

# Evaluation of LED and Broadband Sources

---

R. Timothy Hitchcock, CIH, CLSO  
LightRay Consulting, Inc.  
Cary, North Carolina

## Topics to be addressed ...

---

- ❑ Sources: types, applications & characteristics
- ❑ Basics: viewing angle, point vs. extended source, system of units
- ❑ Exposure guidelines
- ❑ Field measurement
- ❑ Numerical estimates

© LightRay Consulting, Inc.

# Sources

© LightRay Consulting, Inc.

# Source Characteristics

- ❑ Incoherent radiation
- ❑ Polychromatic
- ❑ Inhomogeneous spatial distribution
- ❑ Geometric optics
- ❑ Extended sources

© LightRay Consulting, Inc.

## Basics

---

- Planar & solid angles
- Viewing angle
- Point vs. extended source
- Units: Two Systems
  - Photometry
  - Radiometry

© LightRay Consulting, Inc.

## Basics: Planar & Solid Angles

---

- Planar angles
  - Metric – radian (rad), milliradian (mrad)
  - Used to describe angular subtense & viewing angle,  $\alpha$
- Solid angle,  $\Omega$ 
  - Metric – steradian (sr)
  - Used to describe spatial extent (size) of an object
- Both angles are mathematically unitless

© LightRay Consulting, Inc.

## Planar Angle Measurement

NOTE: angle is mathematically unitless; radian is assigned.

1 radian = 57.3°

$2\pi$  radians = 360°

1 rad = 1000 mrad

$$\theta = \frac{\text{arc length (S)}}{\text{radius (r)}} \text{ (radians)}$$

© LightRay Consulting, Inc.

## Solid Angle

- A measure of how “big” an object appears to an observer.
- Used in describing source brightness.
- Describes spatial emission characteristics of a source.

© LightRay Consulting, Inc.

## Angular Subtense – Viewing Angle

The angular size (subtense) of the flag pole depends on its distance from your eye.

For small angles, the angular subtense (in radians) of an object is the object's size (height) divided by its distance from the observer's eye.

© LightRay Consulting, Inc.

## ACGIH: Viewing Angle, $\alpha$

- Circular lamp
  - $\alpha = \text{lamp diameter} \div \text{viewing distance}$
  - $\alpha = d/r$
  
- Oblong lamp (mean dimension)
  - $\alpha = (\text{length} + \text{width}) \div (2 \times \text{viewing distance})$
  - $\alpha = (l+w)/2r$

© LightRay Consulting, Inc.

## Small Source vs. Extended Source

- ACGIH separates small and large sources at  $\alpha = 100$  mrad (0.1 rad) for thermal hazards
- ACGIH & ICNIRP define  $\alpha < 11$  mrad retinal photochemical limit for blue-light hazard – ACGIH & ICNIRP

© LightRay Consulting, Inc.

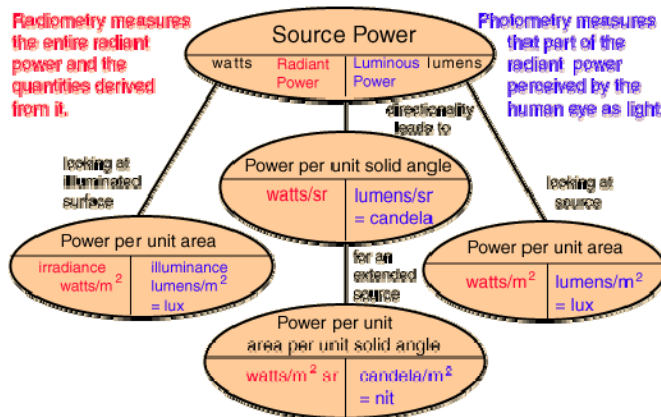

## Units: Two Systems of Measurement

- Photometry – adjusted for response of human eye to visible  $\lambda$
- Radiometry – physical measure of optical radiation

© LightRay Consulting, Inc.

# Relationship between Radiometry & Photometry Quantities

<http://hyperphysics.phy-astr.gsu.edu/hbase/vision/radphocon.html#c1>

© LightRay Consulting, Inc.

## Radiometric

## Photometric

Quantity	Unit	Quantity	Unit
Radiant energy, H	joule (J)	Luminous energy, Q <sub>v</sub>	lumen-s
Radiant power, Φ	watt (W)	Luminous power, F	lumen (lm)
Irradiance, E	W/m <sup>2</sup>	Illuminance, E <sub>v</sub>	lux (lx)
Radiant intensity, I	W/sr	Luminous intensity, I <sub>v</sub>	candela (cd)
Radiance, L	W/m <sup>2</sup> •sr	Luminance, L <sub>v</sub>	cd/m <sup>2</sup>

© LightRay Consulting, Inc.

