

Technology as a Defining Discourse

Brad Allenby
Arizona State University

So long as we do not, through thinking,
experience what is, we can never belong to
what will be.

The flight into tradition, out of a combination
of humility and presumption, can bring about
nothing in itself other than self deception and
blindness in relation to the historical moment.

Source: M. Heidegger, *The Question Concerning Technology and Other Essays*, translation by W. Lovitt (New York, Harper Torchbooks, 1977), "The Turning," p. 49; "The Age of the World Picture," p. 136.

Trends We Should Care About

- The world is becoming much more complex and information dense – meaning ICT becomes more critical
- Information structures are growing at every systems level – e.g., the “cognitive city” is a complex of smart materials, smart buildings, smart infrastructure, smart integrated infrastructures – all linked to human systems
- Information technologies are changing what it means to be “human” along many dimensions
- Professionals and firms are being charged by society with responsibility not just for their actions, but for their technology systems (cf: Monsanto and genetically modified organisms); the ethics that apply at systems scale have not been developed
- Highly likely that technological evolution will become discontinuous in terms of cultural ability to adapt (especially with NBIC convergence (nanotech, biotech, ICT, and cogsci))

Trends We Should Care About: 2

- Much of this rapid technological evolution is captured in the concept of “NBIC convergence” – the convergence of the four foundational technological systems of nanotechnology, biotechnology, information and communications technology, and cognitive science.
 - Nanotech: we’re already working in this domain. Any political or regulatory backlash would cause major disruption
 - Biotech: integration of wetware, hardware and software continues at all scales (e.g., chip level; brain level; prosthetics; genetic computers, etc)
 - ICT: self-explanatory, but the potential issues are explosive (e.g., digital divide as brain hardwiring)
 - Cognitive science: electronics and communication systems major components of “extended mind” cognitive structures: we begin with prosthetics and end up with major industrial and infrastructure systems direct-wired to brain

Nanotech: Levels of Consideration

- Basic toxicology of nanoparticles: we know what needs to be done and how to do it.
- Environmental applications: the possibilities of low waste manufacturing and new remediation/waste control technologies are apparent.
- Environmental and social implications of nanotechnology: generally clueless.

Lessons from GMOs

- Basic industrial research was competent, and all relevant regulatory requirements were met both in the US and EU
- Some concern that questions about the systemic implications of GMOs had not been adequately addressed
- Main attack is ideological: GMOs are “playing God;” effective fear politics picked up this theme (“frankenfoods”); enhanced by mad cow experience and concern over industrial power, and industry failure to respond sensitively to customer concerns
- Adoption of GMO technology by China and India trump EU effort to halt it – future of GMOs, and NBIC, won’t be determined by US or EU, but by China, India, Brazil. Technology is international competition at this point; national policies are important but not determinative

Greater Phoenix 2100

Visualization tools

- Regional e-Atlas
- SIM Phoenix
- Decision Theater
- Urban-SAT(s)

Greater Phoenix 2100

Visualization tools

- Regional e-Atlas
- SIM Phoenix
- Decision Theater
- Urban-SAT(s)

Altogether UrbanSim requires about 60 tables

- These tables include:
 - [Database Tables about Development Types](#)
 - [Database Tables about Employment](#)
 - [Estimation Data Writer Tables](#)
 - [Database Tables about Events](#)
 - [Database Tables about Geographies](#)
 - [Database Tables about Grid Cells](#)
 - [Database Tables about Households](#)
 - [Database Tables about Indicators](#)
 - [Model Configuration Tables](#)
 - [Database Tables about Transportation Analysis Zones](#)

Greater Phoenix 2100

100 Cities Project:

Standardized, repeated urban remote sensing

Different sensors = different information

Las Vegas, NV, 17-Oct-2000

Visible to near-infrared
15 m/pixel

Major land cover classes

- Vegetation health
- Soil properties
- Soil contamination

Shortwave infrared
30 m/pixel

Urban surface materials

- Rooftop materials
- Energy use
- Fugitive dust production
- Metal contamination
- Ecological communities

Thermal infrared bands
90 m/pixel

Surface energy balances

- Regional climate models
- Anthropogenic heat sources
- Heat island development
