## Appendix A <br> Overview of Procedures Used for the NAEP 2003 Reading Assessment

This appendix provides an overview of the NAEP 2003 reading assessment's primary componentsframework, development, administration, scoring, and analysis. A more extensive review of the procedures and methods used in the reading assessment will be included in the assessment procedures sections of the NAEP web site (http://nces.ed.gov/nationsreportcard).
The NAEP 2003 Reading Assessment
The National Assessment Governing Board (NAGB), created by Congress in 1988, is responsible for formulating policy for NAEP. NAGB is specifically charged with developing assessment objectives and test specifications. The design of the NAEP 2003 reading assessment follows the guidelines first provided in the framework developed for the 1992 assessment. ${ }^{1}$ The framework underlying the 1992, 1994, 1998, 2000 (fourth grade only), 2002, and 2003 reading assessments reflects the expert opinions of educators and researchers about reading. The development of this framework and the specifications that guided the development of the assessment involved the critical input of hundreds of individuals across the country, including representatives of national education organizations, teachers, parents, policymakers, business leaders, and the interested general public.

[^0]The framework development process was managed by the Council of Chief State School Officers (CCSSO) for NAGB.

The framework sets forth a broad definition of "reading literacy" that includes developing a general understanding of written text, thinking about it, and using various texts for different purposes. In addition, the framework views reading as an interactive and dynamic process involving the reader, the text, and the context of the reading experience. For example, readers may read stories to enjoy and appreciate the human experience, study science texts to form new hypotheses about knowledge, or follow directions to fill out a form. NAEP reflects current definitions of literacy by differentiating among three contexts for reading and four aspects of reading. The contexts for reading and aspects of reading make up the foundation of the NAEP reading assessment.

The "contexts for reading" dimension of the NAEP reading framework provides guidance for the types of texts to be included in the assessment. Although many commonalities exist among the different types of reading contexts, different contexts do lead to real differences in what readers do. For example, when reading for literary experience, readers make plot summaries and abstract major themes. They describe the interactions of various literary elements (e.g., setting, plot, characters, and theme). When reading for information, readers critically judge the organization and content of the text and explain their judgments. They also look for specific pieces of informa-
tion. When reading to perform a task, readers search quickly for specific pieces of information.

The "aspects of reading" dimension of the NAEP reading framework provides guidance for the types of comprehension questions to be included in the assessment. The four aspects are 1) forming $a$ general understanding, 2) developing interpretation, 3) making reader/text connections, and 4) examining content and structure. These four aspects represent different ways in which readers develop understanding of a text. In forming a general understanding, readers must consider the text as a whole and provide a global understanding of it. As readers engage in developing interpretation, they must extend initial impressions in order to develop a more complete understanding of what was read. This involves linking information across parts of a text or focusing on specific information. When making reader/text connections, the reader must connect information in the text with knowledge and experience. This might include applying ideas in the text to the real world. Finally, examining content and structure requires critically evaluating, comparing and contrasting, and understanding the effect of different text features and authorial devices.

Figure A. 1 demonstrates the relationship between these reading contexts and aspects of reading in the NAEP reading assessment. Included in the figure are sample questions that illustrate how each aspect of reading is assessed within each reading context. (Note that reading to perform a task is not assessed at grade 4.)

Figure A. 1 Sample NAEP questions, by aspects of reading and contexts for reading specified in the reading framework

| Aspect of Reading |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Context for Reading | Forming a general understanding | Developing interpretation | Making reader/text connections | Examining content and structure |
| Reading for literary experience | What is the story/plot about? | How did this character change from the beginning to the end of the story? | What other character that you have read about had a similar problem? | What is the mood of this story and how does the author use language to achieve it? |
| Reading for information | What point is the author making about this topic? | What caused this change? | What other event in history or recent news is similar to this one? | Is this author biased? Support your answer with information about this article. |
| Reading to perform a task | What time can you get a nonstop flight to $X$ ? | What must you do before step 3? | Describe a situation in which you would omit step 5. | Is the information in this brochure easy to use? |

SOURCE: National Assessment Governing Board. (2002). Reading Framework for the 2003 National Assessment of Educational Progress. Washington, DC: Author.

The assessment framework specifies not only the particular dimensions of reading literacy to be measured, but also the percentage of assessment questions that should be devoted to each. The target percentage distribution for contexts of reading and aspects of reading as specified in the framework, along with the actual percentage distribution in the assessment, are presented in tables A. 1 and A.2.

The actual content of the assessment has varied from the targeted distribution. For example, at grade 8 reading for
literary experience falls below the target proportions and reading for information falls above the target proportions specified in the framework. The reading instrument development panel responsible for overseeing the development of the assessment recognized this variance but felt strongly that assessment questions must be sensitive to the unique elements of the authentic reading materials being used. Thus, the distribution of question classifications will vary across reading passages and reading contexts.

Table A.1 Target and actual percentage distribution of questions, by context for reading, grades 4 and 8: 2003

|  |  | Context for Reading <br> Reading for <br> literary experience | Reading for <br> information | Reading to <br> perform a task |
| :--- | :---: | :---: | :---: | :---: |
| Grade 4 | Target | 55 | 45 | $\dagger$ |
|  | Actual | 50 | 50 | $\dagger$ |
| Grade 8 |  |  |  |  |
|  | Target | 40 | 40 | 20 |

$\dagger$ Not applicable. Reading to perform a task was not assessed at grade 4.
NOTE: Detail may not sum to totals because of rounding.

## The Assessment Design

Each student who participated in the 2003 reading assessment received a booklet containing three or four sections: a set of general background questions, a set of subject-specific background questions, and one or two sets of questions assessing students' comprehension of a text or texts. The sets of questions assessing students' comprehension are referred to as "blocks." Each block contains one or more reading passages and a set of comprehension questions. At grade 8, students were given either two 25 -minute blocks or one 50 -minute block. At grade 4, however, only 25-minute blocks were used.

The blocks contain a combination of multiple-choice and constructed-response questions. Multiple-choice questions require students to select the best answer from a set of four options. Constructedresponse questions require students to provide their own written response to an open-ended question. Short constructedresponse questions may require a response of only a sentence or two for the answer to be considered complete. Extended con-structed-response questions, however, may require a response of a paragraph or more for the answer to receive full credit. Each constructed-response question has its own unique scoring guide that is used by trained scorers to rate students' responses. (See the "Data Collection and Scoring" section of this appendix.)

The grade 4 assessment consisted of ten 25-minute blocks: five blocks of literary texts and questions and five blocks of informative texts and questions. Each block contained one passage corresponding to one of the contexts for reading and 9-12 multiple-choice and constructedresponse questions. In most blocks, one of the constructed-response questions required an extended response. As a whole,
the 2003 fourth-grade assessment consisted of 49 multiple-choice questions, 45 short constructed-response questions, and 8 extended constructed-response questions.

The grade 8 assessment consisted of twelve 25-minute blocks (four literary, four informative, and four to perform a task) and one 50-minute block (informative). Each block contained at least one passage corresponding to one of the contexts for reading and 9-13 multiple-choice and constructed-response questions. Most blocks contained at least one extended constructed-response question. As a whole, the eighth-grade assessment consisted of 58 multiple-choice questions, 68 short constructed-response questions, and 15 extended constructed-response questions.

The assessment design allowed maximum coverage of a range of reading abilities at each grade, while minimizing the time burden for any one student. This was accomplished through the use of matrix sampling of items in which representative samples of students took various portions of the entire pool of assessment questions. Individual students are required to take only a small portion, but the aggregate results across the entire assessment allow for broad reporting of reading abilities for the targeted population.

In addition to matrix sampling, the assessment design utilized a procedure for distributing blocks across booklets that controlled for position and context effects. Students received different blocks of passages and comprehension questions in their booklets according to a procedure that assigned blocks of questions, balancing the positioning of blocks across booklets and balancing the pairing of blocks within booklets according to the context
for reading. Blocks were balanced within each context for reading and were partially balanced across contexts for reading. The procedure also cycles the booklets for administration so that, typically, only a few students in any assessment session receive the same booklet.

In addition to the student assessment booklets, three other instruments provided data relating to the assessment: a teacher questionnaire, a school questionnaire, and a questionnaire for students with disabilities (SD) and limited-Englishproficient students (LEP). The teacher questionnaire was administered to teachers of fourth- and eighth-grade students participating in the assessment and included questions about each teacher's background and classroom organization. The fourth-grade teacher questionnaire also included questions on reading instruction. The school questionnaire was given to the principal or other administrator in each participating school and included questions related to school characteristics, policies, programs, and the composition and background of the student body.

The SD/LEP questionnaire was completed by a school staff member knowledgeable about those students selected to
participate in the assessment who were identified as having an Individualized Education Program (IEP) or equivalent plan (for reasons other than being gifted or talented), or being limited-Englishproficient. An SD/LEP questionnaire was completed for each identified student regardless of whether the student participated in the assessment. Each SD/LEP questionnaire took about three minutes to complete and asked about the student and the special-education programs in which he or she participated.

## NAEP Samples

## National Sample

The national results presented in this report are based on nationally representative probability samples of fourth- and eighth-grade students. The national sample consisted of the combined sample of public school students assessed in each state and an additional nonpublic school sample. The method of creating the national sample as an aggregate of the state samples has been used since 2002. Before 2002, the national and state samples were independent. The combined sample was chosen using a stratified twostage design that involved sampling students from selected schools (public and nonpublic).

Each selected school that participated in the assessment and each student assessed represents a portion of the population of interest. Sampling weights are needed to make valid inferences between the student samples and the respective populations from which they were drawn. Sampling weights account for disproportionate representation of students from different states and for students who attend nonpublic schools. Sampling weights also account for lower sampling rates for very small schools and are used to adjust for school and student nonresponse. ${ }^{2}$

As in 2002, the 2003 national assessment has only samples of students where accommodations were permitted. (See page 178 for information on the types of accommodations permitted.) NAEP inclusion rules were applied, and accommodations were offered when a student had an IEP indicating the need for accommodations because of a disability, was protected under Section 504 of the Rehabilitation Act of 1973 because of disability, or was identified as being a limited-En-glish-proficient student (LEP) and/or was normally offered accommodations in other assessment situations. ${ }^{3}$ All other students were asked to participate in the assessment under standard conditions. Unlike the 2002 and 2003 assessments, the 1998 and 2000 national assessments featured the collection of data from
samples of students where assessment accommodations for special-needs students were not permitted and from samples of students where accommodations for special-needs students were permitted. Prior to 1998, testing accommodations (e.g., extended time, small group testing) were not permitted for special-needs students selected to participate in the NAEP reading assessments.

