GAI N Report Number: CH4033

## China, Peoples Republic of

Fresh Deciduous Fruit

## Annual

2004

## Approved by:

Ralph Gifford
U.S. Embassy, Beijing

## Prepared by:

Adam Branson, Wu Bugang, and Casey E. Bean

## Report Highlights:

China, the world's largest producer and consumer of apples, pears, and grapes, accounts for $50 \%$ of world apple production, $65 \%$ of world pear production, and $40 \%$ of world table grape production. Year 2004 apple production should be lower, at 20.2 MMT, following last year's peak in the production cycle, while pear and grape volumes should increase to 10.2 MMT and 5.6 MMT on expanded planting and better yields. CAJ production is also higher, at 560 KMT , on expanded capacity and high world demand. Traded volume in relation to production is relatively small yet growing fast. Fruit imports by dollar value increased over the past year while overall volumes decreased. Exports continue fast growth as prices, although rising, remain low compared to other suppliers, new markets open, and quality improves. CAJ exports continue booming and account for $90 \%$ of production use. Recently issued fruit entry requirements could impact trade of all deciduous fruit, especially re-exports from Hong Kong to China.

## Executive Summary

China is the world's largest producer and consumer of apples, pears, and grapes accounting for approximately $50 \%$ of world apple production, $65 \%$ of world pear production and $40 \%$ of world table grape production. Yet traded volume in relation to production is relatively small but is growing. In 2003, China exported approximately 3\% of its apples, 3\% of its pears, and $0.3 \%$ of its grape production. In contrast, the United States exported 13\% of its apples, $19 \%$ of its pears, and $40 \%$ of its table grapes in 2003.

Chinese agricultural officials are encouraging growers to improve competitiveness so that fruit can be available over a longer period of time, be of better quality (with respect to appearance, taste, and food safety aspects) and consist of more desirable and commercial cultivars demanded on the world market. Growers appear to be taking these encouragements to heart: the trend for the past few years has been the growth of largescale, integrated commercial packinghouses and trading enterprises, some of which are foreign invested, that contract with growers to produce certain cultivars and manage orchards and inputs so as to supply better quality and more desirable fruit.

This consolidation and quality improvement trend has made fruit exports and sourcing for nationwide domestic retailers more convenient, as production scales are larger, cost efficiencies better, and fruit quality, size and appearance more uniform. In the coming years, industry sources expect increasing sales to foreign markets with stringent food safety standards and fussier consumers. Nevertheless, a large number of fruit traders who handle lower quality and lower priced fruits still compete aggressively for export markets. This sector of the trade does not maintain such strict phytosanitary requirements, and its customers have lower incomes and are not as demanding.

China's juice production capacity has grown rapidly in recent years with significant new plant construction and improvement of existing facilities. Concentrated apple juice (CAJ) manufacturers are facing greater domestic competition for low cost apples as capacity grows and as domestic fresh fruit quality improves and fresh fruit export markets grow. CAJ manufacturers had been able to rely on abundant low-cost low-grade fruit, but most manufacturers are now turning to slightly better grade apples. Although not widespread, a few of the larger integrated companies are beginning to plant cultivars specifically for processing, e.g. high-sour apples for juicing. CAJ exports remain strong and still account for nearly 90 percent of production, yet domestic consumption of juices and juice drinks keeps rising as well.

Although China continues to import U.S. deciduous fruit, an increasing share of trade enters from the Southern hemisphere during periods when it can arrive fresh and not compete with domestic product. Industry sources report that Northern hemisphere fruit still arrives, but is typically imported only when it does not compete with domestic fruit, when prices are lower than Southern hemisphere fruit, or during Chinese festivals and holidays. Importers still seek competitive prices, but growing consumption and sophisticated marketing of domestic and imported fresh fruits means more consumers are more willing to pay higher prices. Ministry of Agriculture (MOA) wholesale market information indicates fruit prices increased over the past year. However, this may only reflect the sharp price jump for the entire food basket price.

