

**APPENDIX F**

**GEOGRAPHIC INFORMATION SYSTEM  
AND DEMOGRAPHIC DATA COMPILATION**

# **APPENDIX F**

## **GEOGRAPHIC INFORMATION SYSTEM AND DEMOGRAPHIC DATA COMPILATION<sup>a</sup>**

### **INTRODUCTION**

This appendix describes the geographic information system (GIS) and demographic data compiled to support the Savannah River Site (SRS) dose reconstruction study. It also briefly describes the management activities for the demographic data at the South Carolina State University (SCSU) GIS Laboratory and the comprehensive database design developed to house data that can support population dose assessments.

### **GEOGRAPHIC INFORMATION SYSTEM DATA**

The GIS component of this project focuses on compiling and formatting spatial data and identifying data sources pertinent to locating contaminant sources (air, water, and land); monitoring locations; contaminant transport pathways (surface water, air, and crops); and population distributions. GIS coverages were also developed to provide a boundary for the study area ([Figure F-1](#)) and to support public communication.

One of the objectives for this task was to provide a GIS coverage data directory structure ([Figure F-2](#)) and a database that will be compatible with future Centers for Disease Control and Prevention (CDC) GIS technology needs. As GIS technology continues to develop, it will become more important for storage, analysis, and communication of spatial data.

A reduction in the available funding to support GIS data compilation activities limited efforts to compile all relevant spatial data, conduct analyses on imagery, and complete data documentation to meet Federal Geographic Data Committee (FGDC) standards. What was collected, however, provides a solid foundation for future GIS activities and public communication for the project.

### **Data Acquisition**

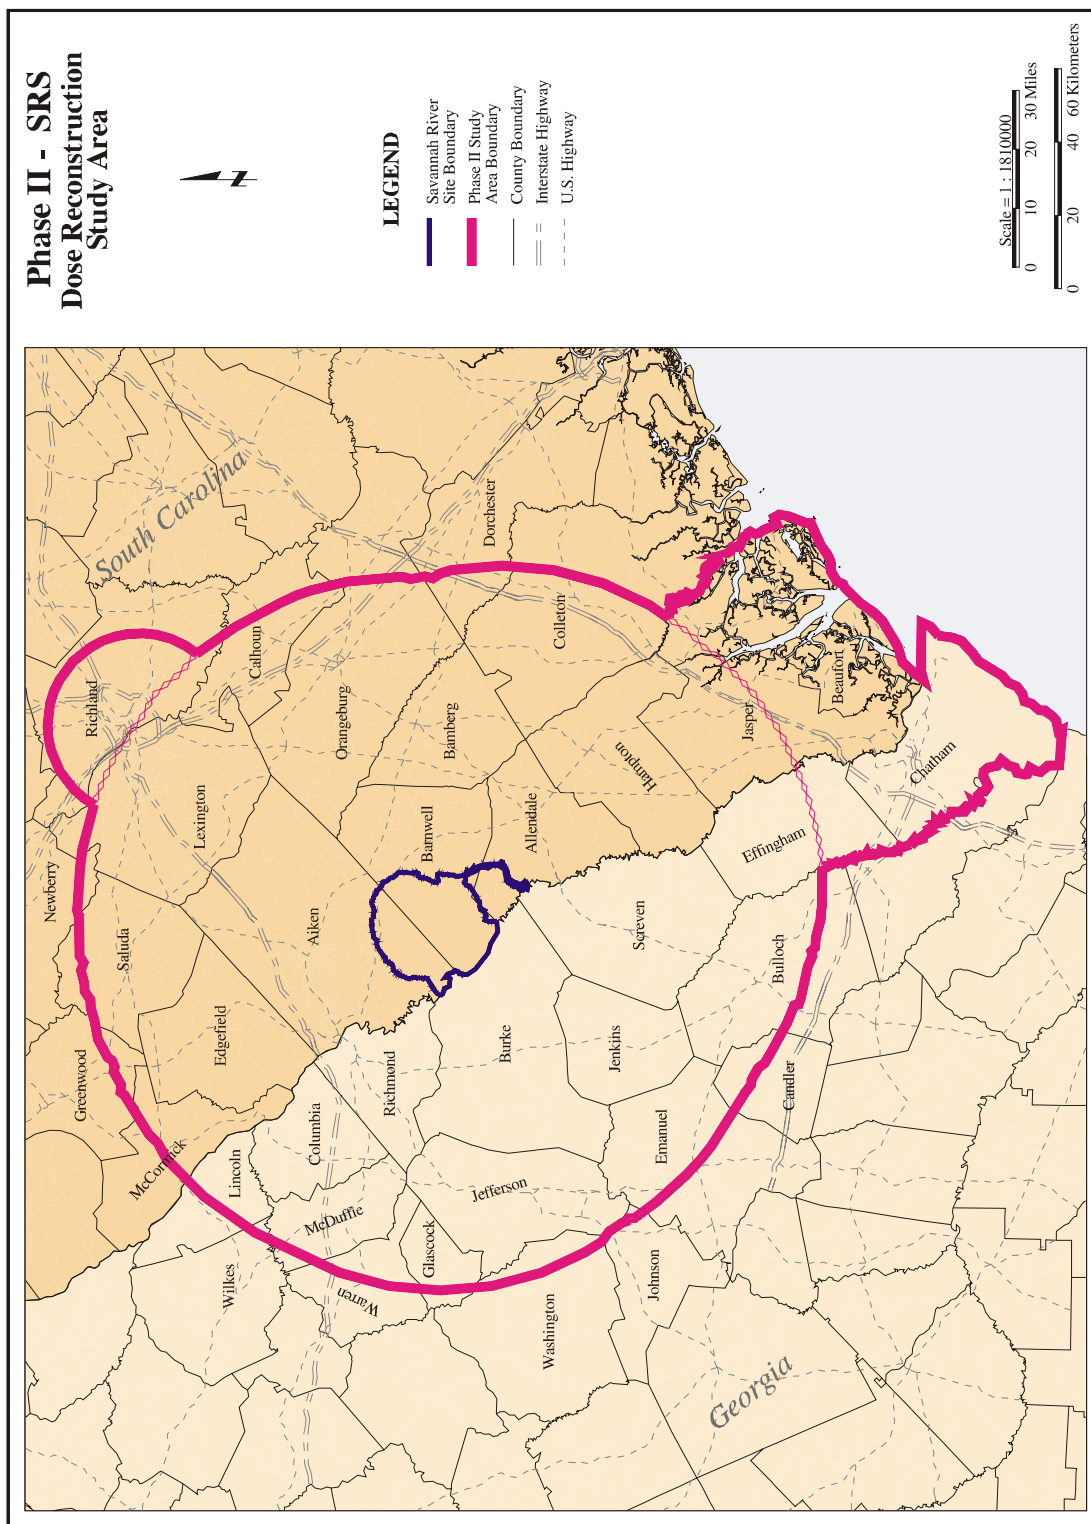

#### **Data Acquisition Scope**

A general study area was defined to focus data acquisition and limit the total amount of data to be obtained. The study area includes the real estate within a 50-mi buffer from the SRS boundary, plus all the counties on either side of the Savannah River downstream from the SRS. Columbia, South Carolina, was also included within the study area ([Figure F-1](#)). Development of this boundary is discussed at the end of this section.

The temporal period of interest for data collection was from the early 1950s through the early 1990s. Data for the beginning of each decade were identified if available. Numerous GIS coverages were obtained from various sources; however, documentation did not accompany some of the data and it could not be obtained. GIS data that lacked documentation regarding sources and accuracy are not included.

---

<sup>a</sup> Authors of this appendix are Ronald C. Rope of Environmental Perspective, Inc.; Wei Yang of South Carolina State University; and Luke White and Patti McGuire of Teton Geographic Information Systems, Inc.

**Figure F-1.** Map of the project study area.

## SRS GIS Coverage Directory Structure

Examples of coverage types for each directory

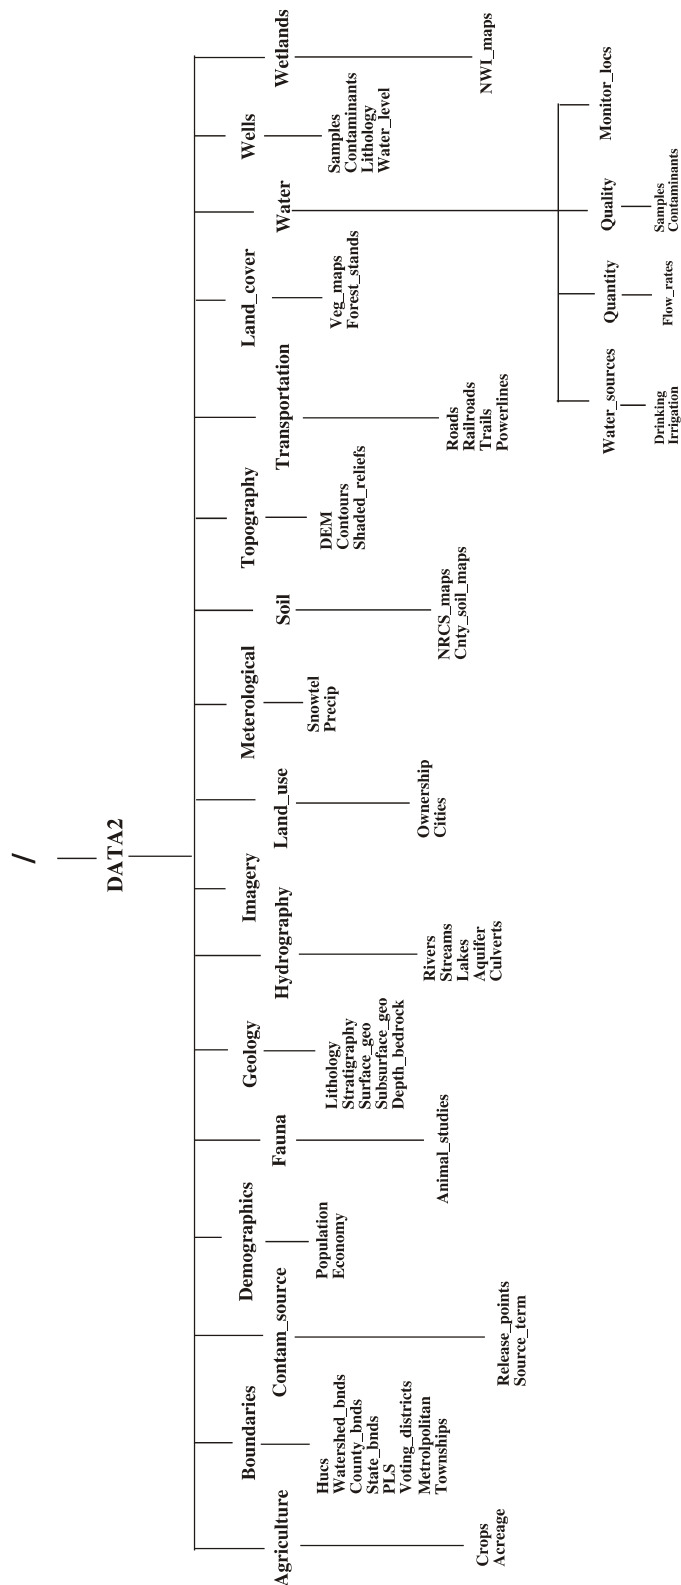

Figure F-2. Proposed GIS data directory structure.

## Data Resolution

Generally, 1:100,000 scale data were collected for the area outside the SRS. However, larger scale data for the SRS and some adjacent lands were also obtained. Discussions among project investigators indicated that greater resolutions were not necessary to support analyses.

## Data Types

The team attempted to obtain data that would support the following project needs:

1. Locating and mapping locations of chemical and radiological releases (effluents, emissions, spills, and disposal areas)
  - Facility drawings with stacks, drains, effluent pipes
  - Waste disposal areas
  - Storage/loading areas
  - Spill sites
  - Aerial photographs.
2. Identification and analysis of contaminant transport, and exposure pathways (air, surface, ground water, and biota)
  - U.S. Geological Survey (USGS) hydrography
  - SRS drainage patterns
  - United States Fish and Wildlife Service (USFWS) National Wetlands Inventory data
  - Fishing and hunting locations
  - Key habitats for game species
  - Ground cover
  - Digital Elevation Model (DEM) data
  - USGS orthophoto quads
  - Soil data
  - TIGER data or other census data
  - Remotely sensed data (aerial photographs and satellite imagery).
3. Locations where single samples were collected and/or monitoring station locations (historic or current)
  - SRS monitoring sites (current/historic)
  - Other state, federal, and university monitoring sites (EarthInfo data for USGS, NCDC, STORET)
4. General GIS base coverages
  - Transportation (roads, trails, and power lines)
  - Ownership, borders (e.g., counties, cities and towns, forests, recreation areas)
  - Land use.

