May 5, 2004

SMV Program Organization

Four Technical Areas (2000-2003)

- Integrity – Competence of Natural / Engineered Systems
- Optimization – Economic Offsets, Efficiency, Transportation
- Monitoring – Performance and Leak Detection
- Risk Assessment (= Probability x Consequences) - FEPs, Methodologies, Modeling, Mitigation / Remediation

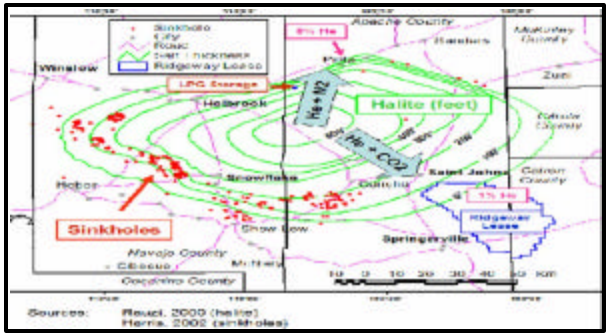
bp	**Christopher (co-lead), Espie, Saunders, Ebrom**
ChevronTexaco	**Imbus (lead), Woliver, Kieke**
	Heidug, Maas
HYDRO	**Eide, Böe**
STATOIL	**Berger**
Eni	**Caruso**
ENCANA	**Stachniak**
SUNCOR ENERGY	**Das**

Integrity – Natural & Industry Analogs

Natural CO_2 Reservoirs (ARI)

- 3 Large US Accumulations
- Thick Evaporite or Clastic seals
- Lack of Faults or Self-Healing Faults

St John's Dome Structural Map



Leaky Systems (Utah State)

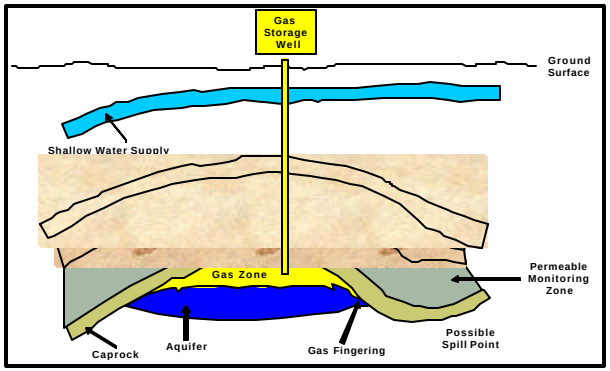
- 3D Structure / Stratigraphy Models
- Fluid Migration Paths & History
- Natural CO_2 Immobilization Rate

Natural CO_2-Charged Geyser System in E. Central Utah

Natural Gas Storage Industry (GTI)

- Widespread, Decades-Old Industry
- Excellent Safety Record
- Site Selection, Operations, Intervention
- Key Implications for CO_2 Storage

Gas storage facility elements



Integrity – Reservoir & Cap Rock

Geomechanical Response to CO_2 (ASP)

- Stability of Reservoir / Cap Rocks; Faults
- Tools to Predict Maximum Fluid Pressure
- Development of Stress-Seismic Techniques

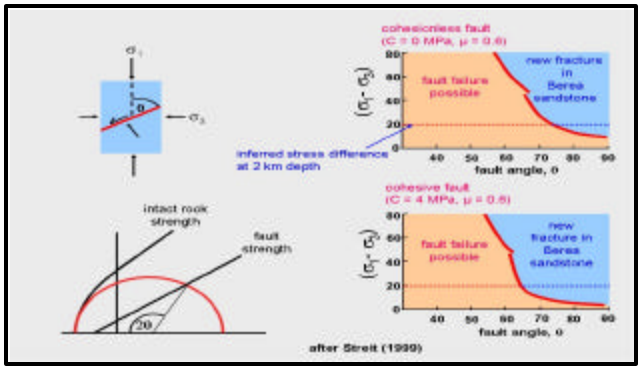
Rock Response to CO_2 (GFZ-Potsdam)

- Geophysical Attributes; Mineral Stability
- Anomalous Effects: Flow Stability?
- Ions Released: Mineral Dissolution

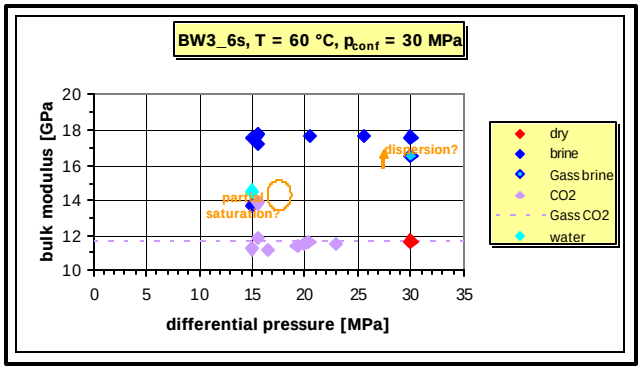
Reactive Transport Modeling (LLNL)