## Conversion: Luminous & Radiant Power

- Use spectral luminous efficacy,  $V(\lambda)$ 
  - $V(\lambda)$  –from tables of standard luminosity data
- Use maximum spectral luminous efficacy,  $K_m$
- Photopic vision
  - $V(\lambda) = 1$  at 555 nm
  - $10^{-4} < V(\lambda) < 1$  at other  $\lambda$
  - $K_m = 683 \text{ lm/W}$  at 555 nm

© LightRay Consulting, Inc.

## Example

- Determine the equivalent luminous power for 15 W at 500 nm, where  $V(\lambda) = 0.3230$ .
- $F_\lambda = K_m V(\lambda) \Phi$
- $F_\lambda = 683 \text{ lumen/W} \times 0.323 \times 15 \text{ W}$
- $F_\lambda = 3309 \text{ lumens}$

© LightRay Consulting, Inc.

## If the quantity name ...

---

- is preceded by “spectral,” then it refers to a narrow band of wavelengths
  - e.g., spectral irradiance,  $\text{W}/\text{cm}^2\cdot\text{nm}$
  
- includes “effective,” then the quantity has been “weighted” (i.e., multiplied by) some function
  - e.g., effective irradiance,  $E_{\text{eff}}$ , weighted against some biological action spectrum

© LightRay Consulting, Inc.

## Exposure Guidelines

---

- American Conference of Governmental Industrial Hygienists (ACGIH)
  
- Illuminating Engineering Society of North America (ANSI / IESNA)
  
- International Commission on Nonionizing Radiation Protection (ICNIRP)

© LightRay Consulting, Inc.

## Specific Guidelines

- ❑ Broadband UVR
- ❑ UV-A (thermal & photochemical)
- ❑ Luminance
- ❑ Retinal thermal hazard
- ❑ Blue-light hazard
- ❑ Aphakic hazard
- ❑ Thermal hazard to cornea & lens
- ❑ IR-A (near IR) hazard where strong visual stimulus is absent

© LightRay Consulting, Inc.

## ACGIH TLVs: IOR (1)

Name	Metric	$\lambda$ (nm)	Hazard Function
Actinic UV	$E_{\text{eff}}$	180-400	$S(\lambda)$
UV-A	$E_{\text{UV}}$	320-400	----
Retinal thermal injury	$L_{\text{R}}$	380-1400	$R(\lambda)$
Retinal thermal injury ( $<0.01 \text{ cd/cm}^2$ )	$L_{\text{NIR}}$	770-1400	$R(\lambda)$
Cornea/lens thermal	$E_{\text{IR}}$	770-3000	----

IOR = incoherent optical radiation

© LightRay Consulting, Inc.

## ACGIH TLVs: IOR (2)

Name	Metric	$\lambda$ (nm)	Hazard Function
Blue light (ext. source)	$L_B$	305-700	$B(\lambda)$
Blue light (<11 mrad)	$E_B$	304-700	$B(\lambda)$
Blue light - aphakic	$L_B$	305-700	$A(\lambda)$
Blue light - aphakic	$E_B$	305-700	$A(\lambda)$

© LightRay Consulting, Inc.

## Viewing Angle, $\alpha = 11$ mrad

- Studies of welders with retinal lesions
- Angular subtense of welding arc
  - Dimension of lesion suggested 11 mrad
  - True angle was ~1 to 1.5 mrad
- Cause: saccadic eye movements

Ref.: How Stuff Works.com

© LightRay Consulting, Inc.

## Format of Exposure Limits: UVR

$$E_{\text{eff}} = \sum_{180}^{400} E_{\lambda} S(\lambda) \Delta\lambda$$

Where  $E_{\text{eff}}$  = effective irradiance relative 270 nm

$E_{\lambda}$  = spectral irradiance ( $\text{W}/\text{cm}^2 \cdot \text{nm}$ )

$S(\lambda)$  = relative spectral effectiveness (unitless)

$\Delta\lambda$  = bandwidth in nm

© LightRay Consulting, Inc.

## UVR Broadband Guideline

- Envelope guideline
- Smooth curve drawn to include threshold data for acute eye & skin effects
- Lowest at 270 nm

© LightRay Consulting, Inc.

## Format of Exposure Limits

Measured or  
calculated  
quantity

$$E_{\text{eff}} = \sum_{180}^{400} E_{\lambda} S(\lambda) \Delta\lambda$$

Bandwidth or  
calculation  
interval

Where  $E_{\text{eff}}$  = effective irradiance relative 270 nm

Hazard  
(weighting)  
function

$E_{\lambda}$  = spectral irradiance ( $\text{W}/\text{cm}^2 \cdot \text{nm}$ )

$S(\lambda)$  = relative spectral effectiveness (unitless)

$\Delta\lambda$  = bandwidth in nm

© LightRay Consulting, Inc.