## Sources of GIS Data

The primary sources for GIS data were the [SRS Legacy GIS Coverages CD, Version 1 and Version 2](#), [American Digital Cartography Inc. \(ADC\) Cornerstone Data](#), [U.S. Environmental Protection Agency \(EPA\) BASINS CD for Region 4](#), [NASA](#), [USGS](#) and [EPA North American Landscape Characterization Project](#).

## GIS Coverages Obtained

[Table F-1](#) is a list of the GIS coverages and imagery compiled to date. SRS recently released a new version of the SRS Legacy GIS Coverages that includes both GIS coverages and historic aerial photographs for the SRS. Coverages that were obtained, but do not have appropriate documentation are not included in this table.

## **RAC CD-ROM Production**

A CD-ROM has been produced that includes data compiled for this study. The list below provides a general description of the GIS and demographic data directories and files housed on the CD. Several GIS data sets compiled by *RAC* are not included on the *RAC* CD because the data are copyrighted; these are the [American Digital Cartography Cornerstone Data](#) and the [SRS Legacy GIS Coverages](#). These files were transmitted to the CDC on their original CDs with the Preliminary Draft Report, in September 1998. Other data compiled and reviewed may not be included because there was no documentation for the data. [Figure F-3](#) illustrates the GIS and demographic data directories and files found on the Final SRSDRP2-CD.

### **Title: “Final SRSDRP2-CD”**

GIS and demographic data directories include:

#### **ADCsupport**

This folder contains a help file that discusses some of the files obtained from [American Digital Cartography](#). The file provides background information on numerous types of GIS data, only some of which were obtained for this study.

#### **arcexplorer**

This folder contains [ArcExplorer](#) software developed by Environmental Systems Research Institute, Inc. (ESRI). This freeware executable file will setup an application that allows the user to view the GIS coverages on the *RAC* CD. This software is discussed further in the "readme.doc" file on the CD.

#### **demog**

These are the SCSU demographics data collected and entered into Excel tables. The file names used are the same as those in the Demographic Data Table ([Table F-3](#)) that documents data types and sources. This directory also includes the food and lifestyle survey data and the oracle database export file.

#### **earthinfo\_files**

These files are export files obtained from [EarthInfo](#). They are primarily .dbf and .xls files that were extracted to support development of monitoring station GIS coverages. Only the groundwater station location data were developed into a GIS coverage. The remainder of the files can be readily converted to GIS coverages if desired.

#### **map\_files**

These are map postscript files developed for the project (see [Table F-2](#)).

#### **srs\_gis\_data**

This directory has several subdirectories containing GIS data that can be viewed by ArcExplorer software provided on this CD. This entire directory must be copied to the correct drive on your computer for the GIS project .aep files to work correctly. See the "readme.doc" file on the CD for an explanation regarding how to view the GIS data.

**aep\_files**

This folder contains one or more .aep files that will be used to view GIS data.

**basins-data**

These data are from the EPA Region 4, [Better Assessment Science Integrating Point and Nonpoint Sources \(BASINS\)](#)

**imagery**

[USEPA-USGS North American Landscape Characterization \(NALC\)](#) data. This is Landsat MSS data from the early 70's, 80's, and 90's. These data are in ERDAS .lan file format, so they can be viewed using ArcView or ArcExplorer.

**misc\_covs**

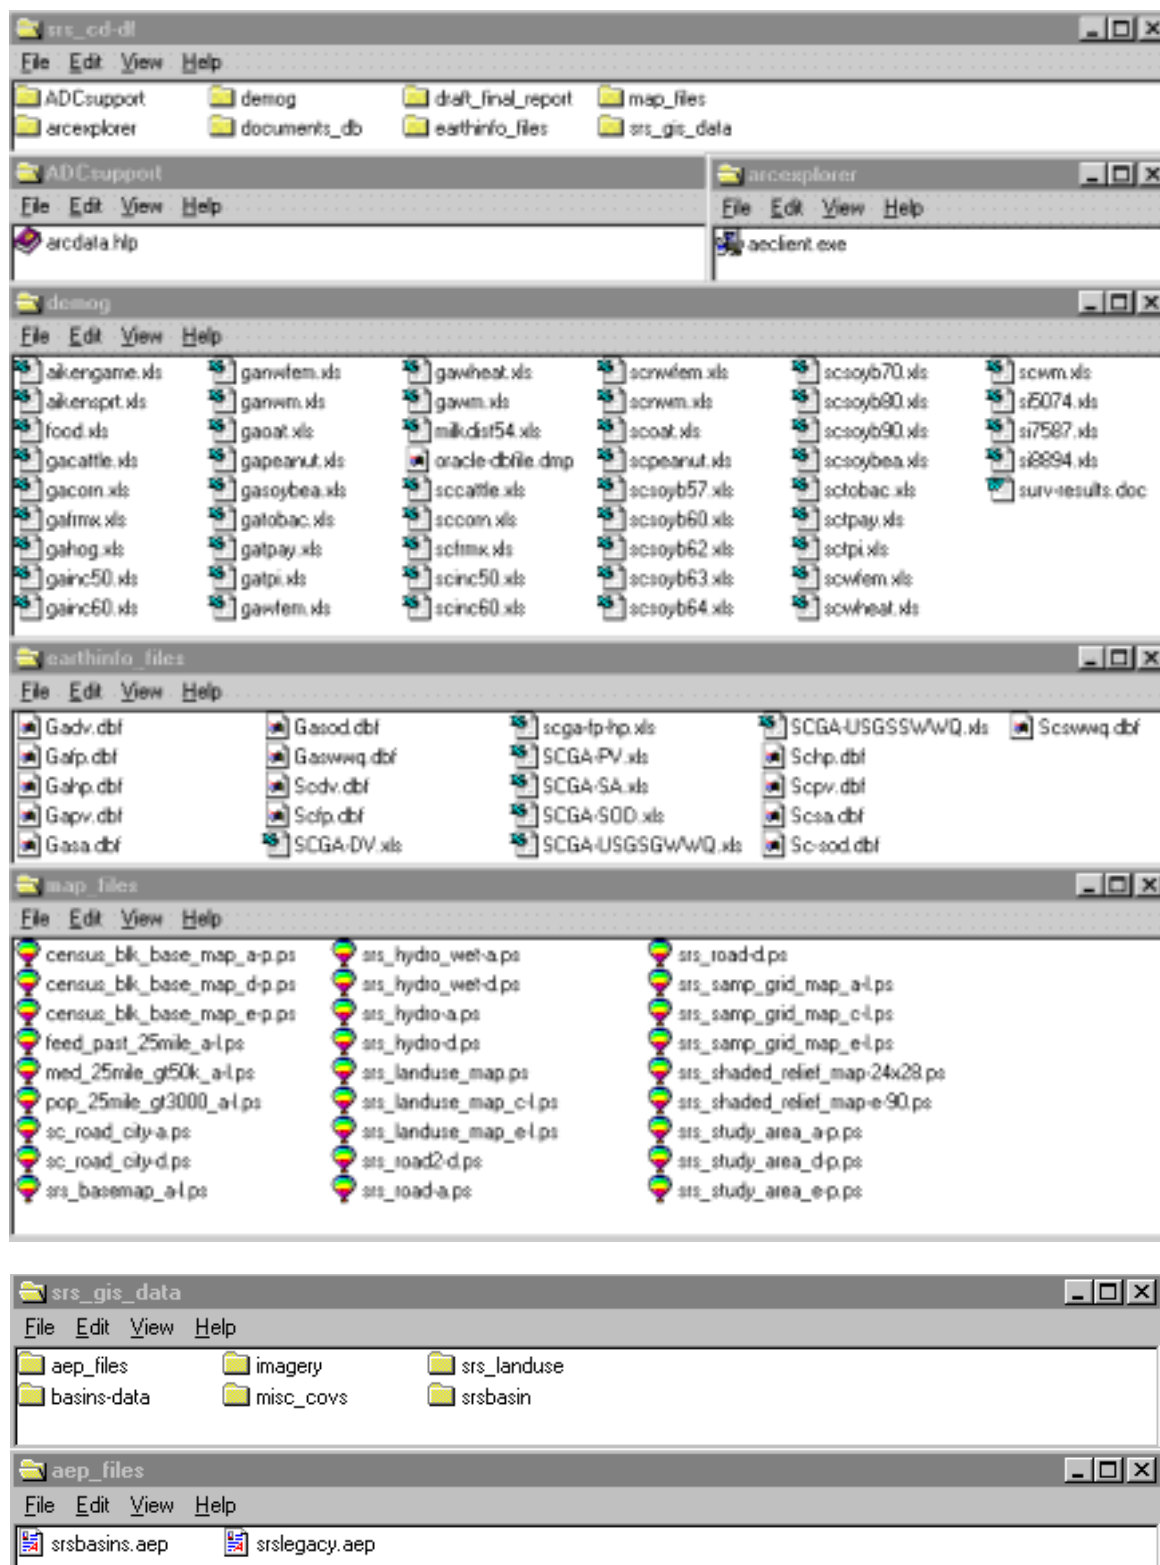

These are several coverages generated by RAC.

