INTRODUCTION

In 1997, the USGS Mineral Resources Program initiated the National Surveys and Analysis (NSA) Projects to develop national scale databases. One primary objective of this project was to compile a national digital geologic map database, utilizing state geologic maps, to support studies in the range of 1:250,000- to 1:1,000,000-scale. In order to accomplish this, state databases were prepared using project standards for the database structure, fields, attribution, and data dictionaries.

This document provides basic background information for the state digital geologic map databases of this report. This report is one of a series releasing preliminary standardized geologic map databases for the United States. Although the databases in this report are complete they are still undergoing final error correction and standardization procedures and are being released in preliminary form to meet production distribution schedules.

The data products of the project consist of two main parts, the spatial databases and a set of supplemental tables relating to map units. It should be understood that the datasets do not collectively represent a single map, but rather serve as a resource to generate a variety of stratigraphic, age, and lithologic maps.

This documentation is divided into four main sections: (1) description of the set of data files provided in this report, (2) specifications of the spatial databases, (3) specifications of the supplemental tables, and (4) an appendix containing the data dictionaries used to populate particular fields of the spatial database and supplemental tables.

SPATIAL DATABASE TERMINOLOGY

The term "spatial database" is a generic term for information systems dealing with objects having a spatial component (Rigaux and others, 2002). In this product, we present spatial databases in two formats from Geographic Information systems (GIS) developed by the Environmental System Research Institute (ESRI).

The term "coverage" is used in this document because the data presented in this series are in ESRI coverage and shapefile formats. A coverage is defined as "a digital version of a map forming the basic unit of vector data storage in Arc/Info" (ESRI, 1997). It is a "set of thematically associated data considered as a unit. A coverage usually represents a single theme" (here such as geologic units, dikes, or faults). A coverage stores map features as primary features (such as arcs, nodes, polygons, and label points) and secondary features (such as tics, map extent, links, and annotation). Associated feature attribute tables describe and store attributes of the map features. The attribute tables are referred to as the PAT (polygon or point attribute table) and AAT (arc attribute table). Coverages are supplied with this publication in ARC interchange export file format as indicated by a .e00 file extension name.

The shapefile format is used by the ESRI ArcView and ArcGIS programs as well as other GIS programs. A "shapefile" spatial database consists of a main file (.shp), an index file (.shx), and a table of attribute data (.dbf) (ESRI, 1998). Shapefiles can be viewed with the free viewer, ArcExplorer, which can be downloaded from http://www.esri.com/software/arcexplorer.

General conventions used through this document are to show table names in capitals (e.g. STUNITS), and field names of tables in italics (e.g. *unit_name*).

GENERAL PROCEDURES

The first stage in developing state databases for the conterminous United States (CONUS, i.e. the contiguous 48 states) was to acquire digital versions of all existing state geologic maps. Although a significant number of digital state maps already existed, a number of states lacked them. For these states new digital compilations were prepared in cooperation with State Geologic Surveys or by the NSA project. These new digital state geologic maps and databases were created by digitizing already existing printed maps, or, in a few cases, by merging existing larger scale digital maps.

The second stage was to attribute the individual state digital map databases, using a standard data structure and data dictionaries where appropriate (Appendices 1-7). Data dictionaries list permitted terms that can occur in specified fields of attribute tables. The spatial databases (coverages) are accompanied by supplemental map unit-, lithologic-, and age-attribute tables to provide for the generation of derivative maps. When the spatial databases are merged, these tables allow development of regional derivative maps based on stratigraphy, lithology and age. No attempt was made to reconcile differences in mapped geology between contiguous states.

All state were coverages were fit to a state boundaries Arc/Info coverage derived from the USGS 100k scale Digital Line Graph (DLG) boundary layer quadrangles (B.R. Johnson and Beth Leveritch, written commun., 1998). This boundary coverage has a polygon for each of the conterminous 48 states. The purpose of fitting is so that adjoining state geologic coverages can be merged to form regional digital maps without slivers or overlaps at the state boundaries. Existing state coverages were fit to the U.S. state boundaries by examining arcs along the state boundary line and extending or clipping them to state boundary depending on whether the arcs under- or overshoot the boundary arc. No "rubber sheeting" was used to warp the geologic coverages to the more closely match the state boundaries.

NATURE AND LIMITATIONS OF SOURCE DATA

Although the concept of combining state level digital maps to create a national digital map database appears straightforward, the disparate nature of the source maps places serious restrictions on how these data can be used and the degree to which they can be integrated. These restrictions arise from a number of different reasons, the chief of which are:

- 1. *Differences in scale.* State geologic maps range in scale from 1:100,000 to 1:1,000,000. Thus, when data from contiguous states at different scales are merged, these scale differences may result in one state having significantly more detail at the boundary than the other and, thus, contacts and other linear features generally do not match.
- 2. Differences in combined map units. Because state geologic maps are typically published at a scale of 1:250,000 or smaller (1:500,000, 1:1,000,000 etc.), they represent considerable simplification of more detailed source maps from which they were originally compiled. It is typical for state maps to have map units composed of multiple formations, but if adjoining states have combined formations or geologic units differently, then contacts will not match along state boundaries. Also, compilers for one state may have strived to maintain as much stratigraphic unit detail as possible, whereas in an adjoining state, units were lumped together to create broader combined units.

- 3. Differences in bedrock exposure. There is a distinct difference in state map type between eastern and western states. In the east, because of limited bedrock exposure and extensive soil or glacial cover, interpretive bedrock maps are typically produced and may be accompanied by one or more separate surficial deposit maps. In the west because bedrock exposure is fairly extensive, state geologic maps consist of a mix of mapped exposed bedrock areas and alluvial or other surficial units mapped along stream and river valleys or as valley fill between mountain ranges.
- 4. *Differences in mapping philosophy*. For a variety of reasons, a few state maps are not the normal stratigraphic-unit based maps. For example, the Idaho state geologic map (Bond and others, 1978) is a compilation of lithostratigraphic units; and the state map of Maine (Osberg and others, 1985) in part shows the interpreted original protolith rather than the existing metamorphic lithologies.

For these and other reasons, many of the contacts at state boundaries do not match contacts in adjoining states. Unfortunately to resolve most of these differences and eliminate "state boundary faults", i.e. discontinuities at state boundaries, would require that the source maps to be recompiled to a common standard which is far beyond the scope and resources of this effort. Thus, we have made no attempt rectify or resolve boundary mismatches. In general, other than basic error correction, the standardized state digital maps in this series present polygons and arcs unmodified from their sources; however, the amount of error correction and updating of state maps varies considerably. Such work is documented in the text and metadata of individual reports of this series.

