Luis Hennicke, Agricultural Specialist

## Report Highlights:

Chile's production forecasts for fresh apples and table grapes are up following good weather conditions, but pear production is expected to remain unchanged, as uprooting of orchards continue.

## General Summary

The industry forecasts an expansion in fresh apple and table grape production, as weather has been favorable in most growing areas. Pear production however, is forecasted to remain stable in MY2007 (J an- Dec 2007), as uprooting of orchards continues.

Fresh apple and table grape exports are forecasted to expand following an increase in output.
A slight reduction of exports is forecasted for pears, as producers are selling increasing amounts of their production to the local processing industries due to falling economic returns.

## Fresh Apples

## Production

Although it is still early to predict production volume for the coming year, Chile's apple harvest for 2007 is forecasted to be slightly larger than last year's harvest, as weather conditions has been good in most growing areas. A good quality harvest is expected, as it was indicated by industry sources. As a result exports are also expected to be slightly larger than this year.

Producers have been diversifying their orchards by planting new and more popular varieties, i.e., Fuji, Gala, Jonathan, Braeburn, Pink Lady and Galaxies. Traditional varieties, such as Red Delicious and its variations (i.e., Richard Red, Starking, etc) are being uprooted and replanted with newer varieties. Red apple varieties still constitute about 70 percent of total output and are grown mainly for the European and the Middle Eastern markets. The principal green variety, Granny Smith, is used both for fresh export (mainly to Europe and the United States) as well as for concentrated apple juice production.

## Crop Area

Although some growers, mainly in Regions VII (Curico-Talca) and VIII (Chillan), continue to replace and increase their planting densities, farmers in other areas are uprooting old orchards. However, in general, the total planted area is on hold due to a significant fall in economic returns observed during the last two years. A strong peso together with increased labor costs is reducing the competitiveness of the labor-intensive fruit industry in Chile.

## Consumption

Since there are no official domestic consumption statistics for apples, figures are estimated as a residual of production and exports. Because the residual figure includes apples for fresh domestic consumption and for processing, there tend to be large variations in domestic fresh consumption in the PS\&D tables from year to year.

## Trade

A slightly larger output together with low stocks of apples in the European Union explains the increase in total exports in 2006. For 2007 a stronger demand is expected, due to lower production in Europe, which will expand exports again in 2007.

Red apple varieties account for about two-thirds of exports, but sweet/sour varieties are increasing in share, while Chile's traditional varieties are losing ground. This trend is
becoming more evident each year. Production and exports of new varieties, like Fuji and Pink Lady, are increasing significantly.

## Policy General

Chile's fruit sector has a voluntary export quality program for apples, table grapes, stone fruit and kiwis shipped to the United States and Europe. Nearly 80 percent of Chile's exports to these two markets are under the auspices of this quality program. The minimum standards are voluntary and will remain the same in 2007 as those applied in 2006. Currently growers and exporters limit the quality control only to fruit maturity. There are no requirements related to the size of the fruit or to the volumes exported. Normally the market sets these requirements.

## Marketing General

Although Chile is a major producer of table grapes, apples and pears, there are some opportunities for imports, particularly when domestic supplies are low or non-existent in the off- season. A major constraint on demand is price. Consumers are accustomed to low prices for in-season apples. In general, the small portion of Chileans who are willing to pay for higher- priced off- season fruit limits the market for U.S. fresh fruit.

On the export side, contractual arrangements between producers and exporters vary according to the exporting company. A large portion of Chilean fruit is shipped on a consignment basis. After the exporter sells the fruit in a given market, all marketing and transportation costs are deducted from the sale price. The remaining amount is given to the farmer, so that he/she can pay his/her production costs and determine his own profit. Some producers receive a guaranteed minimum price for their fruit from the exporters. Often the exporters provide some financing to producers during the growing season. These monies are then deducted from the grower's receipts at the end of the season. In Chile, there are presently over 700 fruit exporters, export companies and/or individual producers that export directly.

Returns to Chile's fresh fruit industry during the last season fell again. In many instances, returns reportedly have been lower than the cost of production. This poor profitability is forecast to continue in 2007, due to some ongoing factors. Chile's peso remains strong, reducing returns to growers. Shipping costs have increased. Competition from other countries is increasing and the seasonal advantage is being lost due to increasing southern hemisphere competition and improvements in cold storage technologies.