**srs\_landuse**

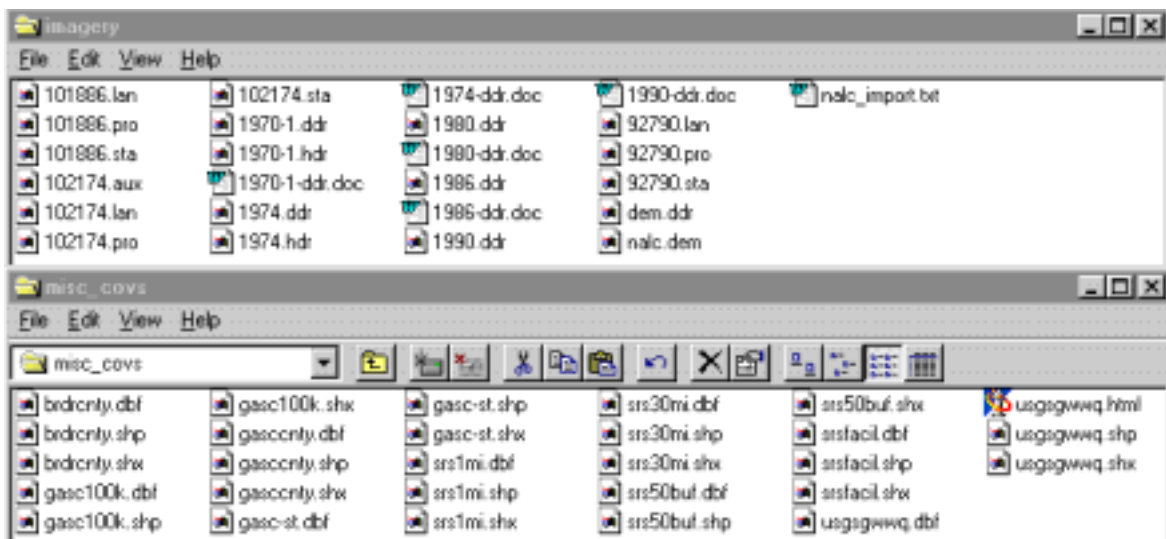

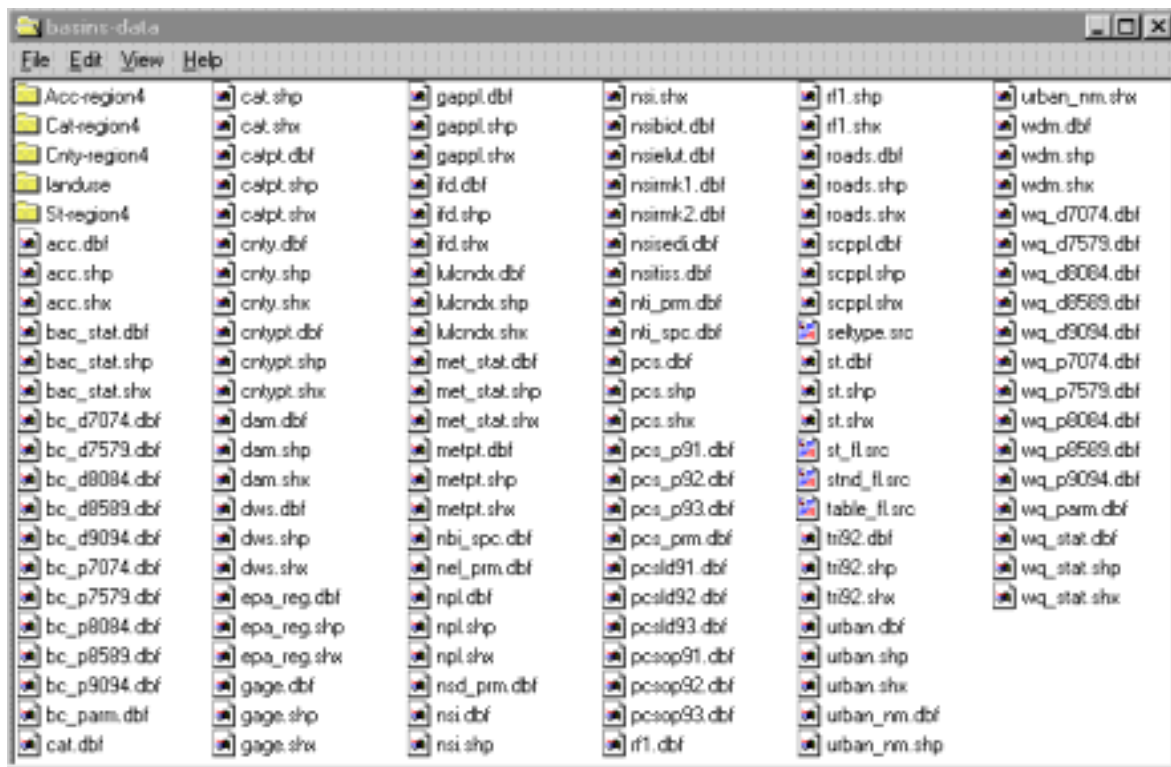

These are files from SRS, originally generated by Georgia Tech to support food production and food chain analysis for the area within fifty miles from the center of SRS.

**srsbasin**

These are several SRS boundary and other coverages that have been projected to be compatible with the EPA BASINS GIS data.

## Appendix F: Geographic Information System and Demographic Data Compilation

**Figure F-3.** Directories and files found on the Final SRSDRP2-CD.

### Selecting the Study Area Extent

Phase II of the SRS dose reconstruction study required reviewing the thousands of documents collected during the study's first phase and collecting the information to be used to estimate offsite historical radiation and chemical doses and risks. Much of the information collected was geographically based (map-based). We needed to find information showing where groups of people lived while SRS releases were occurring and what food crops and animals were being grown in the region. We also needed to know what water supplies were being used and in which directions the winds were blowing during the years of the releases. Much of this information can be recorded as numbers on a map (for example, the number of people living in a certain town or county during 1960). *RAC* has collected such information in great detail, and we decided, with the help of the SRS Citizens' Health Effects Subcommittee, how large the area being studied should be. *RAC* recommended to the CDC and to the HES that the study area for such data collection be limited to a 50-mi distance from the center of the SRS. While it would be reasonable to select either larger or smaller study areas, our experience performing similar studies in Ohio, Colorado, Utah, and Washington State lead us to recommend a limited radius for several reasons.

One of these reasons has to do with the ways in which past radiation and chemical exposures of people who lived near the Site will be determined. There are several methods used to make such calculations, and some are much more accurate than others. The better methods require more detailed information than is usually available, however.

Radiation or chemical doses are best reconstructed from a series of measurements of the concentrations of specific radionuclides or chemicals in the bodies of those people exposed. If the quantity of a radioactive material in a person's body over time is known, a reasonably accurate calculation of the radiation dose can be made and the risk that material would produce over time. While such measurements are occasionally available (perhaps for some time after an accidental release occurred), such information is not routinely collected when exposures are likely to be low.

In the absence of such data, scientists responsible for estimating historical doses use other, less accurate approaches. For example, there may be measurements from air samplers running at various offsite locations that recorded the concentrations of airborne radionuclides or chemical to which people near the samplers were exposed. There may also be similar information from the

analysis of water, soil, vegetation, crops, animals, and animal products. Such information may be used to estimate the human uptake (from breathing, eating, or drinking) of the measured radionuclides. Once estimates of uptake are made, we can calculate how much of the radionuclide or chemical accumulated within people living in the area and then estimate dose and risk. Estimates of accumulation in the body are, in general, less accurate using this approach than if direct, in-the-body measurements were available.

When measurements of radionuclides or chemicals in air, water, and foods are not available, it is usually necessary to use estimates of the facility's releases, both routine and accidental, to calculate offsite human exposure. These release estimates (called the source term) can be used by computer models of the movement of materials in the environment to estimate offsite air, water, and food concentrations of released materials. Calculations of exposure, dose, and risk can then be made; however, they are less accurate than would be the case if actual, offsite measurements had been taken. Most radiation and chemical dose assessments rely heavily on this last approach because better information is rarely available over an extended period of time.

While dose calculations could be made for people living at any distance from a site, the estimates are usually limited to a specific area. This is because as released chemicals or radionuclides releases drift away from a site, they disperse, deposit, and become less concentrated in the air. Smaller doses are, thus, calculated to occur at increasing distances. The decision is usually made to limit a study's area to avoid spending time calculating very small doses at very large distances. For specific cases, doses might be calculated for greater distances, such as when an accident results in the release of larger than usual quantities of radionuclides for a short period.

This general decrease in dose at increasing distance has been studied carefully and is well understood. For example, researchers have performed experiments to examine the accuracy of computer models used to predict doses at increasing distances from a release site ([Fields, et al. 1984](#)). One conclusion of these studies is that doses are relatively small and increasingly inaccurate at great distances from the site of release. It is reasonable to exclude from the study area those regions in which very small dose and risk are likely.

The large set of detailed, geographically based data and satellite imagery necessary to support this study requires a significant amount of time to acquire, format, and document properly. Developing information sets for regions beyond a 50-mi radius from the SRS would add little value to the overall dose assessment and would use resources (staff, time, and money) better spent focusing closer to the Site.

For these reasons, RAC recommended limiting the assessment area for the SRS dose reconstruction research to a 50-mi buffer from the Site's boundary. Communities located outside this radius but potentially using drinking water from the Savannah River are also included in the study area. [Figure F-1](#) shows this recommended study area.

## **DEMOGRAPHIC DATA COMPILATION**

### **Introduction**

The ultimate goal of a dose reconstruction project is an estimation of expected numbers of health effects that would be associated with exposure of members of a particular population to contaminants from the facility or process under study. The purpose of establishing a demographic database is to compile information for those populations that may have been affected by releases of chemicals and/or radionuclides from the SRS. The task for the GIS Laboratory at SCSU is to design and implement a relational database showing where to find and how to retrieve information about the population dynamics, agricultural practices, and human lifestyles for all counties in the Savannah River region.

The data collection process is relatively straightforward for the years since 1980 because the data are available and accessible in a digital format. However, before 1965 demographic and agricultural data are incomplete, documented on paper and, therefore, more difficult to retrieve. Some statistical methods have been used to generate the estimates for data before 1965.

It has been difficult identifying lifestyle data consisting of eating habits, time spent outdoors, and time spent indoors for the population living in the Savannah River region from the 1950s to the present. To obtain the most accurate account of such lifestyle data, a survey was conducted to determine the most appropriate and valid estimates for this area. All the data are for the targeted counties within South Carolina and Georgia within the study area.

To document data sources and provide easy access to the metadata, a data set catalogue containing the names and phone numbers of each individual that aided in collecting the data sets was developed. This catalogue is maintained and updated upon the arrival and retrieval of new data. Each data set includes a data dictionary that allows easy access to the tables and their field names.

### **Demographic Database**

The data sets in the database include agriculture, economic, lifestyle, and demographic data for counties within the study area. The information has been acquired from various sources but primarily from government agencies that are believed to be reliable.

The data collection and database development followed a systematic and functional approach. Generally, the following components were considered during the database development:

- The project tasks
- Logical translation into a GIS database
- GIS system standards (hardware and software)
- GIS database design and standards.

The following components and factors were considered during the database design process:

- File system organization
- Naming conventions
- Spatial data automation standards
- Coordinate system and scale

- Data description
- Access and security
- Maintenance and updates
- Integration with GIS.

## **System Standards**

### **Software**

ESRI's Arc/INFO, GRID, TIN, NETWORK, ARCEDIT, ARCPLOT, TABLES, INFO, ARC Macro language (AML), DATABASE INTEGRATOR, IMAGE INTEGRATOR, ArcStorm, ArcView, ArcDoc, ArcPress, ArcScan, and MapObjects are standard vector based GIS software products for the database.

ERDAS IMAGINE is raster based, standard GIS and image processing software for the database.

Oracle, dBASE, FoxPro are standard database management systems (RDBMS) used to support the database and application development.

Microsoft NT, Window95, and Solaris 2.5 are standard operation systems.

### **Naming Conventions**

1. The demographic database for the project in the GIS Laboratory at SCSU is designed to ensure compatibility with DOS and CD-ROM drives. It is defined as up to eight characters, followed by a period and up to three characters as a file extension.
2. The database has been designed by assigning an abbreviation code for each data set. It is used in associated names. Normally, the code is a combination of the state name and the first character of each word of the data set's names; they are designed to be as meaningful as possible. The abbreviation code may vary from two to seven characters depending on practical situations. A typical example is GAFPT, a code for a data set called "Georgia Full-Part Time Employment."
3. A two-digit number is used to describe the temporal data sets. For example, "1980 Population Dynamics for South Carolina" has an abbreviation of "scpop80" and "1950 Population Dynamics for Georgia" is abbreviated "gapop50."
4. Standard file extensions are used. This includes Oracle file extensions, dBASE file extensions, Microsoft Excel extension, Arc/INFO related file extension, ArcView file extensions, ERDAS IMAGINE extensions, and ordinary ASCII text file extensions.

### **Data Automation Standards**

The SCSU GIS Laboratory automates data with three approaches: data collection, data conversion, and data entry. The data automation plan usually follows this order for a new data set generation:

- Identify automation need based on the tasks
- Determine automation methods (conversion, collection, or entry)
- Implement data quality control procedure.

## **Data Collection, Conversion, and Entry**

The GIS Laboratory is responsible for identifying automation and update needs for new and existing data and their contents. This effort implements standards for quality, content, and transferability. The GIS Laboratory is also responsible for determining data automation methods. For example, data conversion from existing ASCII text, data collection using government files, field survey or other statistical and mathematical methods, and data entry by scan or manual. The Laboratory is responsible for implementing the automation plan and performing the data quality control procedures.

## **Data Quality Control Procedures**

The GIS Laboratory implements a combined quality assurance (QA) procedure for data QA and is responsible for performing and overseeing all data –quality control procedures and activities for the SRS dose reconstruction project at SCSU.

The GIS Laboratory uses the following quality control (QC) procedures to verify accuracy and completeness of the data collected:

- Assess the quality of data if it is in hard copy format
- Check for omissions, incomplete numbers, and copying visibility
- Scan the hard copy data
- Review the scanned data for accuracy in the scan process
- Arrange data in the appropriate format to be entered
- Double check data for errors and accuracy against the original hard copy
- Construct the Database structure
- Enter the completed data into the database table
- Document the source from which the data was obtained
- Keep tracking and reporting progresses of data automation process, make necessary data quality upgrades, enforce consistently the data quality control procedures.

## **Data and File System Backup**

The GIS Laboratory is responsible for the custodianship, retention, protection and backup of all the collected data and file systems currently. To ensure the protection of all data, the Laboratory follows the GRANDFATHER, FATHER, SON scheme for the backup of both file system and data files.

