

Swift Observation of GRB 070412

P. Romano (Univ Bicocca&INAF-OAB), A. Moretti (INAF-OAB), C. Guidorzi (Univ Bicocca&INAF-OAB), T. Sakamoto (GSFC), P. Schady (MSSL), S.D. Barthelmy (GSFC), D.N. Burrows (PSU), P. Roming (PSU), N. White (GSFC), N. Gehrels (GSFC) for the Swift Team

1 Introduction

BAT triggered on and located GRB 070412 at 01:27:03 UT (trigger=275119; Romano et al., GCN Circ.6273). The BAT light curve showed a double-peaked structure with peaks at approximately 5 and 30 seconds and a total duration of about 40s. The peak count rate was ~ 2400 counts s^{-1} (15–350 keV), at ~ 5 s after the trigger. Swift slewed immediately, and the narrow field instruments were on target 61 seconds later. The best Swift position is that determined from the XRT detection of the afterglow at RA(J2000)= 181.5426 deg, Dec(J2000)= +40.1438 deg, RA(J2000)= $12^{\text{h}}06^{\text{m}}10.22^{\text{s}}$, Dec(J2000)= $+40^{\text{d}}08'37.8''$, with a 90% confidence interval of 4 arcsec (Romano et al., GCN Circ. 6287). No detection from ground-based facilities has been reported.

2 BAT Observation and Analysis

Using the data set from T–239.3 to T+962.8s the BAT team reported further analysis of GRB 070412 (Sakamoto et al., GCN Circ. 6290). The BAT ground-calculated position is RA(J2000)= 181.525 deg, Dec(J2000)= +40.133 deg, RA(J2000)= $12^{\text{h}}06^{\text{m}}6.1^{\text{s}}$, Dec(J2000)= $+40^{\text{d}}07'57.0''$, with an uncertainty of 1.5 arcmin, (radius, sys+stat, 90% containment). The partial coding was 98%.

The mask-weighted light curve (Figure 1) shows a double-peaked structure with the first peak from approximately T–4 s to T+10s and a second 2-s long peak at T+30. T₉₀ (15–350 keV) is 34 ± 2 s (estimated error including systematics). The spacecraft slewed away from the burst location at T+122s, although the burst remained in the partially coded field of view until T+716s, when the spacecraft slewed away again.

The time-averaged spectrum from T–4.1s to T+31.2s is best fit by a simple power-law model. The power law index of the time-averaged spectrum is 1.45 ± 0.20 . The fluence in the 15–150 keV band is $4.8 \pm 0.7 \times 10^{-7}$ erg cm^{-2} . The 1-s peak photon flux measured from T+5.32s in the 15–150 keV band is 0.7 ± 0.1 ph $\text{cm}^{-2} \text{s}^{-1}$. All the quoted errors are at the 90% confidence level.

3 XRT Observations and Analysis

Using the data from the first four orbits of XRT data of GRB 070412 (2.4 ks in Photon Counting mode), the refined XRT position is RA(J2000)= 181.5426deg, Dec(J2000)= +40.1438deg, RA(J2000)= $12^{\text{h}}06^{\text{m}}10.22^{\text{s}}$, Dec(J2000)= $+40^{\text{d}}08'37.8''$, with a 90% confidence interval of 4 arcsec (Romano et al., GCN Circ. 6287). This is 10.5 arcsec away from the initial XRT position quoted in Romano et al. (GCN Circ. 6273).

Using the whole dataset, which includes 40s in WT and 2.4ks in PC mode we find that the 0.3–10 keV X-ray light curve can be fit with a simple power-law with a decay slope of 0.98 ± 0.05 , although the initial descent could be due to a flare or the tail of the prompt emission (slope of ~ -3.5).

The X-ray spectrum from the XRT/WT data (40s starting from T+67.8) can be fit by an absorbed power-law with a photon index of 2.2 ± 0.5 and column density of $(1.8_{-0.9}^{+1.1}) \times 10^{21}$ cm^{-2} , higher than the Galactic column density in the direction of the source (1.95×10^{20} cm^{-2}). The unabsorbed (absorbed) 0.3-10 keV flux for the WT spectrum is 3.3×10^{-10} (2.2×10^{-10}) erg $\text{cm}^{-2} \text{s}^{-1}$. The XRT/PC data

(2.4ks starting from T+3386) are consistent with the WT data, and can be fit by an absorbed power-law with a photon index of $2.3_{-0.5}^{+0.6}$ and column density of $(2.5_{-1.2}^{+1.4}) \times 10^{21} \text{ cm}^{-2}$. The unabsorbed (absorbed) 0.3–10 keV flux for the PC spectrum is 6.1×10^{-10} (3.3×10^{-10}) $\text{erg cm}^{-2} \text{ s}^{-1}$.

4 UVOT Observation and Analysis

The Swift/UVOT observed the field of GRB 070412 starting 97.6s after the BAT trigger (Schady et al., GCN Circ. 6293). No new source is detected within the XRT refined position (Romano et al., GCN Circ. 6282) or at the position reported by Jelinek et al. (GCN Circ. 6279) and Berger et al. (GCN Circ. 6280) in any of the UVOT filters, in either single or co-added exposures. The 3-sigma upper limits reported in Table 1, where Tmid is the mid time of the exposure. The reported upper limits are uncorrected for the estimated Galactic reddening of $E(B - V) = 0.02 \text{ mag}$.

Filter	Tmid (s)	Exp. (s)	3-sig UL mag
White	9252	936	20.55
V	17432	1769	20.52
B	5763	171	20.22
U	23567	1082	21.12
UVW1	23107	1284	20.52
UVM2	19141	1082	20.65
UVW2	14440	1195	20.94

Table 1: Magnitude limits from UVOT observations

Figure 1: BAT Light curve. The mask-weighted light curve in the 4 individual plus total energy bands. The units are $\text{counts s}^{-1} \text{ illuminated-detector}^{-1}$ (note $\text{illum-det} = 0.16 \text{ cm}^2$) and T_0 is 2007-04-12 01:27:03.40 UT.

Figure 2: XRT Lightcurve. Counts s⁻¹ in the 0.3-10 keV band: Window Timing mode (blue), Photon Counting mode (red). The approximate conversion is 1 count s⁻¹ \sim 5.5×10^{-11} erg cm⁻² s⁻¹.