The fresh fruit industry is continuing with its generic promotional campaign in the United States, Mexico, Japan, S. Korea and the European Community. This campaign is cofinanced by producers, exporters and the Government (through Pro-Chile).
Approximately 3 to 5 cents of every box shipped to these markets is earmarked for this purpose. The budget for this coming year is expected to be similar to last season at a total of US $\$ 5.5$ million.

Like last year, close to US\$ 4 million will be spent in the United States and Canada and the remainder will be spent in other markets. The main activities paid for with these funds are a media campaign and other promotional activities like cross-promotional point of sales activities with fruit, wine and salmon. The media campaign is based on TV advertising. There is also a website.

## Fresh Table Grapes

## Production

Good weather conditions in almost all growing areas together with an expansion of the harvested area are expected to increase total production slightly in 2007, when compared to the previous year.

Chile produces over 36 varieties of table grapes for export. Thompson Seedless, Flame Seedless and Ribier account for the bulk of production. Varieties like Red Globe, Superior Seedless, Crimson and Autumn Royal have increased significantly in the last few years, as most of the replanting has been with these varieties. Table Grapes are planted from Region III (Copiapo) to Region VII (Curico-Talca).

## Crop Area

After some years of no new plantings, industry sources indicated that total planted area increased again slightly in 2006. New plantings had been suspended for a few years as economic returns have been affected by increasing costs, competition and a constant revaluation of the peso.

## Consumption

There are no statistics on fresh table grape consumption. A residual figure is used to determine fresh consumption and utilization for processing.

## Trade

Table grape export volumes in 2006 increased as output expanded. For 2007 only a small expansion in total production is expected and a good quality production can also be expected in 2007. As in the past, table grapes are being imported during the off- season. A weaker dollar, would suggest that these imports could increase. However, transport costs remain high due to low volumes and there is also an ample supply of competing low priced fruits available year around in Chile.

## Fresh Pears

## Production

Due to good weather for pear production in most growing areas, total output level for 2007 is expected to be similar than for 2005 and 2006 in spite of a significant fall in the total planted area. The latest planting statistics show that total planted area to pears fell more than our previous estimate. However, industry sources indicate that while replanting old orchards, producers are increasing planting densities, thus maintaining present total production levels in the coming years.

There are over 36 pear varieties grown in Chile. Packam's Triumph and Beurre Bosc make up over 60 percent of Chile's exports. Other important varieties in Chile are Abate Fetel, Coscia, Summer Bartlets and D'Anjou.

## Consumption

As with most other Chilean fruits, mostly export rejects enter domestic marketing channels. Pears are mostly consumed fresh, although some are utilized for processing.

## Trade

Although production levels are expected to remain constant, industry sources have indicated that exports are likely to fall due to an increasing competition from Argentina that is Chile's main competitor for pear exports, principally to the European Union, which is also Chile's main export market. Close to 50 percent of exports are destined for the EU. As a result Chilean exports will depend on fluctuations in the Argentinean production. Additionally, due to increasing cost and lower returns for pear exports an increasing numbers of producers are selling their production to the local processing industries, according to industry sources.

## Concentrated Apple Juice

## Production

Chile's production of apple juice concentrate (AJC) primarily reflects foreign demand. Although it is still early to forecast production levels for MY2007, we are expecting apple production to increase due to excellent weather in most growing areas. As a result there should be a larger availability of apples for processing. Therefore, production volumes of AJC probably will be larger then in MY2006.

Although the apple juice industry mainly processes export rejects, the AJC industry has been encouraging farmers to increase production of sour-type apples, as well as to expand new plantings of apple varieties mainly for juice purposes. Reportedly the industry is contacting producers directly to obtain apple supplies in an effort of reduce the use of export rejects.

## Consumption

Only a small amount of AJC, principally single-strength juice, is consumed domestically. AJC competes with a variety of fresh and processed juices in Chile.

## Trade

The United States is Chile's largest AJC export market, accounting for over 80 percent of total export sales. Other markets of increasing importance are Japan, Mexico and Canada. Latin American export markets also are growing fast. Levels of AJC exports will depend upon foreign demand and the ability of the industry to compete in international markets against other suppliers such as China.