- Geochemical / Geomechanical Response (Permeability Decrease/ Increase, Resp.)
- Dependency on Reservoir and Influx Parameters
- Abatement of Effects with Time

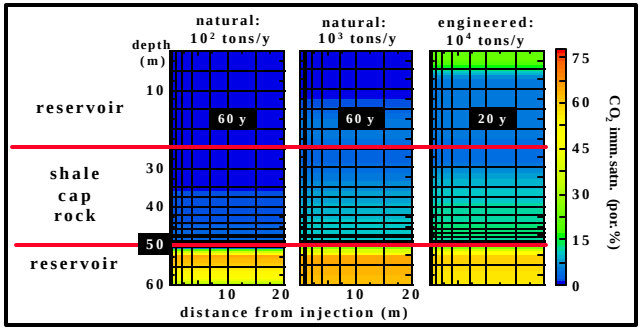
Evaluation of Fault Stability: 2D Failure Plot



Bulk Modulus: Gassmann



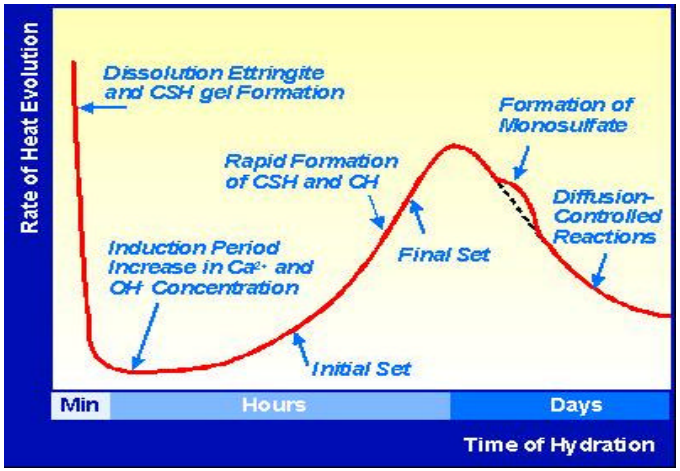
Geochemical and geomechanical response to CO_2 injection



Integrity – Well Stability

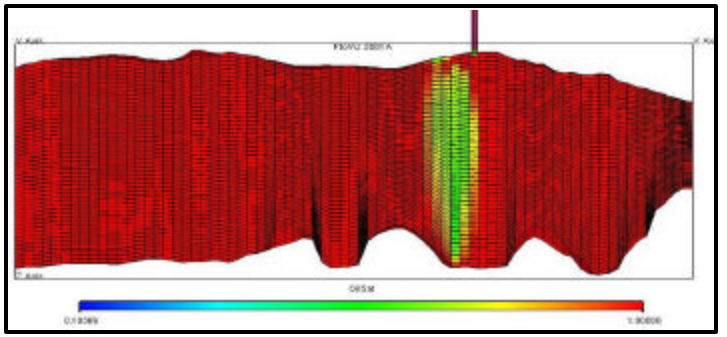
Well Integrity (SINTEF)

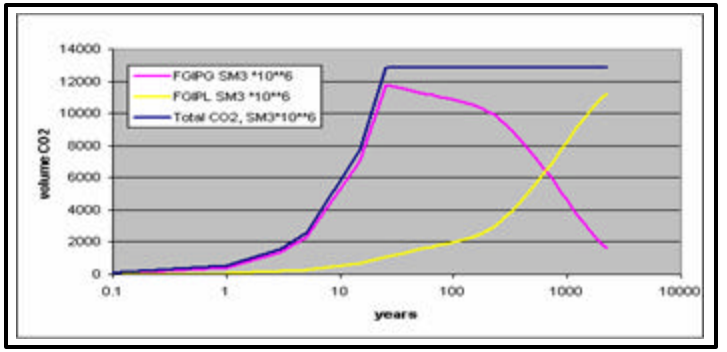
- Testing of Portland Cement
- Degradation Mechanisms and Rate
- New Cements and Sealants
- Well Failure Simulation



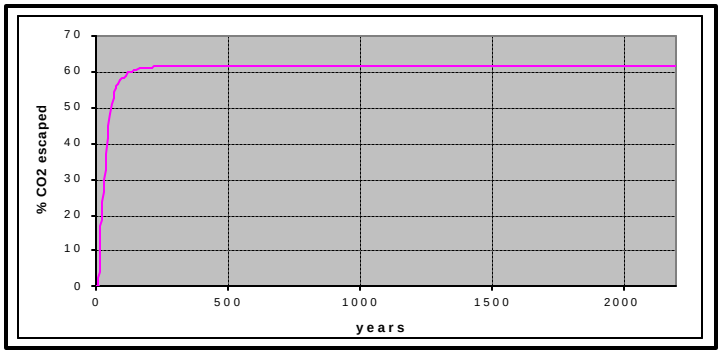
Heat Evolution Profile of Hydrating Cement

