

## Liver-Spleen Scan

*You are scheduled for a liver-spleen scan. This scan helps your doctor study the structure and function of your liver. It is a safe, effective, and painless way to obtain a picture (similar to an x-ray) of your liver and spleen. The scan uses a compound containing a small amount of radioactive material. The compound is used only for diagnostic purposes. The scan takes place in the Nuclear Medicine Department.*

**Preparation:** There is no preparation. You may eat or drink whatever you like before the scan.

**Procedure:**

- A small amount of radioactive compound will be given to you by vein. You will feel a pinprick as this injection is given.
- Pictures will be taken of your mid-abdomen with a very sensitive machine (gamma camera). This camera detects the how your liver and spleen take up the compound.
- Stay very still while the pictures are being taken.
- The procedure lasts about 1 hour.

There should be no adverse effects. Your body rids itself of the compound as it does the food you eat.

**After the Procedure:** If you have questions about the procedure, please ask. Your nurse and doctor are ready to assist you at all times.

**Special Instructions:**

- Because it uses radioactivity, this scan is not performed in pregnant women. *If you are pregnant or think you might be pregnant, please inform your doctor immediately so that a decision can be made about this study.*
- *Also, please inform your doctor immediately if you are breast-feeding.* Some scans can be performed in breast-feeding women if they are willing to stop breast-feeding for a while.