Each Monday through Wednesday and Friday, all the data that have been created or modified will be backed up using the appropriate tape backup unit (TBU). This backup tape is referred to as the SON. Each SON tape will be kept for a minimum of 1 month. Each Thursday a complete backup of all system and data files is completed using the appropriate TBU. This backup tape is referred to as the FATHER. Each FATHER tape will be kept for a minimum of 1 month. On the last Thursday of the month, a complete backup of all system and data files is to be completed using the appropriate TBU. This backup tape is referred to as the GRANDFATHER. Each GRANDFATHER tape will be kept for a minimum of 2 years. All GRANDFATHER tape(s) are stored at an approved offsite location.

### Data Sets in the Database

In the dose reconstruction database, data sets are grouped into four primary groups: agricultural data, economic data, demographic data, and lifestyle data. Summary information for each data set is provided in [Table F-3](#), which includes a description of items listed in the data table and source contacts. These files are found in the “demog” directory on the Final SRSDRP2-CD.

### Database Security and Access

The dose reconstruction project database security involves protecting the whole database file system. Generally, there is no direct public access to the project database file system. The access to the data, as stored in the project file system, is restricted using operating system security tools.

The file system access rights are controlled by the host computer (UNIX, NT) administrator. Usually, there is no limitation for any internal GIS staff who have access to the UNIX and NT environment and want to view the file system. However, access (write and execute) rights are

restricted to the limited staff working on the dose reconstruction project. The access rights to the user account area is defined based on the operating system security by the system administrators.

There are four levels of access rights to the RAC project database file system:

- *Administrator* (GIS manager and host computer administrator): Can create, destroy, or modify the file system; define database structure and tile system; begin and end transactions; and set user access rights.
- *Manager* (GIS manager): Has read and write access to the database; controls transactions; creates and updates data; and can reassign transactions owned by an operator.
- *Operator* (GIS developers and analysts): Has read and limited write access to the database.
- *None* (all other internal and external users): No access to the database and file system.

### **Food and Lifestyle Survey**

A food and lifestyle survey was conducted to learn about the dietary habits of people in the Georgia and South Carolina study area. The survey was designed to collect information on lifestyle activities (food intake, leisure time and work obligations). It is important to survey dietary habits so that estimates of human doses or exposure from ingestion can be based on where food was grown and how much was consumed. For example, for a particular population group (i.e., black males) within the study area, surveys can provide information on their eating habits and about the specific foods they may have consumed. This information is important because eating habits of certain population groups may yield a greater chance of exposure to potentially contaminated foods. The specific results of the survey are in [surv-results.doc](#).

### **Approach and Methods**

Numerous surveys have been conducted to study food habits and consumption of particular food groups ([Rupp 1980](#); [Pao 1982](#); [Pennington 1983](#); [EPA 1984a](#), [1984b](#)). Some studies have involved assessing radionuclide intake. These studies have included distributions by race, sex, age, and occasionally, income levels. The USDA ([USDA 1987](#), [1993](#)) and USDA and U.S. Department of Health, Education, and Welfare (HEW) conducted these surveys ([USDHEW 1963](#)). Literature reviews were conducted to determine appropriate survey methods for the target population. Food and nutrition scientists were contacted from South Carolina State University Family Consumer Sciences Department, U.S. Department of Agriculture (USDA) Food & Nutrition Information Center, and USDA Agriculture Research Service to gather information to help design the consumption survey. After reviewing literature and obtaining information from these agencies, the lifestyle and food survey questionnaire for local populations was produced. The following steps were used to estimate food consumption:

1. Determine the most appropriate previously produced estimates
2. Use sub-population distribution from data obtained to weight for the local population
3. Adjust estimates with supplementary local data
4. Create an annual index of change based on USDA-ERS per capita food consumption data
5. Use the series to create annual estimates from 1950 onward.

Previous study estimates that were reviewed contained detailed information on bioclinical and clinical data. They focused more on actual chemical nutrients consumed than eating habits broken down by age, race, and gender. In addition, many of these estimates were regional or statewide. Based on the available information, obtaining local data through surveys was determined to be the most direct and practicable approach and the surveys would satisfy steps 1 through 3 above.

In producing the surveys, the distribution of specific ages (people 18-years old and older), genders, and races in the sample for the 50-county area were determined. Public locations, such as grocery stores, were chosen as good areas to conduct the surveys because the locations could be categorized (e.g., county/town, urban/rural, and affluent/not so affluent) and provide a good survey distribution. After the surveys were produced, student workers went in pairs to each of the targeted counties. Surveys were conducted in Georgia and South Carolina counties. Five counties for each state served as sample areas. The counties for South Carolina were Aiken, Allendale, Barnwell, Edgefield, and Hampton. Georgia counties included Burke, Columbia, Effingham, Richmond, and Screven. A sample size of 500 (250 for South Carolina and 250 for Georgia) was used to represent the population of all targeted counties. These counties were chosen because of their proximity to the SRS, and their location adjacent to the Savannah River. It was felt that people living in these counties would be most likely to have the greatest chance of exposure in the study area. Using the survey forms, the surveyors collected the name of the main contact, name of person conducting interview, date of interview, time of interview, and county of residence for each respondent. The questionnaire contained two main sections: one section focused on food intake and the other focused on demographic information. Each respondent was informed that their personal answers would be kept confidential and used in combination with other survey data only.

## Results

A large majority (72.5%) of the respondents used a community water supply, while only (19%) used private wells. The main source of drinking water came from the community water supply. A very small amount (4.4%) of respondents drank bottled water. Over 75% of the respondents ate green vegetables such as broccoli, okra, and spinach. Only 30% of the individuals ate asparagus. Over 70% of the respondents ate yams and turnips, while 47% ate winter squash. Of the melons consumed, 70% of the respondents ate cantaloupes and watermelons. The vast majority of respondents ate pears and plums. There was a big disparity in the type of meat eaten. Individuals chose to consume beef, veal, or pork (77%) and chicken liver (64%) over lamb (31%). As for fish, 76% of the respondents ate fish and 24% did not. Of those eating fish, 37% stated that the fish they ate, were caught by someone they knew, and therefore, they probably came from a local source. Twenty-four percent ate fish from an unknown source, and 38% of the respondents did not answer this question.

Of the demographic responses obtained, approximately 32.5% were white, 57.2% were black, 2.6% were American Indian, 1.8% were Asian or Pacific Islander, and 3.0% were other. Approximately 51% of the respondents were in the 20 through 35 years category and 30% were 36-years old or older. A majority of the respondents worked full-time. Thirty-three percent had a

high school degree and 26% had college degrees. Respondents spent most of their time outdoors in their yards. A very small number spent time hunting and camping.

## Discussion

The data that were gathered in the food and lifestyle surveys appear to be a good source of information to understand food distribution patterns assuming local demand is satisfied with local production. However, the data are only useful for the year 1997. In addition, statistical breakdowns will be needed to estimate percentages for each individual county surveyed. Estimates for prior years will have to be derived by using advised sources of prior surveys. Diet variation through time is a complicated problem because the two regional surveys that have been conducted do not cover the time period of interest for this study. Most of the data available from these surveys are from 1980 onward. USDA-ERS data are available for food consumption and food spending. The years for these data are only 1977–1978 and 1987–1988. Sub-populations from past estimates need to be identified and used with local data (including the data from this survey). An annual index of change needs to be developed and used to create annual local estimates from 1950 onward. Additional expertise in the area of food consumption will be sought for this effort. Other food groups including milk products and leafy vegetables need to be considered further along with more information on home-grown food. After estimates of food consumption are derived for the years of interest, they will serve as a primary source to identify populations that may have ingested radionuclides or chemicals released from the Site.

## Survey Form

---

### LIFESTYLE SURVEY FOR DOSE RECONSTRUCTION

#### AT SAVANNAH RIVER SITE

Main Contact: GIS Lab  
South Carolina State University  
1890 Research and Extension  
300 College Street  
Orangeburg, SC 29115  
536-8921 or 7175

Name of Person(s) Conducting Interview: \_\_\_\_\_

Date of Interview: \_\_\_\_\_ Time of Interview: \_\_\_\_\_ am \_\_\_\_\_ pm

County of Residence for respondent (please circle one):

- 1) South Carolina - Aiken, Allendale, Barnwell, Edgefield, Hampton
- 2) Georgia - Burke, Columbia, Effingham, Richmond, Screven

**Purpose:** This survey is designed to collect information on lifestyle activities (food intake, leisure time, work obligations). The information will help us identify pathways for radioactive elements from the Savannah River Site nuclear facility. Your responses to this survey are important for establishing which exposure pathways might have affected air, water, and land area. In order to estimate the radioactive exposure to human populations, data for food consumption, outdoor activities and work obligations are necessary. This survey will be used to collect information from surrounding counties of the Savannah River Site.

Your cooperation and participation in this survey are very important. The information that you provide in this survey will be kept confidential and will be used in combination with other survey data only. Should you have concerns or questions, please feel free to contact the SCSU GIS Lab.

### **FOOD INTAKE**

1) What is the main source of the water used for cooking in your home? Is it:

the community water supply, .....	01
your own well or rain cistern , .....	02
your own spring or a public spring, .....	03
bottled water your purchase, or .....	04
something else? (SPECIFY) .....	05

---

2) What is the main source of the water used in your home for preparing beverages such as coffee, tea, juices, and baby formula? Is it:

the community water supply, .....	01
your own well or rain cistern,.....	02
your own spring or a public spring, ...	03
bottled water you purchase, or .....	04
something else? (SPECIFY)	

---

3) What is the main source of plain drinking water in your home? Is it:

the community water supply, .....	01
your own well or rain cistern, .....	02
your own spring or a public spring, .....	03
bottled water you purchase, or	
something else? (SPECIFY).....	04

---

Appendix F: Geographic Information System and Demographic Data Compilation

---

SUGGESTED COMMENT: [You may paraphrase this] Now let's go to yesterday and talk about where you, or other people who live here, obtained the food you ate and where you ate it. (Ask following questions)

- 4) Where did you obtain most of the ingredients for this food? (please circle all that apply)

- 01 Store, such as
  - Supermarket, Grocery Store, or Warehouse,
  - Convenience Store, Drug Store, or Gas Station
- Specialty Store such as:
  - Bakery, Deli, Seafood, Ethnic Food, Health Food
- Commissary
- Produce Stand or Farmer's Market
- 02 Restaurant with waiter/waitress Service
- 03 Fast Food Place, Pizza Place
- 04 Bar Tavern
- 05 School Cafeteria
- 06 Other Cafeteria
- 07 Vending Machine
- 08 Child Care Center, Family Day Care Home, Adult Day Care
- 09 Soup Kitchen Shelter, Food Pantry
- 10 Meals on Wheels
- 11 Other Community Food Program
- 12 Grown or \*Caught by you or someone you know

\* IF FISH OR SEAFOOD, ASK: Did it come from a:

- 41 Freshwater lake, pond, or river
- 42 The ocean, or
- 43 A bay, sound, or estuary?
- 44 Don't know type of water

- 13 Someone else/gift

Some Other Place (please circle)

- 14 Mail Order Purchase
- 15 Common Coffee Pot Or Snack Tray
- 16 Residential Dining Facility
- 17 Other (Specify)
- 98 Don't know

- 5) Did you eat/drink this food/beverage at your home?

Yes ..... 01  
No ..... 02

- 6) Before you ate/drank this particular food/beverage, was it ever at your home?

Yes ..... 01  
No .....02

- 7) Was the amount of food that you ate yesterday about usual, less than usual, or more than usual?

Usual ..... 01  
Less Than Usual ..... 02  
More Than Usual ..... 03

- 8) What is the main reason the amount you ate yesterday was less than usual?  
(please circle all that apply)

Sickness ..... 01  
Short Of Money ..... 02  
Traveling ..... 03  
At a Social Occasion Or  
On a Special Day ..... 04  
On Vacation ..... 05  
Too Busy ..... 06  
Not Hungry ..... 07  
Dieting ..... 08  
Fasting ..... 09  
Bored Or Stressed ..... 10  
Some Other Reason (Specify)  

---

- 9) What is the main reason the amount you ate yesterday was more than usual?  
(please circle all that apply)

Traveling ..... 01  
At a Social Occasion Or  
On a Special Day ..... 02  
On Vacation ..... 03  
Very Hungry ..... 04  
Bored Or Stressed..... 05  
Some Other Reason

Appendix F: Geographic Information System and Demographic Data Compilation

---

(SPECIFY) \_\_\_\_\_

SUGGESTED COMMENT: Now I'd (or we) would like you to think about all the plain drinking water that you had yesterday, regardless of where you drank it. By plain drinking water, I mean tap water or any bottled water that is not carbonated, with nothing added to it, not even lemon.