Reservoir Simulation: 5 Years





Free vs. Dissolved CO_2 With Time



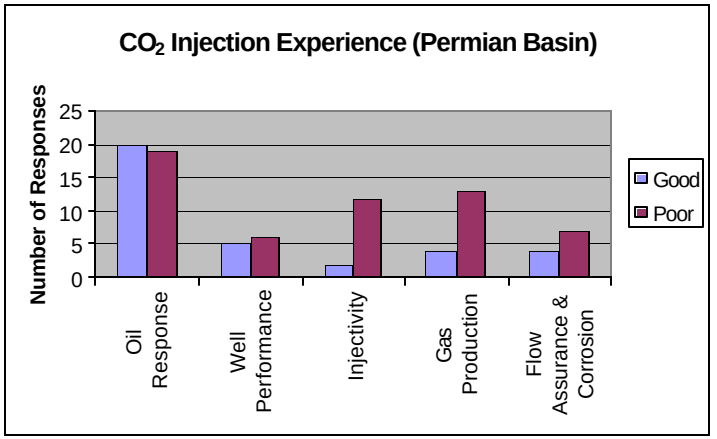
A "Worst Case" Scenario

Optimization – Hydrocarbon Reservoirs

CO_2 EOR Record (NMT)

- "Look back" - Permian Basin Survey
- Oil Response & Breakthrough
- Lack of Reservoir Characterization
- Need for Monitoring
- Anecdotal Safety Record

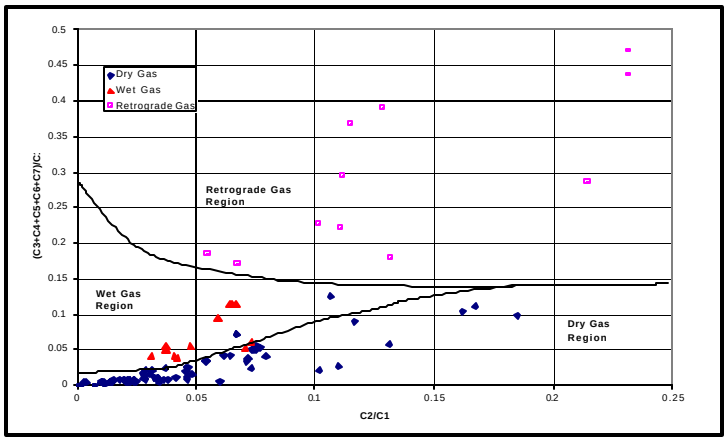
Survey Results: Permian Basin EOR Experience



Gas & Condensate Field Storage (TTU)

- Experimental capacity / compatibility
- Phase Behavior; Compressibility (Z)
- "Sequestration Parameter" Screening Tool

Hydrocarbon Gas Phase Behavior

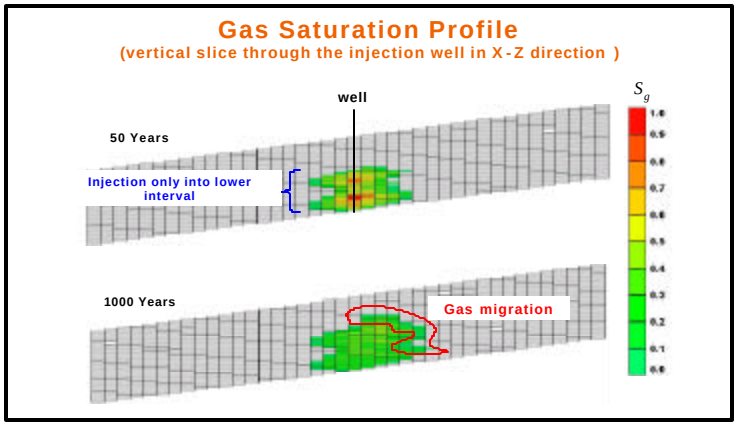


Optimization – Saline Aquifers

CO_2 Movement & Immobilization (UT)

- Trapping Mechanisms & Timing
- Injection Location in Reservoir
- Petrophysical Sensitivity
- Solubility and Residual Gas Trapping
- Most CO_2 Immobilized by 1000 yr.
- Mineralization Small, 10000 yr.

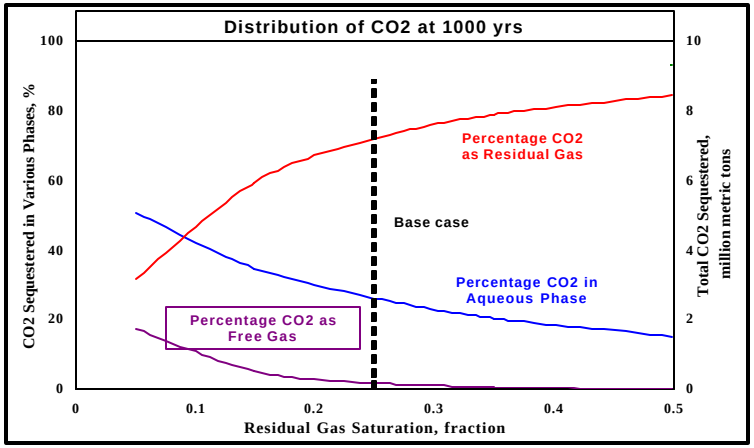
Injection Location Effect on CO_2 Dispersion



