-air pressure data were obtained throughout the Mach number range and at angles of attack from 0 degrees to 10 degrees. The high drag coefficient of 1.14 was in good agreement with the value predicted by the theory used in the design and indicated other AID shapes may be designed on a rational basis with a high degree of confidence.

An experimental research program was conducted on the erosion of particulate surfaces by a jet exhaust. These

experiments were scaled to represent the lunar module (LM) during landing. A conical cold-gas nozzle simulating the lunar module nozzle was utilized. The investigation was conducted within a large vacuum chamber by using gravel or glass beads as a simulated soil. The effects of thrust, descent speed, nozzle terminal height, particle size on crater size, and visibility during jet erosion were determined.

Flight Tests Results from Supersonic Deployment of an 18-Foot Diameter (5.49 meter) Towed Ballute Decelerator

Mayhue, Robert J.; Eckstrom, Clinton V.; March 1969; In English; See also 19690017080; See also NASA-TM-X-1773; Originally recorded in 16mm, Silent, Color, 112ft., 3min.; DVD produced from the original 16mm recording

Report No(s): L-1045; No Copyright; Avail: CASI: [C01](#), DVD; Movie/Video (High Res)

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

A ram-air-inflated, towed ballute decelerator having a maximum frontal diameter of 18 feet (5.49 meters) was deployed during free flight at a Mach number of 3.15 and a dynamic pressure of 38.5 lb/ft(exp 2) (1843.4 newtons/m(exp 2)). Deployment and extraction of the test ballute were normal but inflation stopped about 1 second after mortar firing and produced an average plateau drag force of 1500 pounds (6.7 kN) for about 1 second. Approximately 30 percent of expected total frontal area was obtained.

Flight Test of a 40-Foot Nominal Diameter Disk-Gap-Band Parachute Deployed at a Mach Number of 3.31 and a Dynamic Pressure of 10.6 Pounds per Square Foot

Eckstrom, Clinton V.; November 1969; In English; See also 19700010021; See also NASA-TM-X-1924; Originally recorded in 16mm, Silent, Color, 116ft., 3.2min.; DVD produced from the original 16mm recording

Report No(s): L-1066; No Copyright; Avail: CASI: [C01](#), DVD; Movie/Video (High Res)

ONLINE: [View Movie/Video](#) (Low Res); [View Movie/Video](#) (Medium Res)

A 40-foot-nominal-diameter (12.2 meter) disk-gap-band parachute was flight tested as part of the NASA supersonic high altitude parachute experiment (SHAPE) program. The test parachute (which included an experimental energy absorber in the attachment riser) was deployed from an instrumented payload by means of a deployment mortar when the payload was at a Mach number of 3.31 and a free-stream dynamic pressure of 10.6 pounds per square foot (508 newtons per square meter). The parachute deployed properly, the canopy inflating to a full-open condition at 1.03 seconds after mortar firing. The first full inflation of the canopy was immediately followed by a partial collapse with subsequent oscillations of the frontal area from about 30 to 75 percent of the full-open frontal area. After 1.07 seconds of operation, a large tear appeared in the cloth near the canopy apex. This tear was followed by two additional tears shortly thereafter. It was later determined that a section of the canopy cloth was severely weakened by the effects of aerodynamic heating. As a result of the damage to the disk area of the canopy, the parachute performance was significantly reduced; however, the parachute remained operationally intact throughout the flight test and the instrumented payload was recovered undamaged.

ASTRO-1 to explore invisible universe

Nov 1, 1989; In English

Report No(s): MSFC-16527; NASA-TM-109360; NONP-NASA-VT-94-198207; No Copyright; Avail: CASI: [B01](#), Videotape-Beta: [V01](#), Videotape-VHS

This video explains the ASTRO 1 observatory and its ten day mission aboard SpaceLab on NASA's Space Shuttle, which Marshall Space Flight Center (MSFC) and Goddard Space Flight Center (GSFC) astronomers will use to study distant stars, supernovae, and black holes. The observatory contains ultraviolet and x ray telescopes that will capture images earth-bound observatories can't, due to interference from the earth's atmosphere. The video contains footage of the instrument being loaded on the shuttle, animations of anticipated images to be captured, and scenes of the SpaceLab Control Center at MSFC.

Filtered Rayleigh Scattering and shadowgraph flow visualization were used to characterize the penetration of helium or moist air injected transversely at several pressures into a Mach 3 flow in the NASA Lewis 3.81 inch by 10 inch continuous flow supersonic wind tunnel. This work is in support of the LOX (liquid oxygen) Augmented Nuclear Thermal Rocket program. The present study used an injection-seeded, frequency doubled ND:YAG pulsed laser to illuminate a transverse section of the injectant plume. Rayleigh scattered light was passed through an iodine absorption cell to suppress stray laser light and was imaged onto a cooled CCD camera. The scattering was based on condensation of water vapor in the injectant flow. Results are presented for various configurations of sonic and supersonic injector designs mounted primarily in the floor of the tunnel. Injectors studied include a single 0.25 inch diameter hole, five 0.12 inch diameter holes on 0.177 inch spacing, and a 7 deg. half angle wedge. High speed shadowgraph flow visualization images were obtained with several video camera systems. Roof and floor static pressure data are presented several ways for the three configurations of injection designs with and without helium and/or air injection into Mach 3 flow. A 12 min. video supplement is also included.