Table A. 3 shows the number of students included in the national samples for the NAEP reading assessments at grades 4 and 8. The 2002 and 2003 reading assessments had only one sample of students, for whom accommodations were permitted. For the 1998 and 2000 assessments, the table shows both the number of students in the sample in which accommodations were not permitted and the number of students in the sample in which accommodations were permitted. Both samples included the same non-SD/non-LEP students; only the SD and/or LEP students differed between the two samples. The 1992 and 1994 design differed from more recent assessment years in that the SD and/or LEP students were assessed in standard conditions and accommodations were not permitted. The sample sizes and target populations for the 2003 reading assessment are listed for the nation and states in table A. 4 and for the participating districts in table A.5.

2 Additional details regarding the design and structure of the national and state samples will be included in the technical documentation section of the NAEP web site (http://nces.ed.gov/nationsreportcard).
${ }^{3}$ Section 504 of the Rehabilitation Act of 1973 is a civil rights law designed to prohibit discrimination on the basis of disability in programs and activities, including education, that receive federal financial assistance.

Table A. 3 Number of students assessed, by sample type, special needs status, and accommodation option, grades 4 and 8 public and nonpublic schools: 1992-2003

- Not available. Data were not collected at grade 8 in 2000.
$\dagger$ Not applicable. Accommodations were not permitted in this sample.
${ }^{1}$ Students with disabilities/limited-English-proficient students.
NOTE: The sample sizes are larger in 2002 and 2003 than in previous years because the 2002 and 2003 national samples were based on the combined sample of students assessed in each participating state, plus an additional sample from nonparticipating states as well as a sample of nonpublic schools.

SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 2003 Trail Urban District Reading Assessment.

Table A. 6 provides a summary of the 2003 national school and student participation rates for the reading assessment sample. Participation rates are presented for public and nonpublic schools, both individually and combined. Four different rates are presented. The first rate is a student-centered, weighted percentage of schools participating in the assessment, before substitution of demographically
similar schools. ${ }^{4}$ This rate is based only on the schools that were initially selected for the assessment. The numerator of this rate is the estimated number of students represented by the initially selected schools that participated in the assessment. The denominator is the estimated number of students represented by the initially selected schools that had eligible students enrolled.

[^3]The second school participation rate is a student-centered weighted participation rate after substitution. The numerator of this rate is the estimated number of students represented by the participating schools, whether originally selected or selected as a substitute for a school that chose not to participate. The denominator is the estimated number of students represented by the initially selected schools that had eligible students enrolled (this is the same as that for the weighted participation rate for the sample of schools before substitution). Because of the common denominators, the weighted participation rate after substitution is at least as great as the weighted participation rate before substitution.

The third school participation rate is a school-centered, weighted percentage of schools participating in the assessment before substitution of demographically similar schools. This rate is based only on the schools that were initially selected for the assessment. The numerator of this rate is the estimated number of schools represented by the initially selected schools that participated in the assessment. The denominator is the estimated number of schools represented by the initially selected schools that had eligible students enrolled.

The fourth school participation rate is a school-centered, weighted participation rate after substitution. The numerator is the estimated number of schools represented by the participating schools, whether originally selected or selected as a substitute for a school that did not participate. The denominator is the estimated number of schools, represented by the initially selected schools that had eligible students enrolled.

The student-centered and schoolcentered school participation rates differ if school participation is associated with the size of the school. If the studentcentered rate is higher than the schoolcentered rate, this indicates that larger schools participated at a higher rate than smaller schools. The converse applies also.

Also presented in table A. 6 are weighted student participation rates. The numerator of this rate is the estimated number of students who are represented by the students assessed (in either an initial session or a makeup session). The denominator of this rate is the estimated number of students represented by the eligible sampled students in participating schools.

Table A. 6 National school and student participation rates, by type of school, grades 4 and 8: 2003

|  | School participation |  |  |  |  | Student participation |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Student-centered weighted |  | School-centered weighted |  | Number of schools participating |  |  |
|  | Percentage before substitution | Percentage after substitution | Percentage before substitution | Percentage after substitution |  | Student weighted percentage | Number of students assessed |
| Grade 4 |  |  |  |  |  |  |  |
| Combined national | 98 | 98 | 92 | 93 | 7,485 | 94 | 187,581 |
| Public | 100 | 100 | 100 | 100 | 6,908 | 94 | 179,013 |
| Nonpublic | 79 | 80 | 74 | 76 | 542 | 95 | 7,488 |
| Grade 8 |  |  |  |  |  |  |  |
| Combined national | 97 | 98 | 90 | 91 | 6,109 | 92 | 155,183 |
| Public | 100 | 100 | 100 | 100 | 5,531 | 91 | 146,351 |
| Nonpublic | 74 | 76 | 75 | 78 | 568 | 94 | 8,324 |

NOTE: The number of schools and students in the combined national total includes students in the Department of Defense domestic schools located within the U.S. and Bureau of Indian Affairs schools that are not included as part of either the public or nonpublic totals.

## State Samples

The results provided in this report of the 2003 state assessment in reading are based on state-level samples of fourth- and eighth-grade public school students. The samples were selected using a two-stage sample design that first selected schools within each state or other jurisdiction and then selected students within schools. The samples were weighted to allow valid inferences about the populations of interest. Participation rates for the states and other jurisdictions were calculated the same way that rates were computed for the nation. Tables A. 7 and A. 8 contain the unweighted number of participating schools and students, as well as weighted school and student participation rates for the state samples at grades 4 and 8 , respectively.

## District Samples

Results from the 2003 reading assessments are reported (on a trial basis) for districtlevel samples of fourth- and eighth-grade students in the large urban school districts that participated in the Trial Urban District Assessment (TUDA)—Atlanta, Boston, Charlotte, Chicago, Cleveland, District of Columbia, Houston, Los Angeles, New York City, and San Diego. The sample of students in the urban school districts represents an augmentation to the sample of students who would usually be selected as part of state samples. These samples allow reliable subgroup reporting in these districts. Furthermore, all students at lower geographic sampling levels are assumed to be part of higher-level samples. For example, Houston is one of the urban districts included in the TUDA. Data from students tested in the Houston sample were used to report results for Houston, but also contributed to the Texas and national estimates. Participation rates for the urban district samples are presented in table A.9.

Table A. 7 School and student participation rates, grade 4 public schools: By state, 2003

| Grade 4 | School participation |  |  |  |  | Student participation |  |

| San Diego | 100 | 28 | 89 | 1,236 |

${ }^{1}$ The student weighted participation rate is calculated as follows: The numerator of this rate is the estimated number of students who are represented by the students assessed. The denominator of this rate is the estimated number of students represented by the eligible sampled students in participating schools.

## Standards for State Sample Participation and Reporting of Results

In carrying out the 2003 state assessment program, the National Center for Education Statistics (NCES) established participation rate standards that states and other jurisdictions were required to meet in order for their results to be reported. Participation rates before substitution needed to be at least 80 percent for schools and at least 85 percent for students. In the 2003 reading assessment at both fourth and eighth grades, all jurisdictions met NAEP participation rate standards.

The nonresponsive bias for private schools showed significant differences between responding and nonresponding schools in terms of reporting group, census region, and racial/ethnic composition of the schools. Nonresponse weighting adjustments have completely accounted for differences in reporting group, and largely accounted for differences in census region. These adjustments are unlikely to have fully accounted for differences in race/ethnicity.

Students with Disabilities (SD) and/or Limited-English-Proficient (LEP) Students
It is NAEP's intent to assess all selected students from the target population. Therefore, every effort is made to ensure that all selected students who are capable of participating in the assessment are assessed. Some students sampled for participation in NAEP can be excluded from the sample according to carefully defined criteria. These criteria were revised in 1996 to communicate more clearly a presumption of inclusion except under special circumstances. According to these criteria, students who had an Individualized Education Program (IEP) or were protected under Section 504 of the Rehabilitation Act of 1973 were to be included in the NAEP assessment except in the following cases:

- the school's IEP team determined that the student could not participate;
- the student's cognitive functioning was so severely impaired that she or he could not participate;
- the student's IEP required that the student had to be tested with an accommodation or adaptation that NAEP does not allow and the student could not demonstrate his or her knowledge without that accommodation.

All LEP students who received academic instruction in English for three years or more were to be included in the assessment. Those LEP students who received instruction in English for fewer than three years were to be included unless school staff judged them to be incapable of participating in the assessment in English.

Participation of SD and/or LEP Students in the NAEP Samples
Testing all sampled students is the best way for NAEP to ensure that the statistics generated by the assessment are as representative as possible of the performance of the entire national population and the populations of participating jurisdictions. However, all groups of students include certain proportions that cannot be tested in large-scale assessments (such as students who have profound mental disabilities) or who can only be tested through the use of testing accommodations such as extra time, one-on-one administration, or use of magnifying equipment. Some students with disabilities and some LEP students cannot show on a test what they know and can do unless they are provided with accommodations. When such accommodations are not allowed, students requiring such adjustments are often excluded from large-scale assessments such as NAEP. This
phenomenon has become more common in the last decade and gained momentum with the passage of the 1997 Individuals with Disabilities Education Act (IDEA), which led schools and states to identify increasing proportions of students as needing accommodations on assessments in order to best show what they know and can do. ${ }^{5}$ Furthermore, section 504 of the Rehabilitation Act of 1973 requires that, when students with disabilities are tested, schools must provide them with appropriate accommodations so that the test results accurately reflect students' achievement. In addition, as the proportion of LEP students in the population has increased, some states have started offering accommodations such as translations of assessments or the use of bilingual dictionaries as part of assessments.