China's agriculture policy reforms target increased and altered production, improved food safety, and expanded trade. Furthermore, early in the year the central government called for reducing or eliminating agricultural taxes and the specialty agricultural product tax (which includes deciduous fruit) in order to stimulate rural income growth. Implementing the plan is difficult because of the many levels of government involved, each of which has a different interpretation and perspective on the issue. As of late July, fruit growers in Shandong had not heard about the decision and expected to pay taxes after harvest.

Recently drafted pesticide maximum residue limits (MRL's) apply to both domestic and imported fruit. In December 2003, USDA provided comments to the State General Administration for Quality Supervision, Inspection, and Quarantine (AQSIQ) and the Ministry of Commerce (MOFCOM) stressing concern with grape product MRL's. Further, the USDA provided AQSIQ and MOFCOM comments on the recently issued revised fruit entry measures, which include logistical, sanitary and phytosanitary rules. According to trade sources, the proposed measures may push fruit prices higher for goods transiting Hong Kong while simultaneously reduce illegal trade. Expanded direct trade to China may result and possibly a more equitable and competitive marketplace for both high-quality domestic fruit and imported fruit may result.

## Production

## Apple, Pear, and Grape Production, Area, and Primary Cultivars

Post estimates 2004 apple production will be 20.2 million metric tons (MMT), pear production 10.2 MMT, and grape production 5.6 MMT. These estimates are slight changes from 2003 deciduous fruit production as apple acreage reductions seem to have abated, new pear plantings remain flat, and the rate of grape planting expansion has slowed. Further, weather across the growing areas has been favorable, input costs remain unchanged, fruit prices, although higher, did not climb as much as other agricultural products, and orchards and vineyards matured to fuller yields.

According to China's National State Statistics Bureau (SSB) and MOA's "Statistical Report," calendar year (CY), 2003 apple production was 21.1 MMT on 1.9 million hectares (MHa), pear production was 9.8 MMT over 1.1 MHa and grape production was 5.2 MMT on 0.4 MHa . Last year was a high year in the apple production cycle and broke the pattern of falling apple production volumes that had occurred in the previous five years. Commercial orchards and growers are choosing to top-graft apple and pear trees to alternate cultivars rather than uproot and replant entire trees.

The UN Food and Agriculture Organization (FAO) estimates for 2003 apple production coincide with Chinese government figures. The FAO estimates 2003 apple production at 20 MMT, pear production at 9.4 MMT and grape production at 3.9 MMT . Post's (FAS China) previous estimates for pear and grape planting acreage and production coincided with MOA and the SSB (see GAIN report CH3121). Our original forecast for apple production, however, was lower than MOA and SSB data as production in Shandong and Shaanxi proved better than originally anticipated.

During 2003, Red Fuji apples accounted for approximately $61 \%$ or 12.8 MMT of the 21.1 MMT apple harvest. Rallus Janet apples amounted to roughly $7 \%$ or 1.5 MMT . As for the 9.8 MMT 2003 pear harvest, Ya Pears amounted to 2.2 MMT ( $22 \%$ of total harvest) and Snow Pears amounted to 1.7 MMT (17\% of total harvest). In 2002, the Red Fuji and Rallus Janet accounted for $57 \%$ and $7.5 \%$ of apple production respectively while Ya and Snow Pears accounted for $23 \%$ and $20 \%$ respectively. Expectations are similar for 2004.

MOA does not provide detailed grape variety production. Table grapes like Kyoho (JuFeng), Globe, and Muscat are common, but nearly all production in Xinjiang, the largest grape producing province, has been the green oblong, and seedless Thompson-like Ma Nai ("Cow's Nipple"), that is dried for raisins, as well as smaller, rounder, green seedless grapes that are consumed fresh. Expansion of the wine industry is a substantial driving force for new plantings in Hebei, Shandong, and Liaoning, including Chardonnay, Sauvignon, Cabernet, Merlot and Pinot Noir.

