

Model Checking for the Practical Verificationist: A User's Perspective on SAL

SAL's language in a slide

- ▶ Typed with predicate subtypes (**incomplete type-checker**).
- ▶ Higher-order functions.
- ▶ Uninterpreted functions.
- ▶ Infinite types (e.g., INTEGER and REAL).
- ▶ Synchronous (lock-step) and asynchronous (interleaving) composition (`||` and `[]`, respectively).
- ▶ Algebraic data types.
- ▶ Quantification (over finite types).
- ▶ Recursion (over finite types).

Cheap Invariants

Finding **inductive** invariants is hard and is the basis for proving safety properties. Three strategies:

1. ***k*-Induction** to strengthen invariants *automatically*.
 - ▶ Generalizes induction over transition systems.
 - ▶ Automatic, but exponential in the size of *k*.
2. **Disjunctive invariants**.
 - ▶ Each disjunction covers some configuration of the system.
 - ▶ Developed by Pneuli & Rushby, independently.
 - ▶ A disjunctive invariant can be **built iteratively** to cover the reachable states from the counterexamples returned by SAL for the hypothesized invariant being verified.
3. Nondeterministic assignment vs. asynchronous composition.

k -induction

Generalize from single transitions to trajectories of fixed length.

Consider a transition system $\langle S, S^0, \rightarrow \rangle$. For safety property P , show

- ▶ **Base:** If $s_0 \in S^0$, then for all trajectories $s_0 \rightarrow s_1 \rightarrow \dots \rightarrow s_k$, $P(s_i)$ for $0 \leq i \leq k$;
- ▶ **IS:** For all trajectories $s_0 \rightarrow s_1 \rightarrow \dots \rightarrow s_k$, If $P(s_i)$ for $0 \leq i \leq k - 1$, then $P(s_k)$.

Conclude that for all reachable s , $P(s)$.

Induction is the special case when $k = 1$.

Models and Development

We build our models and code side-by-side.

- ▶ Helps ensure design + code stays in sink.
- ▶ Healthy shame if proofs fail.
- ▶ Takes FM seriously as part of development process.
- ▶ I've added some Bash scripts to the SAL wiki:

http://sal-wiki.csl.sri.com/index.php/User-supplied_SAL-related_shell_scripts