Before 1996, NAEP did not allow any testing under nonstandard conditions (i.e., accommodations were not permitted). At that time, NAEP samples were able to include almost all sampled students in standard assessment sessions. However, as the influence of IDEA grew more widespread, the failure to provide accommodations led to increasing levels of exclusion in the assessment. Such increases posed two threats to the program: 1) they threatened the stability of trend lines (because excluding more students in one assessment year than in another might lead to apparent rather than real differences) and 2) they made

NAEP samples less than optimally representative of target populations.

NAEP reacted to this challenge by adopting a multipart strategy. The program had to move toward allowing the same assessment accommodations that were afforded students in state and district testing programs in order for NAEP samples to be as inclusive as possible. However, allowing accommodations represents a change in testing conditions that may affect measurement of changes over time. Therefore, beginning with the 1996 national assessments and the 1998 state assessments and up to 2000, NAEP assessed a series of parallel samples of students. In one set of samples, testing accommodations were not permitted; this allowed NAEP to maintain the measurement of achievement trends. In addition to the samples where accommodations were not permitted, parallel samples in which accommodations were permitted were also assessed. By having two overlapping samples and two sets of related data points, NAEP could meet two core program goals. ${ }^{6}$ First, data trends could be maintained. Second, parallel trend lines could be set in ways that ensure that in future years the program would be able to use the most inclusive practices possible and mirror the procedures used by most state and district assessments. As of 2002, NAEP has used only the more inclusive samples in which assessment accommodations are permitted.

[^5]In reading, national and state data from 1992, 1994, and 1998 are reported for the sample in which accommodations were not permitted. National and state data for the sample in which accommodations were permitted are reported for 1998, 2002, and 2003. National-only data at grade 4 for both accommodated and unaccommodated samples are reported for 2000.

In order to make it possible to evaluate both the impact of increasing exclusion rates in some jurisdictions and differences between jurisdictions, complete data on exclusion in all years are included in this appendix. Since the exclusion rates may affect trend measurement within a jurisdiction, readers should consider the magnitude of exclusion rate changes when interpreting score changes in jurisdictions. In addition, different rates of exclusion may influence the meaning of state comparisons. Thus, exclusion data should be reviewed in this context as well.

Percentages of SD and/or LEP students for the national sample of public and nonpublic schools in which accommodations were not permitted are presented in table A.10. The data in this table include the percentages of students identified as SD and/or LEP, the percentage of students excluded, and the percentage of SD and/or LEP students assessed. Tables A. 11 and A. 12 show similar information by jurisdiction.

Percentages of these students in the national sample where accommodations were permitted are presented in table A.13. The state and jurisdiction results where accommodations were permitted are shown in tables A. 14 through A. 19. The data in these tables include the percentages of students identified as SD and/or LEP, the percentage of students excluded, the percentage of SD and/or LEP students assessed, the percentage assessed without accommodations, and the percentage assessed with accommodations. Similar information for districts that participated in the Trial Urban District Assessment is presented in table A. 20 for grade 4 and table A. 21 for grade 8.

In the 2003 national sample, 6 percent of students at grade 4 and 5 percent of students at grade 8 were excluded from the assessment (see table A.13). Across the various jurisdictions that participated in the 2003 state assessment, the percentage of students excluded ranged from 2 to 11 percent at grade 4 (see table A.14) and from 1 to 9 percent at grade 8 (see table A.17). At the district level, between 2 and 24 percent of students were excluded at grade 4 (see table A.20) and between 3 and 15 percent were excluded at grade 8 (see table A.21).

Table A. 10 Students with disabilities and/or limited-English-proficient students identified, excluded, and assessed, when accommodations were not permitted, grades 4 and 8 public and nonpublic schools: 1992-2000

- Not available. Data were not collected at grade 8 in 2000.
${ }^{1}$ Students with disabilities.
2 Limited-English-proficient students.
NOTE: Detail may not sum to totals because of rounding. Within each grade level, the combined SD/LEP portion of the table is not a sum of the separate SD and LEP portions because some students were identified as both SD and LEP. Such students would be counted separately in the bottom portions but counted only once in the top portion. SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1992, 1994, 1998, and 2000 Reading Assessments.

\# The estimate rounds to zero.
1 Students with disabilities.
${ }^{2}$ Limited-English-proficient students.
NOTE: Detail may not sum to totals because of rounding. Within each grade level, the combined SD/LEP portion of the table is not a sum of the separate SD and LEP portions because some students were identified as both SD and LEP. Such students would be counted separately in the bottom portions but counted only once in the top portion. The numbers of students are larger in 2002 and 2003 than in previous years because the 2002 and 2003 national samples were based on the combined sample of students in each participating state, plus an additional sample from nonparticipating states as well as a sample from nonpublic schools.

Investigating the Potential Effects of Exclusion Rates on Assessment Results
Variation in the rates of exclusion of students with disabilities and limited-English-proficient students introduces validity concerns for comparisons over time or between jurisdictions. The essential problem is the differential representativeness of samples, which could impact the comparability of cross-state comparisons within a given year and state trends across years. Since students with disabilities or limited-English-proficient students tend to score below average on assessments, excluding students with special needs may increase a jurisdiction's scores. Conversely, including more of these students might depress score gains. In 2003, exclusion rates varied among jurisdictions. In addition, cases of both increases and decreases in exclusion rates occurred between 2002 and 2003, making comparisons over time within jurisdictions complex to interpret. Tables A. 14 and A. 17 on the preceding pages display the rates of exclusion in each jurisdiction for grade 4 and grade 8 , respectively.

As shown in table A. 14 , of the 53 jurisdictions that assessed reading at grade 4 in 2003, 12 jurisdictions had exclusion rates of 8 percent or greater, and 3 of these had exclusion rates of 10 percent or greater, while the majority had exclusion rates of less than 8 percent. Table A. 17 displays the corresponding data for grade 8 . Of the 53 jurisdictions that assessed reading at grade 8 in 2003, eight jurisdictions had exclusion rates of 8 percent or above, and none had a rate above 9 percent. The other jurisdictions at grade 8 all had exclusion rates of less than 8 percent.

One factor that contributed to the variability in exclusion rates across states is that the percentage of students who are identified as having disabilities or limited English proficiency varies across jurisdictions. Reasons for the variation include 1) lack of standardized criteria for defining students as having specific disabilities or as being limited in their English proficiency; 2) changes or differences in policy and practices regarding implementation of the Individuals with Disabilities Education Act (IDEA); and 3) differences in the percentage of students classified as limited English proficient and, to a lesser extent, as students with disabilities.

With regard to cross-state comparisons, the correlations between rates of exclusion and average 2003 reading scores were not found to be significant at either grade 4 (.03) or grade 8 (.07). In other words, higher exclusion rates were not associated with higher average scores in 2003. With regard to state trends, the correlations between changes in the rate of exclusion of students with special needs and average reading score gains from 2002 to 2003 were not found to be significant either (. 26 at grade 4 and .22 at grade 8 ).

Because the representativeness of samples is ultimately a validity issue, NCES has commissioned studies of the impact of assessment accommodations on overall scores. NCES has also investigated scenarios for estimating what the average scores might have been had the excluded students been assessed. Two alternative statistical scenarios have been proposed, based on different hypotheses about how excluded students might have performed.

Combined with the actual performance of students who were assessed, these scenarios produce results for the full population (that is, including estimates for excluded students) in each jurisdiction and each assessment year. These techniques provide some indication as to which statements about trend gains or losses might be changed if exclusion rates were zero in both assessment years and if the hypotheses about the performance of missing students are correct.

One scenario was developed by Donald McLaughlin of American Institutes for Research, and predicts what the performance of excluded SD and/or LEP students might have been had these students been tested. The basic assumption underlying this approach is that these students would have performed as well as included SD and/or LEP students with similar disabilities, level of English proficiency, and background characteristics. ${ }^{7}$

The other scenario was developed by Al Beaton of Boston College and similarly makes an assumption about what the performance of excluded SD/LEP students might have been had they been tested. The idea of Beaton's scenario is to calculate median rather than average scores. A "median" is the score reached or exceeded by fifty percent of the student population. This statistic is not influenced by extreme values. Beaton's assumption is
that all SD/LEP students would score below Basic or below the median of the group being analyzed. This assumption lowers the median score for every group.

The methods used to construct the scenarios are still under development. NCES is continuing research into different procedures for reducing the percentages of students excluded from NAEP. In addition, NCES will continue to evaluate the potential impact of changes in exclusion rates on score gains.

## Types of Accommodations Permitted

Table A. 22 displays the percentages of SD and/or LEP students assessed with the variety of available accommodations. It should be noted that students assessed with accommodations typically received some combination of accommodations. The percentages presented in the table reflect only the primary accommodation provided. For example, students assessed in small groups (as compared with standard NAEP sessions of about 30 students) usually received extended time. In one-on-one administrations, students often received assistance in recording answers (e.g., use of a scribe or computer) and were afforded extra time. Extended time was considered the primary accommodation only when it was the sole accommodation provided. The assessment did not allow some accommodations that were permitted in certain states in past

[^15]assessments. Some states have allowed questions and, in some cases, reading passages to be read aloud to the students. In designing the reading assessment, reading aloud as an accommodation was viewed as changing the nature of the construct being measured and, hence, was
not permitted. Because NAEP considers the domain of its reading assessment to be reading in English, no attempt was made to provide an alternate language version of the assessment, and the use of bilingual dictionaries was not permitted.

## Data Collection and Scoring

The 2003 NAEP reading assessment was conducted from January to March 2003 by contractors to the U.S. Department of Education. Trained field staff from Westat conducted the data collection. Materials from the 2003 assessment were shipped to Pearson, where trained staff evaluated the responses to the constructed-response questions using scoring guides prepared by Educational Testing Service (ETS). Each constructed-response question had a unique scoring guide that defined the criteria used to evaluate students' responses. Short constructedresponse questions were scored as either acceptable or unacceptable, or were rated according to three-level guides that permitted partial credit. Extended con-structed-response questions were evaluated with four-level guides.