10) How many glasses of plain drinking water did you drink yesterday?

# of glasses \_\_\_\_\_

None ..... 000

11) How much of this plain drinking water came from your home? Would you say all, most, some, or none?

All ..... 01

Most ..... 02

Some ..... 03

None ..... 04

12) What was the main source of plain drinking water that did not come from your home?

Was it tap water, water from a drinking fountain, bottled water, or something else?

Tap Water And/Or Drinking ..... 01

Bottled Water ..... 02

Other Source..... 03

(SPECIFY) \_\_\_\_\_

Don't Know..... 04

13) During the past 12 months, that is, since last June, have you eaten any of these foods listed below? Please circle all that apply.

	YES	NO
Artichokes .....	1	2
Asparagus .....	1	2
Broccoli .....	1	2
Brussels sprouts .....	1	2
Cauliflower .....	1	2
Eggplant .....	1	2
Kale .....	1	2
Swiss chard .....	1	2
Okra .....	1	2

Spinach .....	1	2
Summer squash (thin skin) .....	1	2
Winter squash .....	1	2
Sweet potato or yams .....	1	2
Turnips, other than greens .....	1	2
Avocado or guacamole .....	1	2
Grapefruit, other than juice .....	1	2
Cantaloupe .....	1	2
Honeydew melon .....	1	2
Watermelon .....	1	2
Nectarines .....	1	2
Pears .....	1	2
Plums .....	1	2
Rhubarb .....	1	2
Chicken liver .....	1	2
Beef, veal or pork liver .....	1	2
Lamb .....	1	2
Shellfish .....	1	2
Fish, other than shellfish or canned fish .....	1	2
IF YES: Was any of the fish you ate caught by you or someone you know? .....	1	2

### DEMOGRAPHIC INFORMATION

1) Circle gender of individual.

Male..... 01

Female.....02

2) What race do you identify yourself as? (Circle one)

White..... 01

Black..... 02

American Indian, Eskimo, or Aleutian.. 03

Asian or Pacific Islander.. 04

Other..... 05

3) What is your age range? (Circle one)

0-5 yrs   6-10 yrs   11-15 yrs   16-20 yrs   21-25 yrs   26-30 yrs   31-35 yrs   36-40 yrs

41-45 yrs   46-50 yrs   51-55 yrs   56-60 yrs   61-65 yrs   66-70 yrs   71-75 yrs   76+

4) What is the highest level of education that you obtained? (Circle response)

Never Attended School Or Kindergarten : 00

Elementary:

01 02 03 04 05 06 07 08

High School:

09 10 11 12 or GED

College:

01 02 03 04+

5) Are you presently: (Skip questions 5-9, if response is given for this question)

Looking For Work .....	01
Going To School .....	02
Keeping House .....	03
Retired .....	04
Unable To Work.....	05
Other (SPECIFY) .....	06

---

6) Last week, did you work at all at a paid job or in your own business or farm?

Yes.....	1
No.....	2

7) Do you have a paid job from which you were temporarily absent?

Yes.....	1
No.....	2

8) How many hours did you work at all jobs in the last week? Include all overtime hours that you worked and hours on any part-time jobs as well as your principal job.

# Of Hours \_\_\_\_\_

9) How many hours a week do you usually work?

# OF Hours \_\_\_\_\_

10) In your best estimation, how many hours did you spend outdoors? Include outside related work and leisure.

# OF Hours \_\_\_\_\_

11) Of your time spent outdoors, what is it mostly in?

Working (job occupation) .....	01
Yard activities (gardening, mowing, cleaning, etc...) .....	02
Athletic events or games .....	03
Hunting/Fishing .....	04
Camping/Hiking .....	05

12) How active do you consider yourself?

Extremely active .....	01
Somewhat active .....	02
Not active .....	03

13) In regard to this household, is the property owned or being bought by:

someone living in this household .....	01
rented with payment required, or .....	02
occupied without payment of rent required .....	03

SUGGESTED ENDING COMMENT: Thank you kindly for allowing me ( if applicable, us) this time to interview you. The information that you have provided is of extreme importance to our project. We need this information, along with others, in order to do our calculations. No person will be identified. Again, thank you, and have a nice (morning/afternoon/evening).

---

### Structures for Demographic Database Tables

Structures for all the demographic database tables are provided below.

Structure for database: **food**

Description: Results of Food Survey taken in 10 Targeted Counties for SC & GA (5 in GA / 5 in SC)

## ENTITY RELATIONSHIPS DIAGRAM, PHYSICAL DATA DIAGRAM, AND DATA DICTIONARY

### Introduction

This section describes a general data model for building a GIS-based data repository for use in computing dose-to-man amounts. The model is based on the simplest form of dose-to-man: source term is transported via pathways to the target receptor, man. The logic is graphically represented in [level 0.0](#) of the included entity-relationship diagrams. The first level below this (0.1, 0.2 etc.) reference a rough physical model for each major component.

This data model is high level, only. Additional work needs to be done to refine the data elements within each entity to assure that temporal and geographic scale descriptors are adequate for the scale of the project. For instance, the entities currently contain a reference to area or acreage location. This may become a county reference, if that is appropriate to the modeling scale and the available data. It may become more highly focused if a census-tract identifier is deemed usable for the particular data element. Note that the groundwater pathway is not modeled in this design.

### Implicit Relationships

The next section describes, generically, the data layers that are contained in the GIS repository. The collected [entity-relationship \(ER\) diagrams](#) and data dictionary ([Table F-4](#)) represent the underlying data layers that are associated with but not part of the GIS data collection. The underlying data layers can be collected and used without involving the GIS model. As well, any GIS data layers may be used in spatial analysis without invoking other database engines.

The term “clipping,” used in describing the data layers below, refers to the GIS process of excluding all data not within a specified study area. A base data layer determining this study area is implied in the other data set descriptions.

Part of the power of the GIS approach, however, is that the data can be selected from the database using implicit relationships: primarily geographic coordinate and secondarily time. Most of the tables modeled in the collected ER diagrams have both spatial and temporal components; each has been keyed to the GIS data layers where appropriate.

### Base Geographic Data Layers

#### Census Tract Data

This data layer consists of a corrected Topologically Integrated Geographic Encoding and Referencing (TIGER) line file clipped to the extent of the study area, as provided by the U.S. Census Bureau. TIGER line files are known to have internal consistency errors, and the layer must be, at minimum, built as a polygon layer with no label errors. Corrected TIGER line files may be available commercially, and this alternative should be considered before attempting to manually correct the errors.

With the TIGER line files built consistently, the TIGER database is accessible for the area of interest. The census database has many useful statistics about the demographics of an area. These statistics are represented by the entity labeled receptor in the receptor ER diagram, 0.4. Additional information will be keyed to this file.

## **Boundary**

This data layer consists of, at minimum, the USGS 1:24000 scale boundary information from the Digital Line Graph (DLG) database clipped to the area of interest. Boundaries have a strong temporal component, and each useful time frame should be represented in a separate data layer. Modelers will find hunting unit boundaries and forest service boundaries to be useful, and these may need to be acquired and added to this data layer in addition to the USGS data.

## **Migratory Ranges**

As available, migratory ranges of large game animals will be captured to be compatible with 1:24000 scale base layers. These ranges will be used primarily as a reference to determine the likelihood of wild game uptake by local population.

## **Land Cover Data Layer**

This file consists of a polygonal representation of the all types of land cover in the study area. This data layer can be extracted from image classification if the data set has not been developed. The strength of the temporal component of this data set is unknown. A brief overview of agricultural practices and development in the study area should indicate the importance of the temporal component. Gradients of urbanization and pasture and grazing lands should be identified on this data layer. The scale of the data available for modeling is not known, and the key value between the GIS data layer and, thus, the tabular data is not clearly defined.

## **Surface Hydrology**

These files consist of, at minimum, the hydrology DLG data from the USGS 1:24000 scale maps, clipped (as appropriate) to the study area; any additional standing water body information as polygons; and the National Wetlands Inventory information represented at the same scale. Stream segments and associated information (flow direction and stream reach magnitude) are also useful for hydrologic modeling, if available. Flow direction can be corrected using utilities provided with ArcINFO. These data are keyed to information in the ER model through the entity RIVERS or the entity LAKES, using the arc and polygon identifiers for the keys to the underlying data.

## **Gauging Station**

This information is often available from the USGS as a point coverage that can be subsequently clipped to the study area. This is really the accurate representation of the water balance numbers provided by the USGS. These data are keyed to the tabular data in the ER diagram through the GAUGING STATION entity.

## **Meteorology Stations**

A data set similar to the gauging stations data set can be acquired through the National Oceanic and Atmospheric Administration (NOAA), indicating where the meteorology stations are located and keying their station identifiers. These data are keyed to the database through the entity MET STATION.

## **Transportation Data Layer**

This data layer consists of the best representation of the public roadways available in the study area. These data may be extracted from the TIGER line files, but much additional information needs to be appended to the data layer to make this a useful approach. Other sources may provide a more useful data layer. These data are useful to define old political boundaries and historical development. The data are represented in the ER model as the ROUTES entity.

## **Releases Data Layer**

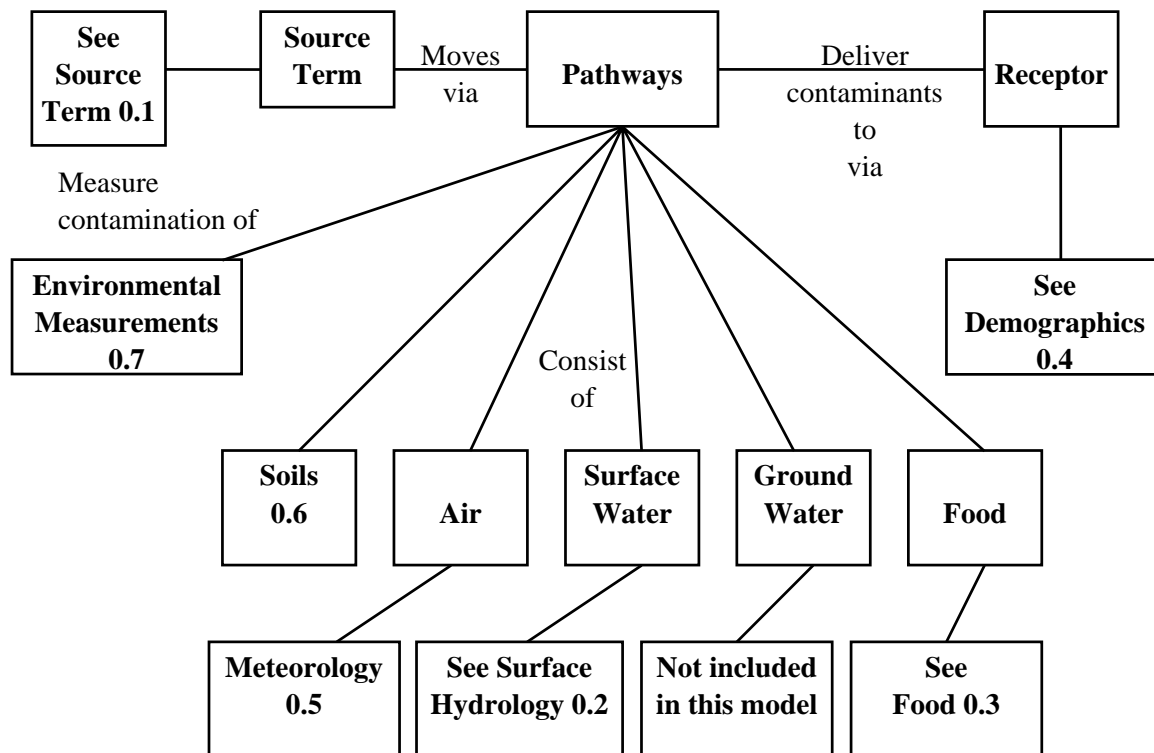

This layer will consist of point and polygon releases as they are identified by the research team. These data are related to the ER model through the SOURCE TERM tables.

