FOREWORD

1. This Standard establishes a uniform set of requirements for electrical, electronic, and electromechanical (EEE) parts selection, management, and control for space flight and mission essential ground support equipment for Marshall Space Flight Center (MSFC) programs. The parts requirements described in this document are to be selectively applied based on equipment grade and mission needs as specified in the Project Specification. Individual equipment needs should be evaluated to determine the extent to which each requirement should be applied.

2. This Standard:

a. Establishes four quality levels (Grade 1, 2, 3, & 4) for EEE parts.

b. Establishes EEE parts selection, and control requirements and provides a suggested Appendix for each of the above quality levels implementation

c. Establishes responsibility for documenting parts selection, qualification, and parts related data.

3. Questions concerning the application of this Standard shall be referred to the EEE Parts and Packaging Group of the Avionics Department.

4. Beneficial comments and suggestions for improving this Standard may be submitted to the Office of Primary Responsibility (ED16).

1.0 <u>SCOPE.</u> This Standard sets forth the selection, testing, and application requirements which each Project Manager shall use (tailor) to manage and control the electrical, electronic, and electromechanical (EEE) parts activities for MSFC space flight and mission essential ground support equipment.

1.0.1 <u>Implementation</u> While the actual selection of EEE parts is an engineering process, the detailed implementation into project baselines of the selected EEE parts shall be accomplished by the process as defined in the Project Configuration Management Plan.. Should a conflict arise between this Standard and the Project Configuration Management Plan, the Project Configuration Management Plan shall govern.

1.1 **General.** Special requirements not covered by or not in conformance with the requirements of this publication shall be detailed in engineering documentation which shall take precedence over appropriate portions of this publication when approved in writing by MSFC prior to use.

1.2 **<u>Applicability</u>**. This publication applies to MSFC programs using EEE parts for flight hardware.

2.0 APPLICABLE DOCUMENTS.

2.1 **<u>General</u>** The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issue in effect on the date of invitation for bids or requests for proposal shall apply.

MIL-C-14409	Capacitors, Variable (Piston Type, Tubular Trimmer), General Specification For

3.0 **DEFINITIONS AND ACRONYMS.**

3.1 Definitions .	
μCkt	Microcuit
CAGE code	An identifying code assigned by the Government that unambiguously identifies EEE part sources.
Commercial	A classification for an assembly, part, or design for which the item manufacturer or vendor establishes performance and quality standards pursuant to market forces rather than by enforceable compliance to a government or industry standard.
Derating	The process of providing for enhanced reliability and life of a EEE part in an application by designing so that the electrical/thermal stresses applied to the part are significantly below the parts rating.
Destructive Physical Analysis	A series of inspections and tests performed on samples of a EEE part and resulting in damage to the samples. Usually part of a failure analysis or quality conformance inspection.
GIDEP	An organization through which users and suppliers of EEE parts may exchange information such as part design changes and failure experiences.
Grade 1	A classification which designates EEE parts of the highest practical quality standards.
Grade 2	A classification which designates EEE parts of high, but generally not the highest, quality standards.
Grade 3	A classification which designates EEE parts which generally meet some formal industry quality standards, but usually the lowest quality class option that is available under the standards.
Grade 4	A classification which designates EEE parts for which no predefined quality classification is imposed.
Hi-Rel	A term used to describe "high reliability" parts which have been screened and qualified to requirements determined solely by the manufacturer.
Lot Date Code	An identification, usually marked on a EEE part and prescribed by the applicable specification, to identify parts which have been processed as a batch.
Multi-Chip Module	A type of hybrid microcircuit consisting of multiple semiconductor chips mounted on a substrate.

Title: EEE PARTS MANA	GEMENT	Document No.: MSFC-STD-3012	Revision: Baseline	
AND CONTROL FOR MSFC SPACE FLIGHT HARDWARE		Effective Date: December 17, 1999	Page 14 of 99	
Off-The-Shelf Assembly, part, or design that is readily available for procurement, usually to catalog specifications, without the necessity of generating detail procurement.specifications for the item.				

Qualified Manufacturing Line	A classification issued by a qualifying agency that identifies products, processes, and manufacturers that have met certain standards for qualification.
Qualified Parts List	A classification issued by a qualifying agency that identifies products and manufacturers that have met certain standards for qualification.
Quality Conformance Inspection	Inspection, or test, used to verify conformance with requirements.
Standard part	A EEE part that meets program piece part qualification requirements. and is designated "standard" in the applicable Grade level table.

3.2 <u>Acronyms</u>.

CAGE	Commercial And Government Entity
DPA	Destructive Physical Analysis
EEE	Electrical, Electronic, and Electromechanical
ER	Established Reliability
ESD	Electrostatic Discharge
FRL	Failure Rate Level

4.0 **<u>GENERAL</u>**.

4.1 <u>Selection of EEE Part Grade</u>. Project planning shall establish for each end item which EEE part Grade described in Table I is required. The choice of the appropriate Grade in large part determines the reliability, and the cost associated with EEE parts. The following provides some guidance for selection of an appropriate Grade.

4.1.1 <u>Grade 1</u>. Grade 1 EEE parts typically meet the highest reliability standards, and have been subjected to independent verification. Grade 1 should be selected for equipment requiring maximum feasible reliability because of critical mission objectives and safety. The related project typically would have high visibility both within and outside of NASA, and could involve objectives which may be difficult to repeat in another mission. Missions of 5 years or longer may also require Grade 1 parts. Repair during the mission is not a practical or desirable option. The mission requires complete functional or block redundancy and requires project manager approval of single point failure situations. The application is space flight equipment.

4.1.2 <u>Grade 2</u>. Grade 2 EEE parts typically meet rigorous (but not the highest) industry reliability standards, and have been subjected to independent verification. Grade 2 should be selected for equipment that requires high reliability, but for which a low risk of failure can be tolerated to meet cost constraints. Missions of 1 to 5 years duration may also use Grade 2 parts. The mission may be multiple or single purpose, with a repeat mission possible. Repair during the mission may be practical. Functional or block redundancy for all primary objectives is desirable but single string design may be acceptable. The application usually is space flight equipment or critical ground support equipment.

4.1.3 <u>Grade 3</u>. Grade 3 EEE parts typically meet standards for high reliability, but there may be significant exceptions and they may not have been independently verified. Grade 3 should be selected for equipment where high reliability is desired, but is not mandatory. Also, the missions are typically for a single purpose or routine mission, with repeat mission possible. Mission duration also may be less than 1 year. Repair during the mission would not necessarily be considered worthwhile. Single string design would normally be acceptable. The application could be space flight experiments or ground support equipment.

Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline	
AND CONTROL FOR MSFC			
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 16 of 99	

4.1.4 <u>Grade 4</u>.- Grade 4 EEE parts typically meet vendor standards for high reliability or commercial market place reliability, but have not been independently verified. Grade 4 should be selected for equipment where high reliability is not a primary factor, the mission is not critical or a repeat mission is possible. The duration of a mission would typically not be lengthy. Repair may be very practical. This is a typical choice for flight experiments and ground support equipment.

a 1	Table 1 – EEE Tails Grade Description					
Grade	Summary	Reliability	MTBF	Cost	Typical Use	
1	"Space" quality class qualified parts, or equivalent.	Highest	Longest	Very High	Space flight	
2	"Full Military" quality class qualified parts, or equivalent.	Very High	Very Long	High	Space flight or critical ground support equipment	
3	"Low Military" quality class parts, and Vendor Hi-Rel or equivalent.	High	Long	Moderate	Space flight experiments and ground support	
4	"Commercial" quality class parts. No qualification required.	Variable	Variable	Low	Flight experiments and ground support	

Table I – EEE Parts Grade Description

5.0 EEE PARTS SELECTION AND CONTROL REQUIREMENTS.

5.1 <u>EEE Parts Plan</u>. All equipment containing EEE parts shall be produced under the control of an approved EEE parts control plan. The requirements of the plan shall be established to obtain the appropriate quality level (Grade 1, 2, 3 or 4), or equivalent, for EEE parts (reference Table II). Project requirements shall specify which Grade of EEE parts is to be applied to project equipment, and shall identify the applicable EEE Parts Plan.

5.1.1 <u>Parts Plan Scope</u>. The plan shall control EEE parts activities from the equipment design and development phase though use and maintenance of the system and equipment. The plan shall document the requirements for part qualification, quality assurance for parts, parts application criteria, parts related data, parts configuration control, life time availability of parts, manufacturing and handling considerations, and parts in Off-The-Shelf (OTS) assemblies.

5.1.2 <u>Administration</u>. Project management shall approve and oversee the administration of the EEE parts plan. The plan shall identify the authority or organization that will serve

	Multiprogram/Project Common-Use Document ED16	
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline
AND CONTROL FOR MSFC		
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 17 of 99

as the focal point in matters pertaining to the plan. The plan, or requirements of the plan, shall be imposed on each sub-tier organization, as applicable.

5.1.3 <u>Affected Parts</u>. The plan shall apply to the following listed EEE part types (Federal Stock Codes shown in parenthesis):

Capacitors (5910)	Fiber Optic Devices (6030)	Relays (5945)
Circuit Breakers (5925)	Fiber Optic Interconnect (6060)	Resistors (5905)
Connectors (5935)	Filters (5915)	Switches (5930)
Crystal oscillators (5955)	Fuses (5920)	Thermistors (5950)
Diodes (5961)	Hybrid microcircuits (5962)	Transistors (5961)
Fiber optic Cables (6030)	Magnetics (5950)	Wire and Cable (6145)
	Monolithic microcircuits (5962)	

5.1.4 <u>Structure</u>. The plan shall meet applicable requirements herein. The EEE parts control plan shall be organized clearly, concisely and unambiguously. The plan may be a separate document or part of the Project Plan, Quality Plan, or other project document. The responsible organization may prepare a tailored plan, or adopt one of the plans contained herein as appendices (Appendix A for Grade 1 parts, Appendix B for Grade 2 parts, Appendix C for Grade 3 parts, and Appendix D for Grade 4 parts).

5.2 **<u>Qualification Requirements</u>**. Grades 1, 2, and 3 EEE parts shall be qualified at the piece part level. For projects using Grade 4 EEE parts, assembly level qualification shall be sufficient.

5.2.1 <u>Piece part level</u>. Qualification at the piece part level shall be achieved by meeting designated military or NASA standards, piece part qualification requirements, or by other means as documented for nonstandard part approval. Requirements for qualification of nonstandard parts shall be equivalent to the requirements imposed on similar standard parts, or shall otherwise satisfactorily demonstrate that the part has an approved margin of safety beyond the demands of the equipment in which it will be used.

5.2.2 <u>Application level</u>. Part qualification at the application level shall be based upon qualification testing of the assembled equipment. A part shall be qualified for a given application within the equipment by successful performance during the equipment qualification testing, or by similarity to a part which has been so qualified.

AND CONTROL FOR MSFC		
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 20 of 99

5.3 **Quality Assurance Requirements.** Quality assurance shall include: assurance of procurement from qualified sources, lot Quality Conformance Inspection (QCI), screening, and receiving inspection. All inspections and test procedures that are used by the procuring activity to determine the quality and/or conformance of a part to the controlling specification shall be documented by the procuring activity. Established test methods and acceptance criteria such as those in MIL-STD-202, MIL-STD-750, MIL-STD-883, and military Established Reliability specifications shall be used as applicable.

5.3.1 <u>Procurement Sources</u>. Grades 1 and 2 parts shall be procured only from qualified sources or their authorized distributors. Grade 3 parts shall be procured from qualified sources their distributers or from MSFC approved sources.

5.3.2 <u>Quality Conformance Inspection (QCI)</u>. QCI shall ensure that each lot of Grade 1, 2, or 3 parts meets the requirements of the part controlling specification.

5.3.2.1 <u>Destructive Physical Analysis (DPA)</u>. DPA, per MIL-STD-1580 or equivalent, shall be performed on each lot of Grade 1, 2, or 3 parts not procured from a military QPL or QML. This requirement applies to semiconductors, microcircuits, metal film and wire-wound resistors, resistor networks, capacitors, relays, filters, crystal oscillators, fuses, hybrids, MCMs and hybrid oscillators. DPA is not required for composition resistors, monolithic glass capacitors, coils, inductors and transformers. Any lot of parts not meeting the DPA acceptance criteria shall not be used in equipment without procuring activity approval.

5.3.3 <u>Screening</u>. All Grades 1, 2 and 3 parts shall be subjected to screening. Part screening shall be designed to remove defective parts and thus increase reliability. For Grades 1 and 2 parts, screening shall consist of testing of 100% of the parts to the requirements of the most applicable military specification for the part type, and any additional tests needed to meet the application requirements.

5.3.4 <u>Receiving inspection</u>. All parts shall be subjected to receiving inspection, by the procuring activity, to verify compliance with the controlling specifications. Testing shall be defined in the procurement requirements as specified by Design Engineering

5.4 <u>Application Criteria Requirements</u>. Parts shall be properly applied in the design.

5.4.1 <u>Derating</u>. Derating guidelines of Table III, or equivalent, shall be met by the design. A derating analysis shall be performed by the cognizant design organization and shall be submitted for project review. Project approval shall be obtained prior to use of a part in an application where derating guidelines are not met. For Grade 4, derating of parts and the derating analysis are optional.

5.4.2 <u>Operating Environment.</u> Consideration shall be given to the operating environment requirements including but not limited to the temperature, humidity, shock, and vibration to which EEE parts will be exposed. For most space applications, military qualified parts (i. e. Grades 1 and 2) will satisfy these requirements except for radiation.

	Multiprogram/Project Common-Use Document ED16	
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline
AND CONTROL FOR MSFC		
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 21 of 99

5.4.2.1 <u>Ionizing radiation</u>. For Grades 1, 2, and 3 parts, and where feasible for Grade 4 parts, used in space flight applications, the effects of the projected ionizing radiation on each part shall be determined by analysis and/or test. Failure mitigation or a design margin shall be established by the project to assure acceptable performance in the projected radiation environment.

5.4.3 <u>Hazard Avoidance</u>. EEE parts shall comply with the hazard avoidance of NSTS 1700.7, Table IV herein, and the following.

5.4.3.1 Oxygen Enriched Atmosphere. EEE parts exposed to an oxygen-enriched atmosphere capable of sustaining combustion shall operate without introducing any fire hazard due to either normal operation or malfunctions occurring during the life of the equipment. This requirement may be met though use of hermetically sealed parts, hermetically sealed equipment enclosures, suitable conformal coatings, or choice of materials.

5.4.3.2 <u>Parts and Materials</u>. The hazardous characteristics of arc generation, flammability, and offgassing of all parts and materials shall be considered and the requirements of NHB 8060.1, or equivalent, shall be met. Also, organic, polymeric, and inorganic materials (i.e. potting compounds, coatings, films, adhesives, elastomers, etc.) used in the construction of EEE parts shall meet the outgassing requirements of SP-R-0022A or equivalent.

5.5 <u>Configuration Control Requirements</u>. The procuring activity's focal point organization shall review and approve all EEE part selections (reference 5.1.2).