Living Places in Other Solar Systems

[2004]; 2 pp.; In English; 1 hr., 50 min. playing time, in color, with sound; No Copyright; Avail: CASI: [V04](#), Videotape-VHS

Dr. Sargent noted that evidence of other solar systems that might sustain life, particularly human life, is being sought. Protoplanetary (or debris) disks have been observed and are considered evidence that other solar systems exist or are being formed. Also observed is a wobble which is seen as evidence of circulation around a celestial body and gaps that are created by the potential planet. One indicator of life may be these rings or disks of debris around stars. Interferometers, which are telescopic devices that consist of multiple lenses, are being developed in order to better see celestial objects and what may be found around them. Other methods for improving celestial viewing capabilities are also under development. She spoke of particularly looking for wobble and gaps and debris disks where new planets are being formed in an effort to discover another planet that might sustain life as we know it. The next speaker, Dr. Chris McKay, is a planetary scientist at NASA Ames. He talked about the possibility of life on Mars or in some other solar system. He commented on the sameness of the origin of all life, and of the origin of, and the need for, oxygen and water. He believes that water originally came to Earth from comets. At least that is a viable possible source. Water might also have come to Earth via asteroids. Dr. McKay also postulates that there can be no water on Mars because Mars has no plate tectonic system, which he believes is an essential for recycling water. . Dr. Wes Huntress, NASA's Associate Administrator for Space Science, and Dr. Barbara Stone, also from NASA Headquarters, joined Drs. Cordova, Sargent and McKay in the question and answer period following the presentations. (Mr. Goldin was excused to keep an appointment with the President.) The discussion included the following statements and questions: The more missions that there are, the more technology is developed. We need to study our solar system to have something to which we can compare other systems. Before we send people to distant places or to other planets, we need to study the psychological and biological problems that are created by going away from Earth for a long period of time. Pulsars appear to have planets rotating around them. This is of interest and should be studied further. Looking back in time, is there any thought to seeing the development of life? How long did it take for oxygen to rise on the Earth? Do debris disks around the stars provide velocity patterns? To detect life scientists are listening for radio signals, looking for oxygen or ozone, and looking for liquid water. On Earth liquid water is the defining ecological parameter for life. This means that operationally the search for life elsewhere is primarily a search for liquid water.

The Plasma Universe

[2004]; In English; 1 hr., 59 min. playing time, in color, with sound; No Copyright; Avail: CASI: **V04**, Videotape-VHS

Dr. France Cordova, NASA's Chief Scientist, chaired this, the eighth seminar in the Administrator's Seminar Series. She introduced the NASA Administrator, Daniel S. Goldin, who, in turn, introduced the subject of plasma. Plasma, an ionized gas, is a function of temperature and density. We've learned that, at Jupiter, the radiation is dense. But, Goldin asked, what else do we know? Dr. Cordova then introduced Dr. James Van Allen, for whom the Van Allen radiation belt was named. Dr. Van Allen, a member of the University of Iowa faculty, discussed the growing interest in practical applications of space physics, including radiation fields and particles, plasmas and ionospheres. He listed a hierarchy of magnetic fields, beginning at the top, as pulsars, the Sun, planets, interplanetary medium, and interstellar medium. He pointed out that we have investigated eight of the nine known planets. He listed three basic energy sources as 1) kinetic energy from flowing plasma such as constitutional solar wind or interstellar wind; 2) rotational energy of the planet, and 3) orbital energy of satellites. He believes there are seven sources of energetic particles and five potential places where particles may go. The next speaker, Dr. Ian Axford of New Zealand, has been associated with the Max Planck Institut fuer Aeronomie and plasma physics. He has studied solar and galactic winds and clusters of galaxies of which there are several thousand. He believes that the solar wind temperature is in the millions of degrees. The final speaker was Dr. Roger Blanford of the California Institute of Technology. He classified extreme plasmas as lab plasmas and cosmic plasmas. Cosmic plasmas are from supernovae remnants. These have supplied us with heavy elements and may come via a shock front of 10^{15} electron volts. To understand the physics of plasma, one must learn about x-rays, the maximum energy of acceleration by supernova remnants, particle acceleration and composition of cosmic rays, maximum acceleration, and how fast protons are heated by ions. He asked questions about where high energy cosmic rays are made, what accelerates electrons, radiates gamma rays, makes electronpositron plasma, and finally noted that pulsars are good time keepers, but we need a better understanding of their mechanism and of plasmas, both cosmic and ground-based. In the discussion period, Goldin asked if NASA should put up an x-ray interferometer. The answer was no;

gamma rays are of greater interest just now. Goldin also asked what the assembled scientists would like to see for a future mission? They expressed an interest in learning more about the origin of galaxies, cosmic rays, solar systems, planets, the existence of life 'out there', gamma ray sources, the nature of gamma ray bursts, and the flow of gases around black holes. The discussion concluded with a suggestion that NASA should communicate to the general public more information regarding actual technological trials and tribulations involved in getting an experiment to work. The speakers thought that this would help non-scientists to better appreciate what it is that NASA does in connection with the benefits that are achieved.

Farthest Supernova Bolsters Proof for a Mysterious Form of Energy Pervading the Universe

[2001]; In English; Videotape: 16 min. 42 sec. playing time, in color, with sound

Report No(s): NONP-NASA-VT-2001047824; No Copyright; Avail: CASI: [B02](#), Videotape-Beta: [V02](#), Videotape-VHS

Computerized animations show the following: (1) the acceleration and deceleration of the universe; (2) an image subtraction of the 1995 and 1997 images of the Hubble Deep Field to reveal a supernova in the 1997 image; (3) a pie-chart

of the mass composition of the universe; (4) the universe's expansion after the Big Bang; (5) a supernova detonating; and (6) the lightbulb test (to determine distance by comparing light intensity). Zoom shots show the Hubble Deep Field (from ground-based observations to the Hubble Space Telescope (HST) image) and the Hubble Deep Field with a supernova (from an artist's conception animation to a ground-based view). Dr. Ron Gilliland explains that he looked for a supernova in the Hubble Deep Field and how supernovae are useful as standard candles. Dr. Adam Riess describes how astronomers used supernovae to discover that the universe is expanding and why it might be expanding.

