MADDEN-JULIAN OSCILLATION

(a.k.a. Intraseasonal Oscillation)

- ❖ Intraseasonal Time Scale: 30-60 days
- ❖ Slow Eastward Propagation:
 - ~5 m/s Phase Speed
- ❖ Strong Coupling Between Deep Convection and Large-Scale Circulation
- ❖ Planetary Zonal Scale (Wavenumber One-Two)
- ❖ Vertical Baroclinic Structure
- ❖ Equatorially Trapped
- ❖ Strong Geographic Preference: The Tropical Indian and West Pacific Oceans (“Warm Pool”)
- ❖ Strong Seasonal Dependence:
 - NH Winter: Strong; Eastward Propagation
 - NH Summer: Weak, Northeast Propagation
- ❖ Significant Interannual Variability
- ❖ Scale Interaction with Many Other High-Frequency, Small-Scale Convective Systems

THE LARGE-SCALE MJO CONVECTION AND CIRCULATION ANOMALIES HAVE BEEN WELL UNDERSTOOD AND DOCUMENTED.

Gill 1980; Hendon and Salby 1994

Subtropical UT anticyclones lag equatorial enhanced MJO convection.

Subtropical UT cyclones lead equatorial enhanced MJO convection.

Equatorial UT easterlies (Rossby wave response)

Equatorial enhanced MJO convection

Equatorial UT westerlies (Kelvin wave response)