5.5.1 <u>Part Selection</u>. Parts shall be selected in accordance with the order of selection preference indicated in Tables V, VI, VII, and VII.

5.5.2 <u>Part Substitutions</u>. For Grades 1, 2, and 3, substitution of different parts for the part numbers listed in assembly parts lists and bills of material shall be prohibited, or restricted to criteria or specific substitution lists having the prior approval of the procuring activity. Substituted parts shall comply with applicable requirements of the EEE parts plan, including listing in the As-Designed EEE Parts List.

5.5.3 <u>Verification of Parts</u>. As-built EEE parts lists, except for Grade 4 parts, shall be compared to the As-Designed EEE parts list by the procuring activity to verify use of approved parts and sources.

5.5.4 <u>Standard and Nonstandard parts</u>. Grades 1, 2, and 3 parts which are deemed piece part level qualified by virtue of their military standard or NASA standard qualification shall be considered "Standard Parts," and are so designated in the part selection preference tables, Tables V, VI, VII, and VIII. Any part not meeting the above criteria is a nonstandard part. A nonstandard part shall not be selected if a suitable standard part is available. For Grade 4 all parts are considered standard.

5.6 Parts Related Data Requirements.

5.6.1 <u>Nonstandard Part Approval</u>. Parts not designated as standard parts in Table V, VI, or VII as applicable, are nonstandard and their use must be approved by the procuring

	Multiprogram/Project Common-Use Document ED16	
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline
AND CONTROL FOR MSFC		
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 22 of 99

activity. Unless otherwise specified by the procuring activity, a Nonstandard Part Approval Request (NSPAR) form shall be submitted by the equipment design activity for each nonstandard part. The NSPAR shall be reviewed and approved before submittal to the next higher tier procuring activity. The NSPAR shall include any applicable part specification or control documents, other than military or NASA standards. NSPARs shall identify additional screening applied to military standard parts. NSPARs shall not be required for design within MSFC, but the use of nonstandard parts shall still be subject to approval by project management. There are no nonstandard Grade 4 parts, therefore NSPARs are not required.

5.6.2 <u>Waivers and Deviations</u>. A waiver/deviation, as appropriate, shall be submitted to the procuring activity by the equipment design activity for any part that does not meet requirements for use.

5.6.3 <u>As-Designed EEE Parts List</u>. The equipment design activity shall submit an As-Designed EEE Parts List for procuring activity approval. As a minimum, the As-Designed EEE Parts List shall identify the using equipment, EEE part number and specification, EEE part qualification method and status, nonstandard part approval status, and part manufacturer(s). A preliminary As-Designed EEE Parts List shall be submitted at Preliminary Design Review (PDR). Changes to the baselined As-Designed EEE Part List shall be monitored and controlled at all levels of procurement, test, and fabrication to ensure the prompt identification, reporting, review, and disposition (approval/disapproval) of changes.

5.6.4 <u>As-Built EEE Parts List</u>. The equipment manufacturing activity shall submit an As-Built EEE Parts List for each deliverable end item. The as-built list shall identify the EEE parts actually used in fabricating each unit. As a minimum, the As-Built EEE Parts List shall identify the using end item and serial number, the using assembly and serial number, EEE part number, EEE part circuit location or reference designation (R1, CR2, etc.), EEE part manufacturer's CAGE code or equivalent identification, and EEE part Lot Date Code (LDC) or equivalent lot identification. However, the LDC or lot identification information is not required for Grade 4 EEE parts.

5.6.5 <u>GIDEP</u>. EEE part problems shall be reported by the equipment design organization through the Government Industry Data Exchange Program (GIDEP), either directly for GIDEP participants or through the procuring activity for nonparticipants

5.6.6 <u>ALERTS.</u> The equipment design organization shall assess and report to the project office the impact of an MSFC ALERT on the equipment end item.

5.6.7 <u>Traceability</u>. The equipment manufacturer shall have a system for providing two way traceability for all EEE parts used in the equipment. For projects using Grade 1, 2, or 3 EEE parts, the system shall provide for tracing a specific part lot through all process steps, identifying which equipment contains specific part lots, and retrieving information relative to the part manufacturer's processing. For projects using Grade 4 EEE parts, the system shall provide for tracing a specific part by its manufacturer through all in-house process steps, identifying which equipment contains a specific manufacturer's part.

	Multiprogram/Project Common-Use Document ED16	
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline
AND CONTROL FOR MSFC		
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 23 of 99

5.6.8 <u>Quality Assurance Data</u>. Results of receiving inspection, destructive physical analyses, materials review boards, failure review boards, and parts problems reported from the field shall be documented and submitted to the project office.

5.6.9 <u>Specifications and Control Drawings</u>. Grade 1 parts shall be defined and controlled by military/industry standard specifications and/or by control drawings. (Examples of control drawings are Source Control Drawings (SCDs), or Vendor Item Control Drawings (VICDs)). Grade 2 parts shall be defined and controlled by military/industry standard specifications and/or by control drawings where feasible, but where necessary may rely on vendor data that is complete and reliable. Grade 3 parts may be defined and controlled by vendor specifications, or applicable military/industry standard specifications where available. Grade 4 parts may be defined and controlled by purchase orders and vendor specifications or any other suitable means.

5.7 <u>Lifetime Parts Availability Requirements</u>. Consideration shall be given in EEE parts selection and procurement to ensuring parts availability for equipment repair and new builds throughout the projected life of the equipment and design.

5.8 Manufacturing and Handling Requirements.

5.8.1 <u>Electrostatic Discharge (ESD) Control</u>. ESD control shall be in accordance with MIL-STD-1686, MSFC-RQMT-2918, or an approved equivalent.

5.8.2 <u>Environmental Control</u>. Environmental controls such as temperature, humidity, and particulate contamination shall be identified for parts handling, packaging, and storage.

5.8.3 <u>Retest</u>. Each EEE part shall be retested in accordance with predetermined requirements if a maximum period, determined by the project, has elapsed since the part successfully completed 100% screening testing.

5.8.4 <u>Allowance for Testing Fallout</u>. Procured quantities should allow for nominal fallout of parts in lot sample or screening tests where these losses would deduct from the quantity available for use. Where practical, it is recommended that parts be ordered from a single lot date code to reduce the number of parts needed for destructive qualification testing.

5.8.5 <u>Manufacturing Process Compatibility</u>. Consideration shall be given to part compatibility with planned equipment manufacturing processes. This may include guidance for or against use of surface mount or through hole parts, preferences or restrictions for lead finish, and if plastic encapsulated microcircuits (PEMs) are used, manufacturing processes shall be reviewed for compatibility with PEMs.

5.8.6 <u>Suspect Parts</u>. Parts affected by MSFC ALERTS, and GIDEP issuances shall not be used in manufacturing without procuring activity approval.

5.9 <u>Off-The-Shelf Assemblies Requirements</u>. For projects using Grade 1, 2 or 3 EEE parts, Off-the-shelf (OTS) equipment shall meet the following requirements.

	Multiprogram/Project Common-Use Document ED16	
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline
AND CONTROL FOR MSFC		
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 24 of 99

5.9.1 <u>Identification of Parts</u>. Constituent EEE parts in OTS equipment shall be included in the As-Built EEE Parts List of the using equipment when identification of EEE parts is obtainable.

5.9.2 <u>Parts Qualification</u>. EEE parts in OTS equipment shall have been qualified to the application by the OTS equipment manufacturer, or else the OTS equipment shall be qualified at the application level by the user.

5.9.3 <u>Use of Standard Parts</u>. It shall be a goal to use standard parts in OTS designs.

Wire and Cable			Current	<u>/wc1, /wc2</u>	<u>/wc1, /wc2</u>		/wc1, /wc2

Table III Notes:

- /cap1. For low voltage applications (<10 Vdc), rated voltage shall be at least 100 Vdc.
- /cap2. Applies to the sum of peak AC ripple and DC polarizing voltages.
- /cap3. For applications where the effective circuit resistance is less than 1 ohm per volt contact EEE part group.
- <u>/cb1</u>. Series resistance shall be used to assure that circuits do not exceed the derated value.

	Multiprogram/Project Common-Use Document ED16	
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline
AND CONTROL FOR MSFC		
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 30 of 99

- <u>/con1</u>. Operating voltage derating equals 25% of the rated Dielectric Withstanding Voltage at sea level.
- <u>/con2</u>. Temperature rating of the dielectric insert equals $T_{(ambient)} + 50^{\circ}C$.
- /cry1. Crystal current shall be limited to 50% of the rated value. In cases where the start up time is critical 75% of the rated value can be used.
- /cryo1. Crystal oscillators shall be derated to the individual level.

<u>/d1</u>. $0.5(I_zmax + I_znom)$.

- <u>/d2</u>. Operate at the manufacturer's specified zener current (I_{ZT}) to optimize temperature compensation.
- /fo1. See SSP-30312, EEE and Mechanical Parts Management for Space Station Program.
- /fo2. None established. Requirements for Fiber Optic Cables, Other will have to be developed upon application.
- <u>/f1</u>. If calculations result in fractional values use the next highest standard fuse rating. Derating factors are based upon data from fuses mounted on printed circuit boards and conformal coated. For other types of mounting consult the EEE parts engineer for recommendations. Derating allows for loss of pressure, which lowers the blow current rating and allows for a decrease of current capability with time. There is an additional derating of 0.5% per °C for an increase in the ambient temperature above 25°C.
- <u>/it1</u>. Inductors and transformers are derated by reducing the maximum operating temperature based on the insulation class used and reducing the operating voltage to 50% of rated dielectric withstanding voltage. See below.
 - a) Maximum operating temperature equals ambient temperature plus temperature rise plus 10°C (allowance for hot spot). Compute temperature rise time as follows:

	Multiprogram/Project Common-Use Document ED16	
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline
AND CONTROL FOR MSFC		
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 31 of 99

Temperature Rise Test (per MIL-T-27, para. 4.8.12)

Temperature rise (°C) = ((RE – RA)/RA * (TI + 234.5°C)) - (TM – TI)

Where RE = winding resistance at elevated temperature RA = winding resistance at ambient temperature TI = specified initial ambient temperature (°C) TM = maximum ambient temperature (°C) at time of power shutoff

TM shall not differ from TI by more than 5°C

- b) The insulation classes of MIL-style inductive parts generally have maximum temperature ratings based on a life expectancy of 10,000 hours. The maximum operating temperatures in this table are selected to extend the life expectancy to 50,000 hours.
- c) Custom-made inductive devices shall be evaluated on a materials basis and stressed at levels below the maximum rated operating temperature for the materials used. Devices having a maximum rated operating temperature in the range from +85° to +130°C shall be derated as follows: maximum operating temperature (°C) equals 0.75 times maximum rated operating temperature (°C). For devices with maximum rated temperatures outside this temperature range, consult the EEE parts engineer for temperature derating recommendations.
- /it2. Derate to 50% of the rated Dielectric Withstanding Voltage.
- <u>/md1</u>. Junction temperature must be calculated and maintained below the maximum limit of 100°C.
- /md2. Under no circumstances shall the input voltage be allowed to exceed the supply voltage.

	Multiprogram/Project Common-Use Document ED16	
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline
AND CONTROL FOR MSFC		
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 32 of 99

- <u>/md3</u>. For those technologies where no supply voltage derating is given in no case shall the device be operated at the absolute maximum supply voltage.
- <u>/md4</u>. The operating supply voltage shall not exceed 79% of the absolute maximum voltage.
- /md5. The operating supply voltage shall not exceed 79% of the absolute maximum voltage.
- /md6. The operating supply voltage shall not exceed 92% of the absolute maximum voltage.
- /md7. The derating factor for TTL open collector devices shall be 0.75.
- $\underline{Md8}$. Further derating may be required for radiation environments (i.e., minimum V_{cc} to insure minimum DC reference for transients).
- /ml1. Absolute maximum supply voltage.
- /ml2. Power dissipation (percent of rated power at maximum operating temperature).
- /ml3. AC input voltage. Under no circumstances shall the input voltage be allowed to exceed the supply voltage.
- /ml4. Output voltage.
- /ml5. Open collector (or drain) DC output voltage.
- /ml6. Operating AC or DC output voltage.
- /ml7. Maximum short-circuit output current.
- $\underline{\text{/ml8}}$. V_{in} V_{out} should be derated 0.80.
- /ml9. Junction temperature must be calculated and maintained below the maximum limit of 100°C.

	Multiprogram/Project Common-Use Document ED16	
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline
AND CONTROL FOR MSFC		
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 33 of 99

/ml10. Under no circumstances shall the input voltage be allowed to exceed the supply voltage.

- /rel1. Make, break, and/or carry loads with an on-time duration of 0 to 500 milliseconds. Off-time is equal or greater than on-time.
- <u>/rel2</u>. Carry-only loads. (Carry-only means that the relay contacts are closed before there is current flowing through the contacts.) Relay does not make or break the load. Maximum on-time is 5 minutes. Off-time is equal to or greater than on-time.
- /rel3. Make, break, and/or carry. Those loads that do not fall into the category of loads A or B. (Limited use.)
- <u>/rel4</u>. The derated contact current (I_{DR}) is found by multiplying the contact current rating (I) and the product of T, R, and L from the table.

Derated Contact Current $I_{DR} = I * T * R * L$

Where:

$$\begin{split} I &= \text{Contact Current Rating} \\ T &= \text{Ambient Operating Temperature} \\ R &= \text{Cycle Rate} \\ L &= \text{Load Application} \end{split}$$

- <u>/res1</u>. Compute the resistor's derated power level by multiplying its nominal power rating by the appropriate derating factor for ambient temperatures less than or equal to T1. If the resistor is operated above T1 derate linearly from the T1 power level to the zero power level at T2. Exposing the resistor to temperatures exceeding T3, even under no load conditions, may result in permanent degradation.
- /res2. The maximum applied voltage shall not exceed the lesser of the following:

	Multiprogram/Project Common-Use Document ED16	
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline
AND CONTROL FOR MSFC		
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 34 of 99

- a) 80% of the specified maximum voltage rating, or
- b) the square root of (P * R) where
 - P = Derated power (watts)
 - R = Resistance of that portion of the element actually active in the circuit

This voltage derating applies to DC and regular AC waveform applications. For pulse and other irregular waveform applications consult MIL-HDBK-978 or the manufacturer.

<u>/res3</u>. Determine the zero power temperature (T3) from the applicable detail specification. Compute the derated zero power temperature (T2) from the following formula:

 $T2 = (D_F * (T3 - T1)) + T1$

Where:

 $\begin{array}{l} T2 = Derated \ zero \ power \ temperature \\ D_F = Derating \ factor \end{array}$

T3 = Zero power temperature

- T1 = Rated power temperature
- <u>/res4</u>. Determine the rated power, the rated temperature (T1), and the zero power temperature (T3) from the manufacturer's specification. Calculate the derated zero power temperature (T2) as per note <u>/res3</u>.
- /sw1. Derate NASA SSQ-21678 switches per SSP-30312 Section B.3.4.4.