China's primary deciduous fruit production regions are the provinces around the Bohai Gulf, the Northwest Loess Plateau, and the northern portion of the Yellow River Basin. (See Historical Production Tables as well as ATO Map Section of this report). Apple production is concentrated in a few provinces: Shandong, Shaanxi, Henan, Hebei, Shanxi, Liaoning and Gansu. These six provinces account for $86 \%$ of planted area and $90 \%$ of production. In 2003, Shaanxi apple planted area surpassed Shandong for the first time in China's modern history. Pear production is slightly more diverse, but concentrated in Hebei and Shandong; accounting for nearly $30 \%$ of area and $40 \%$ of production. Grape production is concentrated in Xinjiang, Hebei, Shandong, Liaoning, and Henan, which combined compose 63\% of planted area and $69 \%$ of production.

## Concentrated Apple Juice (CAJ )

Industry sources forecast 2004 CAJ production at 500,000 MT, up 10\% from last year, as market demand remains strong and more processing facilities are constructed. Post estimates 2003 calendar year production exceeded 450,000 MT. CAJ is produced primarily in Shandong, Shaanxi and Henan. Some processing plants do not operate at full capacity due to the increased cost of raw materials. Juicing companies are no longer able so easily to source out- of-grade apples for processing, as orchard management improves and fewer out-of- grade apples are available. Companies now mainly use second grade apples for juicing, increasing the purchase price to around RMB 80 per ton. As a result, export prices also jumped an average US $\$ 60$ per ton (see price table).

Last year, China's Chamber of Commerce began setting floor prices for exported CAJ to avoid countervailing measures from importing countries such as the United States. This year's FOB prices, adjusted every three months, are from August 1 and set at $\$ 630$ per MT to Europe and $\$ 720$ per MT to the United States. Sources report internal debate on curbing CAJ production to prevent China's share of world CAJ trade from increasing too fast.

Chinese CAJ processors are equipped with state- of-the-art facilities and benefit from cheap labor and raw materials, enabling their product to remain quality- and price-competitive. The greatest challenge facing the CAJ industry is that too rapid export growth may result in safeguard measures by importing countries, or that too few apples will be available for processing.

Juicing companies are contracting more high-sour apples dedicated to juicing. Industry sources estimate no less than 40,000 hectares of high-sour content apples have been planted and another 40,000 hectares are under way with completion projected within a few years. Sources indicate that some of the dedicated apple trees planted several years ago have started bearing fruit this year, but larger volumes will not be available for another three years.

China has limited production of other apple products such as jellies, sauces and additives. CAJ blending with other fruit/vegetable juices exists, but production of apple wine and vinegar is limited. Reports indicate some food manufacturers are using fructose derived from apples to replace cane sugar as a sweetener in processed foods.

## Consumption

## Climbing Fruit Purchases and Consumption in Urban Areas

Thanks to higher consumer income, improved distribution, and increased production, urban and rural consumption of fresh and dried fruits and melons has grown dramatically over the past several years, reaching 56.52 kilogram per urban household in 2002, up 37.5\% from the 1990 levels of 41.11 kilograms. Fresh fruits and melons remain normal goods for Chinese consumers; even the lowest-income urban households consume an average 32 kilograms of fresh fruits and melons annually while the wealthiest households consume an average 75 kilograms/year. Per capita nationwide urban household expenditures on fresh fruits averaged RMB 168 amounting to $2.8 \%$ of living expenses and $7.4 \%$ of food expenses.

Expenditures on fruits and melons were highest in Beijing (RMB 313), Shanghai (RMB 295), Zhejiang (RMB232), Guangdong (RMB216) and Tianjin (215). The data may underrate Zhejiang and Guangdong, however, as these are large provinces with numerous cities where consumption might approach Beijing's level.

## Buying Habits Shifting from Wet-Markets to Retail Hypermarkets

The supermarket/hypermarket revolution is sweeping the nation. Traditional fresh fruit and vegetable purchases at wet-markets are gradually shifting to clean, attractive, inexpensive fruits at modern retail outlets. Products range from locally sourced fruit, specialty fruits from other provinces, or imported fruits. Retailers and chain-stores are centralizing their purchases to obtain economies of scale, contracting production under prescribed growing conditions that will assure the desired fruit quality and uniformity or by contracting with integrated growing and packing facilities who are capable of supplying fruits at low cost due to their own improved and more economical integration. Although it is not yet the norm, a few specialty chain stores are also developing that sell only high-quality domestic and imported fruits and vegetables.