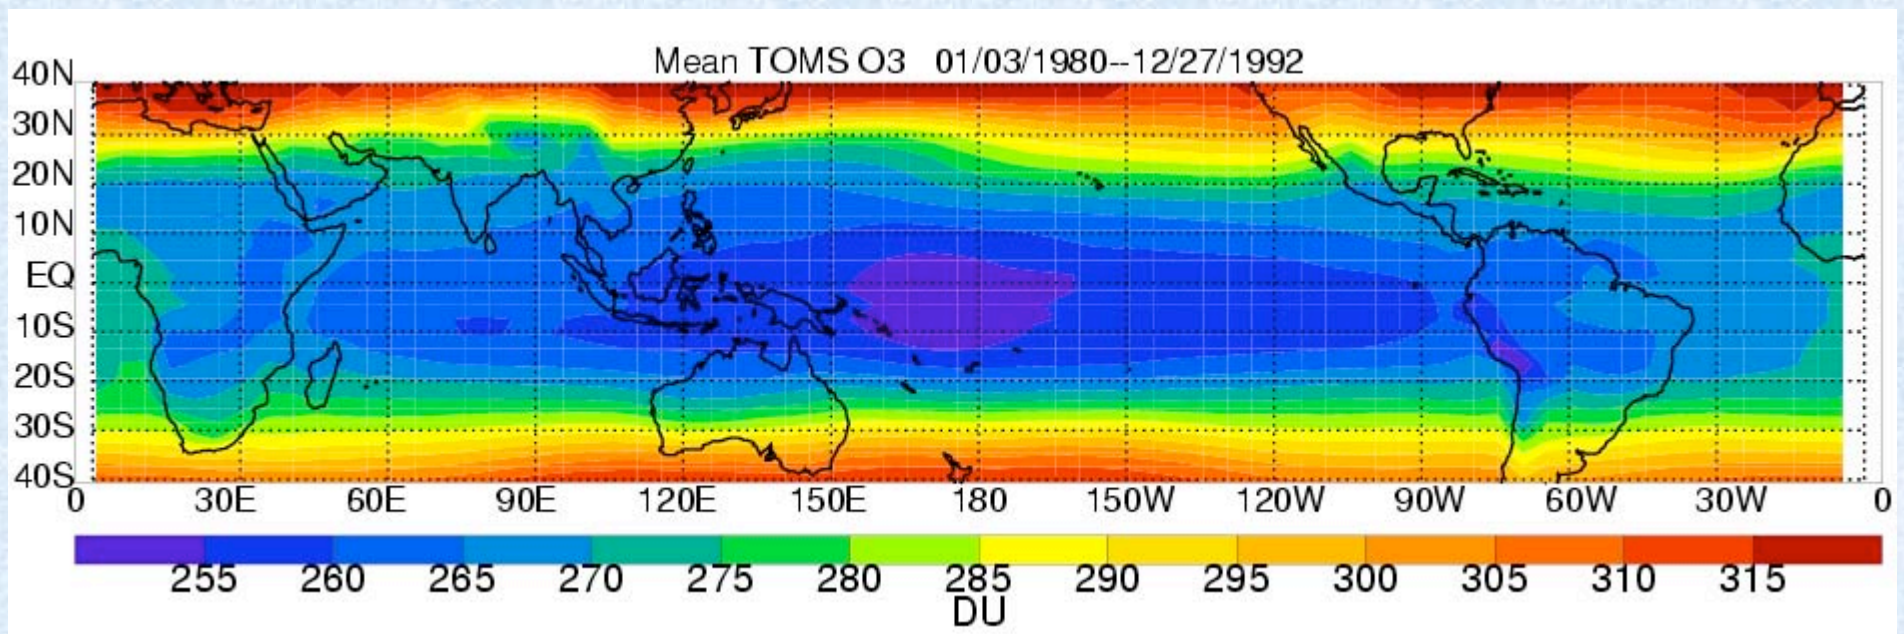

However, the intraseasonal variations of atmospheric compositions, such as ozone and aerosol, have not been well documented and understood.

Pasadena, California

TROPICAL OZONE (O₃) VARIATIONS

Time Scale	Annual Cycle	QBO	ENSO	Solar Cycle	Intraseasonal (MJO)
Magnitude	±10DU (3%)	±15DU (5%)	±10DU (3%)	±5DU (2%)	???

National Aeronautics and
Space Administration

Jet Propulsion Laboratory
California Institute of Technology
Pasadena, California

OBJECTIVE

➤ **To investigate the intraseasonal variations of the tropical total O₃.**

 **Are there any intraseasonal variations of the tropical total O₃?**

 **If yes, how large?**

 **What physical and/or dynamical processes are responsible to these intraseasonal variations?**

National Aeronautics and
Space Administration

Jet Propulsion Laboratory
California Institute of Technology
Pasadena, California

DATA

➤ Total O3:

AIRS L3, 1.0° x 1.0°, Pentad, From 09/01/2002 to 01/31/2005

TOMS, 3° lat x 5° long, Pentad, From 01/01/1980 to 12/31/1992

➤ Rainfall:

TRMM, 1.0° x 1.0°, Pentad, From 01/01/1998 to 07/31/2006

GPCP, 2.5° x 2.5°, Pentad, From 01/01/1979 to 12/31/2005

➤ Dynamical Fields (Winds, Geopotential Height):

**NCEP/NCAR Reanalysis, 2.5° x 2.0°, Pentad,
From 01/01/1980 to 12/31/1992**

National Aeronautics and
Space Administration

Jet Propulsion Laboratory
California Institute of Technology
Pasadena, California

MJO ANALYSIS AND COMPOSITING PROCEDURE

- (1) Removing the annual cycle.
- (2) Filtering the data using a 30-90-day filter.
- (3) Identifying MJO events using Extended EOF analysis.
- (4) Averaging all the MJO events.

SELECTED 8 MJO EVENTS FOR AIRS DATA

SELECTED 24 MJO EVENTS FOR TOMS DATA

AIRS TOTAL O3 MJO ANOMALY

Subtropical negative total O3 anomalies lag equatorial enhanced MJO convection.

Equatorial enhanced MJO convection

Lags -2 and +2 have the same pattern but opposite signs.

Subtropical positive total O3 anomalies lead equatorial enhanced MJO convection.

Equatorial negative total O3 anomalies are coincident with equatorial enhanced MJO convection.

Jet Propulsion Laboratory
California Institute of Technology
Pasadena, California

TOTAL O3 MJO ANOMALY

AIRS

TOMS

Both AIRS and TOMS show that subtropical negative total O3 anomalies lag equatorial enhanced MJO convection.

Both AIRS and TOMS show that subtropical positive total O3 anomalies lead equatorial enhanced MJO convection.

Equatorial enhanced MJO convection

AIRS and TOMS are different in the equatorial MJO convective regions.

Comp AIRS L3 TotO3 (DU) MJO Anomaly (Color Shading)

Contours denote TRMM Rainfall MJO Anomaly

Solid: Postive; Dashed: Negative; Contour Interval: 0.5 mm day⁻¹

Composite TOM O3 (DU) MJO Anomaly (Color Shading)

Contours denote GPCP Rainfall MJO Anomaly

Solid: Postive; Dashed: Negative; Contour Interval: 0.5 mm day⁻¹

OBJECTIVE

1. **Is any intraseasonal variation of the tropical total O₃?**

Answer: Yes.