For the 2003 reading assessment, $3,913,147$ constructed responses were scored. This number includes rescoring to monitor interrater reliability. The withinyear average percentage of exact agreement for the 2003 national reliability sample was 90 percent at both the fourth and eighth grades.

## Data Analysis and IRT Scaling

After the professional scoring, all information was transcribed into the NAEP database at ETS. Each processing activity was conducted with rigorous quality control. After the assessment information was compiled in the database, the data were weighted according to the population structure. The weighting for the national and state samples reflected the probability of selection for each student as a result of
the sampling design, adjusted for nonresponse. ${ }^{8}$

Analyses were then conducted to determine the percentages of students who gave various responses to each cognitive and background question. In determining these percentages for the cognitive questions, a distinction was made between missing responses at the end of a block (i.e., missing responses after the last question the student answered) and missing responses before the last observed response. Missing responses before the last observed response were considered intentional omissions. In analysis, omitted responses to multiple-choice items were scored as fractionally correct. ${ }^{9}$ Omitted responses for constructed-response items were placed into the lowest score category. Missing responses after the last observed response were considered "not reached" and treated as if the questions had not been presented to the student. In calculating response percentages for each question, only students classified as having been presented the question were included in the denominator of the statistic.

It is standard NAEP practice to treat all nonrespondents to the last question in a block as if they had not reached the question. For multiple-choice and short constructed-response questions, this practice produces a reasonable pattern of results in that the proportion reaching the last question is not dramatically smaller than the proportion reaching the next-tolast question. However, for reading blocks that ended with extended constructedresponse questions, there may be extremely large drops in the proportion of

[^16]students attempting some of the final questions. Therefore, for blocks ending with an extended constructed-response question, students who answered the next-to-last question, but did not respond to the extended constructed-response question, were classified as having intentionally omitted the last question.

Item Response Theory (IRT) was used to estimate average reading scale scores for the nation and for various subgroups of interest within the nation. IRT models the probability of answering a question in a certain way as a mathematical function of proficiency or skill. The main purpose of IRT analysis is to provide a common scale on which performance can be compared among groups, such as those defined by characteristics, including gender and race/ethnicity, even when students receive different blocks of items. One desirable feature of IRT is that it locates items and students on this common scale. In contrast to classical test theory, IRT does not rely solely on the total number of correct item responses, but uses the particular patterns of student responses to items in determining the student location on the scale. As a result, adding items that function at a particular point on the scale to the assessment does not change the location of the students on the scale, even though students may respond correctly to more items. It does increase the relative precision with which students are measured, particularly those students whose scale locations are close to the additional items.

The results for 1992, 1994, 1998, 2000, 2002, and 2003 are presented on the NAEP composite reading scale developed in 1992. For the NAEP 1992 reading assessment, a scale ranging from 0 to 500
was created to report performance for each reading context: literary and informative at grade 4; and literary, informative, and task-oriented at grade 8. The scales summarize student performance across all three types of questions in the assessment (multiple-choice, short con-structed-response, and extended con-structed-response). Results from subsequent reading assessments (1994, 1998, 2000,2002 , and 2003) are reported on these scales.

Each reading scale was initially based on the distribution of student performance across all three grades in the 1992 national assessment (grades 4, 8, and 12) and had an average of 250 and a standard deviation of 50 . The composite scale was created as an overall measure of students' reading performance. This composite scale is a weighted average of the three separate scales for the reading contexts (two at grade 4). The weight for each reading context is proportional to the relative importance assigned to the reading context by the specifications developed through the consensus planning process and given in the framework.

In producing the reading scales, three distinct IRT models were used. Multiplechoice questions were scaled using the three-parameter logistic (3PL) model; short constructed-response questions rated as acceptable or unacceptable were scaled using the two-parameter logistic (2PL) model; and short constructedresponse questions rated according to a three-level guide, as well as extended constructed-response questions rated on a four-level guide, were scaled using a Generalized Partial-Credit (GPC) model. ${ }^{10}$ Developed by ETS and first used in 1992, the GPC model permits the scaling of

[^17]questions scored according to multipoint rating schemes. The model takes full advantage of the information available from each of the student response categories used for these more complex con-structed-response questions. ${ }^{11}$

The reading scale is composed of three types of questions: multiple-choice, short constructed-response (scored either dichotomously or allowing for partial credit), and extended constructed-response (scored according to a partialcredit model). Unfortunately, the question of how much information different types of questions contribute to the reading scale has no simple answer. The information provided by a given question is determined by the IRT model used to scale the question. It is a function of the item parameters and varies by level of reading proficiency. ${ }^{12}$ Thus, the answer to the query "How much information do the different types of questions provide?" will differ for each level of reading performance. When considering the composite reading scale, the answer is even more complicated. The reading data are scaled separately by the two contexts for reading (reading for literary experience and reading for information) for grade 4 , and the three contexts for reading (reading for literary experience, reading for information, and reading to perform a task) for grade 8 , resulting in two or three separate subscales at each grade. The
composite scale is a weighted combination of these subscales. IRT information functions are only strictly comparable when the item parameters are estimated together. Because the composite scale is based on three separate estimation runs, there is no direct way to compare the information provided by the questions on the composite scale.

Because of the relatively brief time available for testing, each student receives only a portion of the questions in the assessment, not the coverage of the content that would be required for reliable information about individual performance. Traditional test scores for individual students, even those based on IRT, would result in misleading estimates of population characteristics, such as subgroup means and percentages of students at or above a certain scale-score level. However, it is NAEP's goal to estimate these population characteristics. NAEP's objectives can be achieved with methodologies that produce estimates of the population-level parameters directly, without the intermediary computation of estimates of individuals. This is accomplished using marginal estimation scaling model techniques for latent variables. ${ }^{13}$ Under the assumptions of the scaling models, these population estimates will be consistent in the sense that the estimates approach the model-based population values as the sample size increases. This

[^18]would not be the case for population estimates obtained by aggregating optimal estimates of individual performance. ${ }^{14}$

## Item Mapping Procedures

The reading performance of fourth- and eighth-graders can be illustrated by "item maps," which position question or "item" descriptions along the NAEP reading scale at each grade. Each question shown is placed at the point on the scale where questions are likely to be answered successfully by students. The descriptions used on these item maps focus on the reading knowledge or skill needed to answer the question. For multiple-choice questions, the description indicates the knowledge or skill demonstrated by selection of the correct option; for con-structed-response questions, the description takes into account the knowledge or skill specified by the different levels of scoring criteria for that question.

To map questions to particular points on the NAEP reading scale, a response probability convention was adopted that would divide those who had a higher probability of success from those who had a lower probability. Establishing a response probability convention has an impact on the mapping of the test questions onto the reading scale. A lower boundary convention maps the reading questions at lower points along the scale, and a higher boundary convention maps the same questions at higher points on the scale. The underlying distribution of reading skills in the population does not change, but the choice of a response probability convention does have an impact on the proportion of the student
population that is reported as "able to do" the questions on the reading scales.

There is no obvious choice of a point along the probability scale that is clearly superior to any other point. If the convention were set with a boundary at 50 percent, those above the boundary would be more likely to get a question right than get it wrong, while those below the boundary would be more likely to get the question wrong than right. Although this convention has some intuitive appeal, it was rejected on the grounds that having a 50:50 chance of getting the question right shows an insufficient degree of mastery. If the convention were set with a boundary at 80 percent, students above the criterion would have a high probability of success with a question. However, many students below this criterion show some level of reading ability that would be ignored by such a stringent criterion. In particular, those in the range between 50 and 80 percent correct would be more likely to get the question right, yet would not be in the group described as "able to do" the question.

In a compromise between the 50 percent and the 80 percent conventions, NAEP has adopted two related response probability conventions for all its subjects: 65 percent for constructed-response questions (where guessing is not a factor) and 74 percent for multiple-choice questions (to adjust for the possibility of answering correctly by guessing). These probability conventions were established, in part, based on an intuitive judgment that they would provide the best picture of students' reading skills.

[^19]Some additional support for the dual conventions adopted by NAEP was provided by Huynh. ${ }^{15}$ He examined the IRT information provided by items, according to the IRT model used in scaling NAEP questions. Following Bock, Huynh decomposed the item information into that provided by a correct response $[\mathrm{P}(\Theta) \mathrm{I}(\Theta)]$ and that provided by an incorrect response $[(1-\mathrm{P}(\Theta)) \mathrm{I}(\Theta)] .{ }^{16}$ Huynh showed that the item information provided by a correct response to a constructed-response item is maximized at the point along the reading scale at which the probability of a correct response is . 65 (for multiplechoice items, the information provided by a correct response is maximized at the point at which the probability of getting the item correct is .74). It should be noted, however, that maximizing the item information $\mathrm{I}(\Theta)$, rather than the information provided by a correct response $[\mathrm{P}(\Theta) \mathrm{I}(\Theta)]$, would imply an item mapping criterion closer to 50 percent.

The results in this report are presented in terms of the composite reading scale. However, the reading assessment was scaled separately for the two contexts for reading at grade 4 and the three contexts for reading at grade 8 . The composite scale is a weighted combination of the two or three subscales for the two or three contexts for reading. To obtain item map information, a procedure was used that
models the relationship between the item response function for the subscale and the subscale structure to derive the relationship between the item score and the composite scale (i.e., an item response function for the composite scale). ${ }^{17}$ This item response function is then used to derive the probability used in the mapping.

## Weighting and Variance Estimation

A complex sampling design was used to select the students who were assessed. The properties of a sample selected through such a design could be very different from those of a simple random sample in which every student in the target population has an equal chance of selection and in which the observations from different sampled students can be considered to be statistically independent of one another. Therefore, the properties of the sample for the data collection design were taken into account during the analysis of the assessment data.

One way that the properties of the sample design were addressed was by using sampling weights to account for the fact that the probabilities of selection were not identical for all students. All population and subpopulation characteristics based on the assessment data were estimated using sampling weights. These weights included adjustments for school and student nonresponse.