Multiprogram/Project Common-Use Document ED16		
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline
AND CONTROL FOR MSFC		
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 35 of 99

- <u>/sw2</u>. Transient suppression by diodes or bifilar coils should be provided except in cases where the delay in contact release time caused by the damping could promote contact damage during switching of the inductive load currents, or where contact reclosure during drop-out could cause a system malfunction.
- /sw3. Suppress arcing by paralleling loads with absorption circuits.
- /sw4. Precious metal materials shall be used in dry low signal level circuits.
- /sw5. The director of motion of the contacts shall not be coincident with the expected direction of shock.
- <u>/sw6</u>. Proper support should be used to prevent any deflection of the part due to shock, vibration, or acceleration.
- /sw7. Peak in-rush current shall not exceed rated value.
- /sw8. Minimum coil current requirements must be maintained to ensure good contacting.
- <u>/th1</u>. Positive temperature coefficient thermistors are generally operated in the "self-heat" mode. Derate to 50% of the rated power, or as required by the detail specification.
- <u>/th2</u>. Negative temperature coefficient (NTC) type thermistors operated in the "self-heat" mode should be derated in accordance with the applicable dissipation constant curve to prevent "thermal runaway." Such parts should be derated to a power level causing a maximum increase of 50 times the dissipation constant, or a maximum part temperature of 100°C., whichever is less. The dissipation constant curve runs at 100% out to 25°C., then drops linearly to approach zero at 200°C (case temperature).
- /wc1. Use this derating for environments other than a hard vacuum. Derating for electrical wire and cable shall comply with NASA Technical Memorandum 102179.
- /wc2. Use this derating for a hard vacuum environment only. Derating is accomplished by determining a single wire maximum current from a combination of wire size and bundle size as listed below. Adjustments are made if the insulation is other than Teflon® (see remark 3 in /wc2 table)

Multiprogram/Project Common-Use Document ED16		
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline
AND CONTROL FOR MSFC		
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 36 of 99

Note /wc2 Derating Table

Wire Size	Single Wire Current	Remark
(AWG)	(I _{SW}) (Amps)	
30	1.3	1. Current ratings are based on wires at $+70^{\circ}$ C in a hard vacuum (10^{-6} to 10^{-9} torr).
28	1.8	 When wires are bundled, the max design current for each individual wire shall be derated according to: For 1 < N ≤ 15: I_{BW} = I_{SW} * ((29 – N)/28)
26	2.5	
24	3.3	
22	4.5	Eer N > 15: I = $(0.5) * I$
20	6.5	For N > 15: $I_{BW} = (0.5) * I_{SW}$
18	9.2	Where: $N =$ number of wires
16	13.0	$I_{BW} = current$, bundled wires
14	19.0	$I_{SW} = current$, single wire
12	25.0	3. Deratings listed are for Teflon® insulated wire (Type TFE) rated for +200°C
10	33.0	a = For 150% wire use $80%$ of value shown in table
8	44.0	 a. For 150°C wire, use 80% of value shown in table. b. For 135°C wire, use 70% of value shown in table.
6	60.0	c. For 105°C wire, use 50% of value shown in table.
4	81.0	4. Dielectric withstanding voltage rating required: at least two times the highest application
2	108.0	4. Dielectric withstanding voltage rating required: at least two times the highest application voltage.
0	147.0	5. Derating values listed apply only to single round conductors on helically wound bundles. See
00	169.0	EEE parts engineer for derating information for ribbon cable and flat conductors.

/xsis1. Worst case combination of DC, AC, and transient voltages should be no greater than the derated limit.

<u>/xsis2</u>. For power MOSFET devices, also derate the gate to source voltage (V_{GS}) to 60% of the maximum rated.

/xsis3. Junction temperature must also be maintained below 125°C.

Table V Notes:

 $\underline{/1}$ This table identifies information for the part selection process, standard parts, and associated restrictions and verifications. The requirements listed shall be implemented in addition to other requirements herein.

Multiprogram/Project Common-Use Document ED16			
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline	
AND CONTROL FOR MSFC			
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 41 of 99	

- /2 All standard parts are identified in this column. The standard part designation is predicated on compliance with all applicable requirements. All nonstandard parts require nonstandard part approval.
- <u>/3</u> Parts selection shall be accomplished in the order indicated. A lower ranked selection shall not be used if a higher ranked selection can be obtained.
- /4 This column identifies screening and associated verifications and restrictions that are required for the part to be classified as acceptable. The project EEE parts plan shall specify details as necessary to implement these requirements, and may specify additional requirements.
- <u>/5</u> Qualification and screening requirements shall be determined to suit the specific application.
- <u>/6</u> PIND and X-ray screening required on cavity devices.
- /7 Supplemental 100% screening (so called upscreening) shall be applied so as to match as much as is feasible the standard 100% screening that would be applied to a similar JANS quality part.
- $\underline{/8}$ A sample of each production lot shall be subjected to destructive physical analysis (DPA).
- <u>A controlling document shall specify the part performance characteristics and manufacturing requirements.</u> The controlling document shall specify design, processing, qualification, and screening requirements so as to match as much as is feasible the standard requirements that would be applied to a similar JANS quality part.
- /10 A controlling document shall specify the part performance characteristics, required lot qualification, and screening tests. A sample of each production lot shall be subjected to qualification, including life testing, so as to match as much as is feasible the standard requirements that would be applied to a similar JANS quality part.
- /11 Approved for use on Space Station. See SSQ-21654.
- $\underline{/12}$ Any other quality assurance levels shall be considered for approval on a case by case basis.
- /13 Refer to MIL-PRF-122 for explanation of FRL.
- /14 Note deleted
- <u>/15</u> NASA Zero-G, contact size 16, fiber optic termini. Approved for use on Space Station. See SSQ-21635.
- /16 Use Rockwell Drawings ME451-0009 (Bussman type GNZ), ME451-010 (Bussman type GQR), ME451-016 (Bussman type ANG, ME451-017 (Bussman type HOB, and ME451-0018 (Bussman type GMV)
- <u>/17</u> Screen per MIL- PRF-38534, Appendix C, Table C-IX as follows: PIND, serialization, electrical test, burn-in for 160 hours, final electrical test and delta limits,

Multiprogram/Project Common-Use Document			
	ED16		
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline	
AND CONTROL FOR MSFC			
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 42 of 99	

seal, radiographic inspection, and external visual. A two piece DPA shall be performed. If the part is very expensive and/or only a few parts are required for the design, a one piece DPA may be performed.

- /18 Qualification and screening shall be per MIL-PRF-38534 for Class K devices. A two piece DPA is required. Radiation tolerance testing may be required depending on the part application. A controlling document shall be generated to specify the part performance characteristics and manufacturing requirements.
- <u>/19</u> Screen per MIL-STD-883, Method 5004, Table I, paragraphs: 3.1.7 (PIND); 3.1.8 Serialization; 3.1.9 Pre burn-in electrical parameters; 3.1.10 Burn-in for 160 hours; 3.1.11 Interim electrical parameters; 3.1.12 Reverse bias burn-in as stated; 3.1.13 Interim electrical parameters; 3.1.14 Percent defective allowable and delta limits (when specified) calculations as stated; 3.1.15 Final electrical parameters; 3.1.16 Seal; 3.1.17 Radiographic inspection. A two piece Destructive Physical Analysis (DPA) is required and radiation latch-up testing may be required depending on the radiation environment.
- (20) Qualification and screening shall be per MIL-PRF-38535, Appendix A for class S devices or Appendix B for class V devices. A two piece DPA per MIL-STD 883, Method 5009 or equivalent is required. A controlling document shall be generated to specify the part performance characteristics and manufacturing requirements.
- /21 The environment must be considered when using plastic encapsulated microcircuits (PEMs). PEMs should not be used in an environment where moisture is present. Where their use can be accommodated special handling and storage procedures must be followed to prevent exposure to moisture. Also, the radiation tolerance of the PEM must be acceptable for the environment in which it will be used. Screen per MIL-STD 883, Method 5004, Table I Paragraphs: 3.1.8 Serialization; 3.1.9 Pre burn-in electrical parameters; 3.1.10 Burn-in for 160 hours; 3.3.11 Interim (post burn-in) electrical parameters; 3.1.12 Reverse bias burn-in; 3.1.13 Interim electrical parameters; 3.1.15 Final electrical parameters; 3.1.17 Radiographic inspection; 3.1.19 External visual inspection. A two piece DPA per MIL-STD 883, Method 5009 as applicable shall be performed. Inspection for delamination is required: e.g. Method 1034 (dye penetrant), cross sectioning, CSAM, etc.
- /22 Approved for use on Space Station. See SSQ-21678.
- /23 Approved for EVA-only use on Space Station. See SSQ-21678.
- /24 Note deleted
- /25 Some ETFE (ethylene-tetrafluoroethylene copolymer / tradename "Tefzel") insulated wire has been found to fail flammability testing in a 30 percent oxygen environment. Consult the project parts engineer for recommendations.
- <u>/26</u> To select part have manufacturer screen per Table IX.

	Multiprogram/Project Common-Use Document ED16	
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline
AND CONTROL FOR MSFC		
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 43 of 99

- /27 For Grade 1 low voltage applications, perform lot sample testing of MIL-C-123 group B, Subgroup 2. Reference MIL-HDBK-978, Vol. 1, 2.2.7.2. c & d. Sample parts subjected to this testing shall not be used.
- $\underline{/28}$ Note deleted
- /29 Lot performance characteristics shall be assessed by use of sample test required by Appendix B, MIL-STD-975, Reference MIL-HDBK-978, Vol. 1,2.2.7.2 & .3. Sample parts subjected tot this testing shall not be used.
- /30 CSR parts shall be subjected to screening in accordance with Appendix B of MIL-STD-975 prior to use. Reference MIL-HDBK-978, Vol 1, 2.6.7.2 & 3. Not applicable for style CSS.
- <u>/31</u> All wire products per this specification shall be restricted to ground support equipment/GSE (non-flight) use only.
- /32 PPL application and screening notes apply.
- /33 If no applicable Class S part is listed, perform additional screening test as indicated in GSFC PPL-21 Appendix C, Table 13.
- /34 Magnetics shall comply with Table XII.
- /35 Refer to GSFC PPL-21 for application information.
- /36 Note deleted
- /37 Consult the project parts engineer for recommendations.
- /38 Cadmium, zinc, or anodized plated connectors and connector accessories (i.e., backshells, contacts, jam nuts, protective caps, jackscrews, etc.) shall not be used in space flight applications. Nickel is an acceptable plating material. Prior to use, connectors and backshells shall be thermal vacuum baked per MSFC-SPEC- 548, or equivalent. Consult the project parts engineer for recommendations.
- /39 Stress corrosion and outgassing properties of these connectors are not controlled and must be evaluated for compliance to project engineering requirements. Prior to use, connectors shall be vacuum baked per MSFC-SPEC-548, or equivalent. Consult the project parts engineer for recommendations.
- <u>/40</u> The rear side of several connectors per this specification is not protected against moisture or debris. Consult the project parts engineer for recommendations.
- <u>/41</u> All connectors per this specification are restricted to ground support equipment/GSE (non-flight) use only.
- <u>/42</u> Wire and cable products per these specifications may require material testing per SP-R-0022A and NHB 8060.1, or equivalents. Consult the project parts engineer for recommendations.

Table VI Notes:

- $\underline{/1}$ This table identifies information for the part selection process, standard parts, and associated restrictions and verifications. The requirements listed shall be implemented in addition to other requirements herein.
- /2 All standard parts are identified in this column. The standard part designation is predicated on compliance with all applicable requirements. All nonstandard parts require nonstandard part approval.

Multiprogram/Project Common-Use Document ED16					
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline			
AND CONTROL FOR MSFC					
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 49 of 99			

- $\underline{/3}$ Parts selection shall be accomplished in the order indicated. A lower ranked selection shall not be used if a higher ranked selection can be obtained.
- <u>/4</u> This column identifies screening and associated verifications and restrictions that are required for the part to be classified as acceptable. The project EEE parts plan shall specify details as necessary to implement these requirements, and may specify additional requirements.
- <u>/5</u> Qualification and screening requirements shall be determined to suit the specific application.
- <u>/6</u> PIND and X-ray screening required on cavity devices.
- <u>7</u> Qualification and screening shall be per MIL-PRF 38534 for Class H devices. PIND testing , radiographic inspection, and a two piece DPA are required. Radiation tolerance testing may be required depending on the part environment. A controlling document shall be generated to specify the part performance characteristics and manufacturing requirements.
- $\underline{/8}$ A sample of each production lot shall be subjected to destructive physical analysis (DPA).
- /9 A controlling document shall specify the part performance characteristics and manufacturing requirements. The controlling document shall specify design, processing, qualification, and screening requirements so as to match as much as is feasible the standard requirements that would be applied to a similar JANTXV quality part.
- /10 A controlling document shall specify the part performance characteristics, required lot qualification, and screening tests. A sample of each production lot shall be subjected to qualification, including life testing, so as to match as much as is feasible the standard requirements that would be applied to a similar JANTXV quality part.
- /11 Approved for use on Space Station. See SSQ-21654.

<u>/12</u> Particle Impact Detection (PIND) testing, Radiographic inspection and a two piece Destructive Physical Analysis (DPA) per MIL-STD 883, Method 5009 are required and radiation latch-up testing may be required depending on the radiation environment.

- <u>/13</u> Qualification, screening, and approval requirements to be developed to suit the application.
- <u>/14</u> See Note <u>/7</u>. The use of plastic encapsulated hybrid microcircuits is not recommended.
- <u>/15</u> NASA Zero-G, contact size 16, fiber optic termini. Approved for use on Space Station. See SSQ-21635.
- <u>/16</u> The rear side of several connectors per this specification is not protected against moisture or debris. Consult the project parts engineer for recommendations.