Microlensing: Globular Cluster M22 Video File

[2001]; In English; Videotape: 6 min. 55 sec. playing time, in color, with sound

Report No(s): NONP-NASA-VT-2001092796; No Copyright; Avail: CASI: [B01](#), Videotape-Beta: [V01](#), Videotape-VHS

A computerized animation begins outside a globular cluster similar to M22, with the center of the Milky Way in the distance. The camera flies through the center of the cluster and rests with a dark object in the distance. This object, a suspected brown star, passes in front of a star in the galactic bulge, bending its light gravitationally. This bending, or lensing, causes a momentary brightening of the background star. Another sequence begins with a ground-based view of the center of our galaxy in the upper right. We zoom in to reveal a ground-based view of the region surrounding the cluster and continue zooming to reveal the Hubble Space Telescope view of M22. In an interview with Kailash Sahu, Astronomer, he describes the Hubble results, explains why the objects in M22 can't be planets, and explains Hubble's role in the observations of M22. The last image was taken with Hubble's Wide Field and Planetary Camera 2 and pierces the heart of a globular cluster with its needle-sharp vision and uncovers tantalizing clues to what could potentially be a strange and unexpected population of wandering, planet-sized objects.

Black Holes Shed Light on Galaxy Formation

[2000]; In English; Videotape: 13 min. 10 sec. playing time, in color, with sound

Report No(s): NONP-NASA-VT-2001026551; No Copyright; Avail: CASI: [B01](#), Videotape-Beta: [V01](#), Videotape-VHS

This videotape is comprised of several segments of animations on black holes and galaxy formation, and several segments of an interview with Dr. John Kormendy. The animation segments are: (1) a super massive black hole, (2) Centarus A active black hole found in a collision, (3) galaxy NGC-4261 (active black hole and jet model), (4) galaxy M-32 (orbits of stars are effected by the gravity of the black hole), (5) galaxy M-37 (motion of stars increases as mass of black hole increases), (6) Birth of active galactic nuclei, (7) the collision of two galaxy leads to merger of the black holes, (8) Centarus A and simulation of the collision of 2 galaxies. There are also several segments of an interview with John Kormendy. In these segments he discusses the two most important aspects of his recent black hole work: (1) the correlations between galaxies speed and the mass of the black holes, and (2) the existence of black holes and galactic formation. He also discusses the importance of the

Hubble Space Telescope and the Space Telescope Imaging Spectrograph to the study of black holes. He also shows the methodology of processing images from the spectrograph in his office.

Quasar Host Galaxies/Neptune Rotation/Galaxy Building Blocks/Hubble Deep Field/Saturn Storm

[2001]; In English; Videotape: 13 min. 57 sec. playing time, in color, no sound

Report No(s): NONP-NASA-VT-2001026556; No Copyright; Avail: CASI: [B01](#), Videotape-Beta: [V01](#), Videotape-VHS

Computerized animations simulate a quasar erupting in the core of a normal spiral galaxy, the collision of two interacting galaxies, and the evolution of the universe. Hubble Space Telescope (HST) images show six quasars' host galaxies (including spirals, ellipticals, and colliding galaxies) and six clumps of galaxies approximately 11 billion light years away. A false color time lapse movie of Neptune displays the planet's 16-hour rotation, and the evolution of a storm on Saturn is seen through a video of the planet's rotation. A zoom sequence starts with a ground-based image of the constellation Ursa major and ends with the Hubble Deep Field through progressively narrower and deeper views.

Plentiful Water Detected in Mars Northern Hemisphere

June 26, 2003; In English; 6 min., 56 sec. playing time, in color, with sound

Report No(s): G03-043; No Copyright; Avail: CASI: [V01](#), Videotape-VHS: [B01](#), Videotape-Beta

NASA's Mars Odyssey Spacecraft is revealing new details about a changeable array of frozen layers on Northern Mars. Odyssey's neutron and gamma-ray sensors have tracked seasonal changes as layers of 'dry ice' carbon dioxide frost or snow accumulated during northern Mars' winter and then dissipate in the spring to expose a permafrost soil layer rich in water ice. The research is presented in a paper in the June 27, 2003 issue of the Journal Science. This video contains a slide show interspersed with computer generated graphics of seasonal ice distribution and thickness on Mars. The graphics utilize Viking and Mars Orbiter Laser Altimeter (MOLA) data as well as Odyssey data.

Is There Water on the Moon? NASA's LCROSS Mission [Supplemental Video]

November 09, 2007; In English; See also [20080015767](#); Video is on CD-ROM, Sound, Color, 4.15 min.; No Copyright; Avail: CASI: [C01](#), CD-ROM

Presents a supplemental video supporting the original conference presentation under the same title. The conference presentation discussed NASA's preparation for its return to the moon with the Lunar CRater Observation and Sensing Satellite

(LCROSS) mission which will robotically seek to determine the presence of water ice at the Moon's South Pole. This secondary payload spacecraft will travel with the Lunar Reconnaissance Orbiter (LRO) satellite to the Moon on the same Atlas-V 401 Centaur rocket launched from Cape Canaveral Air Force Station, Florida. The 1000kg Secondary Payload budget is efficiently used to provide a highly modular and reconfigurable LCROSS Spacecraft with extensive heritage to accurately guide the expended Centaur into the crater. Upon separation, LCROSS flies through the impact plume, telemetering real-time images and characterizing water ice in the plume with infrared cameras and spectrometers. LCROSS then becomes a 700kg impactor itself, to provide a second opportunity to study the nature of the Lunar Regolith. LCROSS provides a critical ground-truth for Lunar Prospector and LRO neutron and radar maps, making it possible to assess the total lunar water inventory. The video contains an animated simulation of the Centaur launch, LRO separation, LRO high resolution lunar survey, LCROSS mission elements and LCROSS impactor separation and impact observations.

