

Oil and Gas Field Code Master List 1997

February 1998

Energy Information Administration
Office of Oil and Gas
U.S. Department of Energy
Washington, DC 20585

This report was prepared by the Energy Information Administration, the independent statistical and analytical agency within the Department of Energy. The information contained herein should be attributed to the Energy Information Administration and should not be construed as advocating or reflecting any policy position of the Department of Energy or any other organization.

Preface

The *Oil and Gas Field Code Master List 1997* is the sixteenth annual listing of all identified oil and gas fields in the United States. It is updated with field information collected through October 1997. The purpose of this electronic publication is to provide unique, standardized codes for identification of domestic fields. Use of these field codes fosters consistency of field identification by government and industry. As a result of their widespread adoption they have in effect become a national standard. The use of field names and codes listed in this publication is required on survey forms and other reports regarding field-specific data collected by EIA. The surveys currently using these field codes are Form EIA-23, "Annual Survey of Domestic Oil and Gas Reserves", and Form EIA-191, "Underground Gas Storage Report".

EIA gratefully acknowledges the assistance provided by various State organizations and trade associations in verifying the existence of fields and confirming their officially recognized names.

General information regarding this publication may be obtained from David F. Morehouse (202-586-4853), Natural Gas Division, in the Energy Information Administration's Office of Oil and Gas. Detailed information regarding the preparation of this document may be obtained from the EIA Field Code Coordinator, Robert F. King (202-586-4787 or rking@eia.doe.gov).

1. Overview

Introduction

This is the sixteenth annual edition of the Energy Information Administration's (EIA) *Oil and Gas Field Code Master List*. It reflects data collected through October 1997 and provides standardized field name spellings and codes for all identified oil and gas fields in the United States. The *Oil and Gas Field Code Master List* is available in electronic form:

- on the quarterly EIA Energy InfoDisc CD-ROM
- at the EIA World-Wide Web site
<<http://www.eia.doe.gov>>
- in PK-zip compressed form on a 3.5-inch high-density floppy diskette, available on request.

It is also printed every other year. Changes to it are printed in *Oil and Gas Field Code Master List Updates* in the alternate years.

Other Federal and State government agencies, as well as industry, use the EIA *Oil and Gas Field Code Master List* (FCML) as the standard for field identification. In order for it to be useful, it must be accurate and remain current. To accomplish this, EIA constantly reviews and revises this list. EIA welcomes all comments, corrections, and additions to the FCML. All such information should be given to the EIA Field Code Coordinator at (202•586•4787).

EIA gratefully acknowledges the assistance provided by numerous State organizations and trade associations in verifying the existence of fields and their official nomenclature.

Summary Statistics

There are 58,366 field records in this year's FCML, 437 more than last year. The FCML includes:

- Field records for each State and county in which a field resides.
- Field records for each offshore area block in the Gulf of Mexico in which a field resides.
- Field records for each alias field name (see definition of alias below).
- Fields crossing State boundaries that may be assigned different names by the respective State naming authorities.

Taking into consideration the double-counting of fields under such circumstances, EIA identifies 46,994 distinct fields in

the United States as of October 1997. This count includes fields that no longer produce oil or gas and 482 fields used at some time in whole or in part for oil or gas storage. The following is a summary count by hydrocarbon type of distinct fields in the United States:

Field Type	Number
U.S. oil and gas distinct fields	46,994
Fields with oil	34,831
Fields with gas	32,013
Fields with associated-dissolved gas	15,947
Fields with nonassociated gas	21,434
Fields with unspecified hydrocarbon	140

Note: The sum of these fields is greater than the total number of distinct fields, since many fields have more than one type of hydrocarbon present.

EIA has assigned a unique six-digit *field name code* to each field name. The field names recognized by the State naming authorities or by tradition total 52,974. Of these, 45,992 are currently considered official, while 6,982 have been declared unofficial by the State naming authorities and are designated as *alias names* by EIA.

This report also contains an Invalid Field Record List of 4 records that have been removed from the FCML since last year's report. These records were found to be either technically incorrect or to represent field names which were never recognized by State naming authorities.

