After Brown (2003)

Background:

In order to clean up contaminated groundwater, and to plan for effective geologic disposal of nuclear waste, we must obtain a thorough understanding of the molecular-scale processes that control movement of contaminants in the subsurface.

Scientific Objective:

To determine the effects of bacteria, natural organic matter and other nano- to micro-scale particles on heavy metal (e.g., Cd, Cu, Pb) and actinide (e.g., U, Np) mobilities in groundwater.

Environmental Molecular Science Institute at the University of Notre Dame

Science/Engineering Projects

Mission: Determine the effects of nano- and micro-particles on heavy metal and radionuclide transport in geologic systems.

- Bacteria
- Natural Organic Matter
- Nanoscale Mineral Aggregates

National Lab/Industry Partnerships

- Argonne (APS; Actinide Facility)
- Sandia (molecular dynamics modeling)
- Oak Ridge (geomicrobiology)
- DuPont Engineering Technologies

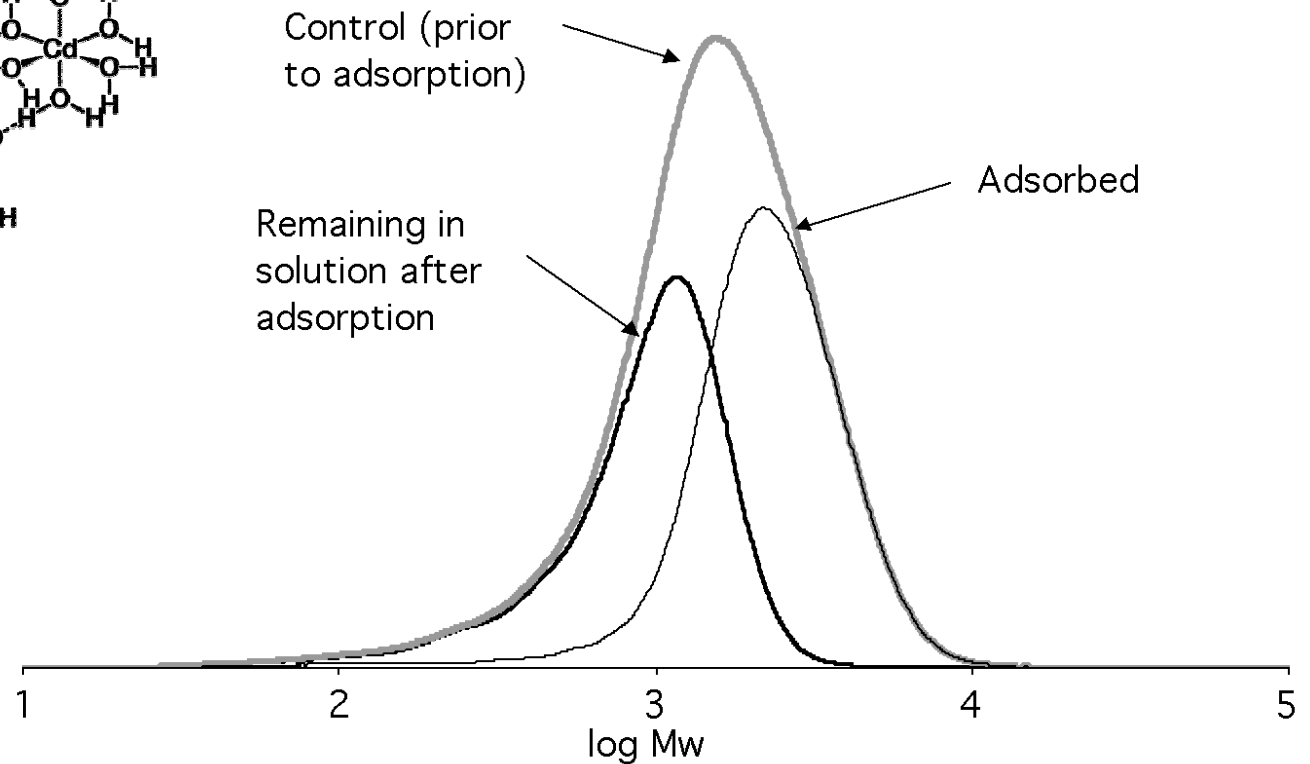

Education/Outreach Projects

- REU Summer Program
- High School Student Internships
- Active Recruitment of Under-represented Groups with G.E.M.
- National Lab/Industry Internships