## Consumer's Fruit Purchasing Preferences

The most widely consumed fruits are apples, pears, and grapes, along with bananas, citrus and melons. Easily pared large-sized apples and pears and grapes with loose skin appeal to most Chinese consumers, who nearly always avoid any fruit skins for sanitary reasons. Strongest consumer demand and highest price is immediately after harvest as new fruit crops enter the market. By and large most fruit consumption still occurs in its growing regions, but consumers increasingly are exposed to fruit from outside their province. Litchi and longan, for example, are widely distributed tropical fruits produced in South China but also now imported. Lower import tariffs from ASEAN countries (See Trade Section) have led to wider availability of tropical fruits like mango, rambutan, jackfruit and durian, which compete with deciduous fruits.

## Regional Branding I mpacting Consumer Purchases

Although individual company efforts are critical, Chinese grower associations at the provincial or local level help market fruits to domestic retailers, consumers, and even overseas markets through their participation in trade shows or through point of purchase. Most of these associations are regional and market fruits like Zhejiang Pears, Xinjiang "Fragrant" Pears, Yantai "Red Fuji Apples", etc. in the capacity of intermediaries between growers, government, and retailers. Some receive local government support; there is no formal central government provincial assistance.

## Booming CAJ and Other Juice Drink Consumption

Fruit juice/drink consumption is surging at more than $40 \%$ each year in China, with production in 2003 surpassing 3 MMT. Annual per capital consumption of juice is still low at around one kilogram, but the number is expected to grow significantly in the next few years. Individual orange juice/drink dominates consumption. Apple juice, also widely consumed, is a key ingredient for many blended drinks and for the food industry. Currently, more than $90 \%$ of CAJ produced in China is for export. Domestic CAJ consumption is between 30,00050,000 MT a year and growing fast. Housewives prefer $100 \%$ juice (including apple juice) while young people favor juice drinks (with juice content ranging from $10 \%-30 \%$ ). Surveys indicate that consumers say juice drinks taste better. While juice drinks maintain the fastest growth rate, tea drinks and sports drinks (or functional drinks) witnessed robust growth in recent years, as well.

## Trade

China revised and announced its Administrative Measure for Inspection, Quarantine, and Supervision for Fruit Entry on August 6, 2004 to the World Trade Organization (WTO). Post analysis of these measures is in the policy section of this report and in GAIN report CH4036, an unofficial translation of the measures.

Also on August 6, AQSIQ revised and posted on its website the eligibility list for imported fruit by country/region (CH4029). The United States, France, Japan, New Zealand, Chile and Australia can export certain apple varieties to China. The United States, Chile and New Zealand received approval for grape exports to China while pears from New Zealand and Japan also received approval. Nearly all imported deciduous fruit enters the country via ports in South China, much of it transshipped through Hong Kong. However, some traders express an interest in being able to import directly to northern ports, but they recognize it will depend on costs.

China's exports of fresh deciduous fruits are likely to continue the strong pace into the future as quality is better, access to export markets has improved and prices are competitive. China's apple industry hopes to increase exports from current levels to 1.25 MMT by 2008, which would account for nearly one-fourth of global apple trade. There is no official list of approved export destinations for Chinese deciduous fruits available, but as export statistics show, China has been successful in its negotiations with other countries to gain new access or expanded varieties access.

China and many of the ASEAN member nations have begun implementation of the "Early Harvest" program of their Free Trade Agreement, which slashed or eliminated tariffs on a variety of goods including fruit. Consequently China's exports of deciduous fruit and imports of many tropical fruits have risen rapidly. Most exported fresh fruits leave China from northern ports near production areas for neighboring countries like Russia or Southeast Asia, but access to new markets in Europe along with North and South America are being negotiated. Some Chinese exporters have partnerships with foreign investors.

