

## Diagnostic Codes Used to Define Cohort

Disease Category	ICD-9 code	Description
Stroke	V57	BREATHING EXERCISES
Stroke	430	SUBARACHNOID HEMORRHAGE
Stroke	431	INTRACEREBRAL HEMORRHAGE
Stroke	432	INTRACRANIAL HEM NEC/NOS*
Stroke	4320	NONTRAUMATIC EXTRADURAL HEMORRHAGE
Stroke	4321	SUBDURAL HEMORRHAGE
Stroke	4329	UNSPECIFIED INTRACRANIAL HEMORRHAGE
Stroke	43301	OCCLUSION & STENOSIS OF BASILAR ARTERY, W/CEREBRAL INFARCTION
Stroke	43311	OCCLUSION & STENOSIS OF CAROTID ARTERY, W/ CEREBRAL INFARCTION
Stroke	43321	OCCLUSION & STENOSIS OF VERTEBRAL ARTERY, W/ CEREBRAL INFARCTION
Stroke	43331	OCCLUSION& STENOSIS OF MULTIPLE & BILATERAL ARTERIES, W/ CEREBRAL INF
Stroke	43381	OCCLUSION & STENOSIS OF OTHER SPECIFIED PRECEREBRAL ARTERY, W/ CEREBR
Stroke	43391	OCCLUSION & STENOSIS OF UNSPECIFIED PRECEREBRAL ARTERY W/ CEREBRAL IN
Stroke	434	CEREBRAL ARTERY OCCLUS*
Stroke	4340	CEREBRAL THROMBOSIS
Stroke	43400	CEREBRAL THROMBOSIS W/O MENTION OF CEREBRAL INFARCTION
Stroke	43401	CEREBRAL THROMBOSIS W/ CEREBRAL INFARCTION
Stroke	4341	CEREBRAL EMBOLISM
Stroke	43410	CEREBRAL EMBOLISM W/O MENTION OF CEREBRAL INFARCTION
Stroke	43411	CEREBRAL EMBOLISM W/ CEREBRAL INFARCTION
Stroke	4349	CEREBRAL ARTERY OCCLUSION, UNSPECIFIED
Stroke	43490	CEREBRAL ARTERY OCCLUSION, UNSPECIFIED, W/O MENTION OF CEREBRAL INFAR
Stroke	43491	CEREBRAL ARTERY OCCLUSION, UNSPECIFIED, W/ CEREBRAL INFARCTION
Stroke	436	ACUTE, BUT ILL-DEFINED, CEREBROVASCULAR DISEASE

## Highlights

**Table 14.1**

### National Overview

In FY-2000, the VHA had over seventy thousand (73,094) patients with either a primary or secondary diagnostic code of one or more of the Stroke codes listed above. This number represents approximately nineteen percent (18.63%) of the total patient population during the fiscal year (Table 14.1). As with most patients seen in the VHA, the majority of patients were male (98%), with only 2% female.

The age distribution of Stroke patients shows that 2.57% were under the age of 45, 11.44% were aged 45-54, 17.39% were between the ages of 55-64, 35.6% were aged 65-74 and 33.01% were 75 years of age or older. The proportion of Stroke patients who were married was similar to the overall VA patient population, at about sixty percent nationally (57.95%). The “Means Test” categories show that about a third (31.78%) were Priority 1 - 3 (service-connected injured) veterans over one-half 57.3% were Priority 5 (low income).

### VISN Overview

The volume of patients with Stroke ranged from a high of 10,202 individuals in the South Central network (VISN 16) to a low of 874 in the Upper Midwest (VISN 13). One network had over three percent of their total patient population in this disease cohort: the South Central (VISN 16). The Ohio network (VISN 10) had the highest percentage of patients under the age of 45, with 3.72% in this age bracket. The Upstate New York network (VISN 2) had the largest proportion of patients in the over 75 age group with 40.99%.

**Table 14.2**

This table compares utilization by the Stroke **primary** diagnosis group for all conditions with utilization by all VA patients for all conditions. Note that for this table, only patients who had a primary diagnosis of Stroke were selected. If a patient had Stroke as a secondary diagnosis only, he/she is not included. Further, for our primary diagnosis Stroke group we examined all utilization that occurred during the fiscal year, both Stroke-specific and all other non-Stroke related medical care obtained.

As an example of what the data show and how to interpret the findings, examine the South Central network (VISN 16). In this particular network, 2.23% of the total patients seen at a VA facility in fiscal year 2000 had a primary diagnosis of Stroke. This group of patients accounted for 10.46% of the total bed-days of care in VISN 16, 8.63% of total discharges in VISN 16, and 4.05% of outpatient visits in VISN 4 made by all patients of VA health care services in the network for all medical conditions.

**Table 14.3**

Table 14.3 is similar to Table 14.2 except that patients who only had a **secondary** diagnosis of Stroke are examined rather than patients who had a primary diagnosis. This table compares utilization by the Stroke secondary diagnosis group for all health conditions they had during the year (i.e., includes both Stroke-specific utilization and utilization for all other non-Stroke care the patient may have received) with utilization by all VISN patients for all conditions.

Using the example of VISN 16, the data can be interpreted as follows: 1.23% of the patients in VISN 4 had at most a secondary

diagnosis of Stroke, but never a primary diagnosis. This group of patients accounted for 2.46% of the total bed-days of care, 2.27% of total discharges and 1.48% of outpatient visits utilized by all patients in the network for all conditions.