## **Available Photographs**

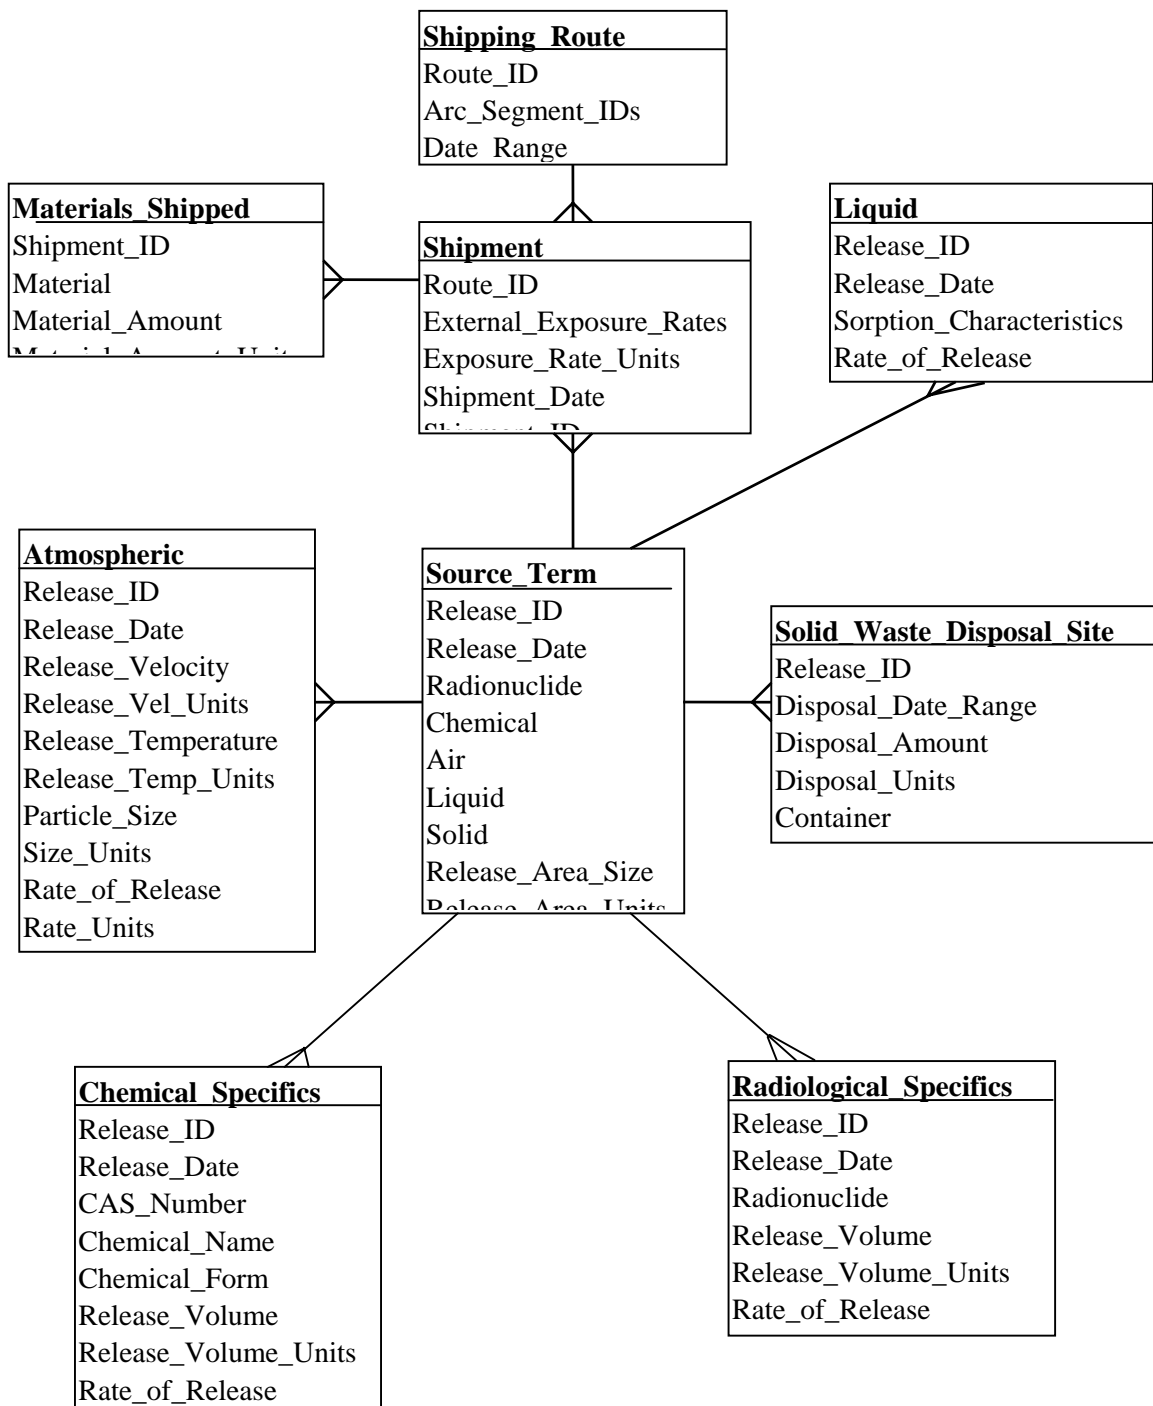

Available photographs, such as soil conservation service aerials, will be digitized and stored online if deemed necessary for ongoing research. There will be no attempt to georeference this data until the photos are actually used.

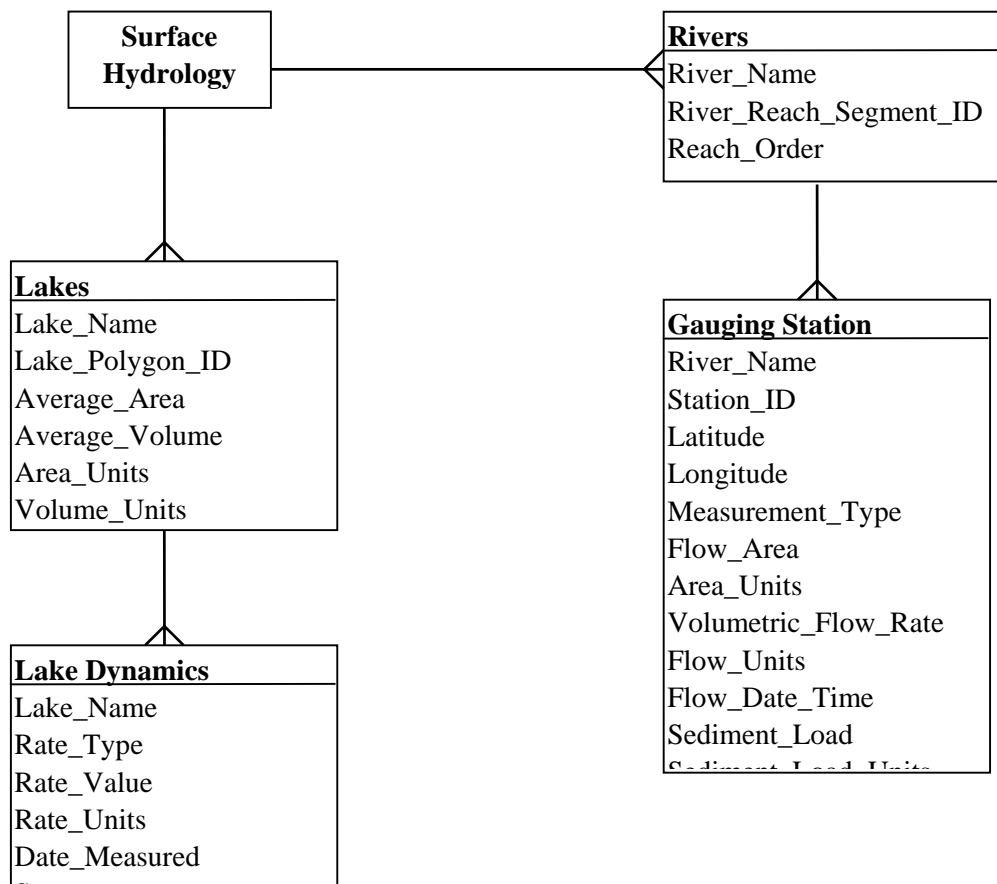

## **Entity Relationship Diagrams**

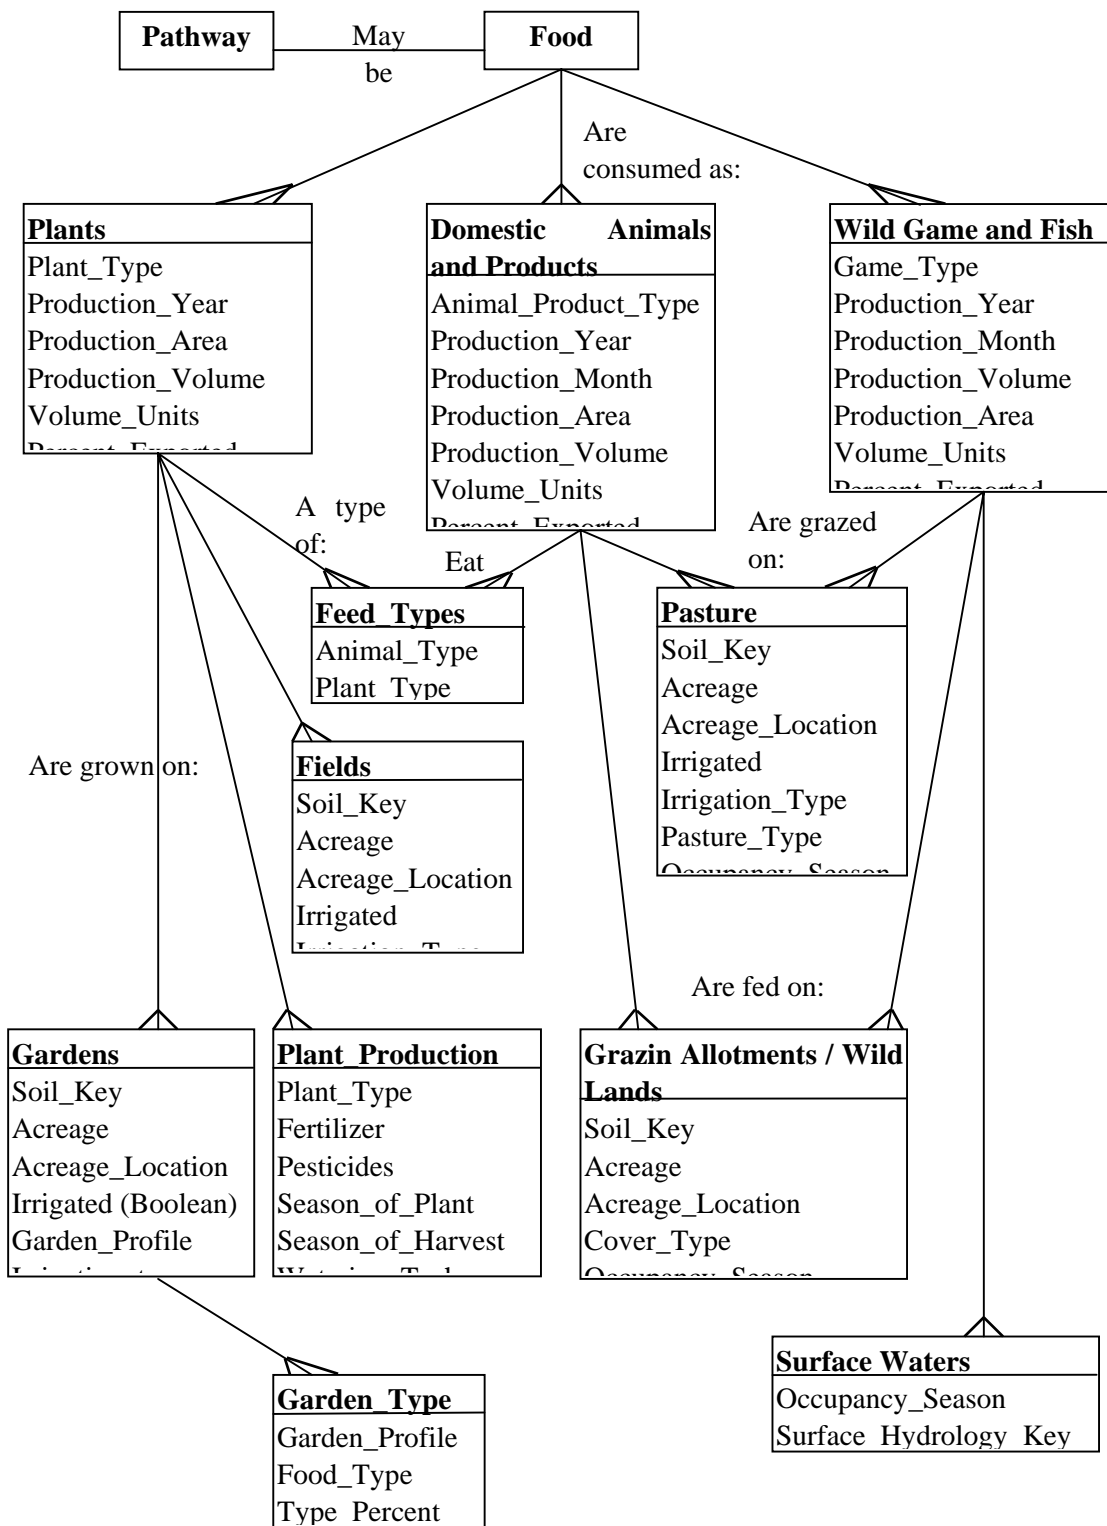

The following section details the ER diagrams, beginning with [level 0.0](#) and extending down vertically one level. The physical implementation of this model would require two or more additional vertical levels to account for cross-reference tables and foreign key relationships.