[^20]Prior to 2002, the national samples used weights that had been poststratified to the census or Current Population Survey (CPS) totals for the populations being assessed. Due to concerns about the availability of appropriate targets for poststratification as a result of changes in the reporting of race in the 2000 Census, nonpoststratified weights have been used in the analysis of national samples since 2002. Due to this change in weights during NAEP's linking procedures, there was a slight change to the 1998 and 2000 national reading results that had been reported previously. The state NAEP samples have always been analyzed using nonpoststratified weights, since there were no targets available from CPS to use in poststratification.

Not only must appropriate estimates of population characteristics be derived, but appropriate measures of the degree of uncertainty must be obtained for those statistics. Two components of uncertainty are accounted for in the variability of statistics based on student ability: 1) the uncertainty due to sampling only a relatively small number of students, and 2) the uncertainty due to sampling only a portion of the cognitive domain of interest. The first component accounts for the variability associated with the estimated percentages of students who had certain background characteristics or who answered a certain cognitive question correctly.

Because NAEP uses complex sampling procedures, conventional formulas for estimating sampling variability that assume simple random sampling are inappropri-
ate. NAEP uses a jackknife replication procedure to estimate standard errors. The jackknife standard error provides a reasonable measure of uncertainty for any student information that can be observed without error. However, because each student typically responds to only a few questions within any theme of reading, the scale score for any single student would be imprecise. In this case, NAEP's marginal estimation methodology can be used to describe the performance of groups and subgroups of students. The estimate of the variance of the students' posterior scale score distributions (which reflect the imprecision due to lack of measurement accuracy) is computed. This component of variability is then included in the standard errors of NAEP scale scores. ${ }^{18}$

Typically, when the standard error is based on a small number of students or when the group of students is enrolled in a small number of schools, the amount of uncertainty associated with the estimation of standard errors may be quite large. Estimates of standard errors subject to a large degree of uncertainty are followed on the tables in the NAEP data tool by the "!" symbol to indicate that the nature of the sample does not allow accurate determination of the variability of the statistic. In such cases, the standard errors-and any confidence intervals or significance tests involving these standard errorsshould be interpreted cautiously. Additional details concerning procedures for identifying such standard errors will be discussed in the technical documentation section of the NAEP web site (http:// nces.ed.gov/nationsreportcard).

18 For further details, see Johnson, E. G., and Rust, K. F. (1992). Population Inferences and Variance Estimation for NAEP Data. Journal of Educational Statistics, 17(2), 175-190.

The reader is reminded that, as with findings from all surveys, NAEP results are subject to other kinds of error, including the effects of imperfect adjustment for student and school nonresponse and unknowable effects associated with the particular instrumentation and data collection methods. Nonsampling errors can be attributed to a number of sources-inability to obtain complete information about all selected schools in the sample (some students or schools refused to participate, or students participated but answered only certain questions); ambiguous definitions; differences in interpreting questions; inability or unwillingness to give correct background information; mistakes in recording, coding, or scoring data; and other errors in collecting, processing, sampling, and estimating missing data. The extent of nonsampling errors is difficult to estimate and, because of their nature, the impact of such errors cannot be reflected in the data-based estimates of uncertainty provided in NAEP reports.

## Drawing Inferences from the Results

The reported statistics are estimates and are therefore subject to a measure of uncertainty. There are two sources of such uncertainty. First, NAEP uses a sample of students rather than testing all students. Second, all assessments have some amount of uncertainty related to the fact that they cannot ask all questions that might be asked in a content area. The magnitude of this uncertainty is reflected in the standard error of each of the estimates. When the percentages or average scale scores of certain groups are compared, the estimated standard error should be taken into account. Therefore, the comparisons are
based on statistical tests that consider the estimated standard errors of those statistics and the magnitude of the difference among the averages or percentages.

For the data from this report, all the estimates have corresponding estimated standard errors of the estimates. For example, table A. 23 shows the average national scale score for the NAEP 19922003 national assessments and table A. 24 shows the percentage of students within each achievement-level range and at or above achievement levels. In both tables, estimated standard errors appear in parentheses next to each estimated scale score or percentage. Additional examples of estimated standard errors corresponding with results included in this report are presented in tables A. 25 , A. 26 , and A. 27. For the estimated standard errors corresponding to other data in this report, the reader can go to the Data Tool on the NCES web site (http://nces.ed.gov/ nationsreportcard/naepdata).

Using confidence intervals based on the standard errors provides a way to take into account the uncertainty associated with sample estimates and to make inferences about the population averages and percentages in a manner that reflects that uncertainty. An estimated sample average scale score plus or minus 1.96 standard errors approximates a 95 percent confidence interval for the corresponding population quantity. This statement means that one can conclude with an approximately 95 percent level of confidence that the average performance of the entire population of interest (e.g., all fourthgrade students in public and nonpublic schools) is within plus or minus 1.96 standard errors of the sample average.

For example, suppose that the average reading scale score of the students in a particular group was 256 with an estimated standard error of 1.2. An approximately 95 percent confidence interval for the population quantity would be as follows:

Average $\pm 1.96$ standard errors

$$
\begin{gathered}
256 \pm 1.96 \times 1.2 \\
256 \pm 2.4 \\
(253.6,258.4)
\end{gathered}
$$

Thus, one can conclude with a 95 percent level of confidence that the average scale score for the entire population of students in that group is between 253.6 and 258.4. It should be noted that this example and the examples in the following sections are illustrative. More precise estimates carried out to one or
more decimal places are used in the actual analyses.

Similar confidence intervals can be constructed for percentages, if the percentages are not extremely large or extremely small. Extreme percentages should be interpreted with caution. Adding or subtracting the standard errors associated with extreme percentages could cause the confidence interval to exceed 100 percent or fall below 0 percent, resulting in numbers that are not meaningful. A more complete discussion of extreme percentages will appear in the technical documentation section of the NAEP web site (http:/ / nces.ed.gov/ nationsreportcard).

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2002 are based on the national sample, not on aggregated state samples.
${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
NOTE: Standard errors of the estimated scale scores appear in parentheses. State-level data were not collected in 1992, 1994, or 2000. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased since 2002, compared to previous years, resulting in smaller detectable differences than in previous assessments.
SOURCE: U.S. Department of Education, Institute of Education Sciences, National Center for Education Statistics, National Assessment of Educational Progress (NAEP), 1998, 2000, 2002, and 2003 Reading Assessments.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
! Interpret data with caution. The nature of the sample does not allow accurate determination of the variability of the statistic.
$\ddagger$ Reporting standards not met. Sample size was insufficient to permit a reliable estimate.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
${ }^{1}$ National results for assessments prior to 2002 are based on the national sample, not on aggregated state samples.
${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
4 "Other" comprises students whose race based on school reports was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic", or did not selfreport racial/ethnic information.
NOTE: Standard errors of the estimated percentages appear in parentheses. State-level data were not collected in 1992, 1994, or 2000. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased since 2002, compared to previous years, resulting in smaller detectable differences than in previous assessments.

## Analyzing Group Differences in Averages and Percentages

Statistical tests determine whether, based on the data from the groups in the sample, there is strong evidence to conclude that the averages or percentages are actually different for those groups in the population. If the evidence is strong (i.e., the difference is statistically significant), the report describes the group averages or percentages as being different (e.g., one group performed higher or lower than another group), regardless of whether the sample averages or percentages appear to be approximately the same. The reader is cautioned to rely on the results of the statistical tests rather than on the apparent magnitude of the difference between sample averages or percentages when determining whether the sample differences are likely to represent actual differences among the groups in the population.

To determine whether a real difference exists between the average scale scores (or percentages of a certain attribute) for two groups in the population, one needs to obtain an estimate of the degree of uncertainty associated with the difference between the averages (or percentages) of these groups for the sample. This estimate of the degree of uncertainty, called the "standard error of the difference" between the groups, is obtained by taking the square of each group's standard error, summing the squared standard errors, and taking the square root of that sum.
Standard Error of the Difference $=$

$$
\mathrm{SE}_{\mathrm{A}-\mathrm{B}}=\sqrt{\left(\mathrm{SE}_{\mathrm{A}}^{2}+\mathrm{SE}_{\mathrm{B}}^{2}\right)}
$$

The standard error of the difference can be used, just like the standard error for an individual group average or per-
centage, to help determine whether differences among groups in the population are real. The difference between the averages or percentages of the two groups plus or minus 1.96 standard errors of the difference represents an approximately 95 percent confidence interval. If the resulting interval includes zero, there is insufficient evidence to claim a real difference between the groups in the population. If the interval does not contain zero, the difference between the groups is statistically significant at the .05 level.

The following example of comparing groups addresses the problem of determining whether the average reading scale score of group A is higher than that of group B. The sample estimates of the average scale scores and estimated standard errors are as follows:

| Group | Average <br> Scale Score | Standard <br> Error |
| :---: | :---: | :---: |
| A | 218 | 0.9 |
| B | 216 | 1.1 |

The difference between the estimates of the average scale scores of groups A and B is two points (218-216). The estimated standard error of this difference is

$$
\sqrt{\left(0.9^{2}+1.1^{2}\right)}=1.4
$$

Thus, an approximately 95 percent confidence interval for this difference is plus or minus 1.96 standard errors of the difference.

$$
\begin{gathered}
2 \pm 1.96 \times 1.4 \\
2 \pm 2.7 \\
(-0.7,4.7)
\end{gathered}
$$

The value zero is within the confidence interval; therefore, there is insufficient evidence to conclude that group A outperformed group B.

The procedure above is appropriate to use when it is reasonable to assume that the groups being compared have been independently sampled for the assessment. Such an assumption is clearly warranted when comparing results across assessment years (e.g., comparing the 2002 and 2003 results for a particular state or subgroup) or when comparing results for one state with another. This is the approach used for NAEP reports when comparisons involving independent groups are made. The assumption of independence is violated to some degree when comparing group results for the nation or a particular state (e.g., comparing national 2003 results for males and females), since these samples of students have been drawn from the same schools. When the groups being compared do not share students (as is the case, for example, in comparing males and females) the impact of this violation of the independence assumption on the outcome of the statistical tests is assumed to be small, and NAEP, by convention, has, for computational convenience, routinely applied the procedures described above to those cases as well.