Multiprogram/Project Common-Use Document ED16					
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline			
AND CONTROL FOR MSFC					
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 50 of 99			

- <u>/17</u> Qualification and screening shall be per MIL-PRF-38535, Appendix A for Class Q devices. In addition PIND and a two piece DPA are required. A controlling document shall be generated to specify the part performance characteristics and manufacturing requirements.
- /18 The environment must be considered when using plastic encapsulated microcircuits (PEMs). PEMs should not be used in an environment where moisture is present. Where their use can be accommodated special handling and storage procedures must be followed to prevent exposure to moisture. Also, the radiation tolerance of the PEM must be acceptable for the environment in which it will be used. Radiographic inspection and a two piece DPA per MIL-STD 883, Method 5009 as applicable are required. Inspect for delimination per MIL-STD-38535, Table IB. Test/monitor 12.
- /19 Qualification and screening shall be per MIL-PRF 38535 Appendix A for Class B devices or Appendix B for Class Q devices. PIND testing (when applicable), radiographic inspection, and a two piece DPA are required.
- <u>/20</u> All connectors per this specification are restricted to ground support equipment/GSE (non-flight) use only.
- <u>/21</u> Wire and cable products per these specifications may require material testing per SP-R-0022A and NHB 8060.1, or equivalents. Consult the project parts engineer for recommendations.
- /22 Approved for use on Space Station. See SSQ-21678.
- /23 Approved for EVA-only use on Space Station. See SSQ-21678.
- /24 Silver-coated copper is susceptible to cuprous oxide ("red plague") corrosion when produced, stored, or used in a moist or high humidity environment. The environment for this wire must be controlled.
- /25 Refer to MIL-PRF-122 for explanation of FRL.
- <u>/26</u> To select part have manufacturer screen per Table IX
- <u>/27</u> Polyimide (tradename "Kapton") insulated wire is susceptible to "arc tracking" when used in certain applications. Consult the project parts engineer for recommendations.
- /28 Note deleted
- /29 Some ETFE (ethylene-tetrafluoroethylene copolymer / tradename "Tefzel") insulated wire has been found to fail flammability testing in a 30 percent oxygen environment. Consult the project parts engineer for recommendations.
- <u>/30</u> All wire products per this specification shall be restricted to ground support equipment/GSE (non-flight) use only.
- /31 Note deleted
- /32 PPL application and screening notes apply.
- /33 Note deleted

Multiprogram/Project Common-Use Document ED16

AND CONTROL FOR MSFC					
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 51 of 99			

- /34 Magnetics shall comply with Table XII
- <u>/35</u> Refer to GSFC PPL-21 for application information.
- /36 Note deleted
- /37 NSPAR or equivalent evaluation process required.
- <u>/38</u> Platings of Cadmium or Zinc shall not be used. Molybdenum contact material shall not be used.
- /39 Components shall not be selected with "Known Reliability Suspect Designs," reference MIL-HDBK-1547.
- <u>/40</u> Components shall not be selected with "Known Material Hazards," reference MIL-HDBK-1547.
- <u>/41</u> Consult the project parts engineer for recommendations.
- <u>/42</u> Cadmium, zinc, or anodized plated connectors and connector accessories (i.e., backshells, contacts, jam nuts, protective caps, jackscrews, etc.) shall not be used in space flight applications. Nickel is an acceptable plating material. Prior to use, connectors and backshells shall be thermal vacuum baked per MSFC-SPEC- 548, or equivalent. Consult the project parts engineer for recommendations.
- <u>/43</u> Stress corrosion and outgassing properties of these connectors are not controlled and must be evaluated for compliance to project engineering requirements. Prior to use, connectors shall be vacuum baked per MSFC-SPEC-548, or equivalent. Consult the project parts engineer for recommendations.

Table VII Notes:

- $\underline{/1}$ This table identifies information for the part selection process, standard parts, and associated restrictions and verifications. The requirements listed shall be implemented in addition to other requirements herein.
- /2 All standard parts are identified in this column. The standard part designation is predicated on compliance with all applicable requirements. All nonstandard parts require nonstandard part approval.
- <u>/3</u> Parts selection shall be accomplished in the order indicated. A lower ranked selection shall not be used if a higher ranked selection can be obtained.
- /4 This column identifies screening and associated verifications and restrictions that are required for the part to be classified as acceptable. The project EEE parts plan shall specify details as necessary to implement these requirements, and may specify additional requirements.
- <u>/5</u> Qualification and screening requirements shall be determined to suit the specific application.
- <u>/6</u> PIND and X-ray screening strongly recommended on cavity devices.
- /7 Qualification and screening shall be per MIL-PRF 38534 for Class H devices. PIND testing , radiographic inspection, and a two piece DPA are required. Radiation tolerance testing may be required depending on the part environment.
- $\underline{/8}$ A sample of each production lot shall be subjected to destructive physical analysis (DPA).
- <u>A controlling document shall specify the part performance characteristics and manufacturing requirements</u>. The controlling document shall specify design, processing, qualification, and screening requirements so as to match as much as is feasible the standard requirements that would be applied to a similar JANTXV quality part.
- /10 A controlling document shall specify the part performance characteristics, required lot qualification, and screening tests. A sample of each production lot shall be subjected to qualification, including life testing, so as to match as much as is feasible the standard requirements that would be applied to a similar JANTXV quality part.
- $\underline{/11}$ Note deleted

Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline		
AND CONTROL FOR MSFC				
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 57 of 99		

- /12 Particle Impact Detection (PIND) testing, Radiographic inspection and a two piece Destructive Physical Analysis (DPA) per MIL-STD 883, Method 5009 are required and radiation latch-up testing may be required depending on the radiation environment.
- <u>/13</u> Qualification, screening, and approval requirements to be developed to suit the application.
- <u>/14</u> See Note <u>/7</u>. The use of plastic encapsulated hybrid microcircuits is not recommended.
- /15 Note deleted
- /16 The controlling documentation shall identify the part performance characteristics, required lot qualification, and screening tests. A sample of each production lot shall be subjected to qualification, including life testing and destructive physical analysis. 100% screening should include 100% Particle Impact Noise Detection (PIND) and x-ray examination of devices with internal cavities.
- <u>/17</u> Qualification and screening shall be per MIL-PRF-38535, Appendix A for Class Q devices. In addition PIND testing is required.
- /18 Commercial parts may be screened and qualified per MIL-PRF 38535 for Class Q, M, or N as appropriate. PIND testing, when applicable, is also strongly recommended. Commercial- off-the-shelf assemblies may be considered qualified upon successful completion of box level environmental testing.
- <u>/19</u> Qualification and screening may be per MIL-PRF 38535 Appendix A for Class B devices or Appendix B for Class Q devices. PIND testing (when applicable), radiographic inspection, and a two piece DPA are strongly recommended.
- /20 Approved for use on Space Station. See SSQ-21654.
- <u>/21</u> NASA Zero-G, contact size 16, socket, fiber optic termini. Approved for use on Space Station. See SSQ-21635.
- /22 Approved for use on Space Station. See SSQ-21678.
- <u>/23</u> Approved for EVA-only use on Space Station. See SSQ-21678.
- /24 Refer to MIL-HDBK-1547 for application information.
- /25 PIND testing is strongly recommended.
- <u>/26</u> Standard Bussman or Littlefuse fuse, sample screened by the manufacturer. See Table IX for screening.
- <u>/27</u> Qualification and screening may be per MIL-PRF 38534 for Class H devices. PIND testing and radiographic inspection are strongly recommended.
- $\underline{/28}$ Note deleted
- <u>/29</u> PIND testing and radiographic inspection are strongly recommended for devices with internal cavities.

Multiprogram/Project Common-Use Document ED16				
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline		
AND CONTROL FOR MSFC				
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 58 of 99		

- <u>/30</u> PIND testing and radiographic inspection are strongly recommended. User should verify that the device temperature range is adequate for the application.
- /31 Note deleted
- /32 PPL application and screening notes apply.
- /33 Note deleted
- <u>/34</u> PIND testing (when applicable) is strongly recommended. For vendor Hi-Rel verify that the part has received burn-in and that the temperature range of the part meets project requirements.
- /35 Note deleted
- $\underline{/36}$ Note deleted
- /37 NSPAR or equivalent evaluation process required.
- <u>/38</u> Platings of Cadmium or Zinc shall not be used. Molybdenum contact material shall not be used.
- /39 Components shall not be selected with "Known Reliability Suspect Designs," reference MIL-HDBK-1547.
- <u>/40</u> Components shall not be selected with "Known Material Hazards," reference MIL-HDBK-1547.
- <u>/41</u> PIND testing and radiographic inspection are strongly recommended. User should obtain the device specification from the vendor and verify that the part meets project requirements.
- <u>/42</u> Commercial hybrid microcircuits shall as a minimum be screened as follows: Burnin at the appropriate temperature for 100 hours; Final electrical tests; PIND testing; Radiographic inspection. The use of plastic encapsulated hybrid microcircuits is not recommended. Commercial-off-the-shelf assemblies containing hybrid microcircuits may be considered qualified upon successful completion of environmental testing.
- <u>/43</u> Comply with the Class B build and screening requirements of MIL-STD-981.
- <u>/44</u> Consult the project parts engineer for recommendations.
- <u>/45</u> Cadmium, zinc, or anodized plated connectors and connector accessories (i.e., backshells, contacts, jam nuts, protective caps, jackscrews, etc.) shall not be used in space flight applications. Nickel is an acceptable plating material. Prior to use, connectors and backshells shall be thermal vacuum baked per MSFC-SPEC- 548, or equivalent. Consult the project parts engineer for recommendations.
- <u>/46</u> Stress corrosion and outgassing properties of these connectors are not controlled and must be evaluated for compliance to project engineering requirements. Prior to use, connectors shall be vacuum baked per MSFC-SPEC-548, or equivalent. Consult the project parts engineer for recommendations.

Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline
AND CONTROL FOR MSFC		
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 59 of 99

- <u>/47</u> The rear side of several connectors per this specification is not protected against moisture or debris. Consult the project parts engineer for recommendations.
- <u>/48</u> All connectors per this specification are restricted to ground support equipment/GSE (non-flight) use only.
- <u>/49</u> Wire and cable products per these specifications may require material testing per SP-R-0022A and NHB 8060.1, or equivalents. Consult the project parts engineer for recommendations.
- <u>/50</u> Silver-coated copper is susceptible to cuprous oxide ("red plague") corrosion when produced, stored, or used in a moist or high humidity environment. The environment for this wire must be controlled.
- <u>/51</u> Polyimide (tradename "Kapton") insulated wire is susceptible to "arc tracking" when used in certain applications. Consult the project parts engineer for recommendations.
- /52 Some ETFE (ethylene-tetrafluoroethylene copolymer / tradename "Tefzel") insulated wire has been found to fail flammability testing in a 30 percent oxygen environment. Consult the project parts engineer for recommendations.
- <u>/53</u> All wire products per this specification shall be restricted to ground support equipment/GSE (non-flight) use only.

Table VIII Notes:

- /1 This table identifies information for the part selection process, standard parts, and associated restrictions and verifications. The requirements listed shall be implemented in addition to other requirements herein. All parts used in flight applications shall comply with the Hazard Avoidance requirements per MSFC-STD-3012.
- $\underline{/2}$ All parts are considered standard parts for Grade 4.
- <u>/3</u> Refer to MIL-HDBK-1547 for selection guidance.
- <u>/4</u> This column identifies screening and associated verifications and restrictions for the part, if any. The project EEE parts plan shall specify details as necessary to implement these requirements, and may specify additional requirements.
- $\underline{5}$ Selection preference ranking is not applicable for Grade 4.

Table IX Notes:

- <u>/1</u> The test conditions and the pass/fail criteria shall be based on the nearest equivalent military specification, the manufacturer's specification, or the application, whichever is most severe.
- $\underline{2}$ A minimum of three fuses shall be measured. In the event of failure, the entire lot shall be screened for dimensions and rejects discarded.
- <u>/3</u> The source current for the resistance measurement shall not exceed 10% of the nominal current rating at room temperature.
- <u>/4</u> The voltage drop (hot) measurement must be recorded to calculate the voltage drop ratio regardless of whether or not it is a specification requirement.
- <u>/5</u> Fuses rated $< +125^{\circ}$ C shall be tested to Condition A.
- <u>/6</u> External visual examination is required after testing to verify no evidence of mechanical damage.
- <u>/7</u> Marking and voltage ratio rejects shall not be counted for purposes of establishing the defect rate.

Table X - Thermistor Screening Requirements (Page 2 of 2)

Table X Notes:

- 1. It is the responsibility of the user to define minimum and/or maximum values for each parameter (pass/fail criteria). These values should be based on the nearest equivalent military specification, manufacturing specification, or the application, whichever is most stringent.
- 2. A minimum of three thermistors shall be measured.
- 3. Zero-power resistance shall be measured in a controlled uniform medium capable of maintaining an accuracy of

Multiprogram/Project Common-Use Document ED16				
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline		
AND CONTROL FOR MSFC				
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 65 of 99		

plus or minus 0.05% Deg. C. for beads (any mounting construction) and plus or minus 0.05% Deg. C. for all other types. The resistance shall be measured using a wheatstone bridge (or equivalent), accuracy to plus or minus 0.05% Deg. C.

- 4. The specified reference temperature is usually ambient + 25 Deg. C. However, since the resistance curve tolerance varies on either side of this reference ambient, for particular applications, it may be advantageous to specify the reference temperature at some point, up to and including the temperature extremes. If a temperature extreme is used as the reference temperature, the complementary temperature for zero-power resistance and resistance ratio shall be the midpoint temperature between the temperature extremes. If the high temperature extreme is greater than + 125 Deg. C., this temperature shall be used for thermal shock and high temperature storage testing.
- 5. Never expose a thermistor to an ambient temperature greater than its maximum operating temperature during testing under no load conditions. Such exposure, even for brief periods, can permanently destabilize the thermistor if the Curie temperature is exceeded. The maximum operating temperature, which can be determined from the power rating, is the maximum body temperature at which the thermistor will continue to operate with acceptable stability of its characteristics. The temperature at which the power has been linearly derated to 0 % corresponds to the maximum ambient temperature under no load conditions.
- 6. External visual examination required after testing to verify no evidence of mechanical damage.
- 7. Marking defects shall not be counted for purposes of establishing the failure rate.
- 8. Grade 4 is not shown in the Table....will be screened to suit the application.

 $\underline{3}$ / The qualification samples shall be subdivided as specified in the table for Groups 3 through 6 inclusive. Group 2 inspections can be performed on unscreened samples or on samples that have completed one of the other qualification test groups. These minimum samples sizes are required for qualification:

Grade 1- 25 thermistors Grade 2- 13 thermistors Grade 3- 3 thermistors

- $\underline{4}$ / External visual examination required after testing to verify no evidence of mechanical damage.
- $\underline{5}$ A controlled temperature bath and drive mechanism are used for beads in probes and beads in rods.
- 6/ Materials listed in Revision 3 of NASA Reference Publication 1124 that meet TML and CVCM limits are acceptable for use without further testing.

APPENDIX A

ELECTRICAL, ELECTRONIC, AND ELECTROMECHANICAL (EEE) PARTS PLAN FOR GRADE 1 PARTS

1.0 <u>SCOPE</u> – This plan implements requirements set forth in MSFC-STD-3012 for Grade 1 parts. Requirements are specified for EEE parts activities from the equipment design and development phase through use and maintenance of the system and equipment. Some special requirements, applicable only to MSFC, are included for MSFC in-house activities. Requirements herein are intended to apply only to flight hardware, except that a requirement is levied on ground equipment connectors that mate with flight connectors.

1.1 <u>General</u> – Special requirements not covered by or not in conformance with the requirements of this publication shall be detailed in engineering documentation which shall take precedence over appropriate portions of this publication when approved in writing by MSFC prior to use.

1.2 <u>Applicability</u> - This plan applies to the following EEE part types (Federal Stock Codes shown in parenthesis). Part types not listed are not subject to the controls herein.