**Dose to Man Data Model 0.0**

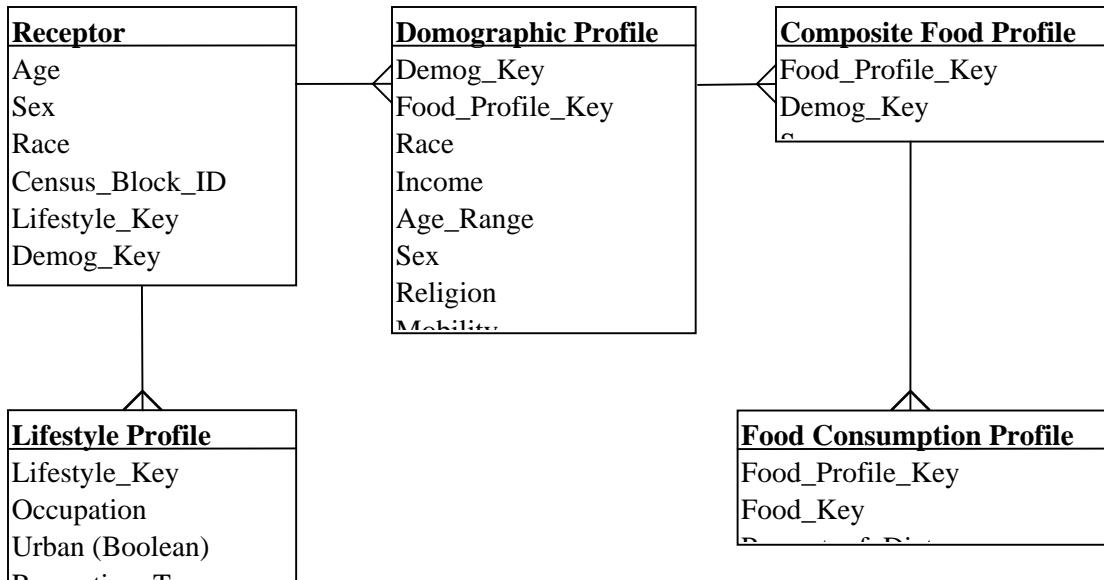

**Dose to Man - Source Term - 0.1**

**Surface Hydrology - 0.2**

**Dose to Man - Food - 0.3**

Table or Field name	Type	Length	Description
<b>LAKES TBL</b>			
LAKE_NAME	C	40	Official USGS lake name, if available. This is the generic key value for all still bodies of water (exclusive of smaller wetlands).
LAKE_POLYGON_ID	I	10	User-assigned feature number in the Arc/INFO coverage used to relate the table with the coverage. Must be defined the same in the table and in the coverage.
AVERAGE_AREA	N		Arc/INFO computed area of the polygon defined as the lake, based on the average area determined from the USGS topography
AVERAGE_VOLUME	N		Arc/INFO computed volume of the defined lake if bottom profiles are available
AREA_UNITS	C	10	Unit of measure used to determine area (meters, feet, etc.)
VOLUME_UNITS	C	10	Unit of measure used to determine volume (cubic meters, acre feet, etc.)
<b>RIVERS TBL</b>			

**Table F-4. Data Dictionary**

<b>Table or Field name</b>	<b>Type</b>	<b>Length</b>	<b>Description</b>
RIVER_NAME	C	40	Official USGS river name, as available. This is the generic key value for an identified river, stream, or branch.
RIVER_REACH_SEGMENT_ID	I	10	User-assigned feature number in the Arc/INFO coverage used to relate the table with the coverage. Must be defined the same in the table and in the coverage. A river consists of many riv_seg_ids.
REACH_ORDER	N		River segment reach (USGS-assigned reach number)
<b>LAKE_DYNAMICS TBL</b>			
LAKE_NAME	C	40	Official USGS lake name. Key value, relates to Lakes tbl above.
RATE_TYPE	C	50	Rate category, such as sedimentation, evaporation, or infiltration rates, used to define water balance and sedimentation dynamics (in- and out-flow rates)
RATE_VALUE	N		The rate of elevation change in the lake
RATE_UNITS	C	10	Unit of measure associated with rate measurements
DATE_MEASURED	D	8	Date the rate was calculated or measured
SEASON	C	12	Time of year (fall, spring, etc.) the data were gathered
<b>GAUGING_STATION TBL</b>			
RIVER_NAME	C	40	Official USGS river name. Key value.
STATION_ID	C	40	A unique string identifying the gauging station (name of the gauging station)
LATITUDE	N		Geographic coordinate of the gauging station on the surface of the earth
LONGITUDE	N		Geographic coordinate of the gauging station on the surface of the earth
MEASUREMENT_TYPE	C	40	Text string describing measurement categories, for example, flow meter, measured cross-section and strip chart, etc.
FLOW_AREA	N		Area of the measurement cross-section as determined by the measuring entity
AREA_UNITS	C	10	Unit of measure used to determine area
VOLUMETRIC_FLOW_RATE	N		Flow volume as measured for this gauging stream and this record

**Table F-4. Data Dictionary**

Table or Field name	Type	Length	Description
FLOW_UNITS	C	10	Unit of measure associated with volumetric flow rate
FLOW_DATE	D	8	Date the data were gathered from the gauging station. Date format MM/DD/YY and time.
SEDIMENT_LOAD	N	10	The sediment load measured for this reach
SEDIMENT_LOAD_UNITS	C	10	Unit of measure used to determine sediment load
GAUGING_ST_ID	I	10	User-assigned feature number in the Arc/INFO coverage used to relate the table and the coverage. The ID must be defined the same in the table and in coverage.
<b>PLANTS TBL</b>			
PLANT_TYPE	C	60	Text string describing crop type for this record
PRODUCTION_YEAR	I	4	Year of crop harvest for this record
PRODUCTION_AREA	C	50	Text string describing crop location place (farm, county, etc.)
PRODUCTION_VOLUME	N		Amount of crop harvested in this location and during this harvest year
VOLUME_UNITS	C	10	Production unit of measure
PERCENT_EXPORTED	N		Percentage of crop which left the county or other specified production area
<b>FEED TYPES</b>			
PLANT_TYPE	C	60	Text string describing crop type for this record
ANIMAL_TYPE	C	60	The type of animal
<b>PLANT PRODUCTION TBL</b>			
PLANT_TYPE	C	60	Text string describing crop type for this record
FERTILIZER	C	40	Fertilizers used on the plants
PESTICIDE	C	4	Pesticides used on the plants
SEASON_OF_PLANT	C	10	Season the crop was planted
SEASON_OF_HARVEST	C	10	Season the plant was harvested
WATERING_TECH	C	40	Watering technique used on the crop
<b>GARDEN_TYPE TBL</b>			

**Table F-4. Data Dictionary**

<b>Table or Field name</b>	<b>Type</b>	<b>Length</b>	<b>Description</b>
GARDEN_PROFILE	I	5	Key value identifying a particular garden profile (many records compose a garden profile). The sum of the type percent should equal 100 for each garden type.
FOOD_TYPE	C	40	Plant type grown (carrot, peas, etc.)
TYPE_PERCENT	N		Percentage of each type of plant grown
<b>FIELDS TBL</b>			
SOIL_KEY	I	5	The key to the soil table
ACREAGE	N		Number of acres farmed with consumable products.
PRODUCTION_AREA	C	50	May contain city, county, or state
IRRIGATED	B	1	Contains Y for irrigated, N for not irrigated
IRRIGATION_TYPE	C	40	The type of irrigation used on the land
<b>DOMESTIC_ANIMAL_AND_PRODUCTION TBL</b>			
ANIMAL_PRODUCT_TYPE	C	50	Type of animal product (cow, eggs, chicken, etc.)
PRODUCTION_YEAR	I	4	Year the product was processed for food consumption
PRODUCTION_MONTH	I	2	Month the product was processed for food consumption
PRODUCTION_AREA	C	50	Identifies place of product origin (farm, county, etc.)
PRODUCTION_VOLUME	N		Volume associated with product for this record (may be head of cattle, gallons of milk, dozens of eggs, etc.)
VOLUME_UNITS	C	10	Animal type
PERCENT_EXPORTED	N		Percentage of this animal product which left the production area
<b>WILD_GAME_AND_FISH TBL</b>			
GAME_TYPE	C	50	Text string containing type of wild game, fowl, or fish (deer, bear, elk, etc.). Key value.
PRODUCTION_YEAR	I	4	Year the animal was processed for food consumption
PRODUCTION_MONTH	I	2	Month the animal was processed for food consumption
PRODUCTION_AREA	C	50	Describes the place of harvest (state, forest, county, etc.)

**Table F-4. Data Dictionary**

Table or Field name	Type	Length	Description
PRODUCTION_VOLUME	N		Number of animals referenced by this record at this specified time they were processed for food consumption
VOLUME_UNITS	C	10	Units of measure for harvest type
PERCENT_EXPORTED	N		Percentage of the animal type that was exported from the harvest area
<b>PASTURE TBL</b>			
SOIL_KEY	I	5	The key to the soil table
ACREAGE	N		Number of acres used as pasture
PRODUCTION_AREA	C	50	Contains location information: city, county, or state
IRRIGATED	B	1	Contains Y for irrigated, N for not irrigated
IRRIGATION_TYPE	C	40	The type of irrigation used on the land
PASTURE_TYPE	C	40	Type of feed on the pasture: grass, hay, etc.
OCCUPANCY_SEASON	C	30	Time of year the pasture is used by animals
<b>GRAZING_ALLOTMENTS_WILD_LANDS TBL</b>			
SOIL_KEY	I	5	The key to the soil table
ACREAGE	N		Number of acres used as grazing or wild lands for this record (and this location)
PRODUCTION_AREA	C	50	Contains a description of the location of the acreage for this record. May be city, county, forest, or state, etc.
COVER_TYPE	C	40	Type of vegetation on the acreage
OCCUPANCY_SEASON	C	30	Time of year the land is used by grazing animals
<b>SURFACE_WATER TBL</b>			
GAME_TYPE	C	50	Species using this water body
SEASON	C	10	Period of time that the waters are used by this species
SURFACE_HYDROLOGY_KEY	N		Polygon or arc linking this record to the information contained in the appropriate Arc/INFO data layer
<b>RECORDED_CLIMATOLOGY TBL</b>			
STATION	C	40	Meteorology station name as assigned by NOAA or other owning agency. This field must be unique.

