

## Complete Summary

---

### GUIDELINE TITLE

Guidelines for the management of chronic kidney disease in HIV-infected patients: recommendations of the HIV Medicine Association of the Infectious Diseases Society of America.

### BIBLIOGRAPHIC SOURCE(S)

Gupta SK, Eustace JA, Winston JA, Boydstun II, Ahuja TS, Rodriguez RA, Tashima KT, Roland M, Franceschini N, Palella FJ, Lennox JL, Klotman PE, Nachman SA, Hall SD, Szczech LA. Guidelines for the management of chronic kidney disease in HIV-infected patients: recommendations of the HIV Medicine Association of the Infectious Diseases Society of America. Clin Infect Dis 2005 Jun 1;40(11):1559-85. [238 references] [PubMed](#)

### GUIDELINE STATUS

This is the current release of the guideline.

**\*\* REGULATORY ALERT \*\***

### FDA WARNING/REGULATORY ALERT

**Note from the National Guideline Clearinghouse:** This guideline references a drug(s) for which important revised regulatory and/or warning information has been released.

- [July 31, 2008, Erythropoiesis Stimulating Agents \(ESAs\)](#): Amgen and the U.S. Food and Drug Administration (FDA) informed healthcare professionals of modifications to certain sections of the Boxed Warnings, Indications and Usage, and Dosage and Administration sections of prescribing information for Erythropoiesis Stimulating Agents (ESAs). The changes clarify the FDA-approved conditions for use of ESAs in patients with cancer and revise directions for dosing to state the hemoglobin level at which treatment with an ESA should be initiated.
- [November 8, 2007 and January 3, 2008 Update, Erythropoiesis Stimulating Agents \(ESAs\)](#): The U.S. Food and Drug Administration (FDA) notified healthcare professionals of revised boxed warnings and other safety-related product labeling changes for erythropoiesis-stimulating agents (ESAs) stating serious adverse events, such as tumor growth and shortened survival in patients with advanced cancer and chronic kidney failure.

## SCOPE

### **DISEASE/CONDITION(S)**

- Chronic kidney disease
- Human immunodeficiency virus (HIV) infection

### **GUIDELINE CATEGORY**

Diagnosis  
Evaluation  
Management  
Screening

### **CLINICAL SPECIALTY**

Family Practice  
Hematology  
Infectious Diseases  
Internal Medicine  
Nephrology  
Pediatrics

### **INTENDED USERS**

Advanced Practice Nurses  
Allied Health Personnel  
Nurses  
Patients  
Physician Assistants  
Physicians

### **GUIDELINE OBJECTIVE(S)**

To address the clinical issues involved in both adults and children with human immunodeficiency virus (HIV)-related renal disease

## **TARGET POPULATION**

Human immunodeficiency virus (HIV)-infected patients (adults and children) with chronic kidney disease

## **INTERVENTIONS AND PRACTICES CONSIDERED**

### **Screening and Diagnostic Evaluation**

1. Qualitative assessment for risk of kidney disease (e.g., race, family history, CD4<sup>+</sup> lymphocyte count, human immunodeficiency virus [HIV]-1 ribonucleic acid [RNA] level, history of nephrotoxic medications, comorbidities)
2. Urine analysis for proteinuria
3. Calculated estimate of renal function (estimation of creatinine clearance or glomerular filtration rate)
4. Annual follow up
5. Blood pressure measurement
6. Quantification of proteinuria (albumin-to-creatinine ratio or protein-to-creatinine-ratio)
7. Renal ultrasound
8. Renal biopsy

### **Management/Treatment**

1. Referral to nephrologist
2. Control of hypertension
  - Angiotensin-converting enzyme (ACE) inhibitors
  - Angiotensin receptor blockers (ARBs)
3. Dialysis
4. Arteriovenous fistulae placement
5. Renal transplantation
6. Highly active antiretroviral therapy (HAART)
7. Prednisone
8. Adjustment of antiretroviral medication and antimicrobial agent dosing
9. Use of recombinant human erythropoietin
10. Use of 1,25-dihydroxy vitamin D3 or its analogues
11. Hepatitis B vaccination (Recombivax HB, Engerix B) and checking of anti-hepatitis B surface antigen titers following vaccination
12. *Streptococcus pneumoniae* vaccination (Pneumovax, Pnu-imize 23)
13. Influenza virus vaccination
14. Hepatitis A vaccination

## **MAJOR OUTCOMES CONSIDERED**

- Renal function
- Side effects of medications
- Incidence of chronic kidney disease
- Incidence of human immunodeficiency virus (HIV)-associated nephropathy

- Survival
- Morbidity and mortality

## METHODOLOGY

### **METHODS USED TO COLLECT/SELECT EVIDENCE**

Searches of Electronic Databases

### **DESCRIPTION OF METHODS USED TO COLLECT/SELECT THE EVIDENCE**

The evidence for these guidelines was collected using MEDLINE searches of the relevant literature and reviews of pertinent abstracts (all in the English language) presented at both major infectious diseases and nephrology society meetings from January 2000 through February 2004.