Publication Organization and Content

Chapter 2 provides details on the methodology used to assign field codes and the procedures followed to standardize field names. Chapter 3, the User's Guide, and the Glossary provides the definitions and explanations needed to utilize this publication. The FCML follows the Glossary. It is organized by State, showing fields sorted alphabetically by name within each State. Fields in the Federal Offshore Outer Continental Shelf are listed separately at the end after Wyoming. Each field name entry contains the field code, field name, geographical information, and other related information. The Field Code Index, which follows the Master List, is an abbreviated listing sorted by field code with field names and the State or States in which each field name is located. This listing is intended for use as a quick reference.

The Master List must be consulted for more detailed information. The Invalid Field Record List identifies those field records which were determined to be invalid since the previous report.

History

The EIA FCML evolved from the Federal Power Commission's Field/Plant Code List (FPC Field Code List). The FPC Field Code List, originally developed over 25 years ago, had a unique code assigned to each field on the list. That is, two fields having identical names in separate States had separate six-digit field codes. However, some respondents to Form FPC 15, "Interstate Pipeline's Annual Report of Gas Supply", began using the first code given in the list for a field name, regardless of the State involved. With few respondents applying computerized edits to their submissions at that time, miscoding of fields became a problem. The solution applied was to recode the fields on the list so that any fields with identical names were assigned the same six-digit code (a field name code) but were differentiated by the State and county codes incorporated in the full field code. For example, 145385KS101 is the field code for the CLARK field in Kansas and 145385TX285 is the field code for the CLARK field in Texas, as 145385 is the *field name code* for CLARK.

The FPC Field Code List, originally designed to handle data relating to interstate gas fields, was expanded over the years, as resources permitted, to include the names of oil fields and intrastate gas fields. Six-digit codes were assigned in ascending order to alphabetically sorted field names. Codes from the FPC Field Code List were used in filing Form FPC 15 and Form FPC 8, "Underground Gas Storage Report".

After the establishment of the Department of Energy (DOE) in 1977, the requirement to gather annual, verifiable oil and gas reserves estimates led to the development of Form EIA-23, "Annual Survey of Domestic Oil and Gas Reserves". Form EIA-23 collects certain data by field, and the use of the FPC Field Code List aided the reporting and processing of these data. As use of the FCML expanded by way of the Form EIA-23 program, additional work to verify and update the code list was necessary to keep the list current. In 1981, the correlation between the code number sequence and the alphabetical field name sequence was dropped. This change precluded the necessity of periodically reassigning field codes in order to maintain the list in parallel numeric and alphabetic order.

A procedure was implemented in conjunction with the *Oil and Gas Field Code Master List 1988* publication which determines the actual count of distinct oil and gas fields in the United States. A part of this procedure is to aggregate the

separate county portions of existing fields into their recognized geological entirety, even if the field crosses a State boundary. This procedure is time-consuming and entails manual intervention, so it is done on a yearly cycle.

Definition of a Field

A field is defined as "an area consisting of a single reservoir or multiple reservoirs all grouped on, or related to, the same individual geological structural feature and/or stratigraphic condition. There may be two or more reservoirs in a field which are separated vertically by intervening impervious strata, or laterally by local geologic barriers, or by both."

This definition is not used by all States in their designation of fields; consequently, areas classified as individual fields by some States may be found combined in the FCML.

Coding Of Fields

As noted above, the six-digit field name code is common to a specific field name, regardless of whether one or several fields exist with that particular name. In order to uniquely identify a particular field, the field name code must be coupled with the corresponding State abbreviation and county code.

Most codes on the FCML remain in a numerically ascending order by alphabetized field name. However, field names added since 1981 have been assigned the first available (numerically lowest) unused code. Fields located in the Federal Offshore area and large State offshore blocks of the Gulf of Mexico will continue to be represented by codes above 800000, according to their area, subarea, and block number.