CO_2 Impurities – Subsurface (UT)

- Impure CO_2 Streams (SNOx effects) on Injectivity, Reservoir & EOR
- Unlikely to Affect Injectivity
- MMP and Mobility Ratio Tradeoff in EOR

Immobili-zation States of CO_2



Optimization – Transportation

Materials Selection for Pipelines (IFE)

- New Experimental Data for Carbon Steel (CS) Corrosion at High P
- Existing Models Exaggerate CS Corrosion Rates
- Pipeline Design and Inhibitor Use

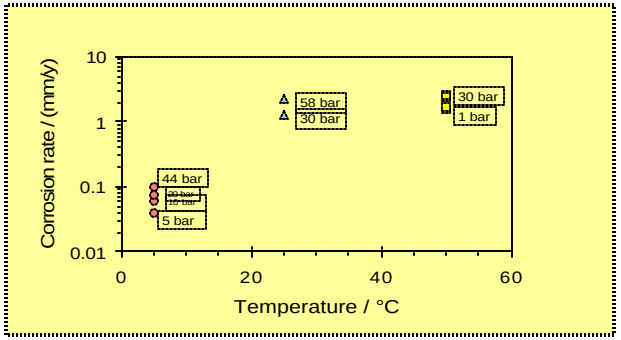
Process Design (Reinertsen Engr.)

- Reevaluate Existing Hydration Pipeline Specifications for Norwegian Offshore Case
- Relaxed From 60 to 600, Perhaps 1300 ppm
- Cost Savings with Process Integration

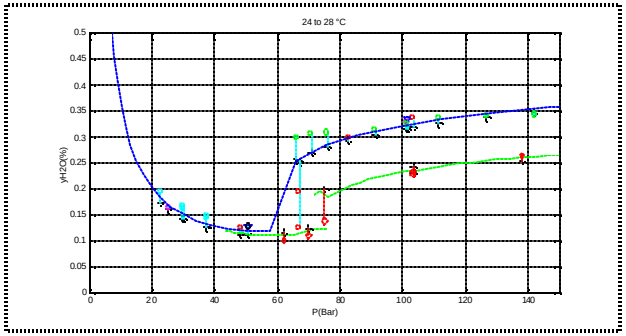
Impurities and Surface Equipment (Battelle)

- Acid Gases Likely to Impact Surface Equipment
- Further Work on Gas Phase Behavior Needed

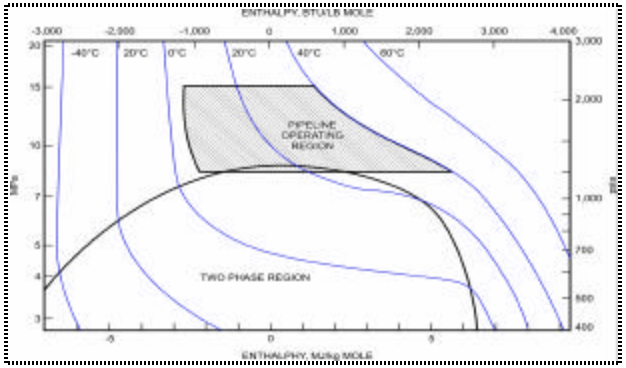
Corrosion Rates w & w/o Inhibitor



Water Solubility on CO_2 (w & w/o CH_4)



Pipeline Operation in 2 phases with Addition of 5% each N_2 and CH_4



Monitoring – General

Survey of Monitoring Applications (TNO)

- Well Monitoring: P&T, ER, TDT, Microseismic, VSP, Cross well Seismic, fluid sampling
- Surface Geophysical: 4D seismic, Sub-bottom profiling and Sonar (marine), gravity, EM, InSAR, tiltmeters
- Geochemical: GW sampling / analysis, tracer surveys, atmospheric detection, geobotanical hyperspectral
- Applicability matched with FEPs (e.g., casing / cement well failure)
- Seismic modeling

Suitability of Surface Geophysical Monitoring Techniques by FEPs

	time lapse seismic	sub-bottom profiling	Sonar	Gravity	EM	Geodetic	InSAR	Tiltmeters
Fault activation (high pressure)	not likely	x	x	x	x	not likely	not likely	when down-hole
Dissolution or dehydration of seal	not likely	x	x	x	x	x	x	x
Casing / cementation failure	x	x	x	x	x	x	x	x
Deterioration cement plug	x	x	x	x	x	x	x	x
Corrosion of casing	x	x	x	x	x	x	x	x
Formation damage due to drilling	not likely	x	x	x	x	x	x	x
Operational well failure	x	x	x	x	x	x	x	x
Fractures seal	possible	x	x	x	x	x	x	x