STANDARD FILE SET

The files supplied with each database chapter consist of: (1) one or more spatial databases, and (2) a set of related supplemental tables (table 1, fig. 1). Each state dataset has the same database structure and attribute fields using standardized data dictionaries. At a minimum, the standard file set consists of a geology (polygon) coverage, metadata, and three supplemental attribute tables. However, additional spatial databases for other line or point features present on the source map may also be included (e.g. faults, dikes, fold axes, volcanic vents, etc.).

Specifications and details for the standard coverage set are explained below in the "Coverage Data Structure" section. The spatial databases are provided in ESRI ARC interchange export (e00) and Shapefile formats. The standard coverage set is provided both in geographic coordinates and a Lambert Conformal Conic projection (table 2). The spatial database metadata files are provided in three formats, ASCII text (.txt), Microsoft Word (.doc), and HTML (.htm).

The supplemental attribute table file set consists of three related attribute tables, units, age, and lithology, and two references tables. The tables provide standardized attribution for the geologic map units for each map. These tables are described in detail in the "Supplemental Attribute Tables" section of this report. These tables are available in, comma separated ascii (.csv), dBASE (.dbf), and FileMaker Pro (.fp5) formats.

Figure 1. Data model for conterminous U.S. databases. Fields marked with an asterisk are populated from a data dictionary.

Table 1. Standard file set for conterminous U.S. states databases. "ST" in a file name is a placeholder for the appropriate state abbreviation (e.g. NV - Nevada, Appendix 1). This convention is used throughout this report.

File Name	Description		
Database documentation			
	documentation.pdf (the document you are reading now)		
	Spatial databases and related files		
STgeol_lcc.e00 STgeol_dd.e00 STgeol_lcc.zip STgeol_dd.zip	Geology polygon coverage (as .e00 ERSI interchange files and as zip compressed ESRI shapefiles) in both Lambert Conformal Conic projection (lcc) and geographic coordinates (dd, decimal degrees).		
STfaults_xxx.xxx	Fault arc coverages (using same naming conventions and file formats as above)		
STdikes_xxx.xxx	Dikes arc coverage (using same naming conventions and file formats as above)		
STfeature_xxx.xxx	Arc (line) and point feature spatial databases. Features represented vary depending on state (e.g. fold axes, continental glacial advance lines, cinder cones, diatremes, etc.). Inclusion of these files is dependent on available data.		
STpoints_xxx.xxx	Point feature spatial databases. Features represented vary depending on state (e.g. cinder cones, diatremes, etc.). Inclusion of the files is dependent on available data.		
STmetadata.txt STmetadata.doc STmetadata.htm	Metadata file in standard ASCII text (.txt) format, Microsoft Word format (.doc), and Hypertext Markup Language (.htm).		
Supplemental Tables			
STunits.xxx STage.xxx STlith.xxx STref.xxx STref-link.xxx	Units, age, lithology references, reference-link, attribute tables in three formats: comma delineated text (.csv), dBASE (.dbf), or FileMaker Pro (.fp5).		

Table 2. Projection parameters for CONUS data sets

Lambert Conformal Conic Projection			
Parameter	Value		
1 st Standard parallel	33° 00' 00" N		
2 nd Standard parallel	45° 00' 00" N		
Central meridian	-100° 00' 00" (W)		
Latitude of projection origin	0° 00' 00"		

False easting (meters)	0
False northing (meters)	0
Units	Meters
Datum	NAD 27
Spheroid	Clarke 1866

COVERAGE ATTRIBUTE TABLES

This section describes the attribute tables of the spatial databases. In order to integrate the state spatial databases the original attribute tables have been replaced by our standard attribute tables documented below (Fig. 1). Only polygon features that define contact topology (e.g. all stratigraphic, plutonic, and fault contacts as well as selected water and ice boundaries) are included in the geology coverage. Faults in the original datasets were either embedded in the geology polygon coverage or provided as separate coverages. For the latter situation, we have not attempted to merge the separate fault line coverages with the corresponding geology polygon coverages. For coverages where faults were embedded, we have replicated the embedded faults as separate fault line coverages in order to provide a uniform set of fault coverages for each state. Features that are not included in the geology polygon coverage such as fold axes, lineaments, metamorphic isograds, and other features typically considered "overprints" on most geologic maps are included in separate feature coverages as described below. For states that had point data overlays, such as fossil locations and structural measurements, these are included as separate point feature coverages.

GEOLOGY COVERAGE POLYGON ATTRIBUTION TABLE (PAT)

We developed a standardized polygon attribute table (PAT) format for the geologic polygon coverages. In addition to the standard fields created for each coverage by the Arc/Info system (stgeol#, stgeol-id, area, perimeter), we have added several fields from STUNITS table including the unit_link field for joins and relates to the supplemental attribute tables as well as map symbol, age, and lithology fields to facilitate plotting of the coverage (table 3).

Table 3. Geology polygon attribute table (PAT). In the format field, I indicates a numeric code stored as integers in the PAT; C is stored as characters, the numbers indicate input or stored width, and the output width. "ST" in file name is placeholder for the appropriate state abbreviation in lower case (e.g. NV – Nevada, see Appendix 1).

Field	d Name	Format	Definition and Notes	Data dictionary
orig	g_label	12, 12, C	Map unit symbol as from the original "source coverage".	
sgm	c_label	16, 16, C	Same as map_sym2 of STUNITS table. (orig_label + ;n where n = province	

		number (n = 0 if no province number) (e.g. original map unit Jtg occurs in two map provinces and is subdivided into two units with <i>sgmc_labels</i> of Jtg;1 and Jtg;2)). Provincial coding not used for Central States (i.e. n=0).	
unit_link	18, 18, C	ST + sgmc_label. This creates a unique identifier for every unit in the set of state databases.	
source	6, 8, C	ref_id number from the references table (STREF). Documents editing changes (i.e. changes to source spatial database).	
unit_age	60, 60, C	Free form field stating age of the unit (e.g. "Permian to Cretaceous"). Same as unit_age field of STUNITS table.	
rocktype1	40, 40, C	Dominant lithology of the unit.	Appendix 6
rocktype2	40, 40, C	Second most abundant lithology.	Appendix 6

ARC ATTRIBUTE TABLES (AAT)

The arc attribute table (.AAT) schema stores attributes that indicate the type of line features in the spatial database files. The attribute codes include information that define the type of line shown, e.g. a normal fault and location (certain, approximate, inferred, or concealed). Each arc within a spatial database also has a source attribute that allows the user to refer to original sources to determine the reason for an attribute assignment. The line-type data dictionary is presented in appendix 7. Arc attribute tables are uniform for all 50 states. Table 4 presents the fields used for the geology and fault AAT tables and the coding of the dikes is described in a separate section below.