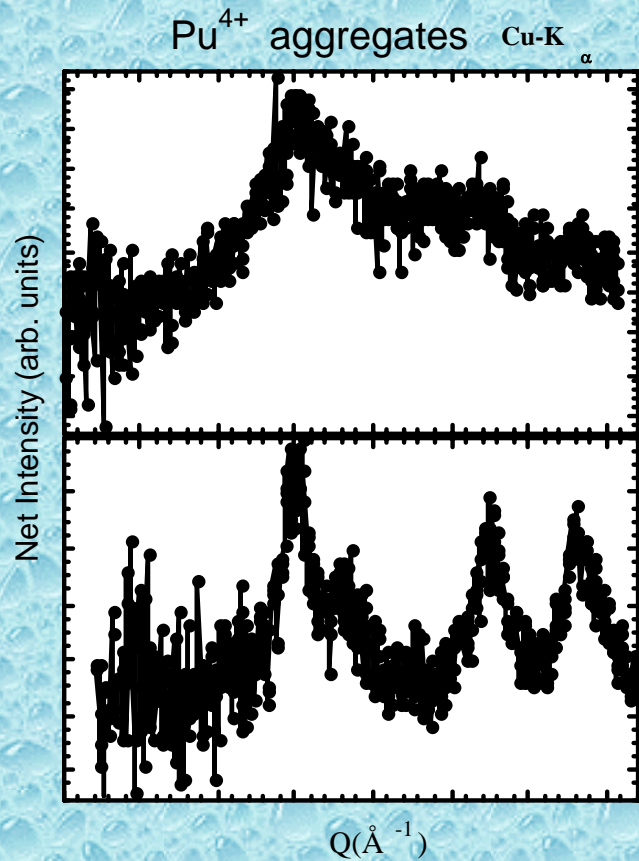

Fulvic/Humic Acid Adsorption and Metal Complexation Reactions

Nano-scale Mineral Aggregates

Advanced Photon Source Argonne National Laboratory

X-ray Absorption Fine Structure

- Attenuation of x-rays
$$I_t = I_0 e^{-\mu(E) \cdot x}$$
- Absorption coefficient
$$\mu(E) \propto I_f / I_0$$