When making comparisons of results for groups that share a considerable proportion of students in common, it is not appropriate to ignore such dependencies. In such cases, NAEP has used procedures appropriate to comparing dependent groups. When the dependence in group results is due to the overlap in samples (e.g., when a subgroup is being
compared to a total group), a simple modification of the usual standard error of the difference formula can be used. The formula for such cases is:

$$
\mathrm{SE}_{\text {Total-Subgroup }}=\sqrt{\left(\mathrm{SE}_{\text {Total }}^{2}+\mathrm{SE}_{\text {Subgroup }}^{2}-2 p \mathrm{SE}_{\text {Subgroup }}^{2}\right)}
$$

where $p$ is the proportion of the total group contained in the subgroup. ${ }^{19}$ This formula was used for this report when a state was compared to the aggregate nation or a school district was compared to the entire state it belongs to.

## Conducting Multiple Tests

The procedures used to determine whether group differences in the samples represent actual differences among the groups in the population and the certainty ascribed to intervals (e.g., a 95 percent confidence interval) are based on statistical theory that assumes that only one confidence interval or test of statistical significance is being performed. However, there are times when many different groups are being compared (i.e., multiple sets of confidence intervals are being analyzed). In sets of confidence intervals, statistical theory indicates that the certainty associated with the entire set of intervals is less than that attributable to each individual comparison from the set. To hold the significance level for the set of comparisons at a particular level (e.g., .05), standard methods must be adjusted by multiple comparison procedures. ${ }^{20}$ One such procedure, the Benjamini-Hochberg False Discovery Rate (FDR) procedure was used to control the certainty level. ${ }^{21}$

[^23]Unlike other multiple comparison procedures that control the familywise error rate (i.e., the probability of making even one false rejection in the set of comparisons), the FDR procedure controls the expected proportion of falsely rejected hypotheses. Furthermore, the FDR procedure used in NAEP is considered appropriately less conservative than familywise procedures for large families of comparisons. ${ }^{22}$ Therefore, the FDR procedure is more suitable for multiple comparisons in NAEP than other procedures. A detailed description of the FDR procedure will appear in the technical docu-
mentation section of the NAEP web site (http:/ /nces.ed.gov/nationsreportcard).

To illustrate how the FDR procedure is used, consider the comparisons of current and previous years' average scale scores for the five groups presented in table A.28. Note that the difference in average scale scores and the estimated standard error of the difference are calculated as the example in the previous section. The test statistic shown is the difference in average scale scores divided by the estimated standard error of the difference. (Rounding of the data occurs after the test is done.)

Table A. 28 Example of False Discovery Rate comparisons of average scale scores for different groups of students

|  | Previous year |  | Current year |  | Previous year and current year |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Average scale score | Standard error | Average scale score | Standard error | Differences in averages | Standard error of differences | Test statistic | Percent confidence ${ }^{1}$ |
| Group 1 | 224 | 1.3 | 226 | 1.0 | 2.08 | 1.62 | 1.29 | 20 |
| Group 2 | 187 | 1.7 | 193 | 1.7 | 6.31 | 2.36 | 2.68 | 1 |
| Group 3 | 191 | 2.6 | 197 | 1.7 | 6.63 | 3.08 | 2.15 | 4 |
| Group 4 | 229 | 4.4 | 232 | 4.6 | 3.24 | 6.35 | 0.51 | 62 |
| Group 5 | 201 | 3.4 | 196 | 4.7 | -5.51 | 5.81 | -0.95 | 35 |

${ }^{1}$ The percent confidence is $2(1-F(x))$ where $F(x)$ is the cumulative distribution of the $t$-distribution with the degrees of freedom adjusted to reflect the complexities of the sample design.

The difference in average scale scores and its estimated standard error can be used to find an approximately 95 percent confidence interval, or they can be used to identify a confidence percentage. The confidence percentage for the test statistics is identified from statistical tables instead of checking to see if zero is within the 95 percent confidence interval about the mean. The significance level from the statistical tables can be directly compared to $100-95=5$ percent.

If the comparison of average scale scores across two years was made for only one of the five groups, there would be a significant difference between the average scale scores for the two years at a significance level of less than 5 percent. However, because we are interested in the difference in average scale scores across the two years for all five of the groups, comparing each of the significance levels to 5 percent is not adequate. Groups of students defined by shared characteristics,

[^24]such as racial/ethnic groups, are treated as sets or families when making comparisons. However, comparisons of average scale scores for each pair of years were treated separately, so the steps described in this example would be replicated for the comparison of other current and previous year average scale scores.

Using the FDR procedure to take into account that all comparisons are of interest to us, the percents of confidence in the example are ordered from largest to smallest: $62,35,20,4$, and 1 . In the FDR procedure, 62 percent confidence for the group 4 comparison would be compared to 5 percent, 35 percent for the group 5 comparison would be compared to $0.05 \times$ $(5-1) / 5=0.04=4$ percent, ${ }^{23} 20$ percent for the group 1 comparison would be compared to $0.05 \times(5-2) / 5=0.03=3$ percent, 4 percent for the group 3 comparison would be compared to $0.05 \times$ $(5-3) / 5=0.02=2$ percent, and 1 percent for the group 2 comparison (actually slightly smaller than 1 prior to rounding) would be compared to $0.05 \times$ $(5-4) / 5=0.01=1$ percent. The procedure stops with the first contrast found to be significant. The last of these comparisons is the only one for which the percent confidence is smaller than the FDR procedure value. The difference between the current year's and previous years' average scale scores for the group 2 students is significant; for all of the other groups, average scale scores for current and previous year are not significantly different from one another. In practice, a very small number of counterintuitive results
occur when the FDR procedures are used to examine between-year differences in subgroup results by jurisdiction. In those cases, results were not included in this report.

## NAEP Reporting Groups

NAEP results are provided for groups of students defined by shared characteristicsgender, race/ethnicity, parental education, region of the country, type of school, school's type of location, and eligibility for free/reduced-price school lunch. Based on participation rate criteria, results are reported for subpopulations only when sufficient numbers of students and adequate school representation are present. The minimum requirement is at least 62 students in a particular subgroup from at least five primary sampling units (PSUs).. ${ }^{24}$ However, the data for all students, regardless of whether their subgroup was reported separately, were included in computing overall results. Definitions of the subpopulations are presented below.
Gender: Results are reported separately for males and females.

Race/Ethnicity: In all NAEP assessments, data about student race/ethnicity is collected from two sources: school records and student self-reports. Prior to 2002, NAEP used students' self-reported race as the primary race/ethnicity reporting variable. As of 2002, the race/ethnicity variable presented in NAEP reports is based on the race reported by the school. When school-recorded information is missing, student-reported data are used to determine race/ethnicity. The mutually

[^25]exclusive racial/ethnic categories are White, Black, Hispanic, Asian/Pacific Islander, American Indian (including Alaska Native), and Other. Information based on student self-reported race/ ethnicity is available on the NAEP Data Tool (http://nces.ed.gov/ nationsreportcard/naepdata/).
Parental Education: Eighth-graders were asked the following two questions, the responses to which were combined to derive the parental education variable.
How far in school did your mother go?

- She did not finish high school.
- She graduated from high school.
- She had some education after high school.
- She graduated from college.
- I don't know.

Students were also asked
How far in school did your father go?

- He did not finish high school.
- He graduated from high school.
- He had some education after high school.
- He graduated from college.
- I don't know.

The information was combined into one parental-education reporting variable in the following way: If a student indicated the extent of education for only one parent, that level was included in the data. If a student indicated the extent of education for both parents, the higher of the two levels was included in the data. If a student responded "I don't know" for both parents, or responded "I don't know" for one parent and did not respond for the other, the parental education level was
classified as "I don't know." If the student did not respond for either parent, the student was recorded as having provided no response.
Region of the Country: Prior to 2003, NAEP results were reported for four NAEP-defined regions of the nation: Northeast, Southeast, Central, and West. As of 2003, to align NAEP with other federal data collections, NAEP analysis and reports have used Census Bureau definitions of region. The four Censusdefined regions are: Northeast, South, Midwest, and West. The Midwest region defined by the Census includes the same states as the NAEP-defined Central region. The Northeast region defined by the Census is made up of the same states in the NAEP-defined Northeast region minus Delaware, the District of Columbia, Maryland, and the section of Virginia in the Washington, DC metropolitan area. The Census-defined West region includes the same states as the NAEP-defined West region except Oklahoma and Texas. The Census-defined South region includes all those states previously defined by NAEP as the Southeast region plus Delaware, the District of Columbia, Maryland, Oklahoma, Texas, and the section of Virginia in the Washington, DC metropolitan area. Due to this change in the region variable, no trend data for each region were provided in this report. Figure A. 2 shows how states are subdivided into these census regions. All 50 states and the District of Columbia are listed. Other jurisdictions, including territories and the two Department of Defense Educational Activities jurisdictions, are not assigned to any region.

Figure A. 2 States within regions of the country defined by the U.S. Census Bureau

| Northeast | South | Midwest | West |

SOURCE: U.S. Department of Commerce Economics and Statistics Administration.

Type of School: Results are reported by the type of school that the student at-tends-public or nonpublic. Nonpublic schools include Catholic and other private schools. ${ }^{25}$ Because they are funded by federal authorities (not state/local governments), Bureau of Indian Affairs schools and Department of Defense Domestic Dependent Elementary and Secondary Schools (DDESS) are not included in either the public or nonpublic categories; they are included in the overall national results.