Capacitors (5910)	Fiber optic devices (6030)	Relays (5945)
Circuit breakers (5925)	Fiber optic interconnect (6060)	Resistors (5905)
Connectors (5935)	Filters (5915)	Switches (5930)
Crystal oscillators (5955)	Fuses (5920)	Thermistors (5950)
Diodes (5961)	Hybrid microcircuits (5962)	Transistors (5961)
Fiber optic cables (6030)	Magnetics (5950)	Wire and Cable (6145)
	Monolithic microcircuits (5962)	

2.0 APPLICABLE DOCUMENTS -

2.1 <u>General</u>. The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issue in effect on the date of invitation for bids or request for proposal shall apply.

MIL-STD-1686	Electrostatic Discharge Control Program For Protection Of Electrical and Electronic Parts, Assemblies And Equipment (Excluding Electrically Initiated Explosive Devices)
MIL-STD-750	Test Methods For Semiconductor Devices
MIL-STD-883	Test Methods And Procedures For Microelectronics
MPG 1280.5	GIDEP ALERTS Specification For

MSFC-STD-355 George C. Marshall Flight Center National Aeronautics And Space Administration Standard Radiographic Inspections Of Electronic Parts						
NSTS 1700.7	Safety Policy and Requirements For Payloads Using the Space					

3.0 **DEFINITIONS AND ACRONYMS** – Definitions and acronyms are in accordance with

Transportation System

MSFC-STD-3012.

4.0 **REQUIREMENTS**

4.1 <u>General</u> – This plan, or MSFC approved equivalent requirements, shall be applied to each subcontract tier for applicable equipment. The requirements of MSFC-STD-3012 for Grade 1 parts and the implementation requirements herein shall be met.

4.1.1 <u>Focal Point Organization</u> – The organization serving as the focal point in matters pertaining to this plan shall be MSFC's EEE Parts Engineering.

4.2 <u>**Part Qualification**</u> – Qualification at the piece part level shall meet the requirements of MSFC-STD-3012. Where guidance is not provided within MSFC-STD-3012 for qualification of nonstandard parts, the qualification shall be equivalent to the requirements imposed on similar standard parts, or shall otherwise satisfactorily demonstrate that the part has a MSFC approved margin of safety beyond the demands of the equipment in which it will be used.

4.3 **<u>Quality Assurance Requirements</u>** – Quality assurance shall comply with the requirements of MSFC-STD-3012 and the following.

4.3.1 <u>Procurement Sources</u> - Parts shall be procured only from qualified manufacturers or their authorized distributors.

4.3.2 <u>Quality Conformance Inspection (QCI)</u> –The QCI provisions of applicable military standards shall be sufficient for parts listed in military or NASA QPLs or QMLs.

4.3.2.1 <u>Destructive Physical Analysis (DPA)</u> - All microcircuits, semiconductors (except noncavity diodes), and crystal oscillators, when not procured from a Military QPL/QML, shall be subjected to DPA on a sample basis from each lot. JANTX semiconductors shall also be subjected to DPA on a sample basis from each lot. The DPA shall be in accordance with MIL-STD-883, Method 5009, MIL-STD-750, Method 2101 or 2102 as appropriate, or to an approved equivalent method. This requirement may be met in the part manufacturer's processing, in third party laboratory testing, or by the procuring activity.

Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline				
AND CONTROL FOR MSFC						
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 76 of 99				

4.3.2.2 <u>In-house DPA</u> – Microcircuits: DPA radiography is required. Die shear testing is not required when radiographic means are used to verify die attachment. DPA electrical testing and internal water vapor content testing are not required. Quality Class S, or equivalent, shall apply where requirements are differentiated by quality class.

4.3.3 <u>Screening</u> – Screening requirements shall be as listed in Table V in MSFC-STD-3012 and as follows.

4.3.3.1 <u>Particle Impact Noise Detection (PIND)</u> - All internal cavity devices of appropriate construction shall be PIND tested, or equivalent, per Method 2020 of MIL-STD-883 (for Microcircuits and crystal oscillators), Method 2052 of MIL-STD-750 (for Semiconductors), or manufacturer's recommendations (for relays). This requirement may be met in the part manufacturer's processing, in third party laboratory testing, or by the procuring activity.

4.3.3.1.1 <u>In-house PIND</u> - Cavity devices shall be tested in accordance with the latest revisions of MIL-STD-750 method 2052 for diodes and transistors, MIL-STD-883 method 2020 for hybrids, microcircuits, and non-electromechanical relays, as appropriate. The following exceptions shall apply: 1) the marking ink is red (reject), and 2) the lot acceptance criteria shall allow unlimited resubmits and the percent defective allowable does not apply , unless otherwise specified for a particular part. All PIND rejects shall be removed from the lot and designated with one red ink dot. If PIND testing is destructive, it shall be omitted.

4.3.3.2 <u>Radiographic (X-Ray) Inspection</u> - All cavity devices and solid construction (noncavity) axial lead diodes (standard and nonstandard) shall undergo X-ray inspection (two orthogonal views), or equivalent, per Method 2012 of MIL-STD-883 (for Microcircuits and crystal oscillators) or Method 2076 of MIL-STD-750 (for Semiconductors). This requirement may be met in the part manufacturer's processing, in third party laboratory testing, or by the procuring activity.

4.3.3.2.1 <u>In-house X-Ray</u> – EEE parts shall be examined in accordance with the latest revision of MIL-STD-883 method 2012 for microcircuits and hybrids, with MIL-STD-750 method 2076 for diodes and transistors, and with MSFC-STD-355 for all other EEE devices. The following exceptions shall be allowed: 1) the number of views is one, 2) the parts are not serialized on the film, and 3) the marking ink is red (reject) and green (accept). Parts that pass radiographic inspection are designated with a green ink dot. All radiographic rejects shall be removed from the lot and designated with two red ink dots. Parts that fail radiographic examination shall be restricted to non-flight applications.

4.3.4 <u>Receiving Inspection</u> – Receiving inspection by the procuring activity shall verify procurement from a qualified source and compliance with the controlling specifications. This may be accomplished by review of certifications.

4.4 Application Requirements

4.4.1 <u>Derating</u> – Parts shall be derated in the application in accordance with MSFC-STD-3012. The data shall document the results of EEE parts application and stress analysis. The data shall be submitted for MSFC review.

Multiprogram/Project Common-Use Document ED16					
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline			
AND CONTROL FOR MSFC					
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 77 of 99			

4.4.2 <u>Ionizing Radiation</u> – In accordance with MSFC-STD-3012, EEE parts shall be acceptable for use in the projected radiation environment identified in project documentation. Consideration shall be given to both total dose and single event effects.

4.4.3 <u>Thermal Vacuum Bake</u> - Connectors and backshells shall be thermal vacuum baked in accordance with MSFC-SPEC-548 or equivalent before being installed on cables, unless the applicable part specification negates the need for bake out. All cables shall be baked in accordance with MSFC-SPEC-684 or equivalent.

4.4.4 <u>Hazard Avoidance</u> – Parts shall comply with the hazard avoidance requirements of MSFC-STD-3012 and the additional requirements of NSTS 1700.7.

4.5 <u>Configuration Control Requirements</u> – The MSFC EEE Parts Engineering organization shall review and approve all EEE parts selections. At each subcontract level, the procuring activity shall review and approve all subtier EEE parts selections.

4.5.1 <u>Parts Selection</u> - Maximum use shall be made of Grade 1 standard parts, in the design, modification, and fabrication of the flight equipment. The parts, selection, and screening shall conform to the requirements and guidelines contained in Table V. Parts selection shall be accomplished in the order indicated. A lower ranked selection shall not be used if a higher ranked selection can be obtained. Commercial quality assurance level parts shall not be used in a Grade 1 application. The program objective shall be to minimize part types, utilize standard part types to the maximum extent possible, and assure that appropriate minimum quality levels are maintained.

4.5.2 <u>Nonstandard Parts</u> - Nonstandard parts may be used in accordance with MSFC-STD-3012 when there is no standard part with a performance capability to satisfy the application requirements or a standard part is not available. The minimum screening requirements shall be in accordance with MSFC-STD-3012 requirements for Grade 1 parts. Nonstandard parts shall be selected in the order of preference specified in MSFC-STD-3012 for Grade 1 parts. In addition, first consideration shall be given to the inherent capability of the parts to withstand the space, terrestrial, and mission environments to which the parts will be subjected.

4.6 Parts Related Data Requirements

4.6.1 <u>Nonstandard Parts Approval Request (NSPAR)</u> – When nonstandard parts are utilized (reference 4.5.1 and 4.5.2), nonstandard part approval requests shall be in accordance with MSFC-STD-3012 and contractual data requirements. A NSPAR form (MSFC Form 4346, or equivalent) shall be submitted to the procuring activity, and to each higher tier procuring activity, for each nonstandard part used in flight components. The NSPAR shall be reviewed and approved before it is submitted to the next higher tier procuring activity. An explanation of the rationale for use, and copies of applicable part specifications and part drawings (excluding military, NASA, and industry standards) shall be included. Copies of applicable Vendor Item Control Drawings (VICDs) shall be included. Note the VICD was formerly called a Specification Control Drawing (SCD).

4.6.1.1 <u>In-house NSPAR Exception</u> – NSPAR forms shall not be required for MSFC in-house design. Instead, nonstandard part approval shall be determined during coordination between MSFC designers and MSFC EEE Parts Engineering, and approval status shall be documented on the applicable As-Designed EEE Parts List.

Multiprogram/Project Common-Use Document ED16						
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline				
AND CONTROL FOR MSFC						
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 78 of 99				

4.6.2 <u>As-Designed EEE Parts List</u> – As-Designed EEE Parts Lists shall be prepared and submitted in accordance with MSFC-STD-3012 and applicable contractual data requirements. Submittals shall include an electronic copy in a format which is acceptable to the procuring activity. As-Designed EEE Parts Lists shall account for parts within all subassemblies, including subcontracted or procured subassemblies. The As-Designed EEE Parts List for an assembly may note the submittal and approval status of a subassembly's As-Designed EEE Parts List rather than individually list the parts for the subassembly. For the As-Designed Parts List the following identification and status information shall be provided as a minimum.

Identifying part number for the end item in which the EEE part will be used.

I	Applicabl	e EEE part type	e (from 1.2	above).					
I	Part number that will appear in the using assembly's parts list as the unique identification of the EEE part.

	Estimated quantity, if available, that will be used per end item.								

4.6.2.1 <u>In-house As-Designed EEE Parts Lists</u> – As-Designed EEE Parts Lists for MSFC inhouse design, shall be prepared in accordance with 4.6.2 above by the design activity and submitted to project management for approval.

4.6.3 <u>As-Built EEE Parts List</u> – As-Built EEE Parts Lists shall be submitted in accordance with MSFC-STD-3012 and applicable contractual data requirements. Submittals shall include an electronic copy in a format which is acceptable to the procuring activity. As-Built EEE Parts Lists must account for parts within all subassemblies, including subcontracted or procured subassemblies, unless excepted by specific project agreement. For the As-Built EEE Parts List the following identification and traceability information shall be provided as a minimum.

Identifying part number for the end item using the EEE part.

I	Serial numb	er of the end item	using the EEE	E part.					
I	Identifying part number of the assembly which calls out the installation of the EEE part.

Multiprogram/Project Common-Use Document ED16						
Title: EEE PARTS MANAGEMENT Document No.: MSFC-STD-3012 Revision: Baseline						
AND CONTROL FOR MSFC						
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 79 of 99				

4.6.3.1 <u>In-house As-Built EEE Parts Lists</u> – As-Built EEE Parts Lists for MSFC in-house manufacturing, shall be prepared in accordance with 4.6.3 above by the manufacturing activity and submitted to project management.

4.6.4 <u>Government Industry Data Exchange Program (GIDEP)</u> – GIDEP participation shall be in accordance with MSFC-STD-3012 and contractual data requirements.

4.6.5 <u>ALERT</u> – ALERT preparation and assessment shall be in accordance with MSFC-STD-3012 and contractual data requirements. An ALERT and Failure Analysis Program shall be established and implemented. ALERT's distributed by GIDEP and reissued by MSFC as "FULL ALERT's" shall be evaluated for impact and corrective actions, and responses shall be provided to MSFC by a systematic approach.

4.6.5.1 <u>In-house ALERT</u> – MSFC in-house ALERT activities shall be in accordance with MPG 1280.5.

4.6.6 <u>Traceability</u> – Traceability shall be provided in accordance with MSFC-STD-3012.

4.6.7 <u>Quality Assurance Data</u> – Results of destructive physical analyses, materials review boards, failure review boards, and parts problems reported from the field shall be documented and submitted for MSFC review.

4.6.8 <u>Specifications and Control Drawings</u> – EEE parts shall be defined and controlled by military/industry standard specifications and/or by control drawings. A part control drawing, such as a VICD, shall be used to document the performance and quality assurance characteristics required for the part where there is no military/industry standard that fully documents the requirements. The activity procuring parts shall be responsible for preparation of part control drawings.

4.6.8.1 <u>In-house Control Drawings</u> – Preparation of part control drawings, such as VICDs, for MSFC in-house initiated parts procurements, shall be the responsibility of the design activity, with support from EEE Parts Engineering.

4.7 Lifetime Parts Availability Requirements – Where feasible, the projects shall procure a quantity of a part (at least 20% over actual requirement) to support equipment maintenance, planned future builds, and potential future builds where any of the following applies: (1) the part is a commercial part rather than a military or NASA standard part, (2) the applicable military or NASA standard is identified as "not for new design," or equivalent, (3) the same part may not be available for future procurement within the life of the design, or (4) the minimum buy for the part exceeds or very nearly equals the lifetime requirement for the design.

4.8 Manufacturing and Handling Requirements

4.8.1 <u>Electrostatic Discharge (ESD) Control</u> – ESD control shall be in accordance with MIL-STD-1686, or equivalent. The ESD measures shall be documented and implemented during all manufacturing phases such as receiving inspections, assembly, testing, repair, storage, and shipping of all items designated as ESD sensitive. Engineering documentation shall incorporate the ESD requirements of MIL-STD-1686 for handling ESD sensitive electronic parts and assemblies.

Multiprogram/Project Common-Use Document

Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline		
AND CONTROL FOR MSFC				
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 80 of 99		

4.8.1.1 <u>In-house ESD</u> – ESD control within MSFC shall be in accordance with MSFC-RQMT-2918.

4.8.2 <u>Environmental Control</u> – Environmental controls such as temperature, humidity, and particulate contamination shall be identified for parts handling, packaging, and storage.

4.8.3 <u>Retest</u> – Parts for which 3 years has transpired since screening shall be tested electrically, to the extent practical, before use.

4.8.3.1 <u>In-house Retest</u> – Parts intended for use within MSFC shall be retested according to requirements agreed to by the affected engineering, quality, and test organizations.

4.8.4 <u>Allowance for Testing Fallout</u> – An allowance should be made for test fallout quantities in accordance with MSFC-STD-3012. Where practical, it is recommended that parts be ordered from a single lot date code to reduce the number of parts needed for destructive qualification testing.

4.8.5 <u>Manufacturing Process Compatibility</u> – Parts shall be compatible with manufacturing processes in accordance with MSFC-STD-3012. Use of plastic encapsulated microcircuits (PEMs) shall require prior approval addressing handling, storage, and installation procedures.