## Other Examples

Blue-light radiance,  
large source

$$L_B = \sum_{305}^{700} L_{\lambda} B(\lambda) \Delta\lambda$$

Blue-light radiance,  
small source

$$E_B = \sum_{305}^{700} E_{\lambda} B(\lambda) \Delta\lambda$$

Retinal thermal injury

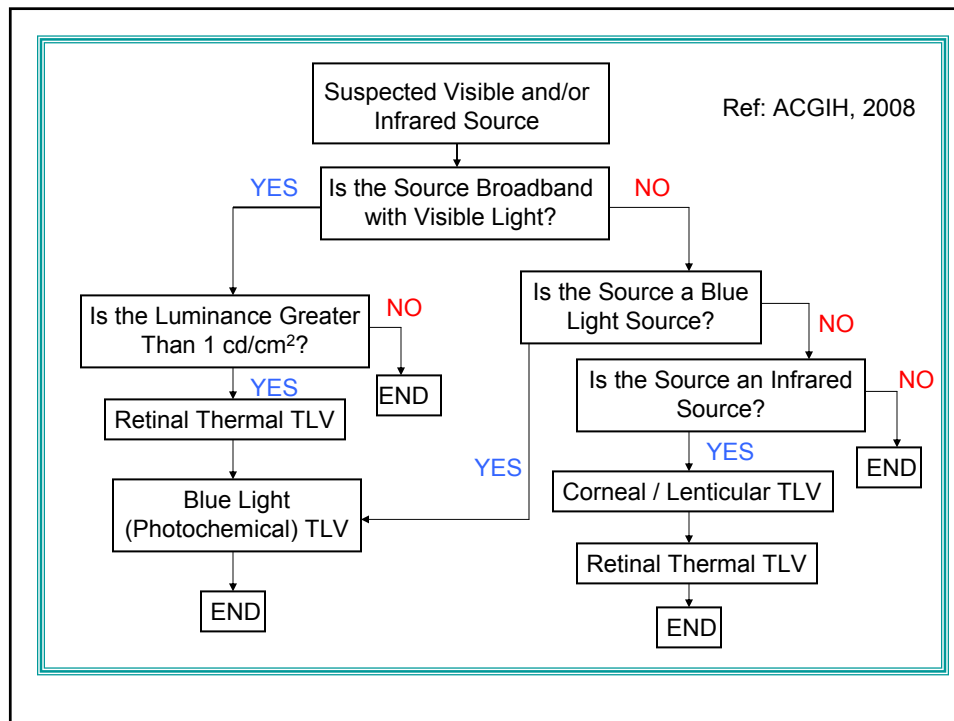

$$L_R = \sum_{380}^{1400} L_{\lambda} R(\lambda) \Delta\lambda$$

© LightRay Consulting, Inc.

## Exposure Evaluation: General Scope

- Wavelengths: 180 to 3000 nm
- Requires measurement if there is a strong visual stimulus
- Requires measurement if the source does not produce a strong visual stimulus but is
  - Rich in UV radiation (e.g., UVGI lamp)
  - Rich in IR radiation (e.g., IR heat lamp)

© LightRay Consulting, Inc.

## Hazard Evaluation

---

- Measurement
  - Primary method
  - Spectroradiometric methods
  - Radiometric methods
  
- Numerical estimates
  - Infrequently used

© LightRay Consulting, Inc.

## Evaluation: Spectral Content

---

- Emissions from lamps, arcs & blackbody sources may be quite broadband (UV, vis, IR)
  
- Lamps – spectral content from mfg. or meas.
  
- Few narrowband sources:
  - Low-pressure Hg-vapor lamps
  - LEDs

© LightRay Consulting, Inc.

## Field Instruments

- Radiometer – instrument used to detect and measure radiant energy or radiant power; usu. over a wide band of wavelengths

© LightRay Consulting, Inc.

## Detector & Input Optics

- Diffuser
- Weighting filter
- Photodiode detector

Note: Elements are threaded apart for easy observation.

© LightRay Consulting, Inc.

## UVR Broadband Guideline

- Envelope guideline
- Smooth curve drawn to include threshold data for acute eye & skin effects
- Lowest at 270 nm

© LightRay Consulting, Inc.

## Weighting Filters

- Attempt to match biological sensitivity factors such as  $S(\lambda)$ ,  $B(\lambda)$ , etc.

© LightRay Consulting, Inc.

## Instrument Companies

---

- International Light Technologies, Inc.
  - [www.intl-lighttech.com/](http://www.intl-lighttech.com/)
  
- Gigahertz-Optik, Inc.
  - [www.gigahertz-optik.com/database\\_en/html/index.html](http://www.gigahertz-optik.com/database_en/html/index.html)
  
- Solar Light
  - [www.solar.com/](http://www.solar.com/)

© LightRay Consulting, Inc.