Records that appear on the list with field name codes in light italics are alias records. The correct field name and field name code appear as part of the alias field name record after the label "Alias For:". Alias field names are not currently recognized by State naming authorities. Alias field names and their codes may be used in filing Form EIA-191, but may **not** be used on Form EIA-23.

Records that were on the FCML last year but which were subsequently found to be invalid are entered on a separate Invalid Field Record List. These records were incorrectly placed on the FCML or when complete information was not available. Field names and codes on the Invalid Field Record List should not be used in DOE filings with the indicated State and county. Note, however, that the identified field name and field name code may still be valid for a different State/county combination.

General Field Naming Conventions

Field name spellings in the FCML reflect a number of conventions and conditions. In most instances, the up to 26-character name reflects the conventions imposed by the data block length on DOE forms and by the State naming authority, usually the oil and gas regulatory agency. Field

identification for a well, lease, block, unit, or section is the responsibility of the State naming authority. Table 1 is a listing of these authorities. In the absence of a State authority, field names which have come into general acceptance in an area may be listed. In the Appalachian Region, field area names are often used. Detailed information is provided in Chapter 2, Methodology for Field Code Assignments, concerning the field naming conventions followed.

Table 1. List of Authorities on Oil and Gas Field Nomenclature

State	Naming Authority	State	Naming Authority
Alabama	State Oil and Gas Board of Alabama	Nebraska	Nebraska Oil and Gas Conservation Commission
Alaska	Alaska Oil and Gas Conservation Commission	Nevada	Nevada Department of Conservation and Natural Resources, Division of Mineral Resources
Arizona	Arizona Oil and Gas Conservation Commission	New Mexico	Energy Mineral Department, New Mexico Oil Conservation Division
Arkansas	Arkansas Oil and Gas Commission	New York	New York Department of Environmental Conservation, Division of Mineral Resources
California	California Department of Conservation, Division of Oil and Gas	North Dakota	North Dakota Geological Survey
Colorado	Colorado Department of Natural Resources, Oil and Gas Conservation Commission	Ohio	Ohio Department of Natural Resources, Division of Oil and Gas
Florida	Florida Department of Natural Resources, Bureau of Geology, Oil and Gas Administration	Oklahoma	Mid-Continent Oil and Gas Association, Oklahoma Nomenclature Committee
Illinois	Illinois Department of Energy and Natural Resources, State Geological Survey	Oregon	Oregon Department of Geology and Minerals Industries Division of Oil and Gas Geology
Indiana	Indiana Department of Natural Resources, Geological Survey, Petroleum Section	Pennsylvania	Pennsylvania Department of Environmental Resources, Bureau of Topographic and Geologic Survey
Iowa	Iowa Geologic Survey	South Dakota	Department of Environment and Natural Resources
Kansas	Kansas Geological Survey	Tennessee	Tennessee Department of Conservation, Division of Geology
Kentucky	Kentucky Geological Survey	Texas	Railroad Commission of Texas, Oil & Gas Division
Louisiana	Louisiana Department of Natural Resources, Office of Conservation	Utah	Utah Field Names Advisory Committee, Oil, Gas and Mining Division
Maryland	Maryland Geological Survey	Virginia	Department of Mines, Minerals and Energy, Oil and Gas Division

2. Methodology for Field Code Assignments

Purpose

The purpose of the Field Code Master List (FCML) effort is to provide the Energy Information Administration (EIA) and others with standardized field name spellings and associated unique codes for all crude oil and natural gas fields throughout the United States. The codes are compiled on the computerized Field Code Master File (FCMF), which is updated on a quarterly cycle. The *Oil and Gas Field Code Master List*, derived from the FCMF, is now published annually in electronic form. The first (printed) edition was released by EIA in December 1982.

General System Overview

Figure 1 presents a flow chart of the activities necessary to process new field information. All new field information received by EIA goes through this cycle, which is designed to process field information received from respondents filing Forms EIA-23 and EIA-191, as well as from other sources such as State publications.