4.8.5.1 <u>In-house Manufacturing Compatibility</u> – Solder dipped, or equivalent, lead finishes are preferred for MSFC in-house use and shall be specified where this is an option. Surface mount or through-hole packages, or a combination of both, are acceptable for in-house use.

4.8.6 <u>Suspect Parts</u> – Use of parts affected by ALERTs and problem advisories shall be in accordance with MSFC-STD-3012.

4.9 <u>Off-The-Shelf (OTS) Assemblies</u> - The using design organization shall be responsible for assuring that OTS hardware and design are in compliance with the OTS requirements of MSFC-STD-3012.

4.10 **<u>Ground Support Equipment (GSE)/Avionics Interface</u>** - Connectors that physically mate with flight hardware shall be of the same physical configuration.

<u>APPENDIX B</u>

ELECTRICAL, ELECTRONIC, AND ELECTROMECHANICAL (EEE) PARTS PLAN FOR GRADE 2 PARTS

1.0 <u>SCOPE</u> – This plan implements requirements set forth in MSFC-STD-3012 for Grade 2 parts. Requirements are specified for EEE parts activities from the equipment design and development phase through use and maintenance of the system and equipment. Some special requirements, applicable only to MSFC, are included for MSFC in-house activities. Requirements herein are intended to apply only to flight hardware, except that a requirement is levied on ground equipment connectors that mate with flight connectors.

1.1 <u>General</u> – Special requirements not covered by or not in conformance with the requirements of this publication shall be detailed in engineering documentation which shall take precedence over appropriate portions of this publication when approved in writing by MSFC prior to use.

1.2 <u>Applicability</u> - This plan applies to the following EEE part types (Federal Stock Codes shown in parenthesis). Part types not listed are not subject to the controls herein.

Capacitors (5910)	Fiber optic devices (6030)	Relays (5945)
Circuit breakers (5925)	Fiber optic interconnect (6060)	Resistors (5905)
Connectors (5935)	Filters (5915)	Switches (5930)
Crystal oscillators (5955)	Fuses (5920)	Thermistors (5950)
Diodes (5961)	Hybrid microcircuits (5962)	Transistors (5961)
Fiber optic cables (6030)	Magnetics (5950)	Wire and Cable (6145)
	Monolithic microcircuits (5962)	

2.0 APPLICABLE DOCUMENTS -

2.2 <u>General</u>- The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issue in effect on the date of invitation for bids or request for proposal shall apply.

MIL-STD-1686	Electrostatic Discharge Control Program For Protection Of Electrical and Electronic Parts, Assemblies And Equipment (Excluding Electrically Initiated Explosive Devices)
MIL-STD-750	Test Methods For Semiconductor Devices
MIL-STD-883	Test Methods And Procedures For Microelectronics
MPG 1280.5	GIDEP ALERTS Specification For
MSFC-RQMT-2918	Requirements For Electrostatic Discharge Control
MSFC-SPEC-548	Specification For Vacuum Baking Electrical Connectors For Spacelab Payloads

Multiprogram/Project Common-Use Document

MSFC-SPEC-684	Specification For Vacuum Baking Electrical Cables For Spacelab Payloads
MSFC-STD-3012	EEE Parts Management And Control For MSFC Space Flight Hardware
MSFC-STD-355	George C. Marshall Flight Center National Aeronautics And Space Administration Standard Radiographic Inspections Of Electronic Parts
NSTS 1700.7	Safety Policy and Requirements For Payloads Using the Space Transportation System

3.0 **<u>DEFINITIONS AND ACRONYMS</u>** – Definitions and acronyms are in accordance with MSFC-STD-3012.

4.0 **REQUIREMENTS**

4.1 <u>General</u> – This plan, or MSFC approved equivalent requirements, shall be applied to each subcontract tier for applicable equipment. The requirements of MSFC-STD-3012 for Grade 2 parts and the implementation requirements herein shall be met.

4.1.1 <u>Focal Point Organization</u> – The organization serving as the focal point in matters pertaining to this plan shall be MSFC's EEE Parts Engineering.

4.2 <u>**Part Qualification**</u> – Qualification at the piece part level shall meet the requirements of MSFC-STD-3012. Where guidance is not provided within MSFC-STD-3012 for qualification of nonstandard parts, the qualification shall be equivalent to the requirements imposed on similar standard parts, or shall otherwise satisfactorily demonstrate that the part has an MSFC approved margin of safety beyond the demands of the equipment in which it will be used.

4.3 **<u>Quality Assurance Requirements</u>** – Quality assurance shall comply with the requirements of MSFC-STD-3012 and the following.

4.3.1 <u>Procurement Sources</u> – A part shall be procured only from qualified manufacturers or their authorized distributors.

4.3.2 <u>Quality Conformance Inspection (QCI)</u> –The QCI provisions of applicable military standards shall be sufficient for parts listed in military or NASA QPLs or QMLs.

4.3.2.1 <u>Destructive Physical Analysis (DPA)</u> - All microcircuits, semiconductors (except noncavity diodes), and crystal oscillators, when not procured from a Military QPL/QML, shall be subjected to DPA on a sample basis from each lot. JANTX semiconductors shall also be subjected to DPA on a sample basis from each lot. The DPA shall be in accordance with MIL-STD-883, Method 5009, MIL-STD-750, Method 2101 or 2102 as appropriate, or to an approved equivalent method. This requirement may be met in the part manufacturer's processing, in third party laboratory testing, or by the procuring activity.

4.3.2.2 <u>In-house DPA</u> – Microcircuits: DPA radiography is required. Die shear testing is not required when radiographic means are used to verify die attachment. DPA electrical testing and internal water vapor content testing are not required. Quality Class B, or equivalent, shall apply where requirements are differentiated by quality class.

Multiprogram/Project Common-Use Document					
	ED16				
Title: EEE PARTS MANAGEMENT Document No.: MSFC-STD-3012 Revision: Baseline					
AND CONTROL FOR MSFC					
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 83 of 99			

4.3.3 <u>Screening</u> – Screening requirements shall be as listed in Table VI of MSFC-STD-3012 and as follows.

4.3.3.1 <u>Particle Impact Noise Detection (PIND)</u> – All internal cavity devices of appropriate construction shall be PIND tested, or equivalent, per Method 2020 of MIL-STD-883 (for Microcircuits and crystal oscillators), Method 2052 of MIL-STD-750 (for Semiconductors), or manufacturer's recommendations (for relays). This requirement may be met in the part manufacturer's processing, in third party laboratory testing, or by the procuring activity.

4.3.3.1.1 <u>In-house PIND</u> - Cavity devices shall be tested in accordance with the latest revisions of MIL-STD-750 method 2052 for diodes and transistors, MIL-STD-883 method 2020 for hybrids, microcircuits, and non-electromechanical relays, as appropriate. The following exceptions shall apply: 1) the marking ink is red (reject), and 2) the lot acceptance criteria shall allow unlimited resubmits and the percent defective allowable does not apply, unless otherwise specified for a particular part. All PIND rejects shall be removed from the lot and designated with one red ink dot. If PIND testing is destructive, it shall be omitted.

4.3.3.2 <u>Radiographic (X-Ray) Inspection</u> - All cavity devices and solid construction (noncavity) axial lead diodes (standard and nonstandard) shall undergo X-ray inspection (two orthogonal views), or equivalent, per Method 2012 of MIL-STD-883 (for Microcircuits and crystal oscillators) or Method 2076 of MIL-STD-750 (for Semiconductors). This requirement may be met in the part manufacturer's processing, in third party laboratory testing, or by the procuring activity.

4.3.3.2.1 <u>In-house X-Ray</u> – EEE parts shall be examined in accordance with the latest revision of MIL-STD-883 method 2012 for microcircuits and hybrids, with MIL-STD-750 method 2076 for diodes and transistors, and with MSFC-STD-355 for all other EEE devices. The following exceptions shall be allowed: 1) the number of views is one, 2) the parts are not serialized on the film, and 3) the marking ink is red (reject) and green (accept). Parts that pass radiographic inspection are designated with a green ink dot. All radiographic rejects shall be removed from the lot and designated with two red ink dots. Parts that fail radiographic examination shall be restricted to non-flight applications.

4.3.4 <u>Receiving Inspection</u> – Receiving inspection by the procuring activity shall verify procurement from a qualified source and compliance with the controlling specifications. This may be accomplished by review of certifications.

4.4 Application Requirements –

4.4.1 <u>Derating</u> – Parts shall be derated in the application in accordance with MSFC-STD-3012. The data shall document the results of EEE parts application and stress analysis. The data shall be submitted for MSFC review.

4.4.2 <u>Ionizing Radiation</u> –In accordance with MSFC-STD-3012, parts shall be acceptable for use in the projected radiation environment identified in project documentation. Consideration shall be given to both total dose and single event effects.

4.4.3 <u>Thermal Vacuum Bake</u> - Connectors and backshells shall be thermal vacuum baked in accordance with MSFC-SPEC-548 or equivalent before being installed on cables, unless the

Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline	
AND CONTROL FOR MSFC			
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 84 of 99	

applicable part specification negates the need for bake out. All cables shall be baked in accordance with MSFC-SPEC-684 or equivalent.

4.4.4 <u>Hazard Avoidance</u> – Parts shall comply with the hazard avoidance requirements of MSFC-STD-3012 and the additional requirements of NSTS 1700.7.

4.5 <u>Configuration Control Requirements</u> – The MSFC EEE Parts Engineering organization shall review and approve all EEE parts selections. At each subcontract level, the procuring activity shall review and approve all subtier EEE parts selections.

4.5.1 <u>Parts Selection</u> - Maximum use shall be made of Grade 2 standard parts, in the design, modification, and fabrication of the flight equipment. The parts, selection, and screening shall conform to the requirements and guidelines contained in Table VI. Parts selection shall be accomplished in the order indicated. A lower ranked selection shall not be used if a higher ranked selection can be obtained. The program objective shall be to minimize part types, utilize standard part types to the maximum extent possible, and assure that appropriate minimum quality levels are maintained.

4.5.2 <u>Nonstandard Parts</u> - Nonstandard parts may be used in accordance with MSFC-STD-3012 when there is no standard part with a performance capability to satisfy the application requirements or a standard part is not available. The minimum screening requirements shall be in accordance with MSFC-SPEC-3012 requirements for Grade 2 parts. Nonstandard parts shall be selected in the order of preference specified in MSFC-STD-3012 for Grade 2 parts. In addition, first consideration shall be given to the inherent capability of the parts to withstand the space, terrestrial, and mission environments to which the parts will be subjected.

4.6 Parts Related Data Requirements -

4.6.1 <u>Nonstandard Parts Approval Request (NSPAR)</u> – When nonstandard parts are utilized (reference 4.5.1 and 4.5.2), nonstandard part approval requests shall be in accordance with MSFC-STD-3012 and contractual data requirements. A NSPAR form (MSFC Form 4346, or equivalent) shall be submitted to the procuring activity, and to each higher tier procuring activity, for each nonstandard part used in flight components. The NSPAR shall be reviewed and approved before it is submitted to the next higher tier procuring activity. An explanation of the rationale for use, and copies of applicable part specifications and part drawings (excluding military, NASA, and industry standards) shall be included. Copies of applicable Vendor Item Control Drawings (VICDs) shall be included. Note that the VICD was formerly called a Specification Control Drawing (SCD).

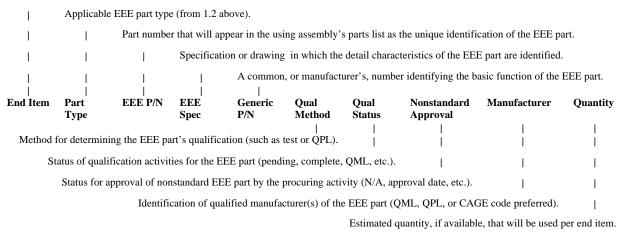

4.6.1.1 <u>In-house NSPAR Exception</u> – NSPAR forms shall not be required for MSFC in-house design. Instead, nonstandard part approval shall be determined during coordination between MSFC designers and MSFC EEE Parts Engineering, and approval status shall be documented on the applicable As-Designed EEE Parts List.

4.6.2 <u>As-Designed EEE Parts List</u> – As-Designed EEE Parts Lists shall be prepared and submitted in accordance with MSFC-STD-3012 and applicable contractual data requirements. Submittals shall include an electronic copy in a format which is acceptable to the procuring activity. As-Designed EEE Parts Lists shall account for parts within all subassemblies, including subcontracted or procured subassemblies. The As-Designed EEE Parts List for an assembly may note the submittal and approval status of a subassembly's As-Designed EEE Parts List rather

than individually list the parts for the subassembly. For the As-Designed EEE Parts List the following identification and status information shall be provided as a minimum.

Identifying part number for the end item in which the EEE part will be used.

4.6.2.1 In-house As-Designed EEE Parts Lists - As-Designed EEE Parts Lists for MSFC inhouse design, shall be prepared in accordance with 4.6.2 above by the design activity and submitted to project management for approval.

4.6.3 As-Built EEE Parts List – As-Built EEE Parts Lists shall be submitted in accordance with MSFC-STD-3012 and applicable contractual data requirements. Submittals shall include an electronic copy in a format which is acceptable to the procuring activity. As-Built EEE Parts Lists must account for parts within all subassemblies, including subcontracted or procured subassemblies, unless excepted by specific project agreement. For the As-Built EEE Parts List the following identification and traceabilty information shall be provided as a minimum.

Identifying part number for the end item using the EEE part.

Ι	Serial number	er of the end item	using the EEE	E part.					
Ι	I	Identifying pa	art number of th	ne assembly whi	ch calls out the	installation of th	e EEE part.		
Ι	I	Ι	Serial numbe	er of the using as	sembly.				
I	I		l	Applicable E	EE part type (fr	om 1.2 above).			
End Item	E.I. S/N	Using Assy	Assy S/N	EEE Type	EEE P/N	Ref Des	Mfg	LDC	EEE S/N

of the installed EEE part, if applicable.

4.6.3.1 In-house As-Built EEE Parts Lists – As-Built EEE Parts Lists for MSFC in-house manufacturing, shall be prepared in accordance with 4.6.3 above by the manufacturing activity and submitted to project management.

CHECK THE MASTER LIST—VERIFY THAT THIS IS THE CORRECT VERSION BEFORE USE

Multiprogram/Project Common-Use Document ED16				
Title: EEE PARTS MANAGEMENT Document No.: MSFC-STD-3012 Revision: Baseline				
AND CONTROL FOR MSFC				
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 86 of 99		

4.6.4 <u>Government Industry Data Exchange Program (GIDEP)</u> – GIDEP participation shall be in accordance with MSFC-STD-3012 and contractual data requirements.

4.6.5 <u>ALERT</u> – ALERT preparation and assessment shall be in accordance with MSFC-STD-3012 and contractual data requirements. An ALERT and Failure Analysis Program shall be established and implemented. ALERTs distributed by GIDEP and reissued by MSFC as "FULL ALERTs" shall be evaluated for impact and corrective actions, and responses shall be provided to MSFC by a systematic approach.

