

Supplemental Fig. 1. Significant plot of changes in gene expression in response to elevated C_a .

Horizontal axis is \log_2 of the estimated fold change adjusted for systematic and random effects through normalization. Vertical axis is $-\log_{10}(P\text{-value})$ to represent magnitude of probability that each pairwise comparison for a gene is falsely detected (i.e., if $P=0.01$, corresponding value is 2). Horizontal reference line indicates Bonferroni adjusted probability setting $P=1.34e-6 = 0.01/7442$ for each pairwise comparison so that the experiment-wise error rate is controlled at $P=0.01$. Vertical reference lines represent two fold changes.

Supplemental table 1. List of altered maize transcripts in response to CO₂ enrichment