The system incorporates both a Field Code Working File (FCWF) and the FCMF. The FCWF contains all new, or unverified, field information. It exists for two reasons:

- The large size of the FCMF makes it relatively difficult to manipulate.
- It is useful in tracking the progress made toward verifying in-process fields, while at the same time assuring that redundant activities are not taking place.

The FCWF is updated as information about the field is obtained. Periodically all fully resolved records are extracted from the FCWF and used to update the FCMF. Once the FCMF update is completed, the resolved records are deleted from the FCWF.

Field Information Research

Geologists and petroleum engineers are responsible for supervising research and final resolution of field information. Listings of the FCWF are produced by region for review. There are several possible explanations why field information under review is not already contained on the FCMF. That information could reflect the following:

- A relatively recent field discovery

- A recently discovered extension of an old field into a new county or State
- An alias used for the official name
- An error exists in the reported information (e.g., a reporting error on the Form EIA-23).

The official recognition of a new field discovery by a State field naming authority is a prerequisite for the assignment of an official EIA field code. Table 1 on page 3 lists these naming authorities. Information regarding State recognition is obtained through official State publications and computer tapes, or through other contact with the State agencies.

If the field name in question has not been officially recognized, several sources of information exist for further investigation into the third and fourth possibilities listed above. These include:

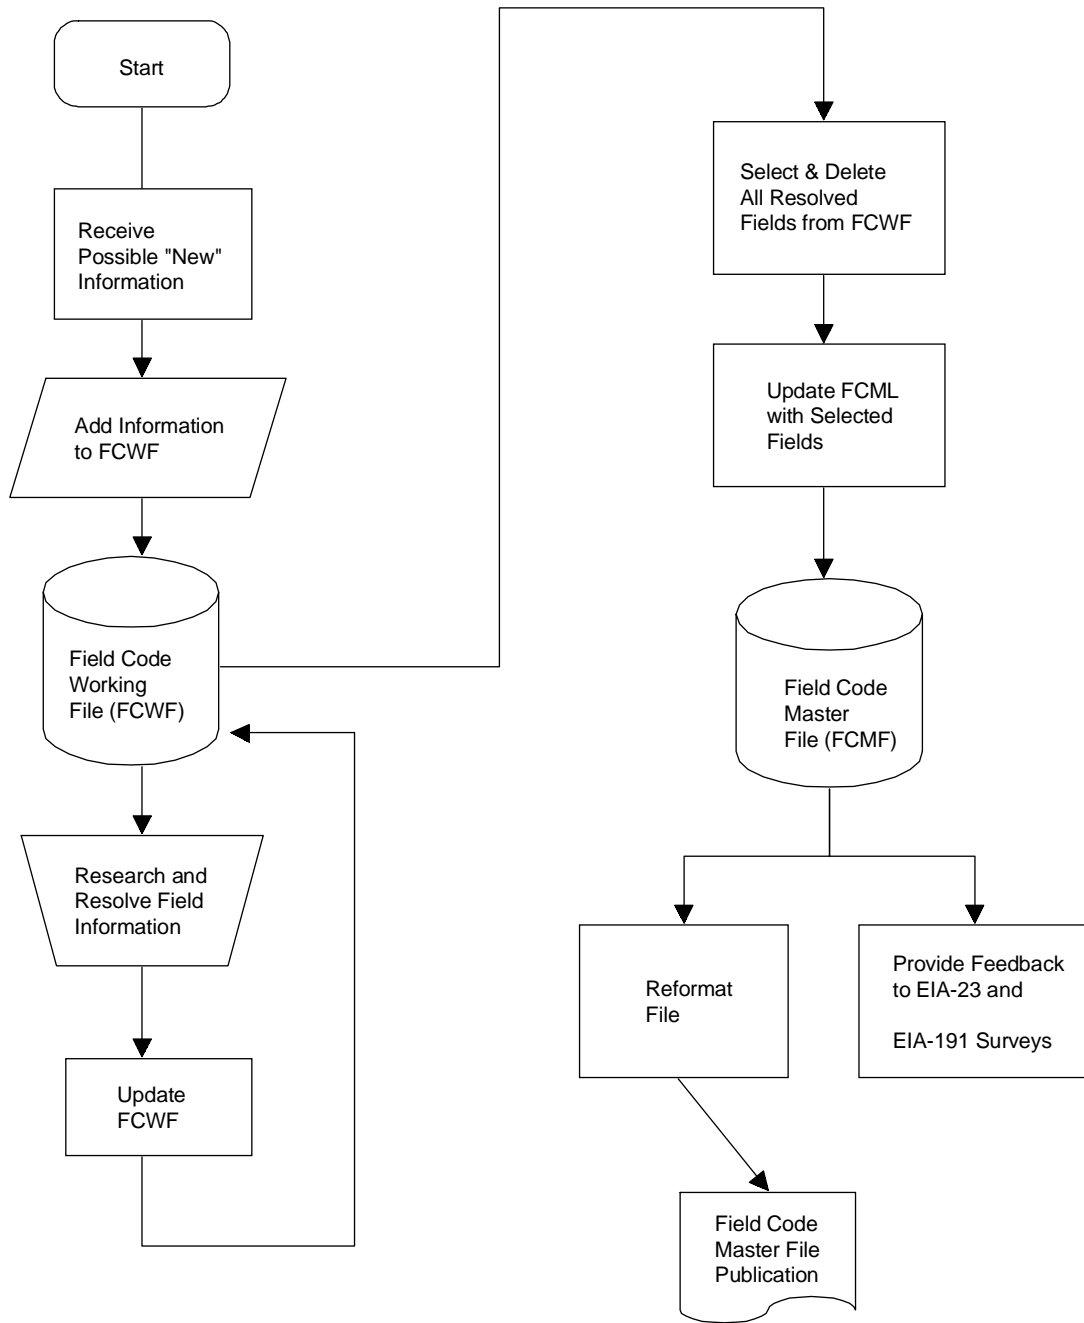

- Analysis of State data files (the Texas and New Mexico files, for example, contain detailed information for each field and operator)
- Review of oil and gas industry publications
- Telephone contact with the source of the information (e.g., a respondent to Form EIA-191 or Form EIA-23).

State Source Review Procedures

State sources provide most of the field names. As State publications are released they are routinely reviewed and the information regarding new fields is compared to the information on the FCMF. If the FCMF does not contain the new field information, the working file is updated to reflect it. Prior to updating the working file, entries on it are reviewed in order to identify any research which might be in progress on the same field. Information added to the working file from State publications is added as resolved information, ready to be entered on the FCMF, since the States are the final authority for this information.