Final Blaze of Glory

[2001]; In English; Videotape: 14 min. 57 sec. playing time, in color, with sound

Report No(s): NONP-NASA-VT-2001026549; No Copyright; Avail: CASI: [B01](#), Videotape-Beta: [V01](#), Videotape-VHS

This video gives an overview of planetary nebulae through a computerized animation, images from the Hubble Space Telescope (HST), and interviews with Space Telescope Science Institute Theorist Dr. Mario Livio. A computerized animation simulates a giant star as it swallows its smaller companion. HST images display various planetary nebulae, such as M2-9 Twinjet Nebula, NGC 3568, NGC 3918, NGC 5307, NGC 6826, NGC 7009, and Hubble 5. An artists conception shows what our solar system might look like in a billion years when the Sun has burned out and cast off its outer layers in a shell of glowing gas. Dr. Livio describes the shapes of the planetary nebulae, gives three reasons to study planetary nebulae, and what the observations made by HST have meant to him. A succession of 17 HST images of planetary nebulae are accompanied by music by John Serrie.

Six Decades of Flight Research: Dryden Flight Research Center, 1946 - 2006 [DVD]

Fisher, David F.; Parcel, Steve; May 2007; 5 pp.; In English

Report No(s): NASA/TM-2007-214617; No Copyright; Avail: CASI: [C01](#), DVD

This DVD contains an introduction by Center Director Kevin Peterson, two videos on the history of NASA Dryden Flight Research Center and a bibliography of NASA Dryden Flight Research Center publications from 1946 through 2006. The NASA Dryden 60th Anniversary Summary Documentary video is narrated by Michael Dorn and give a brief history of Dryden. The Six Decades of Flight Research at NASA Dryden lasts approximately 75 minutes and is broken up in six decades: 1. The Early X-Plane Era; 2. The X-15 Era; 3. The Lifting Body Era; 4. The Space Shuttle Era; 5. The High Alpha and Thrust Vectoring Era; and 6. The technology Demonstration Era. The bibliography provides citations for NASA Technical Reports and Conference Papers, Tech Briefs, Contractor Reports, UCLA Flight Systems Research Center publications and Dryden videos. Finally, a link is provided to the NASA Dryden Gallery that features video clips and photos of the many unique aircraft flown at NASA Dryden and its predecessor organizations.

Subject Term Index

2001 MARS ODYSSEY

Plentiful Water Detected in Mars Northern Hemisphere – 60

ABLATION

Experimental Ablation Cooling – 45

ABLATIVE MATERIALS

Experimental Ablation Cooling – 45

Thermo-Lag Ablation Tests – 44

ABLATIVE NOSE CONES

Experimental Ablation Cooling – 45

ACCELERATION STRESSES (PHYSIOLOGY)

Studies of Accelerations in Manned Vehicles During Exit and Reentry Flight – 52

ACCIDENT INVESTIGATION

Shuttle 51L: Challenger – 21

ACOUSTICS

Acoustic climb to cruise test – 12

ADVANCED SOLID ROCKET MOTOR (STS)

Advanced Solid Rocket Motor – 44

AERODYNAMIC BRAKES

Deployment and Performance Characteristics of 5-Foot Diameter (1.5m) Attached Inflatable Decelerators from Mach Numbers 2.2-4.4 – 42

Drag Characteristics of Several Towed Decelerator Models at Mach 3 – 9

Summary of Attached Inflatable Decelerator (AID) Development – 40

AERODYNAMIC CHARACTERISTICS

Flight Test of 31.2 Diameter Modified Ringsail Parachute Deployed at Mach 1.39, Dynamic Pressure 11 Pounds per Square Foot – 7

Flight Test of a 40-Foot Nominal Diameter Disk-Gap-Band Parachute Deployed at a Mach Number of 2.72 and a Dynamic Pressure of 9.7 Pounds per Square Foot – 9

Flight Test of a 40-Foot Nominal Diameter Disk-Gap-Band Parachute Deployed at a Mach Number of 1.91 and a Dynamic Pressure of 11.6 Pounds per Square Foot – 40

High-Speed Schlieren Movies of Decelerators at Supersonic Speeds – 5

Landing Characteristics of the Apollo Spacecraft with Deployed Heat Shield Impact Attenuation Systems – 35

Landing of Manned Reentry Vehicles – 35

AERODYNAMIC COEFFICIENTS

Aerodynamic Characteristics of Parachutes at Mach Numbers from 1.6 to 3 – 4

Flight Test of a 30-Foot Nominal Diameter Cross Parachute Deployed at a Mach Number of 1.57 and a Dynamic Pressure of 9.7 Pounds per Square Foot – 41

Flight Test of a 40-Foot Nominal-Diameter Disk-Gap-Band Parachute Deployed at a Mach Number of 1.91 and a Dynamic Pressure of 11.6 Pounds per Square Foot – 40

Performance of a 19.7 Meter Diameter Disk-Gap-Band Parachute in a Simulated Martian Environment – 6

AERODYNAMIC DRAG

Aerodynamic Characteristics of Parachutes at Mach Numbers from 1.6 to 3 – 4

Flight Test of a 30-Foot Nominal-Diameter Disk-Gap-Band Parachute Deployed at Mach 1.56 and Dynamic Pressure of 11.4 Pounds per Square Foot – 7

Flight Test of a 40-Foot Nominal Diameter Disk-Gap-Band Parachute Deployed at a Mach Number of 3.31 and a Dynamic Pressure of 10.6 Pounds per Square Foot – 43

High Altitude Flight Test of a 40-Foot Diameter (12.2 meter) Ringsail Parachute at Deployment Mach Number of 2.95 – 8