Type of Location: Results from the 2003 assessment are reported for students attending schools in three mutually exclusive location types: central city, urban fringe/large town, and rural/small town. Central city: Following standard definitions established by the Federal Office of Management and Budget, the U.S. Census Bureau (see http://www.census.gov/) defines "central city" as the largest city of a Metropolitan Statistical Area (MSA) or a Consolidated Metropolitan Statistical Area (CMSA). Typically, an MSA contains a city

[^26]with a population of at least 50,000 and includes its adjacent areas. An MSA becomes a CMSA if it meets the requirements to qualify as a metropolitan statistical area, has a population of $1,000,000$ or more, its component parts are recognized as primary metropolitan statistical areas, and local opinion favors the designation. In the NCES Common Core of Data (CCD) locale codes are assigned to schools. For the definition of central city used in this report, two locale codes of the survey are combined. The definition of each school's type of location is determined by the size of the place where the school is located and whether or not it is in an MSA or CMSA. School locale codes are assigned by the U.S. Census Bureau. For the definition of central city, NAEP reporting uses data from two CCD locale codes: large city (a central city of an MSA or CMSA with the city having a population greater than or equal to 25,000 ) and midsize city (a central city of an MSA or CMSA having a population less than $25,000)$. Central city is a geographical term and is not synonymous with "inner city."

Urban fringe/large town: The urban fringe category includes any incorporated place, census designated place, or nonplace territory within a CMSA or MSA of a large or mid-sized city and defined as urban by the U.S. Census Bureau, but which does not qualify as a central city. A large town is defined as a place outside a CMSA or MSA with a population greater than or equal to 25,000.

Rural/small town: Rural includes all places and areas with populations of less than 2,500 that are classified as rural by the U.S. Census Bureau. A small town is defined as a place outside a CMSA or MSA with a population of less than 25,000 , but greater than or equal to 2,500 .

Results for each type of location are only compared across years 2000 and after. This is due to new methods used by NCES to identify the type of location assigned to each school in the CCD. The new methods were put into place by NCES in order to improve the quality of the assignments, and they take into account more information about the exact physical location of the school. The variable was revised in NAEP beginning with the 2000 assessments.

Eligibility for Free/Reduced-Price School
Lunch: As part of the Department of Agriculture's National School Lunch Program, schools can receive cash subsidies and donated commodities in turn for offering free or reduced-price lunches to eligible children. Based on available school records, students were classified as either currently eligible for free/reducedprice school lunch or not eligible. Eligibility for the program is determined by a student's family income in relation to the federally established poverty level. Free lunch qualification is set at 130 percent of the poverty level, and reduced-price lunch qualification is set at between 130 and 185 percent of the poverty level. Additional information on eligibility may be found on the Department of Agriculture web site (http://www.fns.usda.gov/cnd/lunch/). The classification applies only to the school year when the assessment was administered (i.e., the 2002-2003 school year) and is not based on eligibility in previous years. If school records were not available, the student was classified as "Information not available." If the school did not participate in the program, all students in that school were classified as "Information not available."

## Cautions in Interpretations

As previously stated, the NAEP reading scale makes it possible to examine relationships between students' performance and various background factors measured by NAEP. However, a relationship that exists between achievement and another variable does not reveal its underlying cause, which may be influenced by a number of other variables. Similarly, the assessments do not reflect the influence of unmeasured variables. The results are most useful when they are considered in combination with other knowledge about the student population and the educational system, such as trends in instruction, changes in the school-age population, and societal demands and expectations.

A caution is also warranted for some small population group estimates. At times in this report, smaller population groups show very large increases or decreases across years in average scores. However, it is necessary to interpret such score gains with extreme caution. Another reason for caution is that the effects of exclusion-rate changes may be more marked for small subgroups than they are for the whole population. The standard errors are often quite large around the score estimates for small groups, which in turn means the standard error around the gain is also large.

## Appendix B <br> Subgroup Percentage Appendix

This appendix shows the weighted percentages of students by subgroups. There has been a shift in the racial/ethnic composition of the student population and students participating in NAEP. The percentage of Hispanic students increased from 7 percent in 1992 to 17 percent in 2003 at grade 4, and from 8 percent to 15 percent at grade 8 . The percentage of White students decreased from 73 percent in 1992 to 60 percent in 2003 at grade 4 , and from 72 percent to 63 percent at grade 8 . The percentage of Black students, which has changed less over the years, is approximately 17 percent at grade 4 and 16 percent at grade 8.

Table B. 1 Weighted percentage of students, by region of the country, grades 4 and 8: 2003

|  |  | 2003 |
| :---: | :---: | :---: |
| Grade $\mathbf{4}$ |  |  |
|  |  |  |

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2002 are based on the national sample, not on aggregated state samples.
2 Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
NOTE: State-level data were not collected in 2000. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools at grade 4 (1998-2003) differ slightly from previous years' results, and from previously reported results for 1998, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased since 2002, compared to previous years, resulting in smaller detectable differences than in previous assessments.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2002 are based on the national sample, not on aggregated state samples.
${ }^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
NOTE: State-level data were not collected in 1992, 1994, or 2000. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased since 2002, compared to previous years, resulting in smaller detectable differences than in previous assessments.

\# The estimate rounds to zero.
$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
${ }^{1}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{2}$ Department of Defense Dependents Schools (Overseas).
3 "Other" comprises students whose race, based on school records, was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic," or did not self-report racial/ethnic information.
NOTE: NAEP sample sizes have increased since 2002, compared to previous years, resulting in smaller detectable differences than in previous assessments.

\# The estimate rounds to zero.
$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
${ }^{1}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{2}$ Department of Defense Dependents Schools (Overseas).
3 "Other" comprises students whose race, based on school records, was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic" or did not self-report racial/ethnic information.
NOTE: Detail may not sum to totals because of rounding. NAEP sample sizes have increased since 2002, compared to previous years, resulting in smaller detectable differences than in previous assessments.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
${ }^{*}$ Significantly different from 2003 when only one jurisdiction or the nation is being examined.
** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2002 are based on the national sample, not on aggregated state samples.
${ }_{3}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
4 "Other" comprises students whose race, based on school records, was "other race" or, if school data were missing, who self-reported their race as "multiracial" but not "Hispanic", or did not self-report racial/ethnic information.
NOTE: State-level data were not collected in 2000. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools at grade 4 (1998-2003) differ slightly from previous years' results, and from previously reported results for 1998, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased since 2002, compared to previous years, resulting in smaller detectable differences than in previous assessments.

- Not available. The jurisdiction did not participate or did not meet the minimum participation guidelines for reporting.
$\ddagger$ Reporting standards not met. Sample size is insufficient to permit a reliable estimate.
* Significantly different from 2003 when only one jurisdiction or the nation is being examined.
** Significantly different from 2003 when using a multiple-comparison procedure based on all jurisdictions that participated in both years.
${ }^{1}$ National results for assessments prior to 2002 are based on the national sample, not on aggregated state samples.
${ }_{3}^{2}$ Department of Defense Domestic Dependent Elementary and Secondary Schools.
${ }^{3}$ Department of Defense Dependents Schools (Overseas).
NOTE: State-level data were not collected in 2000. Comparative performance results may be affected by changes in exclusion rates for students with disabilities and limited-English-proficient students in the NAEP samples. In addition to allowing for accommodations, the accommodations-permitted results for national public schools at grade 4 (1998-2003) differ slightly from previously reported results for 1998, due to changes in sample weighting procedures. See appendix A for more details. Significance tests were performed using unrounded numbers. NAEP sample sizes have increased since 2002, compared to previous years, resulting in smaller detectable differences than in previous assessments.

## Sample Text from the <br> NAEP 2003 Reading Assessment

This appendix contains the reading passages released from the NAEP 2003 reading assessment at each grade. To review passages and questions from previous NAEP assessments, please visit the NAEP web site at http://nces.ed.gov/nationsreportcard.

WATCH OUT FOR WOMBATS!

As we rode along the highway sixty miles northeast of Adelaide, Australia, a diamond-shaped sign suddenly loomed ahead. Watch Out for Wombats, it warned. We peered into the sparse scrub along the roadside and searched for the brown furry animals. In the distance we spotted a mob of red kangaroos bouncing out of sight, and near the road a crowlike bird called a currawong was perched, but nowhere did we see any wombats. However, we later found out that this was not surprising because we were traveling during midday, and wombats are active mostly at night. It wasn't until we visited the animal reserve that we finally saw our first wombat and learned more about this funny-looking creature.

We found that there are two types of wombats in Australia: the hairy-nosed wombat, which lives in Queensland and

South Australia, and the coarse-haired wombat, which lives along the southeast coast. Both have soft brown fur, short ears, and thick-set bodies. They are said to resemble North American badgers. The hairy-nosed wombat is smaller and has pointier ears compared to its coarse-haired cousin; otherwise they are very much alike.

In many ways the wombat is similar to another Australian native, the koala. Like koalas, wombats have strong forelimbs and powerful claws. But instead of using its claws to cling to high tree branches as the koala does, the wombat digs large underground burrows. These burrows are usually nine to fifteen feet across, but they can be enormous-sometimes as long as ninety feet. One end of the burrow is used as a sleeping area-there the wombat builds a nest made of bark.

The wombat is a vegetarian, so it also uses its mighty claws to tear up grasses and roots for its food. A mother wombat will pull out single stems of grass and lay them on the ground so her young wombat can eat the tender bases. The wombat's teeth, which grow throughout its life, are sharp and ideal for cutting and tearing.

When a mother wombat gives birth, she never has to worry about finding a baby-sitter—she simply carries her baby along with her. Like most mammals in Australia, wombats are marsupials. A baby wombat is born at a very early stage of development and lives in its mother's pouch until it is old enough to survive on its own.

Wombats have only one baby at a time, usually during the Australian winter months, May to July. A baby wombat is called a joey. At birth the tiny joey-barely an inch long-uses its forelimbs to pull itself along its mother's underside to get into her pouch, where it will be kept warm, protected, and fed.

Marsupials, like all mammals, are nourished by their mothers' milk. The nipples that supply the milk are inside the pouch. Once inside, the wombat joey finds a nipple and grabs it. The
nipple then swells up in the baby's mouth, providing a firm hold and a steady supply of food. The joey stays in its mother's pouch for the next four months and grows rapidly.