Suitability of Geochemical Sampling Monitoring by FEPs

	Groundwater sampling	(Isotopic) tracers	Atmospheric monitoring network	Geo-botanical monitoring
Cap rock integrity (leakage)	In case of leakage to the surface	Injected CO2 discrimination	In case of leakage to the surface	In case of leakage to the surface
Ground movements	x	x	x	x
Lateral spreading	x	x	x	x
Verification or mass balance	x	x	x	x

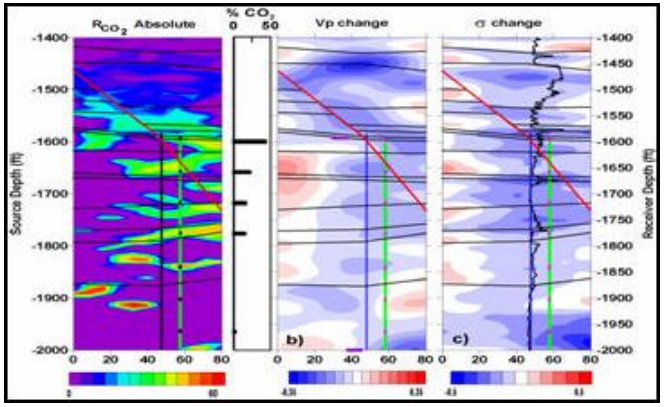
Monitoring – Geophysical & Geochemical

Geophysical

Novel Geophysical Techniques (LBNL)

- Resolution and Applicability of Seismic and Non-Seismic Geophysical Monitoring
- Seismic Amplitude Analysis and AVO Detect Changes in Water w/ CO_2
- Gravity, EM, SP Have Variable Resolution but may Offer Significant Cost Saving

Image Enhance-ment Using EM

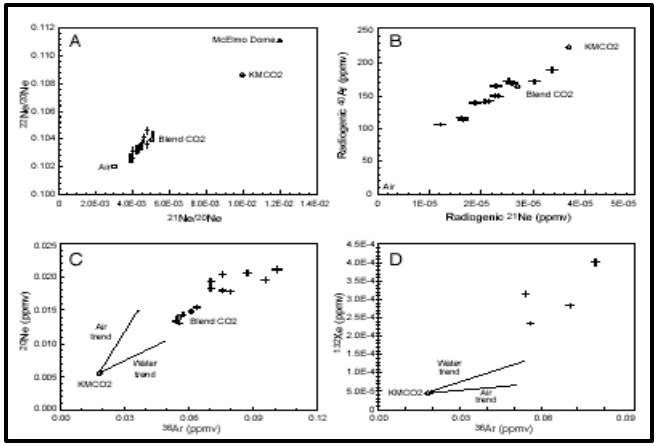


Geochemical

Noble Gas Tracers & Costs (LLNL)

- Selection: Cost, Availability, Transport, Distinctiveness (Xe)
- Gas Selection and Quantification for Mabee Field

Distinguishing Gases Using Noble Gas Isotopes



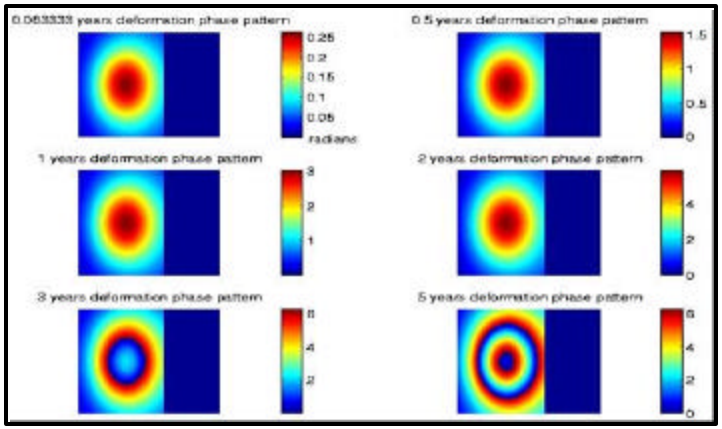
CO_2 Capture Project

Monitoring - Remote

InSAR Resolution (Stanford)

- Satellite-Based Theoretical Detection of Ground Movement with Model Injection Project
- Pressure Profiles and Deformation Maps
- Sensitivity to Topographical Effects

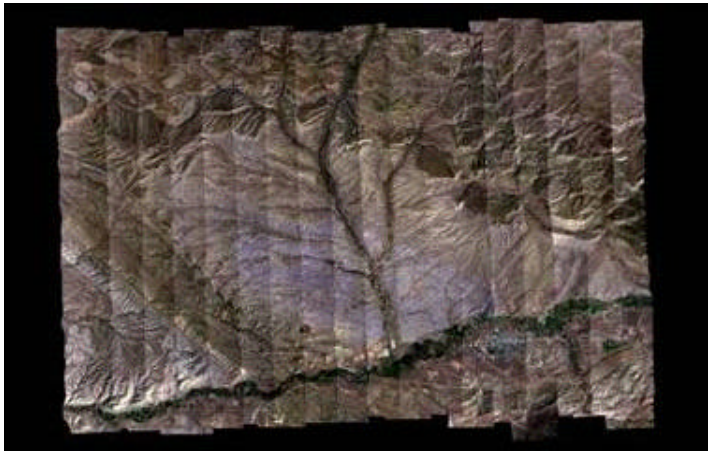
Deformation Maps from Pressure Profiles



Hyperspectral Geobotanical (LLNL)