The linework or "arc" coding scheme was developed originally for use in the production of geologic maps on the Alaska Peninsula (Wilson, 1989; Wilson and others, 1995; Wilson and others, in press). Since that time, the coding scheme has been modified to allow for capture of additional information and to cover the wide range of line types found on geologic maps. The key field of this coding scheme is the attribute *arc-code*. This attribute carries the majority of the information associated with a line. A secondary attribute, *arc-para1*, provides additional information for selected line types. Together these two attributes provide the geologic information about a line. As used in the polygon attribute table, a *source* field is also included in the arc attribute table. For the spatial databases this field relates to the STREFS table of references.

Directional Line Attribution

An important feature of the coverages is line or arc direction. This attribute is an inherent part of the topology for an arc or network coverage. Arcs are coded in Arc/Info using a right hand

rule; that is, when traveling along an arc from the "from-node" to the "to-node", the right side, depending on the defined line type, carries special meaning. Examples are: for thrust or high-angle reverse faults, the upper plate is always on the right, or, for caldera rims, the interior of the rim is on the right side of the arc. Conversion from Arc/Info interchange (.e00 files) files by a user of these data to other formats (e.g. ESRI shapefiles or MapInfo) may not preserve the right-hand rule for arcs. Thus, it is possible that line decoration may be illustrated incorrectly in the new file. Users should to double-check an original source (e.g. paper map) to ensure the correct orientation of line decorations after the import of an interchange file to any GIS format other than a coverage. Some geologic coverages did not include line orientation topology in the source, however, and were not upgraded to include it.

Geology and Fault Attribute Tables

Geology and fault line attribution use the same fields as shown in table 4.

Table 4. Geology and fault arc attribute tables (AAT). In the format field, I indicates a numeric code stored as integers in the PAT; C is stored as characters; the numbers indicate input or stored width, and the output width.

Field Name	Format	Definition and Notes	
arc-code	3, 3, I	Unique identifier for the feature (see appendix 7, AAT data dictionary)	
arc-para1	3, 3, I	arc-para1 is used for "decorated" lines where additional information is needed.	
arc-para2	3, 3, I	arc-para2 is an optionally used field for scratch entries. If used, the details are specified in associated metadata for the coverage.	
source	6, 8, C	ref_id number from the references table (STREF). Documents editing changes (i.e. changes to source spatial database).	

Dike Attribute Table

If a state geologic source map had dikes a separate dike coverage was prepared. The attribute fields of dike coverages are presented in table 5.

Table 5. Dike coverage arc attribute table (AAT). In the format field, I indicates a numeric code stored as integers in the .PAT, C is stored as characters, the numbers indicate input or stored width, and the output width.

Field Name	Format	Definition and Notes
orig_label	12, 12, C	Original map symbol/label (e.g. Td)
sgmc_label	18, 18, C	st + <i>orig_label</i> (e.g. NVTd), including use of special age symbols as necessary (see table below).
arc_code	3, 3, I	Numeric code from AAT data dictionary
dike_lith	20, 20, C	General lithologic classification as specified below: unspecified mafic felsic mafic and felsic lamprophyre
dike_age	60, 60, C	Free form field, usage same as <i>unit_age</i> field from unit coding specifications (e.g. "Tertiary", "Cretaceous-Tertiary", "unknown, probably Precambrian").
source	6, 8, C	<i>ref_id</i> number from the references table (STREF). Documents editing changes (i.e. changes to source spatial database).

Features Attribute Table

This arc coverage was created if the source map or spatial database included line features other than faults or dikes (e.g. fold axes, glacial limit line, etc.). Because of the disparate nature of the possible of the features, no data dictionary has been created for this class of line features and documentation is restricted to the metadata file for the coverage. Table 6 presents the attribute fields for line (arc) features coverages.

Table 6. Features coverage arc attribute table (AAT).

Field Name	Format	Definition and Notes	
orig_line_label	25, 25, C	Arc code taken from original spatial database.	
arc-code	3, 3, I	Unique identifier for the feature (see appendix 7, AAT data dictionary)	
arc-para1	3, 3, I	arc-para1 is used for "decorated" lines where additional information is needed.	
arc-para2	3, 3, I	<i>arc-para2</i> is an optionally used field for scratch entries. If used, the details are specified in associated metadata for the coverage.	
source	6, 8, C	ref_id number from the references table (STREF). Documents editing changes (i.e. changes to source spatial database).	

POINT FEATURE ATTRIBUTE TABLE

Point features coverages are for source maps or spatial databases that include one or more point features (e.g. volcanic vents, fossil localities, radiometric sample locations). Because only a few state maps have such features, we have not compiled a data dictionary for point features and these features are only documented in the coverage attribute table. Table 7 presents the attribute fields for point coverages.

Table 7. Points coverage attribute table (PAT).

Field Name	Format	Definition and Notes
point_feature	40, 40, C	Text descriptor of point feature from original map or spatial database (see coverage metadata).
source	6, 8, C	<i>ref_id</i> number from the references table (STREF). Documents editing changes (i.e. changes to source spatial database).

SUPPLEMENTAL TABLES

The supplemental attribute tables that accompany the spatial databases were developed using the Filemaker Pro (version 5.0, 5.5, or 6) database program. We utilized custom FileMaker forms for data entry in each table. The completed tables are provided in Filemaker Pro format (.fp5 file extension), in comma delineated format (.csv), and in dBASE (.dbf) format. The dBase format does not permit fields to contain more than 255 characters and a few fields were truncated in creating the dbf files.

The CONUS set of supplemental tables consists of five tables: unit descriptions (STUNITS), unit ages (STAGE), unit lithology (STLITH), unit references (STREFS), plus a key table linking references (STREF_LINK), where ST stands for the two-letter abbreviation for a given state. The relationships between these tables and their content fields are shown in figure 1. The units, age, lithology and ref-link tables are related by a key field, *unit_link*, that is described below in the units table section. The STREFS and STREF-LINK tables are related by *ref_id*.

Units Table (STUNITS)

The STUNITS table (table 8) consists of general information about each map unit such as symbolization, unit name and description, stratigraphic information, and summary of age (fig. 1).

The STUNITS table stores map unit symbols and through scripting uses these fields to populate an auto generated field named *unit_link*, which is the linking field (primary key) to other tables in the databases. *Unit_link* is a unique identifier for every map unit in the CONUS database set thus permitting it to be used for multi-state compilations. It consists of the original map unit symbol (*map_sym1*) having the state two letter code added as a prefix (*state*) and the province number (*prov_no*) as the suffix (see table 8 for further explanation).

The STUNITS table includes information about the unit name and description taken from the source map. Determining the map unit name can be more difficult than it appears. For example if the source map contains "Fraser Formation: basalt, with minor andesite and greywacke"; then clearly the unit name is "Fraser Formation" and what follows is the unit description. However if the source map presents a unit as "Interlayered rhyolite, mafic tuff and flows, slate" is it a unit name or description? Basically it is both and the same text will appear in both the unit_name and unitdesc fields of the STUNITS table.