X-ray-Absorption Fine Structure

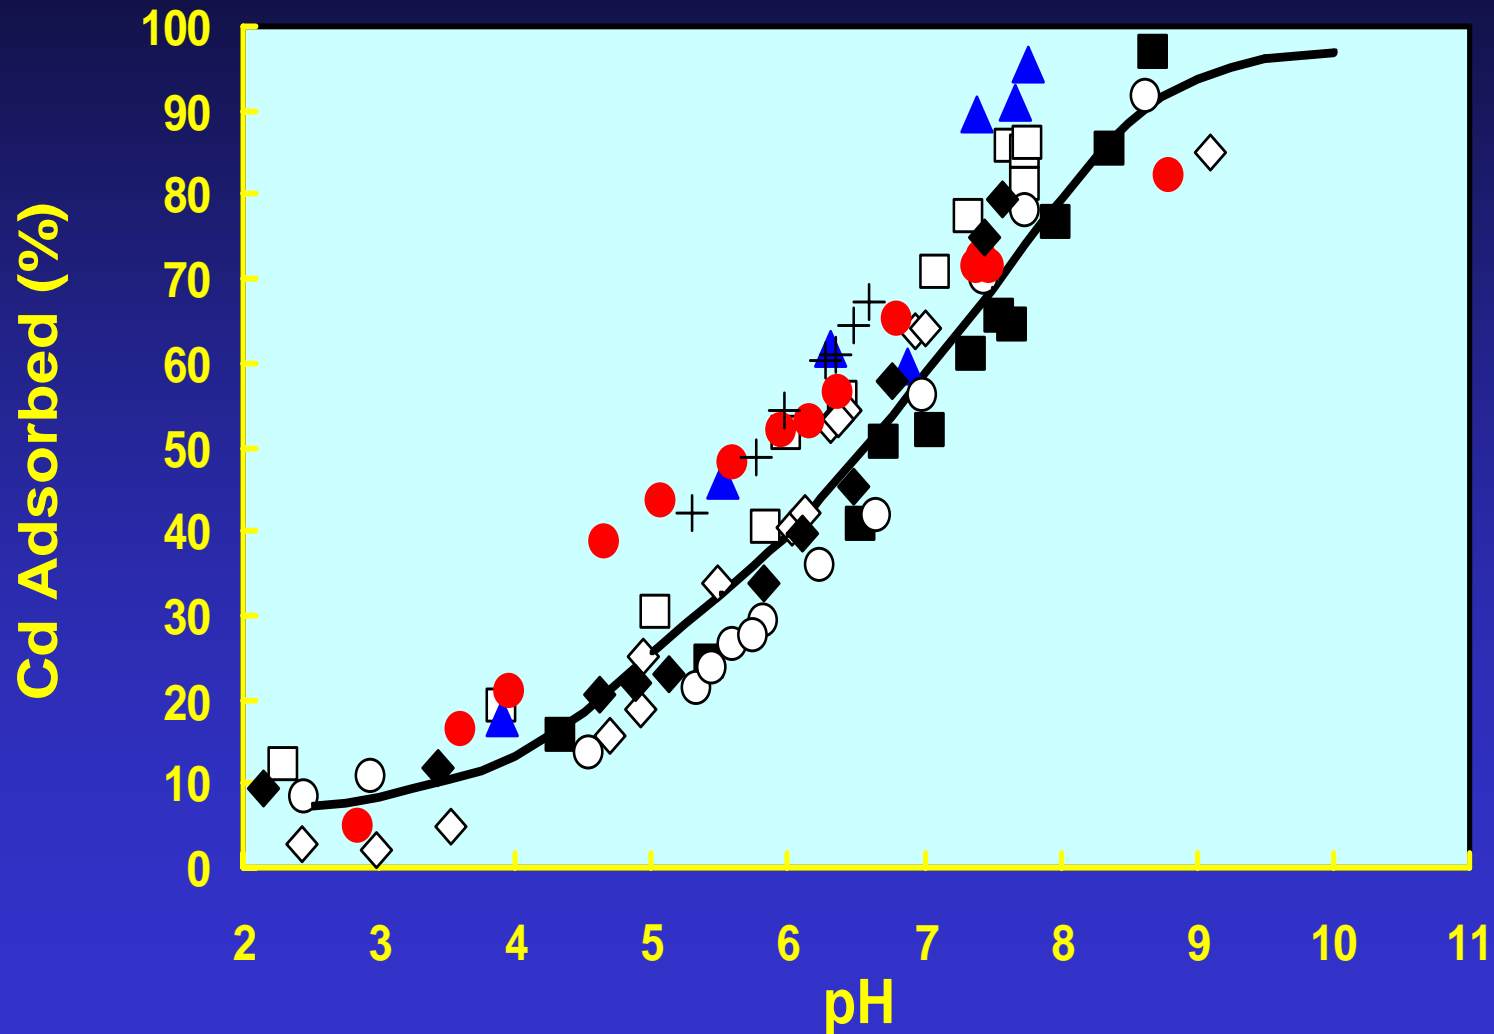

Molecular Modeling of Metal Binding to Cell Wall Components

Cd Adsorption onto Natural Bacterial Consortia

Conclusions:

- **Nano- and micro-particles can control heavy metal and radionuclide mobilities in the environment.**
- **A range of experimental, analytical, and modeling approaches are required in order to understand the molecular-scale processes that involve these particles.**