High Altitude Flight Test of a Reefed 12.2 Meter Diameter Disk-Gap-Band Parachute with Deployment at Mach Number of 2.58 – 8

High-Speed Schlieren Movies of the Flow About Reefed Parachute Models Towed at Supersonic Speeds Behind a Conical Body (4.875 Inches in Diameter). Drag Values Based on the Unreefed Diameter of 1.73 F. Porosity of Unreefed Parachute is 28 Percent. – 2

Performance of 26 Meter Diameter Ringsail Parachute in a Simulated Martian Environment – 8

Performance of a 16.6 Meter Diameter Cross Parachute in a Simulated Martian Environment – 5

Performance of a 16.6 Meter Diameter Modified Ringsail Parachute in a Simulated Martian Environment – 6

Performance of a 19.7 Meter Diameter Disk-Gap-Band Parachute in a Simulated Martian Environment – 6

Unitary Wind Tunnel Tests of 30-Degree Conical Ribbon Parachute and a Rotofoil Parachute Towed in the Wake of a Conical Nosed Cylindrical Body – 4

AERODYNAMIC FORCES

Aeroelastic Tests of an Eight Percent Scale Saturn C-1 Block II – 39

AERODYNAMIC HEATING

Aerodynamic Heating and Deceleration During Entry into Planetary Atmospheres – 4

Aerodynamic Heating of Blunt Nose Shapes at Mach Numbers up to 14 – 3

Experimental Ablation Cooling – 45

STS-121: Discovery Pre-Launch Mission Management Team Press Briefing – 27

AERODYNAMIC STABILITY

Performance of 26 Meter Diameter Ringsail Parachute in a Simulated Martian Environment – 8

Performance of a 16.6 Meter Diameter Modified Ringsail Parachute in a Simulated Martian Environment – 6

Performance of a 19.7 Meter Diameter Disk-Gap-Band Parachute in a Simulated Martian Environment – 6

AEROELASTICITY

Aeroelastic Tests of an Eight Percent Scale Saturn C-1 Block II – 39

AERONAUTICAL ENGINEERING

Dryden summer 1994 update – 62

AGENA ROCKET VEHICLES

Rendezvous Docking Simulator – 38

AIR BAG RESTRAINT DEVICES

Investigation of the Landing Characteristics of a Re-entry Vehicle Having a Canted Multiple Air Bag Load Alleviation System – 39

AIR BREATHING BOOSTERS

X-43 Composite Tape – 21

AIR BREATHING ENGINES

X-43 Composite Tape – 21

AIR LAUNCHING

Hyper-X Model Testing with Animation – 13

X-34 Captive Carry & Seunghee Lee Interview – 21

AIR TRAFFIC CONTROL

Pilot in Command: An Illustration of Autonomous Flight Management – 10

AIRCRAFT CONFIGURATIONS

X-31 tailless testing – 12

AIRCRAFT CONTROL

F-15 Propulsion Controlled Aircraft (PCA) – 13

AIRCRAFT DESIGN

F-16XL interview with Marta Bohn-Meyer – 2

Six Decades of Flight Research: Dryden Flight Research Center, 1946 - 2006 [DVD] – 62

AIRCRAFT LANDING

F-15 resource tape – 12

Pilot in Command: An Illustration of Autonomous Flight Management – 10

AIRCRAFT MANEUVERS

F-15 resource tape – 12

AIRCRAFT MODELS

Radio controlled for research – 13

AIRCRAFT NOISE

Acoustic climb to cruise test – 12

AIRCRAFT PERFORMANCE

F-15 resource tape – 12

AIRFOILS

F-16XL interview with Marta Bohn-Meyer – 2

AIRFRAMES

X-43 Composite Tape – 21

ALUMINUM ALLOYS

Effect of Load-Alleviating Structure on the Landing Behavior of a Reentry-Capsule Model – 34

ANDROMEDA GALAXY

Hubble Identifies Source of Ultraviolet Light in an Old Galaxy – 58

ANGLE OF ATTACK

F-18 HARV presentation for industry – 10

ANGULAR ACCELERATION

Model Investigation of Technique for Full Scale Landing Impact Tests at Simulated Lunar Gravity – 36

ANNUAL VARIATIONS

Atlas of TOMS ozone, 1978-1988 – 49

Evolution of the Southern Hemisphere ozone hole as seen by TOMS from August 1979 to December 1991 – 50

APOLLO 11 FLIGHT

Apollo 11 Facts [Lunar EVA] – 15

Apollo Presentation – 32

LLRV/Apollo 11 25th anniversary – 15

APOLLO PROJECT

Apollo 11: The Goddard connection – 15

APOLLO SPACECRAFT

Apollo-Lunar Orbital Rendezvous Technique – 17

Dynamic Model Investigation of Water Pressures and Accelerations Encountered During Landings of the Apollo Spacecraft – 41

Landing Characteristics of the Apollo Spacecraft with Deployed Heat Shield Impact Attenuation Systems – 35

Low Speed Dynamic Model Investigation of Apollo Command Module Configuration in the Langley Spin Tunnel – 41

ARCTIC REGIONS

Arctic ozone expedition – 49

ASTRO MISSIONS (STS)

ASTRO-1 to explore invisible universe – 44

ASTRONAUT PERFORMANCE

EVA Assembly of Large Space Structure Neutral Buoyancy, Zero-Gravity Simulation: NASA-LaRC Nestable Columns and Joints – 29

ASTRONAUTS

Apollo Presentation – 32

National Boy Scout Jamboree – 53

ATLANTIS (ORBITER)

STS-38 Rollback from Pad A to VAB – 22

ATLAS LAUNCH VEHICLES

High Speed Schlieren Studies of Flow Over Mercury Atlas Vehicle in the Langley 2-Foot Transonic Aeroplasticity Tunnel – 5