On some maps, information about a map unit such as its name, description, and relationship to other stratigraphic units can sometimes be difficult to determine depending on how a map legend is organized (i.e. information about the unit may be distributed in several places within the legend and text of the source map). We have compiled such information in either the *unit_name* or unit description (*unitdesc*) fields.

For some state maps, the legend might indicate that a map unit belongs to a specific stratigraphic group, but not specify which formations comprise the group. Therefore, included in the STUNITS table is a *strat_units* field for adding stratigraphic unit information not present on the map.

The STUNITS table also includes a comments field (*unit_com*) intended for additional information about the unit that could not be included in the standard coding fields. The units comment field can include additional information about the unit that did not fit into our predefined fields or document adjustments or other changes made by the compiler.

Three fields, *rocktype1*, *rocktype2*, and *rocktype3*, are present at the end of the STUNITS table to facilitate the preparation of a generalized dominant lithology map for the United States. These fields are coded using the Lithclass 6.1 data dictionary (Johnson and Leveritch, written commun. 1998; Appendix 6 herein). *Rocktype1* is the lithology inferred to be the most abundant lithology in the unit; *rocktype2* is the second-most abundant lithology, and all other lithologies are listed in *rocktype3*. Neither the *rocktype1* nor the *rocktype2* fields imply anything in regards to abundance other than being the most and second most abundant of the rock types present in the unit. The three *rocktype* fields were placed in the units table because they have a one-to-one relationship to the geology PAT table as does the units table, whereas the lithology table has a one-to-many relationship.

Map Symbols

Many maps use special symbols (e.g. Triassic \mathbb{R}) to display map unit ages. To display such special symbols on a computer screen requires the use of a specialized font. Since it is unlikely that most users will have a particular special font for geologic symbols installed, we have avoided this problem by the use of an age symbol data dictionary not dependent on fonts (appendix 2). Using this data dictionary, Triassic is coded as "TR" and therefore the unit label for a Triassic granite, \mathbb{R} gr, would be entered in the units table map_sym1 field as TRgr.

Table 8. STUNITS table field definitions. The Field column also indicates the requirement of the compiler for populating the field: mandatory (must be filled in), mandatory if (must be filled in if information available), optional (not required), and auto generated (automatically filled in script in the FileMaker database form used to compile the information). This scheme was also applied to the other supplemental tables.

Field	Explanation	Field Type	Data Dictionary
state (mandatory)	Two letter state code (e.g. NM - New Mexico).	Text, restricted value list	Appendix 1
map_ref (mandatory)	Reference id (<i>ref_id</i>) code for the state map being coded (e.g. NM001) from the STREF table.	Text	
unit_ref (mandatory if)	List of reference id codes (<i>ref_id</i>) from the references table (STREF) for sources used to compile a particular unit other than the map_ref above (<i>ref_id</i> s separated by carriage returns if more than one)	Text	
orig_label (mandatory)	Map unit label from the original digital source.	Text	

map_sym1 (mandatory)	Original map unit label as given in the source, having age part of map symbol assigned from the "Standard Age Symbol" data dictionary.	Text	Appendix 2
map_sym2 (auto generated)	Automatically generated, derived by combining <i>map_sym1</i> , a semicolon, and the <i>prov_no</i> (e.g. TRrb;0). This generates a unique map symbol for each province. Prov_no = 0 for all Central States. (Same field as <i>sgmc_label</i> in PAT).	Text	
unit_link (auto generated)	Automatically generated, combining the <i>state</i> code and <i>map_sym2</i> (e.g. NMTRrb;0). This creates a unique code for every unit in the CONUS databases. Linking field (primary key) between supplemental tables and PAT.	Text	
unit_name (mandatory)	The name of the map unit as given on the source map.	Text	
prov_no (mandatory if)	Some state geologic maps are subdivided into regions or provinces (e.g. Carolina Slate Belt, Northwestern Plateau, etc.). Provincial coding was used only in a few eastern states where units had the same map symbol for multiple provinces but different unit description for each province. Province numbers (e.g. 1, 2, 3) were arbitrarily assigned by the unit compiler. If provincial coding is not done, a zero is entered for the province number.	Number	
province (mandatory if)	Name of the province as given on the map (e.g. Carolina Slate Belt).	Text	
strat_unit (mandatory if)	Additional stratigraphic unit information about the map unit.	Text	
unit_age (mandatory if)	Free form field for unit age description (e.g. "Cretaceous", or "Permian to Cretaceous"; or "Permian-Cretaceous, and Miocene"). Generally from the source map or as inferred from the map correlation chart, or other referenced sources. Stated oldest to youngest.	Text	

unitdesc (mandatory if)	The unit description as given on the source map.	Text	
unit_com (optional)	Free form field for additional information about the unit or to document an action taken by a compiler.	Text	
rocktype1 (mandatory)	Single most abundant (dominant) lithology of the unit as best inferred by the complier. Does not imply any minimum percentage of abundance.	Text, restricted value list	
rocktype2 (mandatory_if)	Second most abundant lithology of the unit.	Text, restricted value list	Appendix 6
rocktype3 (mandatory_if)	All other lithologies of the unit, semicolon separated	Text, restricted value list	

Age Table (STAGE)

The STAGE table (table 9) record text and numerical minimum and maximum ages (Ma) for each map unit. This table has a one-to-one relationship with the units table. The names used to populate fields in these tables are assigned using the Age data dictionary (Appendix 3), derived from Palmer (1983) to assign maximum and minimum ages to geologic units. The database software is scripted to create fields that have the full hierarchy of the minimum and maximum ages of the unit, allowing searches based on any part of the time scale. For example, searches could be for units that are at least Paleozoic but no older than Devonian. Because minimum and maximum numeric ages are automatically populated in the databases, the table can also be searched based on numeric maximum and minimum ages.

The age_type field shows whether the age of the unit is based on stratigraphic or fossil control or based on radiometric dating. Only two values are allowed in this field. Relative is used if the unit is simply assigned an age or range based on stratigraphic position (e.g. late Triassic or late Triassic to early Cretaceous). If a map unit's age is within with a single time unit, e.g. late Triassic, then that is used for both maximum and minimum. Relative coding was used for most map units. Absolute is used where age determination information is available. Absolute age information, if available, was manually entered into the tables, overriding the automatically populated field entry. Potentially, if a user chooses to use a different time scale, in converting from our time scale, the user could use this field to determine whether to shift the text age term or the numeric age term (Ma) for each unit.

The comments field (*age_com*) can be used to document methodology, referencing, etc. (e.g. "U/Pb zircon ischron age, reference NV012"). If more than one determination is present, the overall interpreted age was used.