4.6.5.1 <u>In-house ALERT</u> – MSFC in-house ALERT activities shall be in accordance with MPG 1280.5.

4.6.6 <u>Traceability</u> – Traceability shall be provided in accordance with MSFC-STD-3012.

4.6.7 <u>Quality Assurance Data</u> – Results of destructive physical analyses, materials review boards, failure review boards, and parts problems reported from the field shall be documented and submitted for MSFC review.

4.6.8 <u>Specifications and Control Drawings</u> – EEE parts shall be defined and controlled by military/industry standard specifications and/or by control drawings. A part control drawing, such as a VICD, shall be used to document the performance and quality assurance characteristics required for the part where there is no military/industry standard that fully documents the requirements. The activity procuring parts shall be responsible for preparation of part control drawings. Published vendor data sheet and catalog data may be relied on as a substitute for a part control drawing where all of the following apply: (1) a military/industry standard specification does not exist and can not be readily obtained, (2) the vendor data adequately defines the performance and quality assurance provisions for the part, and (3) the part and/or manufacturer has a good record of use within the aerospace industry.

4.6.8.1 <u>In-house Control Drawings</u> – Preparation of part control drawings, such as VICDs, for MSFC in-house initiated parts procurements, shall be the responsibility of the design activity, with support from EEE Parts Engineering.

4.7 <u>Lifetime Parts Availability Requirements</u> – Where feasible, the projects shall procure a quantity of a part (at least 20% over actual requirement) to support equipment maintenance, planned future builds, and potential future builds where any of the following applies: (1) the part is a commercial part rather than a military or NASA standard part, (2) the applicable military or NASA standard is identified as "not for new design," or equivalent, (3) the same part may not be available for future procurement within the life of the design, or (4) the minimum buy for the part exceeds or very nearly equals the life time requirement for the design.

4.8 Manufacturing and Handling Requirements

4.8.1 <u>Electrostatic Discharge (ESD) Control</u> – ESD control shall be in accordance with MIL-STD-1686, or equivalent. The ESD measures shall be documented and implemented during all manufacturing phases such as receiving inspections, assembly, testing, repair, storage, and shipping of all items designated as ESD sensitive. Engineering documentation shall incorporate the ESD requirements of MIL-STD-1686 for handling ESD sensitive electronic parts and assemblies.

Multiprogram/Project Common-Use Document				
ED16				
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline		
AND CONTROL FOR MSFC				
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 87 of 99		

4.8.1.1 <u>In-house ESD</u> – ESD control within MSFC shall be in accordance with MSFC-RQMT-2918.

4.8.2 <u>Environmental Control</u> – Environmental controls such as temperature, humidity, and particulate contamination shall be identified for parts handling, packaging, and storage.

4.8.3 <u>Retest</u> – Parts for which 3 years has transpired since screening shall be tested electrically, to the extent practical, before use.

4.8.3.1 <u>In-house Retest</u> – Parts intended for use within MSFC shall be retested according to requirements agreed to by affected engineering, quality, and test organizations.

4.8.4 <u>Allowance for Testing Fallout</u> – An allowance should be made for test fallout quantities in accordance with MSFC-STD-3012. It is recommended that, where practical, parts be ordered from a single lot date code to reduce the number of parts needed for destructive qualification testing.

4.8.5 <u>Manufacturing Process Compatibility</u> – Parts shall be compatible with manufacturing processes in accordance with MSFC-STD-3012. Use of plastic encapsulated microcircuits (PEMs) shall require prior approval addressing handling, storage, and installation procedures.

4.8.5.1 <u>In-house Manufacturing Compatibility</u> – Solder dipped, or equivalent, lead finishes are preferred for MSFC in-house use and shall be specified where this is an option. Surface mount or through-hole packages, or a combination of both, are acceptable for in-house use.

4.8.6 <u>Suspect Parts</u> – Use of parts affected by ALERTs and problem advisories shall be in accordance with MSFC-STD-3012.

4.9 <u>Off-The-Shelf (OTS) Assemblies</u> - The using design organization shall be responsible for assuring that OTS hardware and design are in compliance with the OTS requirements of MSFC-STD-3012.

4.10 <u>Ground Support Equipment (GSE)/Avionics Interface</u> - Connectors that physically mate with flight hardware shall be of the same physical configuration.

<u>APPENDIX C</u>

ELECTRICAL, ELECTRONIC, AND ELECTROMECHANICAL (EEE) PARTS PLAN FOR GRADE 3 PARTS

1.0 <u>SCOPE</u> – This plan implements requirements set forth in MSFC-STD-3012 for Grade 3 parts. Requirements are specified for EEE parts activities from the equipment design and development phase through use and maintenance of the system and equipment. Some special requirements, applicable only to MSFC, are included for MSFC in-house activities. Requirements herein are intended to apply only to flight hardware, except that a requirement is levied on ground equipment connectors that mate with flight connectors.

1.1 <u>General</u> – Special requirements not covered by or not in conformance with the requirements of this publication shall be detailed in engineering documentation which shall take precedence over appropriate portions of this publication when approved in writing by MSFC prior to use.

1.2 <u>Applicability</u> - This plan applies to the following EEE part types (Federal Stock Codes shown in parenthesis). Part types not listed are not subject to the controls herein.

Capacitors (5910)	Fiber optic devices (6030)	Relays (5945)
Circuit breakers (5925)	Fiber optic interconnect (6060)	Resistors (5905)
Connectors (5935)	Filters (5915)	Switches (5930)
Crystal oscillators (5955)	Fuses (5920)	Thermistors (5950)
Diodes (5961)	Hybrid microcircuits (5962)	Transistors (5961)
Fiber optic cables (6030)	Magnetics (5950)	Wire and Cable (6145)
	Monolithic microcircuits (5962)	

2.0 APPLICABLE DOCUMENTS -

2.1 <u>General</u>-The following specifications, standards, and handbooks form a part of this document to the extent specified herein. Unless otherwise specified, the issue in effect on the date of invitation for bids or request for proposal shall apply.

MIL-STD-1686	Electrostatic Discharge Control Program For Protection Of Electrical and Electronic Parts, Assemblies And Equipment (Excluding Electrically Initiated Explosive Devices)
MIL-STD-750	Test Methods For Semiconductor Devices
MIL-STD-883	Test Methods And Procedures For Microelectronics
MPG 1280.5	GIDEP ALERTS Specification For
MSFC-RQMT-2918	Requirements For Electrostatic Discharge Control
MSFC-SPEC-548	Specification For Vacuum Baking Electrical Connectors For Spacelab Payloads

MSFC-STD-355 George C. Marshall Flight Center National Aeronautics And Space Administration Standard Radiographic Inspections Of Electronic Parts				
NSTS 1700.7	1700.7 Safety Policy and Requirements For Payloads Using the Space Transportation System			

3.0 **DEFINITIONS AND ACRONYMS** – Definitions and acronyms are in accordance with MSFC-STD-3012.

4.0 **REQUIREMENTS**

4.1 <u>General</u> – This plan, or MSFC approved equivalent requirements, shall be applied to each subcontract tier for applicable equipment. The requirements of MSFC-STD-3012 for Grade 3 parts and the implementation requirements herein shall be met.

4.1.1 <u>Focal Point Organization</u> – The organization serving as the focal point in matters pertaining to this plan shall be MSFC's EEE Parts Engineering.

4.2 <u>**Part Qualification**</u> – Qualification at the piece part level shall meet the requirements of MSFC-STD-3012. Where guidance is not provided within MSFC-STD-3012 for qualification of nonstandard parts, the qualification shall be equivalent to the requirements imposed on similar standard parts, or shall otherwise satisfactorily demonstrate that the part has an MSFC approved margin of safety beyond the demands of the equipment in which it will be used.

4.3 **<u>Quality Assurance Requirements</u>** – Quality assurance shall comply with the requirements of MSFC-STD-3012 and the following.

4.3.1 <u>Procurement Sources</u> – A part shall be procured only from qualified manufacturers or their authorized distributors.

4.3.2 <u>Quality Conformance Inspection (QCI)</u> –The QCI provisions of applicable military standards shall be sufficient for parts listed in military or NASA QPLs or QMLs.

4.3.2.1 <u>Destructive Physical Analysis (DPA)</u> - All microcircuits, semiconductors (except noncavity diodes), and crystal oscillators, when not procured from a Military QPL/QML or as a vendor "Hi Rel" product, shall be subjected to DPA on a sample basis from each lot. The DPA shall be in accordance with MIL-STD-883, Method 5009, MIL-STD-750, Method 2101, or 2102 as appropriate, or to an approved equivalent method, This requirement may be met in the part manufacturer's processing, in third party laboratory testing, or by the procuring activity.

4.3.2.2 <u>In-house DPA</u> – Microcircuits: DPA radiography is required. Die shear testing is not required when radiographic means are used to verify die attachment. DPA electrical testing and internal water vapor content testing are not required. Quality Class B, or equivalent, shall apply where requirements are differentiated by quality class.

Multiprogram/Project Common-Use Document ED16			
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline	
AND CONTROL FOR MSFC			
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 90 of 99	

4.3.3 <u>Screening</u> – Screening requirements shall be as listed in Table VII in MSFC-STD-3012 and as follows.

4.3.3.1 <u>Particle Impact Noise Detection (PIND)</u> – It is strongly recommended that all internal cavity devices of appropriate construction be PIND tested, or equivalent, per Method 2020 of MIL-STD-883 (for Microcircuits and crystal oscillators), Method 2052 of MIL-STD-750 (for Semiconductors), or manufacturer's recommendations (for relays). This may be accomplished in the part manufacturer's processing, in third party laboratory testing, or by the procuring activity.

4.3.3.1.1 <u>In-house PIND</u> – It is recommended that cavity devices be tested in accordance with the latest revisions of MIL-STD-750 method 2052 for diodes and transistors, MIL-STD-883 method 2020 for hybrids, microcircuits, and non-electromechanical relays, as appropriate. The following exceptions shall apply: 1) the marking ink is red (reject), and 2) the lot acceptance criteria shall allow unlimited resubmits and the percent defective allowable does not apply, unless otherwise specified for a particular part. All PIND rejects shall be removed from the lot and designated with one red ink dot. If PIND testing is destructive, it shall be omitted.

4.3.3.2 <u>Radiographic (X-Ray) Inspection</u> – It is strongly recommended that all cavity devices and solid construction (noncavity) axial lead diodes (standard and nonstandard) shall undergo X-ray inspection (two orthogonal views), or equivalent, per Method 2012 of MIL-STD-883 (for Microcircuits and crystal oscillators) or Method 2076 of MIL-STD-750 (for Semiconductors). This may be accomplished in the part manufacturer's processing, in third party laboratory testing, or by the procuring activity.

4.3.3.2.1 <u>In-house X-Ray</u> – EEE parts shall be examined in accordance with the latest revision of MIL-STD-883 method 2012 for microcircuits and hybrids, with MIL-STD-750 method 2076 for diodes and transistors, and with MSFC-STD-355 for all other EEE devices. The following exceptions shall be allowed: 1) the number of views is one, 2) the parts are not serialized on the film, and 3) the marking ink is red (reject) and green (accept). Parts that pass radiographic inspection are designated with a green ink dot. All radiographic rejects shall be removed from the lot and designated with two red ink dots. Parts that fail radiographic examination shall be restricted to non-flight applications.

4.3.4 <u>Receiving Inspection</u> – Receiving inspection by the procuring activity shall verify procurement from a qualified source and compliance with the controlling specifications. This may be accomplished by review of certifications.

4.4 Application Requirements –

4.4.1 <u>Derating</u> – Parts shall be derated in the application in accordance with MSFC-STD-3012. The data shall document the results of EEE parts application and stress analysis. The data shall be submitted for MSFC review.

4.4.2 <u>Ionizing Radiation</u> – In accordance with MSFC-STD-3012, parts shall be acceptable for use in the projected radiation environment identified in project documentation. Consideration shall be given to both total dose and single event effects.

4.4.3 <u>Thermal Vacuum Bake</u> - Connectors and backshells shall be thermal vacuum baked in accordance with MSFC-SPEC-548 or equivalent before being installed on cables, unless the

Multiprogram/Project Common-Use Document ED16			
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline	
AND CONTROL FOR MSFC			
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 91 of 99	

applicable part specification negates the need for bake out. All cables shall be baked in accordance with MSFC-SPEC-684 or equivalent.

4.4.4 <u>Hazard Avoidance</u> – Parts shall comply with the hazard avoidance requirements of MSFC-STD-3012 and the additional requirements of NSTS 1700.7.

4.5 <u>Configuration Control Requirements</u> – The MSFC EEE Parts Engineering organization shall review and approve all EEE parts selections. At each subcontract level, the procuring activity shall review and approve all subtier EEE parts selections.

4.5.1 <u>Parts Selection</u> - Maximum use shall be made of Grade 3 standard parts, in the design, modification, and fabrication of the flight equipment. The parts, selection, and screening shall conform to the requirements and guidelines contained in Table VII. Parts selection shall be accomplished in the order indicated. A lower ranked selection shall not be used if a higher ranked selection can be obtained. The program objective shall be to minimize part types, utilize standard part types to the maximum extent possible, and assure that appropriate minimum quality levels are maintained.

4.5.2 <u>Nonstandard Parts</u> - Nonstandard parts may be used in accordance with MSFC-STD-3012 when there is no standard part with a performance capability to satisfy the application requirements or a standard part is not available. The screening requirements shall be in accordance with MSFC-SPEC-3012 requirements for Grade 3 parts. Nonstandard parts shall be selected in the order of preference specified in MSFC-STD-3012, Table VII, for Grade 3 parts. In addition, first consideration shall be given to the inherent capability of the parts to withstand the space, terrestrial, and mission environments to which the parts will be subjected.

4.6 Parts Related Data Requirements -

4.6.1 <u>Nonstandard Parts Approval Request (NSPAR)</u> – When nonstandard parts are utilized (reference 4.5.1 and 4.5.2.) nonstandard part approval requests shall be in accordance with MSFC-STD-3012 and contractual data requirements. A NSPAR form (MSFC Form 4346, or equivalent) shall be submitted to the procuring activity, and to each higher tier procuring activity, for each nonstandard part used in flight components. The NSPAR shall be reviewed and approved before it is submitted to the next higher tier procuring activity. An explanation of the rationale for use, and copies of applicable part specifications and part drawings (excluding military, NASA, and industry standards) shall be included. Copies of applicable Vendor Item Control Drawings (VICD) shall be included. Note that the VICD was formerly called a Specification Control Drawing (SCD).

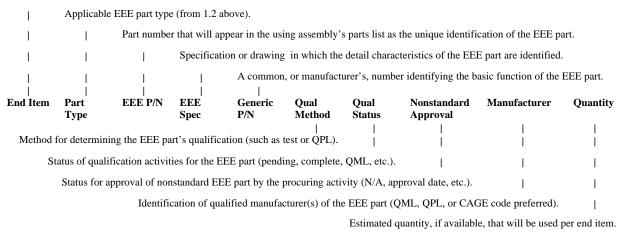

4.6.1.1 <u>In-house NSPAR Exception</u> – NSPAR forms shall not be required for MSFC in-house design. Instead, nonstandard part approval shall be determined during coordination between MSFC designers and MSFC EEE Parts Engineering, and approval status shall be documented on the applicable As-Designed EEE Parts List.