ATMOSPHERIC CIRCULATION

Evolution of the Southern Hemisphere ozone hole as seen by TOMS from August 1979 to December 1991 – 50

Meteor 3/TOMS launch of 15 August 1991 in Plesetsk, USSR – 18

ATMOSPHERIC ENTRY SIMULATION

Performance of a 16.6 Meter Diameter Cross Parachute in a Simulated Martian Environment – 5

ATMOSPHERIC ENTRY

Aerodynamic Heating and Deceleration During Entry into Planetary Atmospheres – 4

Flight Test of 31.2 Diameter Modified Ringsail Parachute Deployed at Mach 1.39, Dynamic Pressure 11 Pounds per Square Foot – 7

Flight Test of a 30-Foot Nominal-Diameter Disk-Gap-Band Parachute Deployed at Mach 1.56 and Dynamic Pressure of 11.4 Pounds per Square Foot – 7

Flight Tests of a 40-Foot Nominal Diameter Modified Ringsail Parachute Deployed at Mach 1.64 and Dynamic Pressure of 9.1 Pounds Per Square Foot – 6

Performance of 26 Meter Diameter Ringsail Parachute in a Simulated Martian Environment – 8

Performance of a 16.6 Meter Diameter Modified Ringsail Parachute in a Simulated Martian Environment – 6

Performance of a 19.7 Meter Diameter Disk-Gap-Band Parachute in a Simulated Martian Environment – 6

SPIKES (AERODYNAMIC CONFIGURATIONS)
Flow Over Blunt Body at M equals 20 in 2-Inch Helium Tunnel – 2

SPIN STABILIZATION
Dynamic Model Investigation of a 1/20 Scale Gemini Spacecraft in the Langley Spin Tunnel – 38

SPIN TESTS
Model Test of Mars Entry Vehicles in Langley Spin Tunnel – 37
Tests of Dynamic Scale Model of Gemini Capsule in the Langley 20-Foot Free-Spinning Tunnel – 39

SPIRAL GALAXIES
The Secret Lives of Galaxies – 58

SR-71 AIRCRAFT
NASA and the SR-71: Back to the future – 11

STABILITY TESTS
Launch Vehicle Dynamics Demonstrator Model – 20
Performance of a Towed, 48-Inch-Diameter (121.92) Ballute Decelerator Tested in Free-Flight Mach Numbers from 4.2 to 0.4 – 39

STAR CLUSTERS
Astronomers Ponder Lack of Planets in Globular Cluster – 59
Giant Star Clusters Near Galactic Core – 58
Hubble Spies Huge Cluster of Stars Formed by Ancient Encounter – 56
The Secret Lives of Galaxies – 58

STAR FORMATION
The Trifid Nebula: Stellar Sibling Rivalry – 59

STELLAR MODELS
Spinning Stardust into Planets – 59

STUDENTS
National Boy Scout Jamboree – 54

SUBSONIC SPEED
High Altitude Flight Test of a 40-Foot Diameter (12.2 meter) Ringsail Parachute at Deployment Mach Number of 2.95 – 8
High Altitude Flight Test of a Reefed 12.2 Meter Diameter Disk-Gap-Band Parachute with Deployment at Mach Number of 2.58 – 8
Performance of a 16.6 Meter Diameter Cross Parachute in a Simulated Martian Environment – 5

SUPERCritical WINGS
Dryden and transonic research – 1

SUPERNOVAE
Farthest Supernova Bolsters Proof for a Mysterious Form of Energy Pervading the Universe – 57

SUPERSONIC FLOW
Flow Studies of Decelerators at Supersonic Speeds – 46
High-Speed Schlieren Movies of the Flow About Reefed Parachute Models Towed at Supersonic Speeds Behind a Conical Body (4.875 Inches in Diameter). Drag Values Based on the Unreefed Diameter of 1.73 F. Porosity of Unreefed Parachute is 28 Percent. – 2
Improved Optical Techniques for Studying Sonic and Supersonic Injection into Mach 3 Flow – 46

SUPERSONIC NOZZLES
Blast Effects of Twin Variable-Cant Rocket Nozzles on Visibility During Landing on a Particle-Covered Surface – 34

SUPERSONIC SPEED
Aerodynamic Characteristics of Parachutes at Mach Numbers from 1.6 to 3 – 4
Aerodynamic Heating of Blunt Nose Shapes at Mach Numbers up to 14 – 3
Deployment and Performance Characteristics of 5-Foot Diameter (1.5m) Attached Inflatable Decelerators from Mach Numbers 2.2-4.4 – 42

Flight Test of a 40-Foot Nominal Diameter Disk-Gap-Band Parachute Deployed at a Mach Number of 2.72 and a Dynamic Pressure of 9.7 Pounds per Square Foot – 9

Flight Test of a 40-Foot Nominal Diameter Disk-Gap-Band Parachute Deployed at a Mach Number of 3.31 and a Dynamic Pressure of 10.6 Pounds per Square Foot – 43

Flight Test of a 40-Foot Nominal Diameter Disk-Gap-Band Parachute Deployed at a Mach Number of 1.91 and a Dynamic Pressure of 11.6 Pounds per Square Foot – 40

Flight Tests Results from Supersonic Deployment of an 18-Foot Diameter (5.49 meter) Towed Ballute Decelerator – 43

Flow Studies of Decelerators at Supersonic Speeds – 46

High Altitude Flight Test of a 40-Foot Diameter (12.2 meter) Ringsail Parachute at Deployment Mach Number of 2.95 – 8

High Altitude Flight Test of a Reefed 12.2 Meter Diameter Disk-Gap-Band Parachute with Deployment at Mach Number of 2.58 – 8