### **NUMBER OF SOURCE DOCUMENTS**

Not stated

### **METHODS USED TO ASSESS THE QUALITY AND STRENGTH OF THE EVIDENCE**

Weighting According to a Rating Scheme (Scheme Given)

### **RATING SCHEME FOR THE STRENGTH OF THE EVIDENCE**

#### **Quality of Evidence**

- I. Evidence from at least one properly randomized, controlled trial
- II. Evidence from at least one well-designed clinical trial without randomization, from cohort or case-controlled analytic studies (preferably from more than one center), from multiple time-series studies, or from dramatic results of uncontrolled experiments
- III. Evidence from opinions of respected authorities based on clinical experience, descriptive studies, or reports of expert committees

### **METHODS USED TO ANALYZE THE EVIDENCE**

Systematic Review

### **DESCRIPTION OF THE METHODS USED TO ANALYZE THE EVIDENCE**

Not stated

### **METHODS USED TO FORMULATE THE RECOMMENDATIONS**

Expert Consensus

## DESCRIPTION OF METHODS USED TO FORMULATE THE RECOMMENDATIONS

Not stated

## RATING SCHEME FOR THE STRENGTH OF THE RECOMMENDATIONS

### Strength of Recommendation

- A. Good evidence to support a recommendation for use
- B. Moderate evidence to support a recommendation for use
- C. Poor evidence to support a recommendation
- D. Moderate evidence to support a recommendation against use
- E. Good evidence to support a recommendation against use

## COST ANALYSIS

A formal cost analysis was not performed and published cost analyses were not reviewed.

## METHOD OF GUIDELINE VALIDATION

External Peer Review

## DESCRIPTION OF METHOD OF GUIDELINE VALIDATION

Not stated

# RECOMMENDATIONS

## MAJOR RECOMMENDATIONS

Definitions of the levels of evidence (**I-III**) and grades of recommendation (**A-E**) are repeated at the end of the Major Recommendations field.

### Screening and Initial Evaluations

All patients at the time of human immunodeficiency virus (HIV) diagnosis should be assessed for existing kidney disease with a screening urine analysis for proteinuria and a calculated estimate of renal function (**C-III**).

If there is no evidence of proteinuria at initial evaluation, patients at high risk for the development of proteinuric renal disease (i.e., African American persons, those with CD4<sup>+</sup> cell counts <200 microL or HIV RNA levels >4,000 copies/mL, and those with diabetes mellitus, hypertension, or hepatitis C virus coinfection) should undergo annual screening (**B-II**). Renal function should be estimated on a yearly basis to assess for changes over time (**B-II**).

Additional evaluations (including quantification of proteinuria, renal ultrasound, and potentially renal biopsy) and referral to a nephrologist are recommended for

patients with proteinuria of grade  $\geq 1+$  by dipstick analysis or glomerular filtration rate (GFR)  $< 60$  mL/min per  $1.73$  m<sup>2</sup> **(B-II)**.

### **Management**

In HIV-infected patients with evidence of nephropathy, blood pressure should be controlled to a level no higher than 125/75 mm Hg **(B-III)**, with the initial preferential use of angiotensin-converting enzyme (ACE) inhibitors or angiotensin receptor blockers (ARBs) for those patients with proteinuria **(B-II)**. Calcium channel blockers should be avoided in patients receiving protease inhibitors **(D-II)**.

Dialysis and the placement of arteriovenous fistulae (native fistulae preferred **[A-II]**) should not be withheld for patients solely because of HIV infection **(A-II)**

Renal transplantation may be considered for patients with end-stage renal disease (ESRD) if provided in a supervised clinical trial or at centers with adequate experience in this area **(C-III)**.

Patients with HIV-associated nephropathy (HIVAN) should be treated with highly active antiretroviral therapy (HAART) at diagnosis **(B-II)**. HAART should not be withheld from patients simply because of the severity of their renal dysfunction **(B-III)**.

Addition of ACE inhibitors, ARBs, and/or prednisone should be considered in patients with HIVAN if HAART alone does not result in improvement of renal function **(B-II)**.