#### Table 14.4

Table 14.4 compares resource utilization specifically directed at treating Stroke. In other words, we examine the utilization for which the primary diagnosis (DXLSF) was a defining diagnosis for the Stroke, with utilization for all conditions by all patients in each network.

For example, in VISN 16 2.23% of the patients had some utilization for which the primary diagnosis was Stroke. Utilization specifically directed at treating the Stroke accounted for 2.38% of all bed-days of care, 1.76% of all discharges, and .48% of all outpatient visits.

#### Table 14.5

Table 14.5 combines the information from Tables 14.2 and 14.4, comparing utilization by the Stroke primary diagnosis group specifically directed at treating their condition with utilization by this same group for all conditions. For example, in VISN 16, 2.23% of the patients had some utilization for Stroke. These patients accounted for 47,506 bed-days of care in FY-2000, of which 10,834 or 22.81%, were utilized specifically for treating their Stroke (i.e., primary diagnosis (DXLSF) of Stroke). Similarly, 20.36% of the discharges for patients in the Stroke primary diagnosis group resulted from inpatient stays to treat their disease, and 11.98% of the

outpatient visits made by these patients were for specifically for the treatment of Stroke.

#### Costs

Cost data are reported for utilization of VA services by veteran VA users with Stroke are shown in Tables 14.6 and 14.7. Veterans with Stroke are identified by a Stroke diagnosis for at least one inpatient or outpatient service received. We separately report for veterans who had at least one primary diagnosis of Stroke and veterans whose only diagnoses of Stroke are secondary to another diagnosis. Costs are for VA utilization include inpatient, outpatient, and pharmacy services for all causes, not just for Stroke related use. That is, we report all VA costs for all causes for individuals identified as diabetics.

There were 77,550 individuals with at least one primary or secondary diagnosis of Stroke for whom cost data were available, and these costs averaged \$13,831 per veteran. Breaking these costs down by whether or not the veteran had at least one primary diagnosis of Stroke, we have an average cost of \$15,474 per veteran for those with at least one primary care diagnosis of Stroke and \$10,169 per veteran for those with only secondary diagnoses of veterans.

Focusing on those with at least one primary diagnosis of Stroke, the \$15,474 costs per veteran are distributed as follows: 45.35% are for inpatient medical/surgical services, 22.77% are for other inpatient services, 23.27% are for outpatient services, and 8.61% are for pharmaceutical services. Across VISNs, overall costs per veteran with a primary diagnosis of Stroke ranged from a low of \$11,638 in VISN 15 to a high of \$20,625 per veteran in VISN 13.

## For More Information

Disability affects over 49 million Americans; over 7 percent of these individuals have disability related to brain dysfunction or neurological diseases. Disability-related costs total more than \$170 billion per year and are expected to escalate with the aging of the population. The magnitude of the economic and social burden of disability related to diseases that affect the brain is exemplified by the number of acute stroke patients admitted to the Department of Veterans Affairs Medical Centers. Despite some recent advances in management of acute stroke (thrombolytic therapy) and brain trauma, there are not widely applicable therapies to reverse neurological damage. Therefore, it is essential that these patients receive the most appropriate rehabilitation care to enhance their recovery, minimize disability and improve quality of life. However, there are few studies that have evaluated the most cost-effective ways to organize and provide care or evaluate specific interventions to restore function and minimize disability.

Currently, there is not a Stroke QUERI, but Health Services Research and Development issued a request for applications to have one established in the near future. However, Stroke is the focus of the HSR&D/RR&D Center of Excellence in Gainesville, Florida. The Rehabilitation Outcomes Center (RORC) is directed by Pamela W. Duncan, Ph.D., an internationally and nationally known rehabilitation health services researcher. Researchers or other interested parties are encouraged to contact the RORC to learn more about VHA's current research foci and ongoing projects in the area of Stroke:

## Research Focus and Activities

RORC investigators are working on projects to:

- Examine population level effects of stroke rehabilitation services
- Evaluate the relationships between structure, process and outcomes of stroke rehabilitation
- Assess utilization of community-based nursing homes for rehabilitation
- Use VA databases to assess disability states and associated health care utilization patterns
- Develop new stroke-specific outcomes measures and assess different methods of acquiring outcomes data
- Describe stroke recovery and the influences of ethnic diversity
- Determine the appropriateness and cost-effectiveness of assistive technology for homebound veterans

A major focus of work is developing an Integrated Stroke Outcomes Database (ISOD) that links administrative and clinical data on stroke patients in VHA. This database will be a key resource for VA quality improvement initiatives, rational planning for rehabilitation services, research, and training and dissemination activities.

Some of the interesting projects ongoing at the RORC include:

- *Measuring Health Related Quality of Life of Veterans with Stroke*
- *Coordination of Hemiparetic Movement after Post-Stroke Rehabilitation*
- *Culturally Sensitive Models of Stroke Recovery and Caregiving After Discharge Home*
- *Optimal Locations for VA Traumatic Brain Injury Treatment Programs*
- *Constraint Induced Therapy: Patient and Caregiver Experiences*
- *Assessment of the National Prosthetics Patient Database: Preliminary Studies of Validity*
- *Developing Risk Adjustment Models for Stroke Rehabilitation Outcomes*
- *Low ADL Monitoring Program (LAMP). Combining Traditional and Advanced Technologies to Promote Independence for Veterans with Activities of Daily Living (ADL) Dependence.*
- *Development of SCI Mobility Measures: A Collaborative Effort*
- *Investigating Patient-Specific Cost Estimates for VA Rehabilitation Patients*