High-Speed Schlieren Movies of Decelerators at Supersonic Speeds – 5

High-Speed Schlieren Movies of the Flow About Reefed Parachute Models Towed at Supersonic Speeds Behind a Conical Body (4.875 Inches in Diameter). Drag Values Based on the Unreefed Diameter of 1.73 F. Porosity of Unreefed Parachute is 28 Percent. – 2

Performance of a 16.6 Meter Diameter Cross Parachute in a Simulated Martian Environment – 5

Performance of a Towed, 48-Inch-Diameter (121.92) Ballute Decelerator Tested in Free-Flight Mach Numbers from 4.2 to 0.4 – 39

Summary of Attached Inflatable Decelerator (AID) Development – 40

Tests of Vortex-Ring Parachute at Supersonic Speed in the Langley Unitary Plan Wind Tunnel – 2

Wind Tunnel Investigation of a Balloon as Decelerator at Mach Numbers from 1.47 to 2.50 – 4

SUPERSONIC WAKES
Unitary Plan Wind Tunnel Tests of Cook Technological Center Parachutes in the Wake of a Conical-Nosed Cylindrical Body Having a Base Diameter of 2.375-Inches (Part 5 of 6) – 3

SWIVELS
Tests of Vortex-Ring Parachute at Supersonic Speed in the Langley Unitary Plan Wind Tunnel – 2

Goddard Space Flight Center robotics demo – 47

GSFC Fun Run – 51

High Altitude Flight Test of a 40-Foot Diameter (12.2 meter) Ringsail Parachute at Deployment Mach Number of 2.95 – 8

High Altitude Flight Test of a Reefed 12.2 Meter Diameter Disk-Gap-Band Parachute with Deployment at Mach Number of 2.58 – 8

High Speed Schlieren Studies of Flow Over Mercury Atlas Vehicle in the Langley 2-Foot Transonic Aeroplasticity Tunnel – 5

High-Speed Schlieren Movies of Decelerators at Supersonic Speeds – 5

High-Speed Schlieren Movies of the Flow About Reefed Parachute Models Towed at Supersonic Speeds Behind a Conical Body (4.875 Inches in Diameter). Drag Values Based on the Unreefed Diameter of 1.73 F. Porosity of Unreefed Parachute is 28 Percent. – 2

HL-10 dedication ceremony – 11

Hubble Identifies Source of Ultraviolet Light in an Old Galaxy – 58

Hubble Spies Huge Cluster of Stars Formed by Ancient Encounter – 56

Hubble's Panoramic Portrait of a Vast Star-Forming Region – 57

Hyper-X Model Testing with Animation – 13

Improved Optical Techniques for Studying Sonic and Supersonic Injection into Mach 3 Flow – 46

Inertial Upper Stage – 31

International Space University – 54

Investigation of the Landing Characteristics of a Re-entry Vehicle Having a Canted Multiple Air Bag Load Alleviation System – 38

Is There Water on the Moon? NASA's LCROSS Mission [Supplemental Video] – 60

Landing Characteristics of a Re-entry Vehicle with a Passive Landing System for Impact Alleviation – 37

Landing Characteristics of the Apollo Spacecraft with Deployed Heat Shield Impact Attenuation Systems – 35

Landing Energy Dissipation for Manned Reentry Vehicles – 32

Landing of Manned Reentry Vehicles – 35

Launch Vehicle Dynamics Demonstrator Model – 20

Living Places in Other Solar Systems – 52

LLRV/Apollo 11 25th anniversary – 15

Long Duration Exposure Facility is coming home – 30

Low Speed Dynamic Model Investigation of Apollo Command Module Configuration in the Langley Spin Tunnel – 41

Mesoscale lightning – 51

Meteor 3/TOMS launch of 15 August 1991 in Plesetsk, USSR – 18

Microlensing: Globular Cluster M22 Video File – 57

Mid-deck experiments, STS-26 – 45

Model Investigation of Technique for Full Scale Landing Impact Tests at Simulated Lunar Gravity – 36

Model Test of Mars Entry Vehicles in Langley Spin Tunnel – 36

NACA/NASA history at Dryden, part 1 and 2 – 62

NACA/NASA: X-1 through X-31 – 1

NASA Agency Overview Briefing – 26

NASA and the SR-71: Back to the future – 11

NASA experiences in the Goddard MMS – 54

NASA Spacelink computer – 52

NASA's Hubble Space Telescope: The challenge and complexity of operations – 56

National Boy Scout Jamboree – 53

October 1979-1989 Southern Hemisphere total ozone as seen by TOMS – 49

Orbiting solar operations – 30

Orion Nebula Movie – 58

Pathfinder: Shuttle exhibit – 20

Performance Characteristics of a Preformed Elliptical Parachute at Altitudes between 200,000 and 100,000 Thousand Feet Obtained by In-Flight Photography – 37

Performance of 26 Meter Diameter Ringsail Parachute in a Simulated Martian Environment – 8

Performance of a 16.6 Meter Diameter Cross Parachute in a Simulated Martian Environment – 5

Performance of a 16.6 Meter Diameter Modified Ringsail Parachute in a Simulated Martian Environment – 6

Performance of a 19.7 Meter Diameter Disk-Gap-Band Parachute in a Simulated Martian Environment – 6

Performance of a Towed, 48-Inch-Diameter (121.92) Ballute Decelerator Tested in Free-Flight Mach Numbers from 4.2 to 0.4 – 39

PET team – 54

Pilot in Command: An Illustration of Autonomous Flight Management – 10

Plentiful Water Detected in Mars Northern Hemisphere – 60

Preliminary Landing Tests of a 1/6-Scale Dynamic Model of a Lunar Excursion Vehicle – 35

Quasar Host Galaxies/Neptune Rotation/Galaxy Building Blocks/Hubble Deep Field/Saturn Storm – 59