2. **If yes, how large?**

Answer: 5 DU

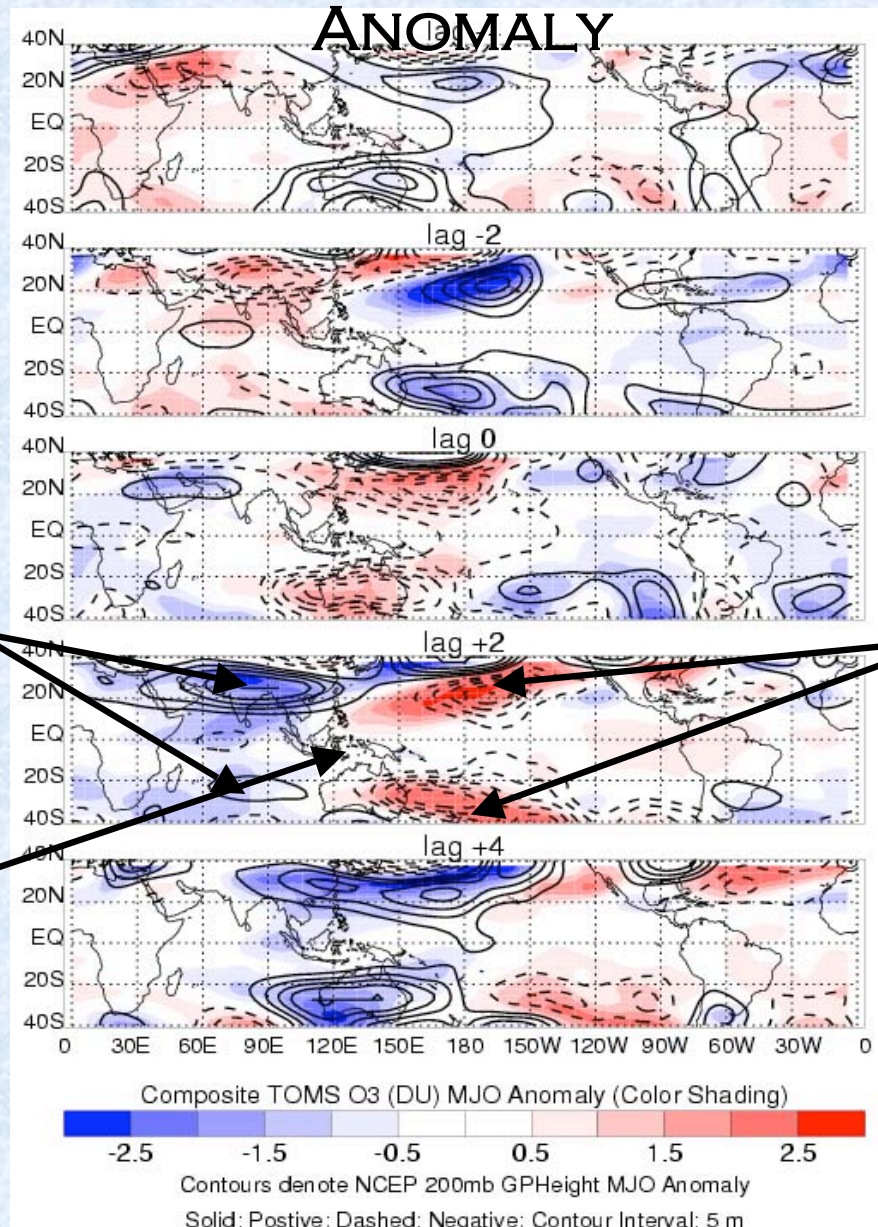

3. **What physical and/or dynamical processes are responsible to these variations?**

Pasadena, California

CONNECTION BETWEEN TOMS TOTAL O3 MJO ANOMALY AND NCEP UT GPHEIGHT MJO

UT air moves up ↑

Total O3 decreases ↓

Subtropical negative total O3 anomalies are coincident with the subtropical positive UT geopotential height anomalies.

