

What planet do all these manufacturers, retailers and users of known toxic materials live on??? Do they have some secret antidote that protects THEM from the deleterious effects of Carbaryl while it does its work on problem insects and honeybees alike, not to mention the rest of us?? If you are interested in keeping the food supply bountiful I suggest all possible brain power be directed at preserving bees. If those blossoms are not pollinated we don't get any fruit or vegetables. Would be a bit upsetting for the lo-carb crowd. Perhaps you should read A.S. Byatt's novel "Possession", then ban Carbaryl or at least give a detailed honest explanation of why it should still be used which can then be rebutted or accepted point by point.

Best regards,
