

# **Complete Summary**

# TITLE

Decubitus ulcer: rate per 1,000 discharges.

# SOURCE(S)

AHRQ quality indicators. Guide to patient safety indicators [version 3.1]. Rockville (MD): Agency for Healthcare Research and Quality (AHRQ)AHRQ Pub; 2007 Mar 12. 76 p.(AHRQ Pub; no. 03-R203).

#### **Measure Domain**

#### PRIMARY MEASURE DOMAIN

Outcome

The validity of measures depends on how they are built. By examining the key building blocks of a measure, you can assess its validity for your purpose. For more information, visit the <u>Measure Validity</u> page.

## SECONDARY MEASURE DOMAIN

Does not apply to this measure

#### **Brief Abstract**

## DESCRIPTION

This measure is used to assess the number of cases of decubitus ulcer per 1,000 discharges with a length of stay greater than 4 days.

## RATIONALE

Hospitals in the United States provide the setting for some of life's most pivotal events - the birth of a child, major surgery, treatment for otherwise fatal illnesses. These hospitals house the most sophisticated medical technology in the world and provide state-of-the-art diagnostic and therapeutic services. But access to these services comes with certain costs. About 30% of personal health care expenditures in the United States go towards hospital care, and the rate of growth in spending for hospital services has only recently leveled out after several years of increases following a half a decade of declining growth. Simultaneously, concerns about the quality of health care services have reached a crescendo with the Institute of Medicine's series of reports describing the problem of medical errors and the need for a complete restructuring of the health care system to improve the quality of care. Policymakers, employers, and consumers have made the quality of care in U.S. hospitals a top priority and have voiced the need to assess, monitor, track, and improve the quality of inpatient care.

Widespread consensus exists that health care organizations can reduce patient injuries by improving the environment for safety from implementing technical changes, such as electronic medical record systems, to improving staff awareness of patient safety risks. Clinical process interventions also have strong evidence for reducing the risk of adverse events related to a patient's exposure to hospital care. Patient Safety Indicators (PSIs), which are based on computerized hospital discharge abstracts from the AHRQ's Healthcare Cost and Utilization Project (HCUP), can be used to better prioritize and evaluate local and national initiatives. Analyses of these and similar inexpensive, readily available administrative data sets may provide a screen for potential medical errors and a method for monitoring trends over time.

The Decubitus Ulcer indicator\* is intended to flag cases of in-hospital decubitus ulcers. Its definition is limited to decubitus ulcer as secondary diagnosis to better screen out cases that may be present on admission. In addition, this indicator excludes patients who have a length of stay of 4 days or less, as it is unlikely that a decubitus ulcer would develop within this period of time. Finally, this indicator excludes patients who are particularly susceptible to decubitus ulcer, namely patients with major skin disorders (Major Diagnostic Category 9 [MDC 9]) and paralysis.

\*The following concerns affect the validity of this indicator:

- Underreporting or screening: Conditions included in this indicator may not be systematically reported (leading to an artificially low rate) or may be routinely screened for (leading to a higher rate in facilities that screen).
- *Heterogeneous severity*: This indicator includes codes that encompass several levels of severity of a condition that cannot be ascertained by the codes.
- *Case mix bias*: This indicator was felt to be particularly subject to systematic bias, and Diagnosis-Related Group (DRG) and comorbidity risk adjustment may not adequately address the concern.

Refer to the original measure documentation for further information.

## PRIMARY CLINICAL COMPONENT

Decubitus ulcer

## DENOMINATOR DESCRIPTION

All medical and surgical discharges, 18 years and older, defined by specific Diagnosis-Related Groups (DRGs)

Exclude cases:

• with length of stay of less than 5 days

- with International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) code of decubitus ulcer in the principal diagnosis field or in a secondary diagnosis field if present on admission, if known
- Major Diagnostic Category (MDC) 9 (Skin, Subcutaneous Tissue, and Breast)
- MDC 14 (pregnancy, childbirth, and puerperium)
- with any diagnosis of hemiplegia, paraplegia, or quadriplegia
- with an ICD-9-CM diagnosis code of spina bifida or anoxic brain damage
- with an ICD-9-CM procedure code for debridement or pedicle graft before or on the same day as the major operating room procedure (surgical cases only)
- admitted from a long-term care facility
- transferred from an acute care facility

**Note**: Refer to the Technical Specifications document cited in the "Companion Documents" field for specific DRGs and ICD-9-CM codes.

## NUMERATOR DESCRIPTION

Discharges with International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) code of decubitus ulcer in any secondary diagnosis field among cases meeting the inclusion and exclusion rules for the denominator

**Note**: Refer to the Technical Specifications document cited in the "Companion Documents" field for specific ICD-9-CM codes.

#### **Evidence Supporting the Measure**

## **EVIDENCE SUPPORTING THE CRITERION OF QUALITY**

- A formal consensus procedure involving experts in relevant clinical, methodological, and organizational sciences
- One or more research studies published in a National Library of Medicine (NLM) indexed, peer-reviewed journal

#### **Evidence Supporting Need for the Measure**

#### NEED FOR THE MEASURE

Variation in quality for the performance measured

## **EVIDENCE SUPPORTING NEED FOR THE MEASURE**

#### CASE FINDING

Users of care only

## **DESCRIPTION OF CASE FINDING**

All medical and surgical discharges, 18 years and older, defined by specific Diagnosis-Related Groups (DRGs) (see the "Denominator Inclusions/Exclusions" field)

**Note**: Refer to the Technical Specifications document cited in the "Companion Documents" field for specific DRGs.

#### **DENOMINATOR SAMPLING FRAME**

Patients associated with provider

## DENOMINATOR INCLUSIONS/EXCLUSIONS

#### Inclusions

All medical and surgical discharges, 18 years and older, defined by specific Diagnosis-Related Groups (DRGs)

Include only patients with a length of stay of 5 or more days.