Table 9. STAGE table field definitions

Field name	Information type	Field type	Data dictionary
unit_link	Same definition as units table	Text	UNITS
min_eon min_era min_period min_epoch min_age (mandatory if)	The minimum or youngest age assignment for the map unit.	Text,restricted value list	Appendix 3
full_min (auto generated)	Automatically generated field that concatenates all of the input from the minimum fields into a single field.	Text, auto entry	
max_eon max_era max_period max_epoch max_age (mandatory if)	The maximum or oldest age assignment for the map unit.	Text, restricted value list	Appendix 3
full_max (auto generated)	Automatically generated field that concatenates all of the input from the maximum fields into a single field.	Text, auto entry	
age_type (mandatory if)	Only two choices: "Relative" and "Absolute" (see text for explanation).	Text, restricted value list	See explanation at left
cmin_age cmax_age (auto generated)	The lowest level geochronologic unit entered from maximum and minimum fields above.	Text, auto entry	
min_Ma max_Ma (auto generated)	Numerical age for the top of the youngest geochronologic unit age and bottom of the oldest. Values automatically entered from the geochronologic data dictionary, unless compler manually entered values.	Number, auto entry	Appendix 3
age_com (optional)	Field for any additional comments about age information.	Text	

Lithology Table (STLITH)

The lithologic information contained in the legend of state geologic maps is highly variable and, for some maps, this information is lacking. Where lithologic information was inadequate, lithologic information was obtained by literature research. The compilers of this information conducted literature research adequate to generalize the lithology of a map unit. The lithologic compilation does not provide information about distribution of lithologies within mapped units or lithologies present at any particular point within a unit.

The STLITH table (table 10) contains a record for each rock type that was identified as being present within a map unit, therefore there will be one or more lithologies compiled for each map unit. Five hierarchical fields are used to compile each lithology (lith1 lith5). The lith1 field contains the general class of the lithology with increasing specificity for that class down through the lithology class levels as specified by the lithology data dictionary (appendix 4). Another field, totallith, concatenates the lithology fields to assist in searching for units having particular lithologies, without the user having to know where that term appears in the hierarchy.

The lith_form field is used to assign an additional modifier to the lithology terms. The lithologic level fields (lith1-lith5) describe each lithology in terms of its composition (e.g. rhyolite), whereas, lith_form describes various aspects, such as form (e.g. tuff), of the lithology using the Lithform Data Dictionary (appendix 5).

The relative volumetric importance of the lithology is assigned in the *lith_rank* field. Four rank categories were used: "Major" (greater than or equal to 33 percent), "Minor" (between 10 and 33 percent), "Incidental" (between 0 and 10 percent) and "Indeterminate." Because our sources rarely provide abundance information about a lithology, the compiler of the record estimated from the unit information available which category to assign each lithology, including, if necessary, the indeterminate category. The term major is added to this field to ensure that searches for units having a particular major lithology will not be overlooked because the particular lithology was coded as indeterminate.

Table 10. STLITH table field definitions

Field	Explanation	Field type	Data Dictionary
unit_link (mandatory)	As defined in UNITS table.	Text	
lith1 lith2 lith3 lith4 lith5 (mandatory)	A hierarchical classification of the lithology. Each contents of each field depends on the next higher field contents (e.g. if "Sedimentary" is selected at <i>lith1</i> only sedimentary lithologic terms can be selected for <i>lith2</i> . Coding completed to the lowest level required to code a specific lithology.	Text, restricted value list	Appendix 4
total_lith (auto generated)	A text string that combines all of the coding from <i>lith1</i> to <i>lith5</i> . This string allows searches based on any aspect of the lithologic hierarchy.	Text, autogenerated	
lith_form (mandatory if)	Derived from a list of terms that modify the lithologic name. Values available dependent on choice for <i>lith1</i> field.	Text, restricted value list	Appendix 5

lith_rank (mandatory)	Relative volumetric importance of the lithology ranked by one of four categories as estimated by complier:			
	<i>Major</i> - ≥33 1/3 %	Text,		
	<i>Minor</i> - 10 – 33 1/3%	restricted value list	See explanation at left	
	Incidental - <10%			
	Indeterminate – information doesn't allow compiler to estimate rank of the lithology			
low_lith (auto generated)	Auto generated field showing the hierarchically lowest level lithology coded.			
lith_com	Free form comment field.			
(optional)				

REFERENCE TABLES (STREF and STREF-LINK)

The STREF table (table 11) serves dual purposes: (1) it contains the citations for reference sources used in compiling the supplemental tables, and (2) contains citations for the *source* field of the spatial databases attribute tables (fig. 1).

The state databases use two reference tables to provide source references for the geologic map and the literature used to compile and code the attribute tables. The first is a linking table (STREF-LINK, table 12) that links the primary reference table (STREF) to the supplemental attribute tables (fig. 1) and the geology PAT. This data structure was used because there is a one-to-many relationship between the *unit_link* field and the references because more than one reference may have been used to code a single unit. The STUNITS table contains two reference fields, *map_ref* and *unit_ref*, which contain the reference code for the source map and the codes for the references used to code the unit, respectively. Each reference in the table has a unique identifier (*ref_id*). The second reference table, STREF-LINK links the *reference* from the STREF table through the *ref_id* to the UNITS table through the *unit_link* field. This relate table is used because of the potential one-to-many relationship between a record in the UNITS table and references.

The reference for the primary source map will generally the first reference in the table (i.e. ST001 where ST represents the state abbreviation). If it was possible to completely compile the supplemental attribute tables from the legend of a state sourcemap, then there is only one unit reference for that state. However, in many cases, there are additional references used to code the individual map units.

Table 11. STREF table field definitions

Field name	Information type	Field Type
ref_id (mandatory)	The unique code assigned to each reference in the table. Format: 2 letter state abbreviation and a 3 digit number (e.g. NV001).	Text and number; unique values
Reference (mandatory)	The reference citation in standard USGS format	Text

Table 12. STREF-LINK table field definitions.

Field	Explanation	Field Type
unit_link (mandatory)	Same as STUNITS table.	Text
ref_id (mandatory)	Identifying code for each reference	Text

APPENDICES: DATA DICTIONARIES

Construction of databases typically necessitates the development of a "language" for storing information in succinct terms. As used here a "data dictionary" is a table of values that define the allowable content of a database field (for example, a table of permitted lithologic terms). We have developed data dictionaries for age, lithology, and line coding (appendices 3 to 7). These data dictionaries are not intended to be comprehensive classification schemes, and only contain the terminology we needed to compile the information of the state geologic maps.