- Indirect detection of floral responses
- Mammoth Lake – Satellite Detection of Tree Kills
- Rangely Field – Aerial detection of Long-Term Habitat Redistribution

Aerial hyperspectral Image of Rangely CO_2 EOR Field, Colorado



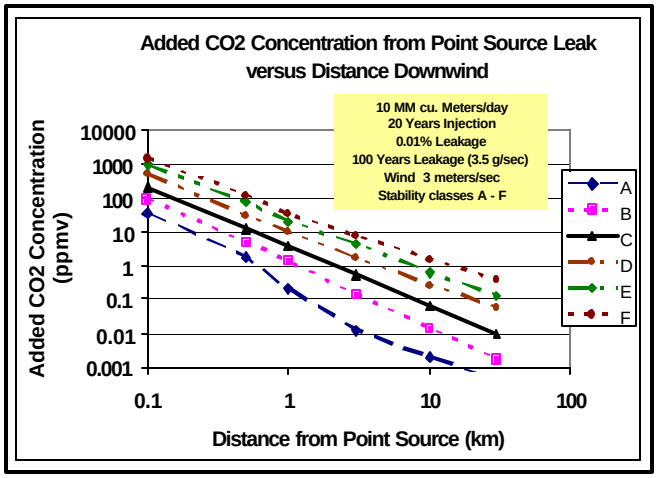
CO_2 Capture Project

Monitoring - Atmospheric

State-of-the-Art Atmospheric (Caltech)

- Available Technologies: Applicability for Time / Length and Costs
- Detectability of 0.01%/year leak
- Spreadsheet Application to Model Detector Applicability Given Point or Diffuse Leaks, Flux, Atmospheric Conditions (>10 ppm Over Background)

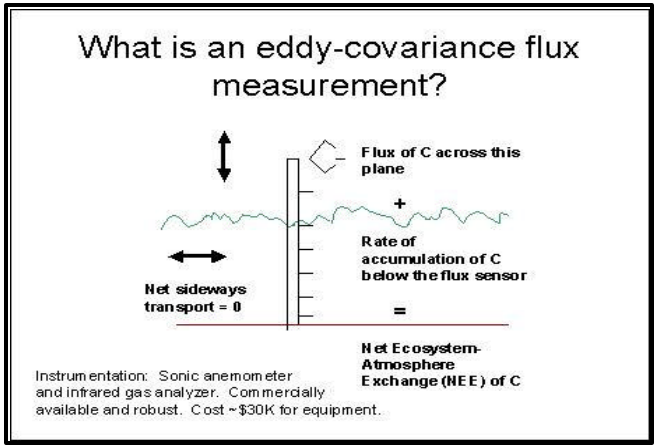
Detectability as a Function of Atmospheric Conditions



Eddy Covariance (Penn State)

- Tower-Based Laser Spectrometry
- Established for CO_2 flux; Suitable for CO_2 storage
- Resolution for leak types: 10^{-1} to 10^{-5} $kgm^{-2}s^{-1}$ (Well Failure to Fault, resp.)

Eddy Covariance Concept

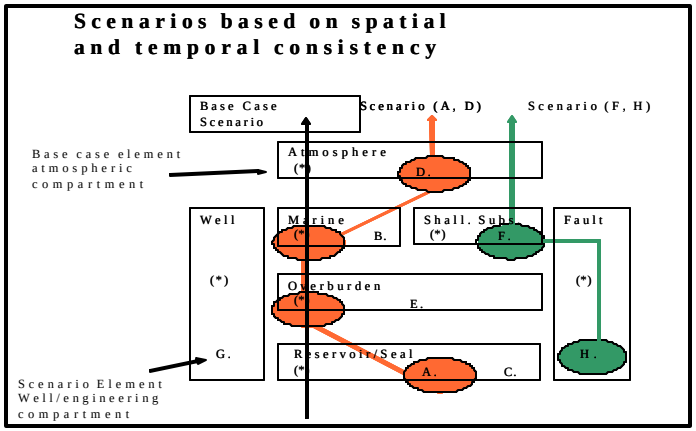


Risk Assessment – Comprehensive Methodologies

SAMCARDS (TNO)

- Scenario & FEP Analysis, Quantitative Model Development, Consequence Analysis; Performance Assessment
- Test on Netherlands On-Offshore Aquifer (No Leakage Over 10000 yr.)