## Apple I mports Climb While Exports J ump Nearly 150 Percent

Sales of imported apples by value increased from MY03/04 while sales by volume fell. The United States, Chile and New Zealand remain the primary apple suppliers to China. From MY02/03 to MY 03/04, imports from the United States fell from 21.6 KMT to 18.5 KMT , but rose from $\$ 9.4$ million to $\$ 14.4$ million in value. At the same time, imports from Chile fell from 18.9 KMT to 11.9 KMT but rose from $\$ 9.1$ million to $\$ 9.3$ million in value. New Zealand origin apple imports fell from 10.6 KMT to 6.2 KMT and also fell in value, from $\$ 5.3$ million to $\$ 4.5$ million. Nearly 90 percent of China's apple imports enter the country through Shenzhen and Guangzhou ports (Guangdong Province). For the past several years, imports have been highest from April to June, but significant imports still take place from January to March and even from July through September.

MY03/04 apple exports grew to nearly $\$ 250$ million, up sharply from MY02/03 exports of $\$ 173$ million; with the largest portion ( $\$ 97$ million) from October through December and another large portion ( $\$ 70$ million) occurring from January to March. China's apple export season is slowly expanding as changing fruit cultivars allow for an extended harvest season and improved cold storage and controlled atmosphere storage development allows for fruit to be better-maintained over a longer period. Although principal export destinations remain Southeast Asia and Russia, increased apple exports to the EU (the Netherlands, Spain, the United Kingdom, Italy, and France) appear to be taking hold. Although China produces many apple cultivars across a number of provinces, exports primarily depart China from Qingdao in Shandong province (MY03/04 exports of $\$ 165$ million). Traders indicate Fuji apples are the primary variety exported, but with more desirable cultivars and better infrastructure developing in the country, many expect to see exports increase from Liaoning and Shaanxi.

## Pear Exports Maintain Stable Growth

China imports small volumes of pears (MY03/04 500 MT ) compared to its annual production of over 9 MMT. Pear imports entering China are almost all from New Zealand and enter the country via Guangzhou or Shenzhen in South China from January to June.

China's pear exports did not expand as quickly as apple exports during MY03/04, but remain an important and growing segment of China's fruit trading industry. The suspension of exports to the United States and other countries following the December 2004 detection of Alternaria fungus in Ya Pears contributed to the slow growth. MY03/04 pear exports reached $\$ 85$ million, up from MY02/03 exports of $\$ 69$ million. The pear export season is primarily from September through December ( $\$ 35$ million in MY03/04) , but it appears to be expanding slightly on both ends.

Primary destinations remain Southeast Asia and Russia. Ya and Fragrant Pear exports to Canada were strong, but stopped by a finding of Alternaria. The greatest export growth was to Indonesia; sales increased from $\$ 8$ million to $\$ 17$ million over the course of the year and should continue growing. A large portion of the export growth was in Fragrant Pears, and "Other" pears aside from Ya and Snow Flake Pears. Exports primarily leave China from the northern ports of Tianjin and Qingdao, but large increases from South China's port of Shenzhen appeared during the last year.

## Southern Hemisphere Grapes Welcomed in China While Domestic Exports Expand

China's imports of grapes continue to grow, jumping from $\$ 32$ million in CY2002 to over $\$ 41$ million in CY2003 and reaching over $\$ 45$ million through the first seven months of CY2004. The jump is due to expanded imports from Chile, the largest supplier by value and volume. Grape imports are strongest from April through June, but January to March is also a high demand season. Imports from Southern Hemisphere countries in the first half of the year will likely remain as China lacks domestic grapes at that time while Chinese holidays, like the Spring Festival, drive demand. Customs data indicates nearly 90 percent of grape imports entered China from ports in Shenzhen and Guangzhou.

Fresh grape exports surged from $\$ 276,000$ dollars in CY2001 to over $\$ 5.8$ million in CY2003 of which approximately $\$ 5.5$ million occurred in the last half of the year. Exports for CY2004 appear strong, as the first seven months reported recorded exports to nearly twice the level of the first half 2003.