## Emission vs. Exposure Measurements

---

- Emission meas.: fit the detector to tripod set near the source.
- Exposure meas.: detector is usu. hand held.
- Estimate distance between detector and source.

© LightRay Consulting, Inc.

## Evaluation: Field Measurements

© LightRay Consulting, Inc.

## Overexposures by Measurement and/or Reported Health Effects

- UV-A curing applications
  - Conveyorized and spot
- Arc welding
  - Esp. skin (erythema; unreported)
- Plasma arc cutting
- Multi-kilowatt CO<sub>2</sub> laser welding
- UVGI lamps
  - HVAC maintenance
- Metal halide lamps
  - Gymnasium
- Outdoors
  - Photosensitization

© LightRay Consulting, Inc.

## Numerical Methods

- Few exist and these are infrequently used
- Estimates of maximum emission from welding arcs
- Projection systems
- Calculation for LEDs
- Best reference: Sliney & Wolbarsht, 1980

© LightRay Consulting, Inc.

## Welding Arcs

Effective UV irradiance (10-700 A)  $E_{\text{eff}} = (k_1 \times I^2) / r^2 \text{ W/cm}^2$

Maximum luminance  $L_v = k_2 \times I^2 \text{ cd/cm}^2$

IR Irradiance (750-2000 nm, 40-200 A)  $E = (k_3 \times I^2) / r^2 \text{ W/cm}^2$

$k_1 = 2 \times 10^{-4} \text{ W/A}^2$   $I = \text{current in amperes, A}$

$k_2 = 2.0 \text{ cd/cm}^2 / \text{A}^2$   $R = \text{distance in cm}$

$k_3 = 9 \times 10^{-4} \text{ W/A}^2$

© LightRay Consulting, Inc.

## LED Example

---

- Optical characteristics
  - $\lambda = 470 \text{ nm}$
  - $I_v = 1200 \text{ mcd} = 1.2 \text{ cd}$
  - Source (chip) size:  $280 \mu\text{m} \times 280 \mu\text{m}$
  - Lambertian source
  
- Determine potential for overexposure to blue-light TLV

© LightRay Consulting, Inc.

## Determine Appropriate TLV

---

- Depends upon viewing angle,  $\alpha$
  
- $\alpha = L/r = 0.028 \text{ cm} / 20 \text{ cm} = 0.0014 \text{ rad}$
  
- $\alpha < 11 \text{ mrad}$
  
- Appropriate TLV is  $E_B \text{ (W/cm}^2\text{)}$

© LightRay Consulting, Inc.

## Conversion to Radiant Intensity

---

- $I_v = I V(\lambda) K_m$ , where  $I_v = \text{cd} = \text{lm/sr}$   
 $I = \text{W/sr}$   
 $V(\lambda) = 0.090980$   
 $K_m = 683 \text{ lm/W}$
- $I = 1.2 \text{ cd} / (683 \text{ lm/W} \times 0.090980)$
- $I = 0.0193 \text{ W/sr}$

© LightRay Consulting, Inc.

## Determine Irradiance

---

- $E = I \cos \theta / r^2$
- $E = 0.0193 \text{ W/sr} / (20 \text{ cm})^2$
- $E = 4.8 \times 10^{-5} \text{ W/cm}^2$

© LightRay Consulting, Inc.

## Exposure Limits: Small Source

$$t \leq 10^2 \text{ s: } E_B \leq \frac{0.01 \text{ J/cm}^2}{t \text{ (s)}}$$

$$\text{If } t = 10^2 \text{ s, then } E_B = 10^{-4} \text{ W/cm}^2$$

$$t > 10^2 \text{ s: } E_B \leq 10^{-4} \text{ W/cm}^2$$

© LightRay Consulting, Inc.

## Comparison to $E_B$ -TLV

- $E = 4.8 \times 10^{-5} \text{ W/cm}^2$
- $E_{B \text{ (TLV)}} = 1 \times 10^{-4} \text{ W/cm}^2$
- Acceptable exposure
  - $E < E_B$  for  $t > 100 \text{ s}$  per day

© LightRay Consulting, Inc.

## On-site Reviews & Classes

---

- ❑ Most organizations do not have an IOR safety program
- ❑ Where these exist, most evaluate only UVR
- ❑ More likely to exist within product safety
- ❑ Where programs exist, H&S personnel often do not understand the instruments and standards

© LightRay Consulting, Inc.

## Summary

---

- ❑ Sources of incoherent optical radiation abound.
- ❑ IOR includes most hazardous form of nonionizing radiation, UVR.
- ❑ Many organizations do not have resources to evaluate exposures.
- ❑ Most evaluations involve measurement.