### **Antiretroviral Dosing And Renal Toxicities**

Appropriate reduction of dosing for antiretrovirals that are primarily renally eliminated is warranted **(C-III)**, with additional doses given after hemodialysis for those drugs that are readily removed by dialysis **(B-II)**.

Nucleoside analogues should not be withheld in patients with reduced renal function for fear of the development of lactic acidosis **(D-III)**.

Patients receiving indinavir should drink at least 1.5 L of water daily to prevent stone formation **(B-III)**. Periodic monitoring of renal function and pyuria should be performed during the first 6 months of indinavir therapy and biannually thereafter **(B-II)**, although routine screening for crystalluria is not warranted unless there is a suspicion of nephrolithiasis **(B-II)**. Indinavir need not be withheld from patients with reduced renal function **(C-III)**. In patients who develop indinavir nephrolithiasis, it would be reasonable to restart indinavir therapy once rehydration is achieved **(B-III)**. Patients who develop indinavir-induced hypertension, pyuria, rhabdomyolysis, or renal insufficiency (acute or chronic) should permanently discontinue use of this drug **(B-III)**.

Patients receiving tenofovir who have a GFR  $< 90$  mL/min per  $1.73$  m<sup>2</sup>, patients receiving other medications eliminated via renal secretion (e.g., adefovir, acyclovir, ganciclovir, or cidofovir), patients with other comorbid diseases (e.g.,

diabetes or hypertension), or patients receiving ritonavir-boosted protease inhibitor regimens should be monitored at least biannually for measurements of renal function, serum phosphorus, and urine analysis for proteinuria and glycosuria **(B-III)**.

### **HIV Antiretroviral Dosing Recommendations**

A summary of dosing recommendations for patients with chronic kidney disease (CKD)/ESRD is provided in Table 3 of the original guideline document.

### **Renal Dosing of Antibiotics Commonly Used in HIV Care**

Many of the antimicrobials commonly used to prevent and treat opportunistic infections such as *Pneumocystis jiroveci* pneumonia, *Toxoplasma* encephalitis, and *Mycobacterium avium intracellulare* infections require dose reduction in the HIV-infected patient with CKD because of their renal elimination. Recommended dosing data for these drugs are available in Table 4 of the original guideline document.

### **HIV Infection And CKD in the Pediatric and Adolescent Populations**

In children without evidence of existing renal disease, screening evaluation for the development of HIVAN is similar to that proposed earlier for adults and should include complete urinalysis and testing to determine serum electrolyte levels, blood urea nitrogen levels, and creatinine levels every 6 months **(C-III)**.

Pediatric HIVAN and other proteinuric nephropathies in HIV-infected children should be treated with HAART; referral to a nephrologist and the addition of ACE-inhibition should also be considered for patients with more severe proteinuria (grade  $\geq 1+$  by urine dipstick analysis or a protein-to-creatinine ratio  $\geq 0.2$  g/g for 3 separate specimens) **(C-III)**. Steroid use is not recommended for this population **(D-II)**.

### **Special Topics**

Use of recombinant human erythropoietin should be considered in patients with hemoglobin levels 2 g/dL less than the lower limit of normal; the therapeutic hemoglobin target is a hemoglobin level of 11 to 12 g/dL **(C-III)**.

Analogous to the general population with CKD, all HIV-infected ESRD patients with secondary hyperparathyroidism (serum calcium level,  $<9.5$  mg/dL; serum phosphorus level,  $<4.6$  mg/dL; and serum parathyroid hormone level,  $>35$  pcg/mL) should be treated with 1,25-dihydroxy vitamin D3 or its analogues **(C-III)**.

HIV-infected patients requiring hemodialysis should have anti-HBs titers checked after receiving a standard primary series of 3 hepatitis B vaccinations and should receive a fourth injection if these titers are  $<10$  IU/L **(B-II)**.