## CAJ Export Prospects Remain Bright as World Demand Grows

Customs data indicates China exported a record 485,700 MT of CAJ in MY2003/04, a 30\% increase, largely boosted by surging U.S. imports. MY03/04 Sales by value were $\$ 308$ million, a 140 percent increase from the prior marketing year. The U.S. remained the largest importer of Chinese CAJ by volume and value. Japan, the EU, Russia, and Australia were among other major buyers of Chinese apple juice, with their import volume growing steadily. China already exported 315,875 MT of CAJ in the first seven months of 2004, an increase of $25 \%$ over the same period last year. Given increasing global CAJ demand, China, being the largest supplier, expects to export 450,000-460,000 MT of apple juice in CY2004.
U.S. CAJ imports from China reached 233,476 MT and $\$ 151$ million in MY03/04, a figure almost double the previous year ( 121,938 MT and $\$ 79$ million). Sources indicate fast growing demand for CAJ, lower U.S. domestic production and the February 2004 U.S. International Trade Commission (ITC) final ruling, eliminating countervailing duties, in favor of 10 Chinese CAJ processors spurred the large increase.

The little apple juice China imports is for blending purposes.

## Stocks

## Cold Storage Expansion Allows Better, Larger Inventory Throughout the Year

China does not maintain any data on fruit stocks. Traders and growers indicate strong growth of controlled atmosphere (CA) storage and cold storage space throughout the country over the past two years. As facilities expand and improve, the likelihood of better quality domestic fruit and better maintained imported fruit being available throughout the year is bound to grow. Although cold storage facility expansion should benefit high-quality fruit consumption and trade, most fruit never enters these facilities because of the cost.

## Policy

Revised Entry Requirements for Fresh Fruit Likely to I mpact and I mpede Trade
China announced revised Administrative Measures for Inspection, Quarantine, and Supervision of its Entry Requirements for Fresh Fruits on August 6, 2004, with adoption on September 20 and enforcement from November 20, 2004. China notified the WTO (G/SPS/N/CHN/80) (see GAIN CH4036 for an UNOFFICIAL translation and analysis) with a comment period until September 15. The USDA provided comments to AQSIQ's Enquiry Point on September 14, but requested China allow a longer comment period, and noted the measures address logistical problems associated with imported commodities and not just phytosanitary or food safety risk posed by shipments. An unofficial translation of China's previous Administrative Measures for Fruit Entry is in GAIN report CH1058.

The measures require that importers receive a Quarantine Import Permit (QIP), valid for six months, before signing contracts. The measures require and suggest importers cite sanitary requirements in the QIP application and again in contracts. The scientific validity of the requirement remains in question as it is unimaginable to cite sanitary concerns before signing a contract and knowing from where (country/region) fruit imports will arrive. Therefore the concern is that the QIP may act as a de-facto import licensing mechanism. Additionally, the QIP requires importers to designate the port of entry thereby curtailing chances for diversion to other ports.

Other noteworthy changes in the Measures include additional inspection and certification requirements for fruit re-exported to China via Hong Kong, language that packaging and pallets carry markings designating China as the fruit destination, documentation on packinghouses and crop protection applications and a zero tolerance on dead leaves and branches in shipments. Industry sources grant the measures could impede some illegal trade and trade posing a legitimate health or phytosanitary risk, but expect the changes will also impede legal trade by pushing imported fruit prices higher with longer storage times and extra inspections. There is also concern that the required markings do not aid commodity trace back and prevent the possible re-export of fruit to other markets. And, the documentation on chemicals and zero tolerance for dead leaves and branches may be unreasonably restrictive.

Some domestic traders suggest the measures could encourage direct fruit trade to China and divert it from transiting Hong Kong. Others, however, believe the measures will merely alter the cost structure for trading through Hong Kong. One large domestic packinghouse applauds the measures citing the changes will make a more equitable market for high-quality domestic fruit to compete with imported fruit.

## Drafted MRLs Designed to Improve Food Quality May Hurt I mports

In October 2003, China's National Notification Authority gave the WTO (G/SPS/N/CHN/30) drafted revisions for 136 pesticides (acaracides, fungicides, insecticides, and herbicides) MRLs of which, at least 50 are for apples, pears, and grapes. The U.S. California Table Grape Commission commented through the U.S. Embassy and the USDA FAS Office of Food Safety and Technical Services Division that proposed limits for Fenpropathrin, Glyphosate, Mancozeb, Metalaxyl, and Parathion were all lower than U.S. established MRLs. According to China's SPS Enquiry Point, the Measures are still in draft form, however; a final publication could become available in late September 2004.