4.6.2 <u>As-Designed EEE Parts List</u> – As-Designed EEE Parts Lists shall be prepared and submitted in accordance with MSFC-STD-3012 and applicable contractual data requirements. Submittals shall include an electronic copy in a format which is acceptable to the procuring activity. As-Designed EEE Parts Lists shall account for parts within all subassemblies, including subcontracted or procured subassemblies. The As-Designed EEE Parts List for an assembly may note the submittal and approval status of a subassembly's As-Designed EEE Parts List rather

Multiprogram/Project Common-Use Document ED16

than individually list the parts for the subassembly. For the As-Designed EEE Parst List the following identification and status information shall be provided as a minimum.

Identifying part number for the end item in which the EEE part will be used.

4.6.2.1 In-house As-Designed EEE Parts Lists - As-Designed EEE Parts Lists for MSFC inhouse design, shall be prepared in accordance with 4.5.2 above by the design activity and submitted to project management for approval.

4.6.3 As-Built EEE Parts List – As-Built EEE Parts Lists shall be submitted in accordance with MSFC-STD-3012 and applicable contractual data requirements. Submittals shall include an electronic copy in a format which is acceptable to the procuring activity. As-Built EEE Parts Lists must account for parts within all subassemblies, including subcontracted or procured subassemblies, unless excepted by specific project agreement. For the As-Built EEE Parts List the following identification and traceability information shall be provided as a minimum.

Identifying part number for the end item using the EEE part.

I	Serial numb	er of the end item	using the EEE	E part.

4.6.4 <u>Government Industry Data Exchange Program (GIDEP)</u> – GIDEP participation shall be in accordance with MSFC-STD-3012 and contractual data requirements.

4.6.5 <u>ALERT</u> – ALERT preparation and assessment shall be in accordance with MSFC-STD-3012 and contractual data requirements. An ALERT and Failure Analysis Program shall be established and implemented. ALERTs distributed by GIDEP and reissued by MSFC as "FULL ALERTs" shall be evaluated for impact and corrective actions, and responses shall be provided to MSFC by a systematic approach.

4.6.5.1 <u>In-house ALERT</u> – MSFC in-house ALERT activities shall be in accordance with MPG 1280.5.

4.6.6 <u>Traceability</u> – Traceability shall be provided in accordance with MSFC-STD-3012.

4.6.7 <u>Quality Assurance Data</u> – Results of destructive physical analyses, materials review boards, failure review boards, and parts problems reported from the field shall be documented and available for MSFC review.

4.6.8 <u>Specifications and Control Drawings</u> – EEE parts shall be defined and controlled by military/industry standard specifications and/or by control drawings. A part control drawing, such as a VICD, or a published vendor data sheet and catalog data may be used to document the performance and quality assurance characteristics required for the part where there is no military/industry standard that fully documents the requirements. The activity procuring parts shall be responsible for preparation of part control drawings.

4.6.8.1 <u>In-house Control Drawings</u> – Preparation of part control drawings, such as VICDs, for MSFC in-house initiated parts procurements, shall be the responsibility of the design activity, with support from EEE Parts Engineering.

4.7 <u>Lifetime Parts Availability Requirements</u> – Where feasible, the projects shall procure a quantity of a part (at least 20% over actual requirement) to support equipment maintenance, planned future builds, and potential future builds where any of the following applies: (1) the part is a commercial part rather than a military or NASA standard part, (2) the applicable military or NASA standard is identified as "not for new design," or equivalent, (3) the same part may not be available for future procurement within the life of the design, or (4) the minimum buy for the part exceeds or very nearly equals the life time requirement for the design.

4.8 Manufacturing and Handling Requirements

4.8.1 <u>Electrostatic Discharge (ESD) Control</u> – ESD control shall be in accordance with MIL-STD-1686, or equivalent. The ESD measures shall be documented and implemented during all manufacturing phases such as receiving inspections, assembly, testing, repair, storage, and shipping of all items designated as ESD sensitive. Engineering documentation shall incorporate the ESD requirements of MIL-STD-1686 for handling ESD sensitive electronic parts and assemblies.

4.8.1.1 <u>In-house ESD</u> – ESD control within MSFC shall be in accordance with MSFC-RQMT-2918.

4.8.2 <u>Environmental Control</u> – Environmental controls such as temperature, humidity, and particulate contamination shall be identified for parts handling, packaging, and storage.

APPENDIX D ELECTRICAL, ELECTRONIC, AND ELECTROMECHANICAL (EEE) PARTS PLAN FOR GRADE 4 PARTS

1.0 <u>SCOPE</u> – This plan implements requirements set forth in MSFC-STD-3012 for Grade 4 parts. Requirements are specified for EEE parts activities from the equipment design and development phase through use and maintenance of the system and equipment. Some special requirements, applicable only to MSFC, are included for MSFC in-house activities. Requirements herein are intended to apply only to flight hardware, except that a requirement is levied on ground equipment connectors that mate with flight connectors.

1.1 <u>General</u> – Special requirements not covered by or not in conformance with the requirements of this publication shall be detailed in engineering documentation which shall take precedence over appropriate portions of this publication when approved in writing by MSFC prior to use.

1.2 Applicability – This plan applies to the following EEE part types (Federal Stock Codes shown in parenthesis). Part types not listed are not subject to the controls herein.

Capacitors (5910)	Fiber optic devices (6030)	Relays (5945)
Circuit breakers (5925)	Fiber optic interconnect (6060)	Resistors (5905)
Connectors (5935)	Filters (5915)	Switches (5930)
Crystal oscillators (5955)	Fuses (5920)	Thermistors (5950)
Diodes (5961)	Hybrid microcircuits (5962)	Transistors (5961)
Fiber optic cables (6030)	Magnetics (5950)	Wire and Cable (6145)
	Monolithic microcircuits (5962)

3.0 **DEFINITIONS AND ACRONYMS** – Definitions and acronyms are in accordance with MSFC-STD-3012.

4.0 **REQUIREMENTS**

4.1 <u>General</u> – This plan, or MSFC approved equivalent requirements, shall be applied to each subcontract tier for applicable equipment. The requirements of MSFC-STD-3012 for Grade 4 parts and the implementation requirements herein shall be met.

4.1.1 <u>Focal Point Organization</u> – The organization serving as the focal point in matters pertaining to this plan shall be MSFC's EEE Parts Engineering.

4.2 <u>**Part Qualification**</u> – In accordance with MSFC-STD-3012 qualification at the piece part level is not required. However, since commercial parts receive no screening and offer no notification of changes to design or processes it is recommended that qualified parts be used when the schedule and funding will allow it.

4.3 <u>**Quality Assurance Requirements**</u> – Quality assurance requirements shall comply with the requirements for Grade 4 parts of MSFC-STD-3012.

4.4 Application Requirements -

4.4.1 <u>Derating</u> –It is strongly recommended that parts be derated in the application in accordance with MSFC-STD-3012.

4.4.2 <u>Ionizing Radiation</u> – Where feasible in accordance with MSFC-STD-3012,parts should be acceptable for use in the projected radiation environment identified in project documentation. Consideration should be given to both total dose and single event effects. It should be noted that certain parts may not perform to specification in a radiation environment.

4.4.3 <u>Thermal Vacuum Bake</u> - Connectors and backshells shall be thermal vacuum baked in accordance with MSFC-SPEC-548 or equivalent before being installed on cables, unless the applicable part specification negates the need for bake out. All cables shall be baked in accordance with MSFC-SPEC-684 or equivalent.

4.4.4 <u>Hazard Avoidance</u> – Parts shall comply with the hazard avoidance requirements of MSFC-STD-3012 and the additional requirements of NSTS 1700.7.

4.5 <u>Configuration Control Requirements</u> – The MSFC EEE Parts Engineering organization shall be available to assist in the selection of EEE parts. No formal approval of the EEE parts is required.

4.5.1 <u>Parts Selection</u> - The parts, selection, and screening shall conform to the requirements and guidelines contained in Table VIII of MSFC-STD-3012.

4.5.2 Nonstandard Parts - There are no nonstandard parts. All parts are considered standard.

4.6 Parts Related Data Requirements -

4.6.1 <u>As-Designed EEE Parts List</u> – An As-Designed EEE Parts Lists shall be prepared in accordance with MSFC-STD-3012 in an electronic format. This parts list will enable the project to evaluate the impact of GIDEP ALERTs and also contribute to a flight history database for future use of commercial parts. The following identification and status information shall be provided as a minimum.

Identifying part number for the end item in which the EEE part will be used.

I	Applicab	le EEE part type	e (from 1.2	above).				
I	I	Part numbe	r that will a	ppear in the using	g assembly's parts	list as the unique identif	ication of the EEE pa	art.
Ι	I	I	Specifica	tion or drawing in	n which the detail	characteristics of the EE	E part are identified.	
I	I	I	Ι	A common, o	or manufacturer's,	number identifying the b	oasic function of the	EEE part.
 End Item	 Part Type	 EEE P/N	 EEE Spec	 Generic P/N			Manufacturer	Quantity
					Ι			
							I	I
							I	I

Identification of manufacturer(s) of the EEE part (QML, QPL, or CAGE code preferred).

Estimated quantity, if available, that will be used per end item.

Τ

4.6.1.1 <u>In-house As-Designed EEE Parts Lists</u> – An As-Designed EEE Parts Lists for MSFC inhouse design shall be prepared in accordance with 4.6.2 above by the design activity and submitted to project management for approval.

4.6.2 <u>As-Built EEE Parts List</u> – An As-Built EEE Parts Lists shall be submitted in accordance with MSFC-STD-3012. The following identification and traceability information shall be provided as a minimum.

Identifying part number for the end item using the EEE part.

I	Serial number	er of the end item	using the EEF	E part.					
I	Ι	Identifying pa	art number of th	ne assembly whi	ch calls out the	installation of t	he EEE part.		
I	I	Ι	Serial number	er of the using as	ssembly.				
I	Ι	Ι	Ι	Applicable E	EE part type (fr	om 1.2 above).			
 End Item	 E.I. S/N	Using Assy	 Assy S/N	 EEE Type	EEE P/N	Ref Des	Mfg		
Part numb	er that appears	in the using asser	nbly's parts lis	t as the EEE par	 t identification.	 			
	Reference	ce designation that	at indentifies th	e EEE part's cir	cuit location (i.e	e. R1, C1, etc.).	I	Ι	I
		Precise identit	fication of the 1	nanufacturer of	the installed EE	E part (CAGE	code preferred).	Ι	I
									I

4.6.2.1 <u>In-house As-Built EEE Parts Lists</u> – An As-Built EEE Parts Lists for MSFC in-house manufacturing shall be prepared in accordance with 4.6.3.above by the manufacturing activity and submitted to project management.

Multiprogram/Project Common-Use Document				
	ED16			
Title: EEE PARTS MANAGEMENT	Document No.: MSFC-STD-3012	Revision: Baseline		
AND CONTROL FOR MSFC				
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 98 of 99		

4.6.3 <u>Government Industry Data Exchange Program (GIDEP)</u> – GIDEP participation shall be in accordance with MSFC-STD-3012 and contractual data requirements.

4.6.4 <u>ALERT</u> – ALERT preparation and assessment shall be in accordance with MSFC-STD-3012 and contractual data requirements. An ALERT and Failure Analysis Program shall be established and implemented. ALERTs distributed by GIDEP and reissued by MSFC as "FULL ALERTs" shall be evaluated for impact and corrective actions, and responses provided to MSFC by a systematic approach.

4.6.4.1 <u>In-house ALERT</u> – MSFC in-house ALERT activities shall be in accordance with MPG 1280.5.

4.6.5 <u>Traceability</u> – Traceability shall be provided in accordance with MSFC-STD-3012.

4.6.6 <u>Quality Assurance Data</u> -Results of destructive physical analyses, materials review boards, and failure review boards, parts problems reported from the field shall be documented and available for MSFC review.

4.6.7 <u>Specifications and Control Drawings</u> – EEE parts shall be defined and controlled by military/industry standard specifications, by control drawings or by vendor data sheets. A part control drawing, such as a VICD, may be used to document the performance and quality assurance characteristics required for the part where there is no military/industry standard that fully documents the requirements. The activity procuring parts is responsible for preparation of part control drawings. Published vendor data sheets, purchase order data, and catalog data may substitute for a part control drawing.

4.6.7.1 <u>In-house Control Drawings</u> – Preparation of part control drawings for MSFC in-house initiated parts procurements, shall be the responsibility of the design activity, with support from EEE Parts Engineering.

4.7 <u>Lifetime Parts Availability Requirements</u> – Where feasible, the projects shall procure a quantity of a part (at least 20% over actual requirement) to support equipment maintenance, planned future builds, and potential future builds where any of the following applies: (1) the part is a commercial part rather than a military or NASA standard part, (2) the applicable military or NASA standard is identified as "not for new design," or equivalent, (3) there is other reason to indicate that the same part may not be available for future procurement within the life of the design, or (4) the minimum buy for the part exceeds or very nearly equals the life time requirement for the design.

4.8 Manufacturing and Handling Requirements

4.8.1 <u>Electrostatic Discharge (ESD) Control</u> – ESD control shall be in accordance with MIL-STD-1686, or equivalent. The ESD measures shall be documented and implemented during all manufacturing phases such as receiving inspections, assembly, testing, repair, storage, and shipping of all items designated as ESD sensitive. Engineering documentation shall incorporate the ESD requirements of MIL-STD-1686 for handling ESD sensitive electronic parts and assemblies.

4.8.1.1 <u>In-house ESD</u> – ESD control within MSFC shall be in accordance with MSFC-RQMT-2918.

AND CONTROL FOR MSFC					
SPACE FLIGHT HARDWARE	Effective Date: December 17, 1999	Page 99 of 99			

4.8.2 <u>Environmental Control</u> – Environmental controls such as temperature, humidity, and particulate contamination shall identified for parts handling, packaging, and storage.

4.8.3 <u>Manufacturing Process Compatibility</u> – Parts shall be compatible with manufacturing processes in accordance with MSFC-STD-3012.

4.8.5.1 <u>In-house Manufacturing Compatibility</u> – Solder dipped, or equivalent, lead finishes are preferred for MSFC in-house use and shall be specified where this is an option. Surface mount or through-hole packages, or a combination of both, are acceptable for in-house use.

4.8.4 <u>Suspect Parts</u> – Use of parts affected by ALERTs and problem advisories shall be in accordance with MSFC-STD-3012.

4.9 <u>Off-The-Shelf (OTS) Assemblies</u> - The design organization using OTS assemblies shall be responsible for assuring that OTS hardware is suitable for the application.

4.10 <u>Ground Support Equipment (GSE)/Avionics Interface</u> - Connectors that physically mate with flight hardware shall be of the same physical configuration.