The quality and quantity of information available through the State publications varies. Some States publish new field information relatively frequently (e.g., monthly) in a format that is easily reviewed for incorporation into the FCMF. Routine processing of State sources begins with these publications. Additional State publications, such as State geological papers, are also included in these routine reviews.

Figure 1. Field Code Processing Flow Chart

Source: Energy Information Administration, Office of Oil and Gas

Periodically, all FCMF records for a State are compared to the most recent State publication.

Some States do not publish field information, or the field information is not carried in the latest publication but in a previous one. In an overall review of the FCMF, when a particular field is not found in any available State publication, the source **NISP** (not in State publication) is initially coded into the source section of the FCMF. When an earlier State source reports “No Production”, “No Reports”, or some similar remark for one or more years, and does not show the field in subsequent sources, the field is still considered to be official, whether it is presently producing or not. When a field is found in an older State source in some combination with, or in subordination to, another field name, the State is contacted and asked to clarify the status of the field. This research resolves most of the **NISP** records, allowing them to be finally categorized as a master field record with a State naming authority source, as an alias field record, or as an invalid field record. Certain field records, representing field names assigned by non-State Naming Authority publications which were coded prior to initiation of production in a field that subsequently was abandoned without any recorded production, have been classified as invalid.

Assigning New Field Code Numbers

A sequential listing of available field code numbers starting with 000101 is used by the Field Code Coordinator when new field codes are assigned. The first available code (numerically lowest) is used for a new field, regardless of name spelling, with the following exception: codes 800000-999998 are excluded from sequential code assignments, as they are reserved for offshore Gulf of Mexico fields.