## Lower Tariff and VAT Rates for 2004 Imported Deciduous Fruits

China is in the last year of its scheduled tariff reductions that began with the nation's 2001 WTO accession. Effective tariff rates for 2004 fell by $6 \%$ for grapes and $4 \%$ for apples and pears when compared to 2003 rates. Although it is possible additional reductions may occur in the future, there is no schedule for their reductions at the present time.

| Deciduous Fruit Import Tariff and VAT Rates for 2004 |  |  |  |  |
| :--- | :--- | :--- | :--- | :---: |
| HS Code | Description | 2004 | Effective |  |
|  |  | Tariff | VAT | Rate |
| 0806.10 | Grapes, Fresh | $13.0 \%$ | $13.0 \%$ | $27.7 \%$ |
| 0808.10 | Apples, Fresh | $10.0 \%$ | $13.0 \%$ | $24.3 \%$ |
| 0808.2012 | Pears, Duck (Ya) or Snow (Hsueh), Fresh | $12.0 \%$ | $13.0 \%$ | $26.6 \%$ |
| 0808.2013 | Pears, Fragrant (Xiang), Fresh | $12.0 \%$ | $13.0 \%$ | $26.6 \%$ |
| 0808.2019 | Pears, Other, Fresh | $10.0 \%$ | $13.0 \%$ | $24.3 \%$ |
| 0808.2020 | Quinces, Fresh | $16.0 \%$ | $13.0 \%$ | $31.1 \%$ |

## Marketing

## South China Key, but Eyes Turning North to Expanded Consumer Base

The largest percent of deciduous fruit arrives in South China, often re-exported from Hong Kong. Although most Hong Kong and South China fruit traders are well aware of the availability and variability of U.S. and other nation's fruit, U.S. traders and packinghouses should continue marketing fruits to traders in this key geographic area. At the same time, however, it will be increasingly important to reach buyers in to northern and central China as direct exports become more cost efficient, and rules for re-export certification in Hong Kong change.

Indications are that not only USDA Cooperator associations, but also other countries' fruit associations are targeting the large northern China markets of Shanghai, Beijing, and emerging city markets like Dalian. Exporters of U.S. deciduous fruits are advised to contact any of the three USDA China Agricultural Trade Offices (ATOs) and the USDA cooperator associations assisting with marketing U.S. fruits (see following page with China map).

Successful marketing tactics include association- or company-managed contests awarding prizes and gift packages to importers or vendors buying the largest volumes or values of fruit. Traditional methods include point-of-sale marketing, advertisements and flyers in newspapers for retail stores, and promotions at restaurants, shopping malls, stores, and public areas receiving large numbers of visitors.

New Century Pears prior to fruit grading and post-harvest packaging in August 2004. 3. Factory inspection for pests and diseases within packinghouse supplying export and domestic markets in August 2004.

Xinjiang Grapes
Photo description (L-R): 1. Green seedless grapes grown at a state- owned orchard in Turpan, Xinjiang in August 2003. 2. Green seedless grapes and other fruit on display in Urumqi Wholesale market in August 2003.

## China Map for USDA ATO Marketing Region and Production Areas

The following color- coded map of China indicates provinces and regions where USDA ATO's conduct market surveys and promotions. Chinese provinces shaded red are covered by ATO Beijing, while ATO Shanghai covers green provinces, and ATO Guangzhou covers the provinces shaded yellow. Provinces shaded gray are not covered by any ATO while Hong Kong, shaded blue, is covered by a separate ATO located in Hong Kong.

The map may be of general use, as well, for understanding provinces and cities mentioned in the production, consumption, and trade portions of this report. For reference, the Bohai Gulf area is principally Liaoning, Hebei, and Shandong. The Northwest Loess Plateau is Shanxi, Shaanxi, and Gansu. The Yellow River Basin is Henan, Anhui, and Jiangsu.