Equatorial enhanced MJO convection

UT air moves down ↓

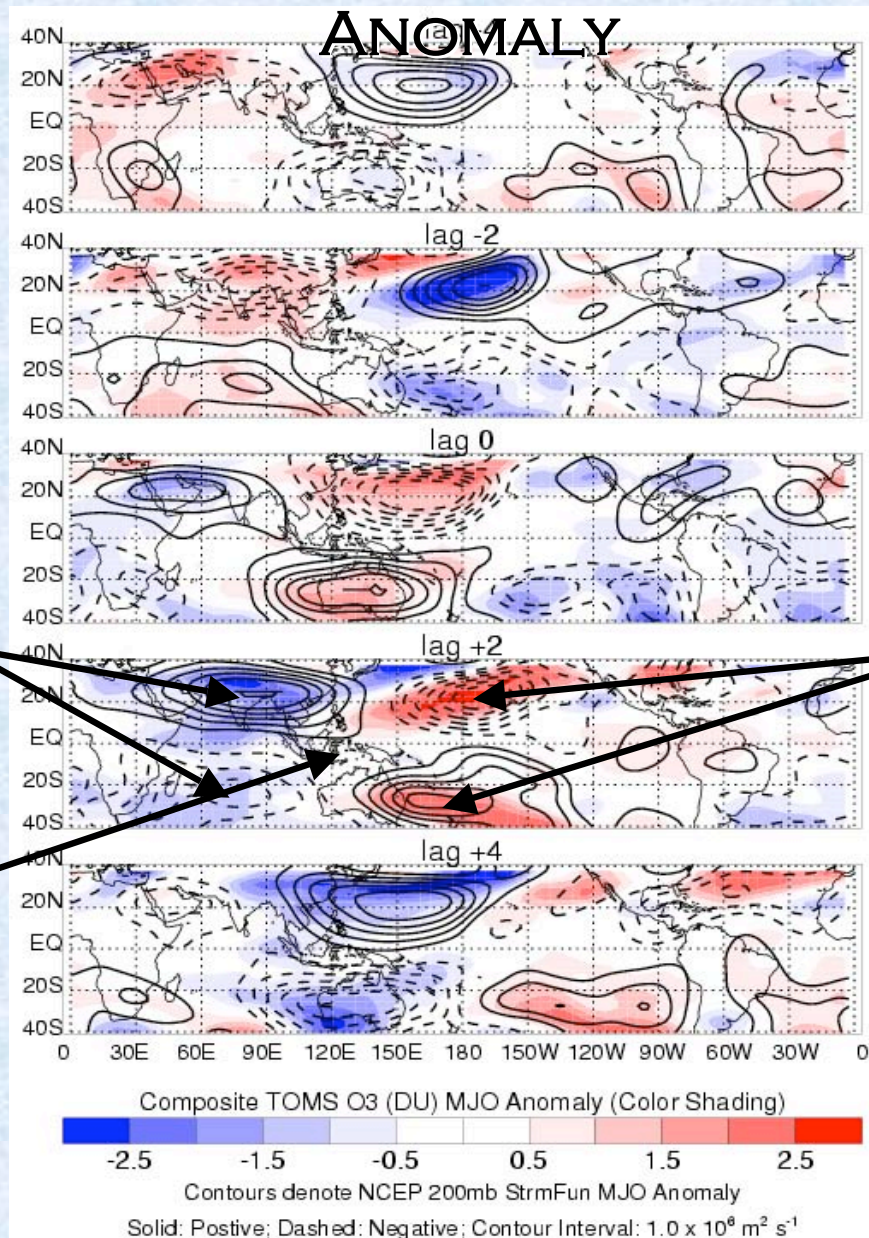

Total O3 increases ↑

Subtropical positive total O3 anomalies are coincident with the subtropical negative UT geopotential height anomalies.

National Aeronautics and Space Administration
Jet Propulsion Laboratory
California Institute of Technology
Pasadena, California

CONNECTION BETWEEN TOMS TOTAL O3 MJO ANOMALY AND NCEP UT STREAM FUNCTION MJO

Subtropical negative total O3 anomalies are coincident with subtropical anticyclones.

Subtropical positive total O3 anomalies are coincident with subtropical cyclones.