Most marsupials have pouches which open upward when the animal is standing. However, both koalas and wombats have pouches which face downwards. A strong muscle keeps the pouch tightly closed and prevents the young wombat or koala from falling out. An advantage of the downward-opening pouch for wombats is that dirt is less likely to get inside when the wombat is burrowing. The wombat is a shy and gentle animal. But even if you lived in Australia and were willing to keep watch during the nighttime hours, it would be difficult to get to know one. As more and more people move into territories in which wombats live, they destroy the wombat's burrows and food supplies. In some areas where the wombat was once plentiful, it is now almost extinct. Animal reserves have been set up recently to protect the wombat. Perhaps with a little help these friendly creatures will again prosper and multiply. The next time we drive through Australia, we really may have to Watch Out for Wombats!

## THANK YOU, M’AM

by Langston Hughes

She was a large woman with a large purse that had everything in it but a hammer and nails. It had a long strap, and she carried it slung across her shoulder. It was about eleven o'clock at night, dark, and she was walking alone, when a boy ran up behind her and tried to snatch her purse. The strap broke with a sudden single tug the boy gave it from behind. But the boy's weight and the weight of the purse combined caused him to lose his balance. Instead of taking off full blast as he had hoped, the boy fell on his back on the sidewalk and his legs flew up. The large woman simply turned around and kicked him right square in his blue-jeaned sitter. Then she reached down, picked the boy up by his shirtfront, and shook him until his teeth rattled.

After that the woman said, "Pick up my pocketbook, boy, and give it here."
She still held him tightly. But she bent down enough to permit him to stoop and pick up her purse. Then she said, "Now ain't you ashamed of yourself?"

Firmly gripped by his shirtfront, the boy said, "Yes'm."
The woman said, "What did you want to do it for?"
The boy said, "I didn't aim to."
She said, "You a lie!"
By that time two or three people passed, stopped, turned to look, and some stood watching.
"If I turn you loose, will you run?" asked the woman.
"Yes'm," said the boy.
"Then I won't turn you loose," said the woman. She did not release him.
"Lady, I'm sorry," whispered the boy.
"Um-hum! Your face is dirty. I got a great mind to wash your face for you. Ain't you got nobody home to tell you to wash your face?"
"No'm," said the boy.
"Then it will get washed this evening," said the large woman, starting up the street, dragging the frightened boy behind her.

He looked as if he were fourteen or fifteen, frail and willow-wild, in tennis shoes and blue jeans.

The woman said, "You ought to be my son. I would teach you right from wrong.
Least I can do right now is to wash your face. Are you hungry?"
"No'm," said the being-dragged boy. "I just want you to turn me loose."
"Was I bothering you when I turned that corner?" asked the woman.
"No'm."
"But you put yourself in contact with me," said the woman. "If you think that that contact is not going to last awhile, you got another thought coming. When I get through with you, sir, you are going to remember Mrs. Luella Bates Washington Jones."

Sweat popped out on the boy's face and he began to struggle. Mrs. Jones stopped, jerked him around in front of her, put a half nelson about his neck, and continued to drag him up the street. When she got to her door, she dragged the boy inside, down a hall, and into a large kitchenette-furnished room at the rear of the house. She switched on the light and left the door open. The boy could hear other roomers laughing and talking in the large house. Some of their doors were open, too, so he knew he and the woman were not alone. The woman still had him by the neck in the middle of her room.

She said, "What is your name?"
"Roger," answered the boy.
"Then, Roger, you go to that sink and wash your face," said the woman, whereupon she turned him loose-at last. Roger looked at the door-looked at the womanlooked at the door-and went to the sink.
"Let the water run until it gets warm," she said. "Here's a clean towel."
"You gonna take me to jail?" asked the boy, bending over the sink.
"Not with that face, I would not take you nowhere," said the woman. "Here I am trying to get home to cook me a bite to eat, and you snatch my pocketbook! Maybe you ain't been to your supper either, late as it be. Have you?"
"There's nobody home at my house," said the boy.
"Then we'll eat," said the woman. "I believe you're hungry-or been hungry-to try to snatch my pocketbook!"
"I want a pair of blue suede shoes," said the boy.
"Well, you didn't have to snatch my pocketbook to get some suede shoes," said Mrs. Luella Bates Washington Jones. "You could've asked me."
"M'am?"
The water dripping from his face, the boy looked at her. There was a long pause. A very long pause. After he had dried his face and not knowing what else to do, dried it again, the boy turned around, wondering what next. The door was open. He could make a dash for it down the hall. He could run, run, run, run!
The woman was sitting on the daybed. After a while she said, "I were young once and I wanted things I could not get."
There was another long pause. The boy's mouth opened. Then he frowned, not knowing he frowned.

The woman said, "Um-hum! You thought I was going to say but didn't you? You thought I was going to say, but I didn't snatch people's pocketbooks. Well, I wasn't going
to say that." Pause. Silence. "I have done things, too, which I would not tell you, son. Everybody's got something in common. So you set down while I fix us something to eat. You might run that comb through your hair so you will look presentable."
In another corner of the room behind a screen was a gas plate and an icebox. Mrs. Jones got up and went behind the screen. The woman did not watch the boy to see if he was going to run now, nor did she watch her purse, which she left behind her on the daybed. But the boy took care to sit on the far side of the room, away from the purse, where he thought she could easily see him out of the corner of her eye if she wanted to. He did not trust the woman not to trust him. And he did not want to be mistrusted now.
"Do you need somebody to go to the store," asked the boy, "maybe to get some milk or something?"
"Don't believe I do," said the woman, "unless you just want sweet milk yourself. I was going to make cocoa out of this canned milk I got here."
"That will be fine," said the boy.
She heated some lima beans and ham she had in the icebox, made the cocoa, and set the table. The woman did not ask the boy anything about where he lived, or his folks, or anything else that would embarrass him. Instead, as they ate, she told him about her job in a hotel beauty shop that stayed open late, what the work was like, and how all kinds of women came in and out, blondes, redheads, and Spanish. Then she cut him a half of her ten-cent cake.
"Eat some more, son," she said.
When they were finished eating, she got up and said, "Now here, take this ten dollars and buy yourself some blue suede shoes. And next time, do not make the mistake of latching onto my pocketbook nor nobody else's. I got to get my rest now. But from here on in, son, I hope you will behave yourself."

She led him down the hall to the front door and opened it. "Good night! Behave yourself, boy!" she said, looking out into the street as he went down the steps.

The boy wanted to say something other than, "Thank you, m'am," to Mrs. Luella Bates Washington Jones, but although his lips moved, he couldn't even say that as he turned at the foot of the barren stoop and looked up at the large woman in the door. Then she shut the door.
"Thank You M'am" from SHORT STORIES by Langston Hughes. Copyright © 1996 by Ramona Bass and Arnold Rampersad. Reprinted by permission of Hill and Wang, a division of Farrar, Straus and Giroux, LLC.

## cknowledgments

This report is the culmination of the effort of many individuals who contributed their considerable knowledge, experience, and creativity to the NAEP 2003 reading assessment. The assessment was a collaborative effort among staff from the National Center for Education Statistics (NCES), the National Assessment Governing Board (NAGB), Educational Testing Service (ETS), Westat, and Pearson Educational Measurement. Most importantly, NAEP is grateful to the students and school staff who made the assessment possible.
The NAEP 2003 reading assessment was funded through NCES, in the Institute of Education Sciences of the U.S. Department of Education. The Commissioner of Education Statistics, Robert Lerner, and the NCES staff-Peggy Carr, Arnold Goldstein, Steven Gorman, Carol Johnson, Andrew Kolstad, Val Plisko, Taslima Rahman, and Marilyn Seastrom-worked closely and collegially with the authors to produce this report. The NAEP project at ETS is directed by Stephen Lazer and John Mazzeo, with assistance from John Barone. Sampling and data collection activities were conducted with Westat under the direction of Renee Slobasky, Nancy Caldwell, Keith Rust, and Dianne Walsh. Printing, distribution, scoring, and processing activities were conducted by Pearson Educational Measurement under the direction of Brad Thayer, Connie Smith, and William Buckles.
Test development activities took place at ETS under the direction of Patricia Donahue with assistance from Robert Finnegan.
The complex statistical and psychometric activities necessary to report results for the NAEP 2003 reading assessment were directed by Catherine McClellan and Jinming Zhang, with assistance from Andreas Oranje, Hui Deng, Kelvin Gregory, and Ying Jin. The extensive data processing and computer programming activities underlying the statistical and psychometric analyses conducted at ETS are under the direction of David Freund, Edward Kulick, Bruce Kaplan, and Steven Isham. Data analyses presented in the report were managed by Steven Isham and Tatyana Petrovicheva with assistance from Laura Jerry, Youn-Hee Lim, Haiying Liu, Norma Norris, Alfred Rogers, Fred Schaefer, Satwinder Thind, Mike Weiss, and John Willey. The complex database work for this assessment was managed by Katharine Pashley with assistance from Gerry Kokolis.
The reporting process was directed by Jay Campbell with assistance from Wendy Grigg. The design and production of this report were overseen by Loretta Casalaina with assistance from Joseph Kolodey, Rick Hasney, and Susan Mills. Janice Goodis coordinated the documentation and data checking procedure with assistance from Ming Kuang, Andrea Bergen, and Alice Kass. Arlene Weiner coordinated the editorial procedures with assistance from Trish Hamill and Jennifer O'Bryan. The consistency review process was coordinated by Carmen Payton. The Web version of this report was coordinated by Rick Hasney with assistance from Loretta Casalaina.
Many thanks are due to the numerous reviewers. The comments and critical feedback of the following reviewers are reflected in the final version of this report: Young Chun, Mary Crovo, Arnold Goldstein, Steven Gorman, Barbara Kapinus, Andrew Kolstad, Laurence Ogle, Naomi Senkeeto, Linda Shafer, Alan Vanneman, and Aileen Waters.

[^3]:    4 The initial base sampling weights were used in weighting the percentages of participating schools and students. An attempt was made to preselect one substitute school for each sampled public school, one for each sampled Catholic school, and one for each sampled nonpublic school (other than Catholic). To minimize bias, a substitute school resembled the original selection as much as possible in affiliation, type of location, estimated number of grade-eligible students, and minority composition.