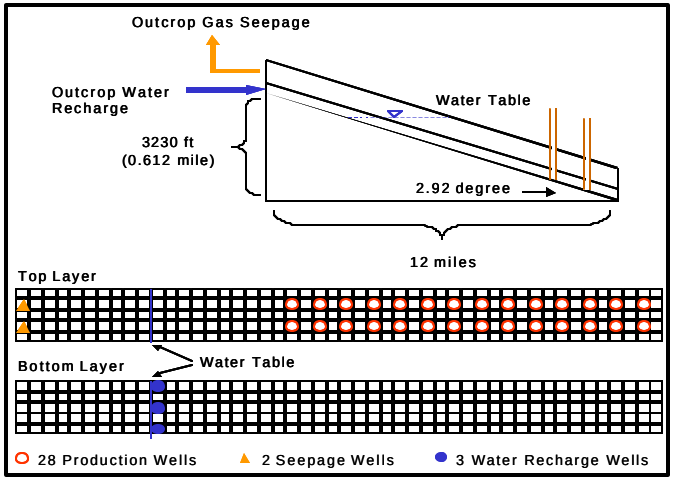
Multicompartment Risk Assessment Model



Probabalistic (INEL)

- 4 Elements & 6 Functional Constituents Geomechanics Module
- MS Access Prototype Application w/ Monte Carlo Simulation
- Coal Bed Tests: Predictive Modeling for Well Placement & Operation Parameters
- Coal Characterization
- History Matching & Future Injection
- Previous Production Effects

Representative Seepage Model

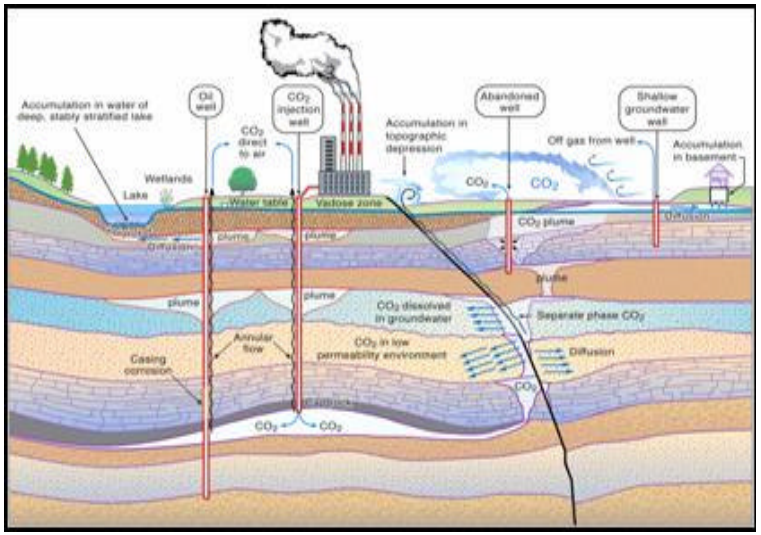


Risk Assessment – Seepage Modeling, Intervention & Remediation

Early Detection, Intervention & Remediation (LBNL)

- Early Detection Monitoring Approaches
- Leakage / Seepage Scenarios
- Existing / Needed Intervention and Remediation Technologies from Other Industries
- Site-Specific Contingency Planning

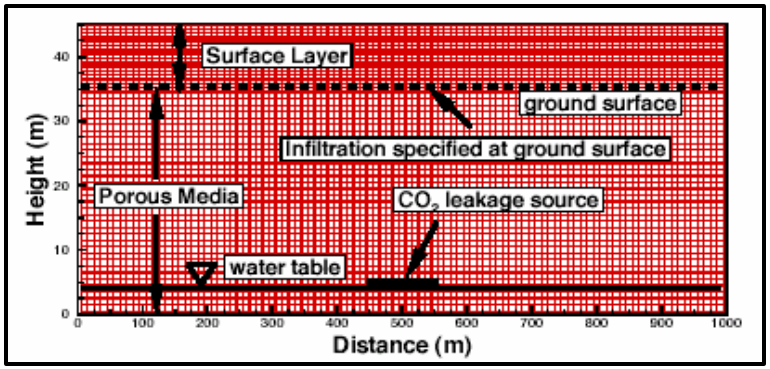
Leakage and seepage scenarios



Flow Simulation (LBNL)

- Leakage / Seepage Coupling
- Flux and Atmospheric Conditions
- Case Studies

Coupled Subsurface – Surface Dispersion Problem Model



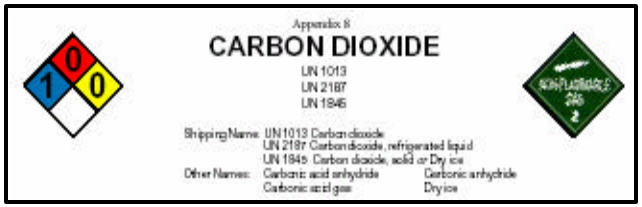
Risk Assessment – Environmental / Public Perception