Equatorial enhanced MJO convection

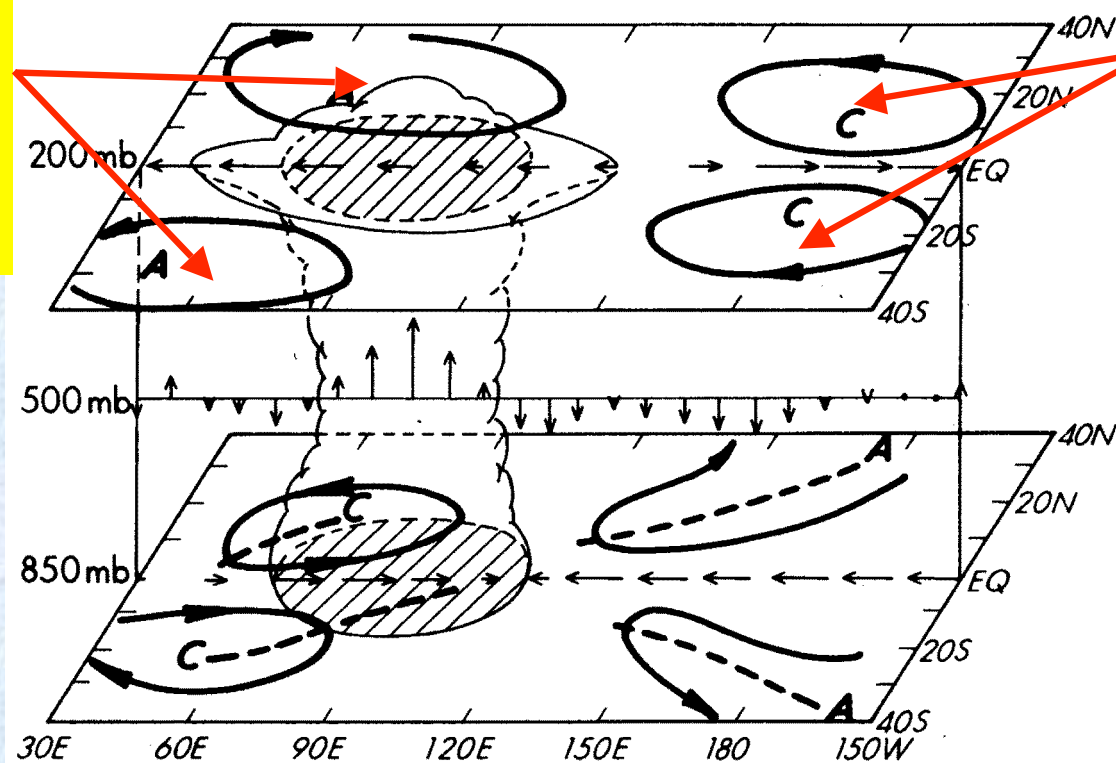

National Aeronautics and Space Administration
Jet Propulsion Laboratory
 California Institute of Technology
 Pasadena, California

MJO IMPACT ON TROPICAL TOTAL O₃

Subtropical UT anticyclones bring up O₃-poor tropospheric air (increase geopotential height) to decrease the subtropical total O₃.

Subtropical UT cyclones bring down O₃-rich stratospheric air (decrease geopotential and tropopause height) to increase the subtropical total O₃.

Schematic of the large-scale wind structure of the MJO. The cloud symbol indicates the convective center. Arrows represent anomalous winds at 850 and 200 hPa and the vertical motions at 500 hPa. “A” and “C” mark the anticyclonic and cyclonic circulation centers, respectively. Dashed lines mark troughs and ridges. From [Rui and Wang \[1990\]](#).

Space Administration

Jet Propulsion Laboratory
California Institute of Technology
Pasadena, California

SUMMARY

- **There are intraseasonal variations of tropical total O₃ in both AIRS and TOMS.**
- **The intraseasonal variations of tropical total O₃ are large (around 5DU) and comparable to those associated with other time scales.**
- **The intraseasonal variations of total O₃ are mainly in the subtropics. These anomalies are mainly dynamically driven as a result of the subtropical upper-tropospheric (anti-)cyclones generated by the equatorial MJO convection.**
- **AIRS data together with other satellite data (e.g., TRMM, CloudSat, MLS, ISCCP, and TOMS) are very useful to study tropical convection and climate.**

A TYPICAL MJO IN N.H. WINTER

The 200mb stream function is shown by the color shading. The OLR anomalies are contoured at 10 W m^{-2} (dashed line), indicating enhanced convection, and at $+10 \text{ W m}^{-2}$ (solid line), indicating reduced convection. The images are spaced approximately 3 days apart and one whole cycle lasts approximately 48 days. From [Matthews et al. \(2004\)](#).