#### Exclusions

Exclude cases:

• with length of stay of less than 5 days

- with International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) code of decubitus ulcer in the principal diagnosis field or in a secondary diagnosis field if present on admission, if known
- Major Diagnostic Category (MDC) 9 (Skin, Subcutaneous Tissue, and Breast)
- MDC 14 (pregnancy, childbirth, and puerperium)
- with any diagnosis of hemiplegia, paraplegia, or quadriplegia
- with an ICD-9-CM diagnosis code of spina bifida or anoxic brain damage
- with an ICD-9-CM procedure code for debridement or pedicle graft before or on the same day as the major operating room procedure (surgical cases only)
- admitted from a long-term care facility
- transferred from an acute care facility

**Note**: Refer to the Technical Specifications document cited in the "Companion Documents" field for specific DRGs and ICD-9-CM codes.

## **RELATIONSHIP OF DENOMINATOR TO NUMERATOR**

All cases in the denominator are equally eligible to appear in the numerator

# **DENOMINATOR (INDEX) EVENT**

Clinical Condition Institutionalization Therapeutic Intervention

#### **DENOMINATOR TIME WINDOW**

Time window is a single point in time

## NUMERATOR INCLUSIONS/EXCLUSIONS

#### Inclusions

Discharges with International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) code of decubitus ulcer in any secondary diagnosis field among cases meeting the inclusion and exclusion rules for the denominator

**Note**: Refer to the Technical Specifications document cited in the "Companion Documents" field for specific ICD-9-CM codes.

#### **Exclusions**

Unspecified

# MEASURE RESULTS UNDER CONTROL OF HEALTH CARE PROFESSIONALS, ORGANIZATIONS AND/OR POLICYMAKERS

The measure results are somewhat or substantially under the control of the health care professionals, organizations and/or policymakers to whom the measure applies.

#### NUMERATOR TIME WINDOW

Institutionalization

## **DATA SOURCE**

Administrative data

# LEVEL OF DETERMINATION OF QUALITY

Not Individual Case

## OUTCOME TYPE

Adverse Outcome

## **PRE-EXISTING INSTRUMENT USED**

Unspecified

**Computation of the Measure** 

## SCORING

Rate

## **INTERPRETATION OF SCORE**

Better quality is associated with a lower score

# ALLOWANCE FOR PATIENT FACTORS

Analysis by high-risk subgroup (stratification on vulnerable populations) Analysis by subgroup (stratification on patient factors, geographic factors, etc.) Risk adjustment method widely or commercially available

## **DESCRIPTION OF ALLOWANCE FOR PATIENT FACTORS**

Risk adjustment of the data is recommended using age, sex, modified Diagnosis-Related Group (DRG), and comorbidity categories.

Application of multivariate signal extraction (MSX) to smooth risk adjusted rates is also recommended.

## STANDARD OF COMPARISON

External comparison at a point in time External comparison of time trends Internal time comparison

#### **Evaluation of Measure Properties**

## EXTENT OF MEASURE TESTING

The Patient Safety Indicators (PSIs) were evaluated by the project team using empirical analyses to explore the frequency and variation of the indicators, the potential bias, based on limited risk adjustment, and the relationship between indicators. The data sources used in the empirical analyses were the 1997 Florida State Inpatient Database (SID) for initial testing and development and the 1997 Healthcare Cost and Utilization Project (HCUP) State Inpatient Database for 19 States for the final empirical analyses.

All potential indicators were examined empirically by developing and conducting statistical tests for precision, bias, and relatedness of indicators. Three different estimates of hospital performance were calculated for each indicator:

- 1. The raw indicator rate was calculated using the number of adverse events in the numerator divided by the number of discharges in the population at risk by hospital.
- 2. The raw indicator was adjusted to account for differences among hospitals in age, gender, modified Diagnosis-Related Group (DRG), and comorbidities.
- Multivariate signal extraction methods were applied to adjust for reliability by estimating the amount of "noise" (i.e., variation due to random error) relative to the amount of "signal" (i.e., systematic variation in hospital performance or reliability) for each indicator.

The project team constructed a set of statistical tests to examine the precision, bias, and relatedness of indicators for all accepted Provider-level Indicators, and precision and bias for all accepted Area-level Indicators. It should be noted that rates based on fewer than 30 cases in the numerator or the denominator are not reported.

The project team conducted a structured review of each indicator to evaluate the face validity (from a clinical perspective) of the indicators. The methodology for the structured review was adapted from the RAND/UCLA Appropriateness Method and consisted of an initial independent assessment of each indicator by clinician panelists using an initial questionnaire, a conference call among all panelists, followed by a final independent assessment by clinician panelists using the same questionnaire. The review sought to establish *consensual validity*, which "extends face validity from one expert to a panel of experts who examine and rate the appropriateness of each item..." The panel process served to refine definitions of some indicators, add new measures, and dismiss indicators with major concerns from further consideration.

Refer to the original measure documentation for additional details.

#### ADAPTATION

This indicator was originally proposed by Iezzoni and colleagues (1994) as part of Complications Screening Program (CSP) (CSP 6, "cellulitis or decubitus ulcer"). Needleman and Buerhaus (2001) identified decubitus ulcer as an "outcome potentially sensitive to nursing." The American Nurses Association (1999), its State associations, and the California Nursing Outcomes Coalition have identified the total prevalence of inpatients with Stage I, II, III, or IV pressure ulcers as a "nursing-sensitive quality indicator for acute care settings."