APPENDIX 1. STATE ABBREVIATIONS

State	Code	State	Code
Alabama	AL	Montana	MT
Alaska	AK	Nebraska	NE
Arizona	AZ	Nevada	NV
Arkansas	AR	New Hampshire	NH
California	CA	New Jersey	NJ
Colorado	CO	New Mexico	NM
Connecticut	СТ	New York	NY
Delaware	DE	North Carolina	NC
Florida	FL	North Dakota	ND
Georgia	GA	Ohio	ОН
Hawaii	HI	Oklahoma	OK
Idaho	ID	Oregon	OR
Illinois	IL	Pennsylvania	PA

APPENDIX 2. STANDARD AGE SYMBOLS

The following codes are to used for source map unit age symbols in the *map_sym1* field of the UNITS table, e.g. a Triassic granite unit which has special symbol on the source map for Triassic + gr, would coded in the *map_sym1* field as TRgr. These symbols used standard letter characters in order to avoid using special fonts that display the symbol properly but may not be available to a user and to avoid the use of special fonts or characters in the geology PAT. As much as possible follows symbolization from USGS Suggestions to Authors 7th Edition (Hansen, 1991, p. 59).

Standard symbol	Footnote	Time Unit
PH	a	Phanerozoic
CZ	b	Cenozoic
Q	b	Quaternary
Н	a	Holocene/recent
PS	a	Pleistocene
T	b	Tertiary
N	b	Neogene
PE	b	Paleogene
PO	a	Pliocene
MI	a	Miocene
OG	a	Oligocene
EO	a	Eocene
PN	a	Paleocene
MZ	b	Mesozoic
K	b	Cretaceous
J	b	Jurassic
TR	a	Triassic
PZ	b	Paleozoic
P	b	Permian
С	b	Carboniferous
PA	a	Pennsylvanian
M	b	Mississippian
D	b	Devonian

S	b	Silurian
О	ь	Ordovician
CA	a	Cambrian
pCA	С	Precambrian
PR	a	Proterozoic
Z	b	Late Proterozoic (570-900 Ma)
Y	b	Middle Proterozoic (900-1600 Ma)
Y3	d	Late Middle Proterozoic (900-1200 Ma)
Y2	d	Middle Middle Proterozoic (1200-1400 Ma)
Y1	d	Early Middle Proterozoic (1400-1600 Ma)
X	b	Early Proterozoic (1600-2500 Ma)
Х3	d	Late Early Proterozoic (1600-1800 Ma)
X2	d	Middle Early Proterozoic (1800-2100 Ma)
X1	d	Early Early Proterozoic (2100-2500 Ma)
A	b	Archean (2500-3800 Ma)
W	b	Late Archean (2500-3000 Ma)
V	b	Middle Archean (3000-3400 Ma)
U	b	Early Archean (3400-3800 Ma)

Footnotes:

- a. As defined by here, no symbol for this in Suggestion to Authors 7th. Ed.
- b. Follows USGS Suggestions to Authors 7th Edition (Hansen, 1991, p. 59)
- c. Lower base "p" can be used for pre- (e.g. Pre-Jurassic unit = pJ)
- d. Subdivisions of the Middle and Early Proterozoic that have been accepted by the USGS, but are not shown in USGS Suggestions to Authors 7^{th} Edition . These subdivisions are also shown in the Precambrian time scale figure caption on p. 7 of Reed and others (1993). Note that in Reed and others these subdivisions are superscripted, e.g. Y^3 .

APPENDIX 3. GEOCHRONOLOGIC TIME SCALE DATA DICTIONARY (AGELIST)

The age data dictionary used is presented in the table below. There is no universally accepted and standard geologic time scale, and many proposed time scales exist. Wilson (2001) compiled data for a number of available time scales. We chose the Geological Society of America DNAG time scale (Palmer, 1983) which we modified by adding additional sub-divisions in the Proterozoic as accepted by the USGS Geologic Names Committee. Most of the geologic maps included in this National database were created over the last four decades and reflect the particular time scale selected by the authors at that time. In the past 10 years, considerable refinement of the time scale has resulted from study of critical boundaries using new techniques and high-precision dating methods (International Commission on Stratigraphy, 2003); however, the source maps in this database were most likely compiled using a time scale akin to Palmer (1983).

The age unit scheme used here is not completely hierarchical because geochronologic nomenclature has not been used in a consistent manner over time; thus some adjustments were made to account for this. For example, the Tertiary, Neogene, and Paleogene are all treated as periods even though the later two are subdivisions of the Tertiary; the same situation exists for the Carboniferous, with respect to Pennsylvanian and Mississippian. Both forms appear in the period fields of the database (i.e. Tertiary, Tertiary-Neogene, and Tertiary-Paleogene; Carboniferous, Carboniferous-Pennsylvanian, and Carboniferous-Pennsylvanian). Also note that the term "preCambrian" is not a formal part of any scheme, but because it's so commonly used, we have inserted it in the scheme at the eon level.

Numerical values (Ma) for the boundaries between the geochronologic age units are also included in the age data dictionary and are derived from Palmer (1983). This numeric coding was provided to allow for queries (e.g. "show all stratigraphic units with ages between 570 to 64.4 Ma"), without having to enter all of the age unit names. Although the numeric values used here may no longer reflect currently accepted values, their intended primary use is for queries that span multiple age units (e.g. the above example query would yield all map stratigraphic units between the start of the Cambrian and the end of the Cretaceous). As these numeric boundaries vary between different geologic time scales, a user may wish to supplement the scheme by adding their own values. To assist in this, a field has been added to indicate if a map unit's age assignment is relative, (e.g., based on stratigraphic position), or is absolute (i.e. based on radiometric age determination).

Eon	Era	Period	Epoch	Age	Minimum	Maximum
					Ma	Ma
Phanerozoic					0	570
Phanerozoic	Cenozoic				0	66.4

APPENDIX 4. LITHOLOGIC DATA DICTIONARY (LITHLIST)

This data dictionary was used to populate the lithology fields of the STLITH supplemental attribute table. The LITHLIST data dictionary is a hierarchical list of common rock and unconsolidated deposit names derived from common usage. It is not a comprehensive classification but rather was created by starting with a short list of common lithology terms and adding additional terms to the data dictionary as required to support the compilation. Lithologic classification of map units is a difficult issue and the reader is directed to the work of the North American Geologic-map Data Model Science Language Technical Team, (2004, Introduction, Section 3.2.1, p.15-16).

APPENDIX 5. LITHFORM DATA DICTIONARY

The LITHFORM dictionary is not restricted to terms describing form but is a way to convey additional information (modifiers) about the lithologies in a map unit. It includes terms like bed, pluton, and dike, but also terms like pyroclastic (for application to volcanic rocks), greenschist (facies information for application to metamorphic rocks), and deltaic (depositional environment information for application to sedimentary rocks). Thus rhyolite lava flows and rhyolite ash-flow tuffs are two different lithologies, as are greenschist-facies schist and amphibolite-facies schist. Like our lithology data dictionary (Appendix 4) it is not comprehensive, and was created by defining a short list of terms and adding additional terms as needed.