**Table F-4. Data Dictionary**

<b>Table or Field name</b>	<b>Type</b>	<b>Length</b>	<b>Description</b>
LOCATION	C	40	Description of the physical location of the station
COUNTY	C	40	County name in which the station is located
STATION_ID	C	10	Point identifier from the Arc/INFO coverage. This both assures uniqueness and allows access to the information contained in the INFO database (location, topology, etc.).
<b>STATION_INFO TBL</b>			
OPERATION_START_DATE	D		Start of operation
OPERATION_END_DATE	D		End of operation
LEVEL_OF_SENSORS	C	50	The level of the sensors
ELEVATION	N		Elevation of station
STATION_ID	C	10	Point identifier from the Arc/INFO coverage. This both assures uniqueness and allows access to the information contained in the INFO database (location, topology, etc.).
<b>SOURCE_TERM TBL</b>			
RELEASE_ID	C	20	The release identifier. This is a user-generated, unique key that will be used to relate all of the tables in the source term relation. This field must be unique for each record. Release ID is the key into the Arc/INFO coverage that has coordinates for the release.
RELEASE_DATE	D		The date and time stamp that specifies when the release information for this record was collected.
RADIONUCLIDE	C	1	A Boolean indicating whether there was one or more radionuclide components for this release identifier
CHEMICAL	C	1	A Boolean indicating whether there was one or more chemical components for this release identifier
AIR	C	1	A Boolean indicating whether this release has an atmospheric component
LIQUID	C	1	A Boolean indicating whether this release has a liquid component
SOLID	C	1	A Boolean indicating whether this release has a solid component

**Table F-4. Data Dictionary**

Table or Field name	Type	Length	Description
RELEASE_AREA_SIZE	N		For nonpoint source releases, a measurement of the release area is referenced by this field
RELEASE_AREA_UNITS	C	10	The associated units for the release area size field
RELEASE_TIME_TYPE	C	20	This field describes the type of release with respect to time: periodic, episodic, single event, etc.
<b>MATERIALS_SHIPPED TBL</b>			
SHIPMENT_ID	C	20	The shipment identifier. This is a user-generated key that will be used to relate all of the shipment-oriented tables in the source term relation.
MATERIAL	C	40	For each shipment_id there may be several materials, one for each record
MATERIAL_AMOUNT_UNITS	C	20	The units associated with the amount value for this record
MATERIAL_AMOUNT	N		The quantity of material associated with this record and this shipment
<b>SHIPMENT_ROUTE TBL</b>			
ROUTE_ID	C	20	A user-assigned identifier that references a collection of roadways that is repeatedly used for shipping waste products to waste repositories or temporary storage sites
DATE_RANGE	C	30	Range of dates that this route was used for shipping waste
<b>SHIPMENT_ROUTE_ARC</b>			
ARC_SEGMENT_IDS	N		Each route_id is composed of several arc_segment identifiers from the Arc/INFO data layer
ROUTE_ID	C	20	The shipment route arc
<b>SHIPMENT TBL</b>			
ROUTE_ID	C	20	A user-assigned identifier that references a collection of roadways that is repeatedly used for shipping waste products to waste repositories or temporary storage sites
EXTERNAL_EXPOSURE_RATE	N		Measured exposure rate for the route identified by this record

**Table F-4. Data Dictionary**

<b>Table or Field name</b>	<b>Type</b>	<b>Length</b>	<b>Description</b>
EXPOSURE_RATE_UNITS	C	20	Units associated with the exposure rate units measured for this record
SHIPMENT_DATE	D		The date and time stamp that specifies when this shipment was moved from start
SHIPMENT_ID	C	20	Shipment identifier as defined in the MATERIALS_SHIPPED.TBL relation
<b>LIQUID TBL</b>			
RELEASE_ID	C	20	The release identifier. This is a user-generated, unique key that will be used to relate all of the tables in the source term relation.
RELEASE_DATE	D		The date and time stamp that specifies when this release occurred
SORPTION_CHARACTERISTIC	C	40	Sorption characteristics associated with the material identified in this record
RATE_OF_RELEASE	N		Measured rate of release for the release identified in this record
RATE_UNITS	C	20	Units associated with the rate of release measurement
<b>ATMOSPHERIC TBL</b>			
RELEASE_ID	C	20	The release identifier. This is a user-generated, unique key that will be used to relate all of the tables in the source term relation.
RELEASE_DATE	D		The date and time stamp that specifies when this release occurred
RELEASE_VELOCITY	N		Measured stack release velocity
RELEASE_VEL_UNITS	C	20	Units associated with the release velocity from the stack
RELEASE_TEMPERATURE	N		Temperature of the exit gas
RELEASE_TEMP_UNITS	C	10	Units of measure for the release temperature for this record
PARTICLE_SIZE	N		Associated particulate size, if this record documents a particulate release
SIZE_UNITS	C	10	The units of measure associated with the particulate size measurement for this record
STACK_HEIGHT	N		The height of the stack from the ground
STACK_HEIGHT_UNITS	C	10	The units of measure associated with the stack height
RATE_OF_RELEASE	N		Release volumetric rate measurement

**Table F-4. Data Dictionary**

Table or Field name	Type	Length	Description
RATE_UNITS	C	20	Units associated with the volumetric release measurement
<b>SOLID_WASTE_DISPOSAL_SITE TBL</b>			
RELEASE_ID	C	20	The release identifier. This is a user-generated, unique key that will be used to relate all of the tables in the source term relation. Several records may be associated with this field.
DISPOSAL_DATE_RANGE	C	30	The range of dates that this site was in operation. mm/dd/yy-mm/dd/yy
DISPOSAL_AMOUNT	N		Amount of the material that is disposed at this repository.
DISPOSAL_UNITS	C	20	Units associated with this volume or amount measurement
CONTAINER	C	20	Type of container for this site
CONTAINMENT_TYPE	C	20	Type of containment (barrier, clay liner, etc.) in place for this disposal site
<b>CHEMICAL_SPECIFICS TBL</b>			
RELEASE_ID	C	20	The release identifier. This is a user-generated, unique key that will be used to relate all of the tables in the source term relation. Several fields may be associated with this field.
RELEASE_DATE	D		The release date for this chemical type if different than the parent source term information
CAS_NUMBER	C	15	The chemical abstract system number associated with this material, as released
CHEMICAL_NAME	C	80	The chemical name, as identified by the researchers, for the chemical material released at this release point, for this record
CHEMICAL_FORM	C	20	Form of the chemical material released
RELEASE_VOLUME	N		Volume of the released material corresponding to this record
RELEASE_VOLUME_UNITS	C	20	Units associated with the release volume for this record
RATE_OF_RELEASE	N		Release volumetric rate measurement for this material for this release episode
RATE_UNITS	C	20	Units associated with the rate of release measurement for this record

**Table F-4. Data Dictionary**

Table or Field name	Type	Length	Description
<b>RADIOLOGICAL_SPECIFICS TBL</b>			
RELEASE_ID	C	20	The release identifier. This is a user-generated, unique key that will be used to relate all of the tables in the source term relation. Several fields may be associated with this field.
RELEASE_DATE	D		The release date for this chemical type if different than the parent source term information
RADIONUCLIDE	C	20	Radionuclide name for the material described in this record
RELEASE_VOLUME	N		The volume of material released in this event
RELEASE_VOLUME_UNITS	C	20	The units associated with the release volume
RATE_OF_RELEASE	N		The volumetric release rate for the event referenced by this record
RATE_UNITS	C	20	The volumetric release rate units
<b>RECEPTOR TBL</b>			
ID	N	10	Unique id
AGE	N		Age of receptor
SEX	C	1	Sex of receptor
RACE	C	15	Race of receptor
CENSUS_BLOCK_ID	C	20	Census block identifier associated with this record. This value is carried as an attribute in the Arc/INFO data layer and allows the tabular information in these relations to be spatially related.
LIFESTYLE_KEY	C	15	This is the key value associated with the lifestyle relation
DEMOG_KEY	C	15	This is the key value associated with the demographic profile relation
FOOD_KEY	C	15	This is the key value associated with the food profile relation
<b>DEMOGRAPHIC_PROFILE TBL</b>			
RACE	C	15	Race associated primarily with this demographic profile
INCOME	C	15	Income range associated with this demographic profile

**Table F-4. Data Dictionary**

Table or Field name	Type	Length	Description
AGE_RANGE	C	8	Range of ages associated with this demographic profile
SEX	C	1	The primary sex of this demographic profile, if applicable
RELIGION	C	20	The primary religion of this demographic profile
MOBILITY	N		Mobility of the typical constituent of this demographic profile, as measured in years residence
PERCENT_OUTDOORS	N		Percent of time spent outdoors, by the typical constituent of this profile
<b>COMPOSITE_FOOD_PROFILE TBL</b>			
FOOD_PROFILE_KEY	C	15	This is the key value that relates this entity with the food consumption profile entity
DEMOG_KEY	C	15	The key value that associates this record with the demographics profile
SEASON	C	10	The keys in this table relate the food profile to the demographic group depending on the season indicated in this record
<b>FOOD_CONSUMPTION_PROFILE TBL</b>			
FOOD_PROFILE_KEY	C	15	This is the food_profile key, a user-defined unique value that is used to indicate the composite food group profile
FOOD_TYPE	C	30	This is the food type (milk, cheese, wheat products, etc.)
PERCENT_OF_DIET	N		This is the percent of the food profile that consists of this food_type
<b>LIFESTYLE TBL</b>			
LIFESTYLE_KEY	C	15	The user-defined, unique key value that defines this lifestyle profile record
OCCUPATION	C	80	The predominant occupation, or class of occupation, that is found in this lifestyle profile
URBAN	C	1	A Boolean indicating urban ( = T) or rural ( = F)

**Table F-4. Data Dictionary**

<b>Table or Field name</b>	<b>Type</b>	<b>Length</b>	<b>Description</b>
RECREATION_TYPE	C	80	Categories of recreation activity associated with this lifestyle profile
<b>SOILS TBL</b>			
SOIL_KEY	I	5	The key to the soil table
SOIL_TYPE	C	40	The type of soil
SORPTION	N		
CEC	N		
PERCENT_ORGANICS	N		
<b>ENVIRONMENTAL_MEASUREMENTS TBL</b>			
MEDIA	C	40	The media of the measurement
MEASUREMENT_TYPE	C	40	
MEASUREMENT_VALUE	N		
MEASUREMENT_UNITS	C	10	The units associated with the measurement value
LOCATION	C	40	Description of the physical location
MEASUREMENT_TIME	D		The time of the measurement
UNCERTAINTY	N		The uncertainty of the measurement value
<b>LOOKUP TABLES</b>			
<b>ANIMAL_TYPE TBL</b>			
ANIMAL_TYPE	C	50	The list of animal types
<b>CONTAINER TBL</b>			
CONTAINER	C	20	The list of containers
<b>CONTAINER_TYPE TBL</b>			
CONTAINER_TYPE	C	20	The types of containers
<b>COVER_TYPE TBL</b>			
COVER_TYPE	C	40	The types of covers
<b>FOOD_TYPE TBL</b>			
FOOD_TYPE	C	40	Types of foods
<b>GAME_TYPE TBL</b>			
GAME_TYPE	C	50	Types of game
<b>GARDENS TBL</b>			
SOIL_KEY	I		
ACREAGE	N		
IRRIGATED	C	1	
GARDEN_PROFILE	I		
IRRIGATION_TYPE	C	40	
PRODUCTION_AREA	C	50	
<b>IRRIGATION_TYPE TBL</b>			
IRRIGATION_TYPE	C	40	Irrigation methods

**Table F-4. Data Dictionary**

Table or Field name	Type	Length	Description
<b>MEASUREMENT_TYPE TBL</b>			
MEASUREMENT_TYPE	C	40	Types of measurements
<b>MATERIAL TBL</b>			
MATERIAL	C	40	Materials that can be shipped
<b>PASTURE_TYPE TBL</b>			
PASTURE_TYPE	C	40	Types of pastures
<b>PLANT_TYPE TBL</b>			
PLANT_TYPE	C	60	Plants
<b>PRODUCTION_AREA TBL</b>			
PRODUCTION_AREA	C	50	Production areas
<b>RACE TBL</b>			
RACE	C	15	Race
<b>RATE_TYPE TBL</b>			
RATE_TYPE	C	50	Rate types
<b>RELEASE_TYPE TBL</b>			
RELEASE_TIME_TYPE	C	20	Release time types
<b>SEASON TBL</b>			
SEASON	C	10	Seasons
<b>UNITS TBL</b>			
UNITS	C	10	Units of measure
<b>WATER_TECH TBL</b>			
WATER_TECH	C	40	Watering techniques