- HSE Review (LBNL)
  - Natural Analogs and Industrial Experience
  - Regulatory Framework and HSE Effects
  - Magnitude of Hazard & Principal Risks
  - Regulatory Paradigms & Risk Assessment

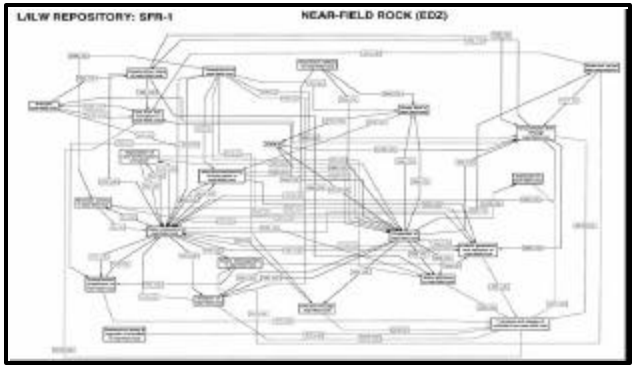
Nuclear Storage Lessons Learned
- Not Comparable in Hazard Level but Lessons from Technical Assessment and Stakeholder Engagement
- Technical Review of Gas Migration

Subsurface Ecosystems (Princeton)
- NGO concern for Biodiversity
- CO_2 Affects Microbial Assemblages Which Could In Turn Affect Performance (Gas Generation, Pore Plugging)

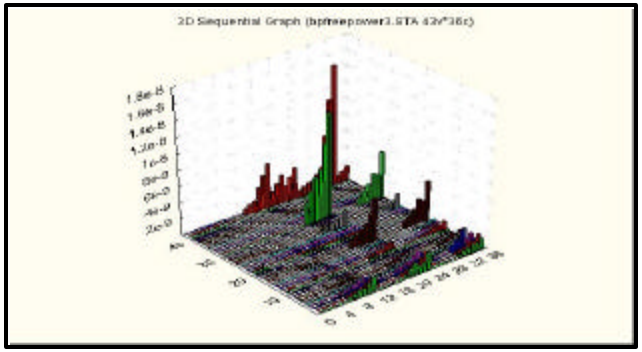
MSDS for CO2



Process Influence Diagram



Microbial Power Simulation



The SMV Contribution to CO_2 Storage -1

Establishing the Relevance of Industrial Analogs
- Could the EOR and NGS analogs (or Sleipner) have passed regulatory muster today?
- A credible industry analogs HES review established "relative" risk of CO_2 storage
- The HES and operational records from these processes were "keyed" to CO_2 storage

Systematic Evaluation Process
- Site evaluation protocols: "Integrity", "Optimization", "Monitoring" and "Risk Assessment"
- Development of theory, experiments, models and simulation
- Performance, economics and tradeoffs issues investigated

ID of Likely Leakage Modes and their Characterization / Quantify / Avoidance / Remediation
- Venue quality is predictable using 3D geologic models and fluid history analysis
- Geologic systems offer several mechanisms of CO_2 immobilization, facilitated by operation methods
- Well failure is a greater than most geologic issues; Engineered and remediative solutions available

Applicability of Monitoring and Verification Technologies for CO_2 Evaluated
- Several technologies applied from various vantage points investigated
- Preferred approaches based on level of development, reliability, cost-effectiveness

Systematic risk assessment methodologies applicable to CO_2 Storage
- Independently developed, comprehensive methodologies are available
- Leakage scenarios, flow simulation models, remediation strategies

Technical Networking, Stakeholder Engagement Activities
-Technical workshops with non-CCP participation; Inter-JIP collaboration
- NGO engagement and response to concerns

The SMV Contribution to CO_2 Storage - 2

The CCP-SMV effort has developed methodologies for CO_2 storage venue assessment that reduce uncertainty and instill confidence of stakeholders. It has a unique place among related JIPs in that studies comprise a mix of practical industry experience and meticulous academic theory and research. The methodologies employed include those applicable generically and to specific geological storage venue types (e.g., coal, depleted oil and gas, saline aquifers). Networking with other JIPs and NGO engagement has enhanced the program's relevance and increased the likelihood of stakeholder acceptance of CO_2 storage. Continued CCP-SMV efforts will focus on methodology integration, performance / economic issues, networking and development of demonstration projects.

Present Technology & Process Gaps / CCP2 Solutions

Integrity
- Geologic Systems – Analog development
- Engineered Systems – Well material resistance; Failure scenarios

Optimization
- Storage Venue Characterization – Coupled Geochemical / Geomechanical
- Operations – Injection rate / location; Storage performance
- Economics – EOR strategies
- Abandonment – Performance criteria for liability release

Monitoring
- Subsurface Imaging – Cost-effective alternatives
- Remote Detection – Direct approaches
- Monitoring Wells – Dual use wells; Compartments and breakthrough prediction

Risk Assessment
- Existing methodology evaluation and testing
- Quantitative bracketing of risk (probability, consequences) relative to familiar hazards

Demonstrations
- Test CCP technologies
- Stay “relevant”