APPENDIX 6. LITHCLASS 6.1 LITHOLOGIC DATA DICTIONARY

This data dictionary was used to compile the contents of the *rocktype1*, *rocktype2*, and *rocktype3* fields of the STUNITS supplemental attribute table. The data dictionary used is the Geologic Map Unit Classification, version 6.1 that was developed as a lithologic data dictionary for a prototype national geologic map data model (Johnson, 2002). This lithologic coding will be used for the creation of a conterminous United States dominant lithology map.

This hierarchical dictionary uses a single term to describe lithology and contains compositional and other terms that allow the representation of lithologic information with a single variable. We have added three new terms (water, ice, and indeterminate) at the end of the dictionary that were required to ensure that we could attribute all geology cover polygons. The dictionary contains hierarchical numbering which is not used in our compilation but was retained to make the hierarchical level easy to determine.

The dictionary has not been formally published, but is available online at the web link below and the reader is referred there for details.

http://www.nadm-geo.org/dmdt/pdf/lithclass61.pdf

1. unconsolidated deposit

- 1. alluvium
 - 1.1.1. flood plain
 - 1.1.2. levee
 - 1.1.3. delta
 - 1.1.4. alluvial fan
 - 1.1.5. alluvial terrace
- 1.2. lake or marine deposit (non-glacial)
 - 1.2.1. playa
 - 1.2.2. mud flat
 - 1.2.3. beach sand
 - 1.2.4. terrace
- 1.3. eolian
 - 1.3.1. dune sand
 - 1.3.2. sand sheet
 - 1.3.3. loess
- 1.4. volcanic ash
- 1.5. mass wasting
 - 1.5.1. colluvium

- 1.5.2. mudflow
 - 1.5.2.1. lahar
- 1.5.3. debris flow
- 1.5.4. landslide
- 1.5.5. talus
- 1.6. glacial drift
 - 1.6.1. till
 - 1.6.1.1. moraine
 - 1.6.2. stratified glacial sediment
 - 1.6.2.1. outwash
 - 1.6.2.2. sub- and supra-glacial sediment
 - 1.6.2.3. glaciolacustrine
 - 1.6.2.4. glacial-marine
- 1.7. biogenic sediment
 - 1.7.1. peat
 - 1.7.2. coral
- 1.8. residuum
- 1.9. clay or mud
- 1.10. silt
- 1.11. sand
- 1.12. gravel

2. sedimentary rock

- 2.1. clastic
 - 2.1.1. mudstone
 - 2.1.1.1. claystone
 - 2.1.1.1.1 bentonite
 - 2.1.1.2. shale
 - 2.1.1.2.1. black shale
 - 2.1.1.2.2. oil shale
 - 2.1.1.3. argillite
 - 2.1.1.4. siltstone
 - 2.1.2. fine-grained mixed clastic
 - 2.1.3. sandstone
 - 2.1.3.1. arenite
 - 2.1.3.1.1. orthoquartzite
 - 2.1.3.1.2. calcarenite
 - 2.1.3.2. arkose

2.1.3.3. wacke

2.1.3.3.1. greywacke

- 2.1.4. medium-grained mixed clastic
- 2.1.5. conglomerate
- 2.1.6. sedimentary breccia
- 2.1.7. coarse-grained mixed clastic
- 2.1.8. olistostrome
 - 2.1.8.1. mélange
- 2.2. carbonate
 - 2.2.1. limestone
 - 2.2.2. dolostone (dolomite)
- 2.3. mixed clastic/carbonate
- 2.4. mixed clastic/volcanic
- 2.5. phosphorite
- 2.6. chemical
 - 2.6.1. evaporite
 - 2.6.2. chert
 - 2.6.3. novaculite
 - 2.6.4. iron formation
 - 2.6.5. exhalite
- 2.7. coal
- 2.8. mixed clastic/coal

3. volcanic rock (aphanitic)

- 3.1. glassy volcanic rock
 - 3.1.1. obsidian
 - 3.1.2. vitrophyre
 - 3.1.3. pumice
- 3.2. pyroclastic
 - 3.2.1. tuff
 - 3.2.1.1. welded tuff
 - 3.2.1.2. ash-flow tuff
 - 3.2.2. ignimbrite
 - 3.2.3. volcanic breccia (agglomerate)
- 3.3. lava flow
 - 3.3.1. bimodal suite
- 3.4. felsic volcanic rock
 - 3.4.1. alkali rhyolite

- 3.4.2. rhyolite
- 3.4.3. rhyodacite
- 3.4.4. dacite
- 3.4.5. alkali trachyte
- 3.4.6. trachyte
- 3.4.7. quartz latite
- 3.4.8. latite
- 3.5. intermediate volcanic rock
 - 3.5.1. trachyandesite
 - 3.5.2. andesite
- 3.6. mafic volcanic rock
 - 3.6.1. trachybasalt
 - 3.6.2. basalt
 - 3.6.2.1. tholeiite
 - 3.6.2.2. hawaiite
 - 3.6.2.3. alkaline basalt
- 3.7. alkalic volcanic rock
 - 3.7.1. phonolite
 - 3.7.2. tephrite (basanite)
- 3.8. ultramafitite (komatiite)
- 3.9. volcanic carbonatite

4. plutonic rock (phaneritic)

- 4.1. aplite
- 4.2. porphyry
 - 4.2.1. lamprophyre
- 4.3. pegmatite
- 4.4. granitoid
 - 4.4.1. alkali-granite (alaskite)
 - 4.4.2. granite
 - 4.4.2.1. peraluminous granite
 - 4.4.2.2. metaluminous granite
 - 4.4.2.3. subaluminous granite
 - 4.4.2.4. peralkaline granite
 - 4.4.3. granodiorite
 - 4.4.4. tonalite
 - 4.4.4.1. trondhjemite
 - 4.4.5. alkali syenite

- 4.4.6. quartz syenite
- 4.4.7. syenite
- 4.4.8. quartz monzonite
- 4.4.9. monzonite
- 4.4.10. quartz monzodiorite
- 4.4.11. monzodiorite
- 4.4.12. quartz diorite
- 4.4.13. diorite
 - 4.4.13.1. diabase
- 4.5. gabbroid
 - 4.5.1. quartz monzogabbro
 - 4.5.2. monzogabbro
 - 4.5.3. quartz gabbro
 - 4.5.4. gabbro
 - 4.5.4.1. norite
 - 4.5.4.2. troctolite
 - 4.5.5. anorthosite
- 4.6. alkalic intrusive rock
 - 4.6.1. nepheline syenite
- 4.7. ultramafic intrusive rock
 - 4.7.1. peridotite
 - 4.7.1.1. dunite
 - 4.7.1.2. kimberlite
 - 4.7.2. pyroxenite
 - 4.7.3. hornblendite
- 4.8. intrusive carbonatite