### **Vaccinations Recommended for HIV-Infected Adults with Chronic Kidney Disease**

<b>Pathogen</b>	<b>Recommendation(s)</b>
<b><i>Streptococcus pneumoniae</i></b>	Pneumovax <sup>a</sup> or Pnu-Imune <sup>b</sup> 23 administered in a single 0.5-mL subcutaneous or intramuscular dose if CD4 <sup>+</sup> cell count $\geq$ 200 cells/mm <sup>3</sup> . Additional vaccination is recommended for patients initially vaccinated at a CD4 <sup>+</sup> count <200 cells/mm <sup>3</sup> whose CD4 <sup>+</sup> count increases to $\geq$ 200 cells/mm <sup>3</sup> . It is preferable to vaccinate such individuals before development of end-stage renal disease. Patients should be revaccinated after 5 years.
<b>Influenza virus</b>	All patients should be vaccinated annually.
<b>Hepatitis A virus</b>	Patients who are negative for anti-hepatitis A virus and patients at increased risk for hepatitis A virus infection (e.g., illicit drug users, men who have sex with men, and patients with chronic liver disease [including chronic hepatitis B or hepatitis C]) should be vaccinated.
<b>Hepatitis B virus</b>	
<i>Patients of all ages</i>	For monitoring, check antibody to hepatitis B surface antigen (anti-HBs) titers 1-2 months after the last primary vaccine dose is administered (an adequate response is $\geq$ 10 mIU/mL). Revaccinate those patients who do not respond with 3 doses. For those patients who do respond, follow anti-HBs levels semiannually; if anti-HBs levels are <10 mIU/mL, administer a booster dose.
<i>Patients aged <math>\geq</math>20 years</i>	
Predialysis	Administer Recombivax HB <sup>a</sup> at a dose of 10 micrograms at 0, 1, and 6 months or Engerix-B <sup>c</sup> at a dose of 20 micrograms intramuscularly (im) at 0, 1, and 6 months.
Dialysis dependent	Administer Recombivax HB <sup>a</sup> at a dose of 40 micrograms at 0, 1, and 6 months or Engerix-B <sup>c</sup> at a dose of 40 micrograms im at 0, 1, and 6 months.
<i>Patients aged &lt;20 years</i>	Administer Recombivax HB <sup>a</sup> at a dose of 5 micrograms at 0, 1, and 6 months or Engerix-B <sup>c</sup> at a dose of 10 micrograms im at 0, 1, and 6 months.

## **Definitions**

### **Quality of Evidence**

- I. Evidence from at least one properly randomized, controlled trial
- II. Evidence from at least one well-designed clinical trial without randomization, from cohort or case-control analytic studies (preferably from more than one center), from multiple time-series studies, or from dramatic results of uncontrolled experiments
- III. Evidence from opinions of respected authorities based on clinical experience, descriptive studies, or reports of expert committees

### **Strength of Recommendations**

- A. Good evidence to support a recommendation for use
- B. Moderate evidence to support a recommendation for use
- C. Poor evidence to support a recommendation
- D. Moderate evidence to support a recommendation against use
- E. Good evidence to support a recommendation against use

### **CLINICAL ALGORITHM(S)**

A clinical algorithm is provided in the original guideline document for "Screening for Human Immunodeficiency Virus (HIV)-related Renal Disease."

## **EVIDENCE SUPPORTING THE RECOMMENDATIONS**

### **TYPE OF EVIDENCE SUPPORTING THE RECOMMENDATIONS**

The type of supporting evidence is identified and graded for each recommendation (see "Major Recommendations").

## **BENEFITS/HARMS OF IMPLEMENTING THE GUIDELINE RECOMMENDATIONS**

### **POTENTIAL BENEFITS**

Identification of human immunodeficiency virus (HIV)-infected patients at risk for renal disease may help clinicians implement potentially preventative and therapeutic strategies.

### **POTENTIAL HARMS**

- Calcium channel blockers of both the dihydropyridine and nondihydropyridine classes should be used with caution because of their potential interaction with protease inhibitors, which can result in hypotension and possibly in conduction delays.
- Peritonitis has been reported in several small series of HIV-infected patients receiving peritoneal dialysis.
- Solid-organ transplantation in HIV-infected patients is complicated by drug interactions and a complex set of infectious, metabolic, and neoplastic complications related to each condition. Clinical management must be provided by a multidisciplinary team of providers who are able to communicate rapidly about evolving signs, symptoms, and laboratory abnormalities.

## **CONTRAINDICATIONS**

### **CONTRAINDICATIONS**

- Underlying infection would be a contraindication for immunosuppressive therapy.
- Cidofovir is contraindicated in patients with preexisting creatinine clearance of <55 mL/min or a urine protein level  $\geq 2+$  (100 mg/dL) on urine dipstick.

## QUALIFYING STATEMENTS

### QUALIFYING STATEMENTS

- Guidelines are written to improve the quality of care, to improve the appropriateness of care, to improve cost-effectiveness, and to serve as educational tools. The goal is not to create standards of care; however, other organizations may choose to adopt these guidelines or components thereof for such purposes. Practice guidelines, however, are never a substitute for clinical judgment. Clinical discretion is of the utmost importance in the application of a guideline to individual patients, because no guideline can ever be specific enough to be applied in all situations.
- Although the authors feel that these recommendations should generally apply to all human immunodeficiency virus (HIV)-infected patients, it is understood that providers need to tailor these guidelines around the needs and circumstances of the individual patient.

## IMPLEMENTATION OF THE GUIDELINE