Radio controlled for research – 13

Reentry Body Stability Tests Conducted in Langley Spin Tunnel – 33

Rendezvous Docking Simulator – 38

Research excitation system flight testing – 10

Return to flight 1 – 54

Return to flight 3, the journey continues – 55

Robotics Demo Peer Group review – 47

Robotics for Space Station, tape 1 – 47

Robotics for Space Station tape 2 – 47

Robotics in space – 47

Saturn: A Giant Thrust into Space – 33

Scaled Lunar Module Jet Erosion Experiments – [42](#)

Schlieren Movies of the 8-Inch Diameter Rigid Parachute Model of the Cook Research Laboratory Taken During the Fourth Phase of Testing in the Langley Unitary Plan Wind Tunnel – [3](#)

SHARP – [53](#)

Shuttle 51L: Challenger – [20](#)

Shuttle-C, the future is now – [20](#)

Simulator Study of Lunar Orbit Establishment – [17](#)

Six Decades of Flight Research: Dryden Flight Research Center, 1946 - 2006 [DVD] – [62](#)

Southern and Northern Hemisphere total ozone as seen by TOMS – [50](#)

Space classroom – [53](#)

Space Shuttle Program Update News Conference with Wayne Hale – [25](#)

Space Shuttle Program Update – [25](#)

Space Shuttle Status News Conference – [24](#)

Space Station: The link to America's future – [31](#)

Spinning Stardust into Planets – [59](#)

Starfire I/ Consort III Launch – [31](#)

Stock footage of Goddard Space Flight Center and Headquarters – [17](#)

STS-1: Columbia Briefings – [23](#)

STS-1: Columbia Complete Mission – [22](#)

STS-1: Columbia Landing and Safing Operations – [16](#)

STS-1: Columbia Pre-Launch Press Conference with Young/Crippin – [22](#)

STS-121: Crew Activities – [23](#)

STS-121: Discovery End of Mission Crew Briefing – [23](#)

STS-121: Discovery Entry Flight Director Post Landing Press Conference – [27](#)

STS-121: Discovery L-1 Countdown Status Briefing – [26](#)

STS-121: Discovery L-2 Countdown Status Briefing – [28](#)

STS-121: Discovery Launch Postponement MMT Briefing – [19](#)

STS-121: Discovery Mission Management Team Briefing – [26](#)

STS-121: Discovery Mission Overview Briefing – [28](#)

STS-121: Discovery Post Flight Readiness Review Briefing – [22](#)

STS-121: Discovery Post Landing Press Conference – [1](#)

STS-121: Discovery Post Launch Press Briefing – [27](#)

STS-121: Discovery Pre-Flight Crew News Briefing – [25](#)

STS-121: Discovery Pre-Launch Mission Management Team Press Briefing – [27](#)

STS-121: Discovery Space Shuttle Safety Improvements Briefing – [28](#)

STS-121: Discovery Spacewalk Overview Briefing – [26](#)

STS-121: TCDT (Terminal Countdown Demonstration Test) Compilation – [23](#)

STS-121/Discovery: Imagery Quick-Look Briefing – [24](#)

STS-121/Discovery L-3 Countdown Status Briefing – [18](#)

STS-121/Discovery: Launch Readiness Press Conference – [19](#)

STS-121/Discovery: Mission Status Briefing – [24](#)

STS-121/Discovery Preflight Briefing Program Overview – [24](#)

STS-38 Rollback from Pad A to VAB – [22](#)

Studies of Accelerations in Manned Vehicles During Exit and Reentry Flight – [51](#)

Summary of Attached Inflatable Decelerator (AID) Development – [40](#)

TDRS press release – [31](#)

TDRS video clip – [30](#)

TDRS-1 Going Strong at 20 – [29](#)

Technology test bed – [13](#)

Tests of Dynamic Scale Model of Gemini Capsule in the Langley 20-Foot Free-Spinning Tunnel – [39](#)

Tests of Vortex-Ring Parachute at Supersonic Speed in the Langley Unitary Plan Wind Tunnel – [2](#)

The desert tortoise: A delicate balance – [49](#)

The Lunar Orbiter: A Spacecraft to Advance Lunar Exploration – [29](#)

The Plasma Universe – [55](#)

The Secret Lives of Galaxies – [58](#)

The Trifid Nebula: Stellar Sibling Rivalry – [59](#)

The Western Aeronautical Test Range – [14](#)

Thermo-Lag Ablation Tests – [44](#)

To Boldly Go: The Universe Now and Beyond – [16](#)

TOMS computer graphics – [49](#)

Unitary Plan Wind Tunnel Tests of Cook Technological Center Parachutes in the Wake of a Conical-Nosed Cylindrical Body Having a Base Diameter of 2.375-Inches (Part 5 of 6) – [3](#)

Unitary Wind Tunnel Tests of 30-Degree Conical Ribbon Parachute and a Rotofoil Parachute Towed in the Wake of a Conical Nosed Cylindrical Body – [4](#)

University Joint Venture: JOVE – [55](#)

USA Space Explorations 1958 – [19](#)

Water Landing Characteristics of a 1/6-Scale Model Reentry Capsule with an 80-Inch Heat Shield – [32](#)

Water Landing Characteristics of a Reentry Capsule – [33](#)

What is the Value of Space Exploration? - A Prairie Perspective – [48](#)

Wind Tunnel Investigation of a Balloon as Decelerator at Mach Numbers from 1.47 to 2.50 – [4](#)

Worlds Smaller than Saturn – [60](#)

X-31 resource tape – [12](#)

X-31 tailless testing – [12](#)

X-33, X-34, X-37 Press Conference (Tape 2) – [21](#)

X-34 Captive Carry & Seunghee Lee Interview – [21](#)

X-38 Phase 3 Drops V-132 FF#3 – [21](#)

X-43 Composite Tape – [21](#)