5. metamorphic rock

- 5.1. hornfels
- 5.2. metasedimentary rock
 - 5.2.1. meta-argillite
 - 5.2.2. slate
 - 5.2.3. quartzite
 - 5.2.4. meta-conglomerate
 - 5.2.5. marble
- 5.3. metavolcanic rock
 - 5.3.1. felsic metavolcanic rock
 - 5.3.1.1. meta-rhyolite

- 5.3.1.2. keratophyre
- 5.3.2. intermediate metavolcanic rock
- 5.3.3. mafic metavolcanic rock
 - 5.3.3.1. meta-basalt
 - 5.3.3.2. spilite
 - 5.3.3.3. greenstone
- 5.4. phyllite
- 5.5. schist
 - 5.5.1. greenschist
 - 5.5.2. blueschist
 - 5.5.3. mica schist
 - 5.5.4. pelitic schist
 - 5.5.5. quartz-feldspar schist
 - 5.5.6. calc-silicate schist
 - 5.5.7. amphibole schist
- 5.6. granofels
- 5.7. gneiss
 - 5.7.1. felsic gneiss
 - 5.7.1.1. granitic gneiss
 - 5.7.1.1.1. biotite gneiss
 - 5.7.2. mafic gneiss
 - 5.7.3. orthogneiss
 - 5.7.4. paragneiss
 - 5.7.5. migmatite
- 5.8. amphibolite
- 5.9. granulite
- 5.10. eclogite
- 5.11. greisen
- 5.12. skarn (tactite)
- 5.13. calc-silicate rock
- 5.14. serpentinite

6. tectonite

- 6.1.1. tectonic mélange
- 6.1.2. tectonic breccia
- 6.1.3. cataclasite
- 6.1.4. phyllonite
- 6.1.5. mylonite

- 6.1.6. flaser gneiss
- 6.1.7. augen gneiss
- 7. water
- 8. ice
- 9. indeterminate

APPENDIX 7. ARC (LINE) CODING DATA DICTIONARY

The table below is the data dictionary used for arcs (lines) in the geologic map and other associated line and network coverages. ARC-CODE designates the line or arc type in the coverages.

ARC-CODE	DESCRIPTION
	CONTACTS
1	contact, location certain
2	contact, location approximate
3	contact, location inferred, queried
51	contact, concealed
18	Internal contact
19	Internal contact having tics on right from origin
8	Internal contact or phase change; no symbol (not drawn)
9	Boundary of altered zone or hornfels; no symbol (not drawn)
130	Pinch out; where unit is too narrow to map as a polygon on the source map and has been represented as a line
FAULTS - GENERAL	
30	Fault, sense of displacement unknown or undefined, location certain
31	Fault, sense of displacement unknown or undefined, location approximate
32	Fault, sense of displacement unknown or undefined, location inferred or
	queried
100	Fault, sense of displacement unknown or undefined, concealed
	NORMAL FAULTS
4	Normal fault, location certain, digitized with upthrown side on the right (code
	of 1 added to ARC-PARA1 where U/D is designated in source)
5	Normal fault, location approximate, digitized with upthrown side on the right
	(code of 1 added to ARC-PARA1 where U/D is designated in source)
6	Normal fault, location inferred, queried, digitized with upthrown side on the
	right (code of 1 added to ARC-PARA1 where U/D is designated in source)
71	Normal fault, location certain, having right lateral oblique slip.
72	Normal fault, location approx., having right lateral oblique slip.
73	Normal fault, location certain, having left lateral oblique slip.
74	Normal fault, location approx., having left lateral oblique slip.
75	Normal fault, location inferred, queried, having left lateral oblique slip.
76	Normal fault, location inferred, queried, having right lateral oblique slip.
52	Normal fault, concealed
55	Normal fault, having right lateral oblique slip, concealed
56	Normal fault, having left lateral oblique slip, concealed.
THRUST FAULTS	
10	Thrust fault, location certain, teeth on right from origin (angle of thrusting
	added to ARC-PARA1 where designated in source)

11	Thrust fault, location approximate, teeth on right from origin (angle of thrusting added to ARC-PARA1 where designated in source)	
12	Thrust fault, location inferred, queried, teeth on right from origin (angle of	
12	thrusting added to ARC-PARA1 where designated in source)	
16	Thrust fault, having left lateral oblique slip (angle of thrusting added to ARC-PARA1 where designated in source)	
17	Thrust fault, having right lateral oblique slip (angle of thrusting added to	
1 /	ARC-PARA1 where designated in source)	
53	Thrust fault, concealed	
101	Thrust fault, direction of motion undefined (i.e. teeth not shown), location	
	certain	
102	Thrust fault, direction of motion undefined (i.e. teeth not shown), location approximate	
103	Thrust fault, direction of motion undefined (i.e. teeth not shown), location	
	inferred	
104	Thrust fault, direction of motion undefined (i.e. teeth no shown), location	
	concealed	
105	Thrust fault, reactivated with normal motion, location certain	
106	Thrust fault, reactivated with normal motion, location approximate	
107	Thrust fault, reactivated with normal motion, location inferred	
108	Thrust fault, reactivated with normal motion, location approximate	
	DETACHMENT FAULTS	
109	Detachment fault, location certain	
110	Detachment fault, location approximate	
111	Detachment fault, location inferred	
112	Detachment fault, location concealed	
112	HIGH-ANGLE FAULTS	
35	High-angle reverse fault, location certain, teeth on right from origin (angle of	
33	thrusting added to ARC-PARA1 where designated in source)	
36	High-angle reverse fault, location approximate, teeth on right from origin	
30	(angle of thrusting added to ARC-PARA1 where designated in source)	
37	High-angle reverse fault, location inferred, teeth on right from origin (angle of	
37	thrusting added to ARC-PARA1 where designated in source)	
54	High-angle reverse fault, concealed	
34	RIGHT-LEFT LATERAL FAULTS	
113	Strike slip fault, motion unknown, location certain	
114	Strike slip fault, motion unknown, location approximate	
115	Strike slip fault, motion unknown, location inferred	
116	Strike slip fault, motion unknown, location concealed	
87	Right lateral fault, location certain	
88	Right lateral fault, location approximate	
89	Right lateral fault, location inferred, queried.	
57	Right lateral fault, concealed	
90	Left lateral fault, location certain.	
91	Left lateral fault, location approximate.	
92	Left lateral fault, location inferred, queried	
58	Left lateral fault, concealed	
	SHEAR ZONES & FISSURES	
94	Shear zone, certain	
95	Shear zone, approximate	
96	Shear zone, inferred	
59	Shear zone, concealed	
69	Fissures