Field Alias Procedures

A field alias is an unofficial name for an officially recognized field. Each name designated as an alias is cross-referenced to the official name. An official name is the current, State-sanctioned name. An unofficial name is one which no longer is, or never was, a State-sanctioned name.

A field alias may reflect the following possibilities:

- An alternate name for the official name
- A field that has been renamed to something else
- A field that has been combined, consolidated, or merged into another field

- A field that has split into two or more new fields and the old name is no longer used.

For the combined or renamed types of aliases, both the official and alias names are on the FCMF.

For alternate name aliases, the official name must be on the FCMF in all cases. The alias name will be on the FCMF in the following cases:

- A representative from the State agency is aware of the alias name as an alternative for the official name
- The alias name was submitted by a Form “FERC 15 “Interstate Pipeline’s Annual Report of Gas Supply” respondent (formerly collected by the Federal Energy Regulatory Commission)
- Two or more operators report the same alias
- The alias is already on the FCMF for some reason.

An alternate name alias which does not meet one of these four criteria normally would not be added to the FCMF.

Field Alias Records That Have Several Official Names

Certain alias field records result from the splitting of a field into two or more fields, with none of the resulting fields using the original field name. For example, Field A was split into three fields: Field B, Field C, and Field D. Fields B, C, and D would be listed as field records on the FCML. Field A would be listed as a field alias record referencing Field B, **but not** Fields C and D and would show **SPLIT** as its reason for alias. Because of space limitations, the appropriate State naming Authority or the Field Code Coordinator must be contacted to determine names of the other fields created out of Field A when it was split, as well as how many others were created.

Fields With More Than One Name Change

The current official name may be the result of several name changes. For instance, in Oklahoma, RINGWOOD NE was combined with RINGWOOD NORTH in 1965, which was subsequently combined into RINGWOOD in 1966. The listing for RINGWOOD NE would show the correct field name as RINGWOOD. If multiple names were involved, the alias field name record would list only the current (correct) field name. (For example, in Oklahoma, HENNESSEY SE is an alias for HENNESSEY EAST which has since been changed first to DOVER-HENNESSEY and finally to SOONER TREND. The correct name for the alias HENNESSEY SE, HENNESSEY EAST and

DOVER-HENNESSEY is SOONER TREND.) Information on the chain of successive field names may be obtained from the appropriate State naming authority or the Field Code Coordinator.

Offshore Code Assignments

Federal Outer Continental Shelf fields in areas other than the Gulf of Mexico are given names in the same manner as onshore fields, and are coded with the next sequential code.

Offshore fields on the Federal Gulf of Mexico Outer Continental Shelf receive a field name code that is determined by the lease block (or blocks) for which they are named by the Minerals Management Service (MMS). The last three digits of the code are the block number. For instance, East Cameron (offshore area prefix code 824) Block 071, receives the field code of 824071. If several blocks are included in one field, the field code reflects the number of the block for which the field is named. The other blocks included in the field appear as aliases to the official name. When MMS has named two fields with the same basic block number, i.e., Ship Shoal Blk 113 field and Ship Shoal Blk 113A field, for the second designated field the basic block number is combined with the prefix code of an adjacent area within which this block number would not occur.

There are cases where a particular OCS lease block contains portions of two or more fields. If one of the fields is named for the block concerned, there will be an entry in the REMARKS section indicating PBI, for "Part of Block In", followed by the field code of the other included field. If the block concerned is only an alias to all the fields involved, it will be designated in MULTI to highlight that more than one field is included within the lease block.

Fields in large offshore State blocks in the Gulf of Mexico are assigned codes in the manner of offshore Federal fields. Special prefixes, generally unassigned prefixes for area surveys, are used for the small State block fields. A special prefix has been set aside for High Island-State. This prefix is used only with the small block fields. For State blocks that exceed 999, an unused three-digit prefix ending in 1 is used, such as SOUTH PADRE IS BLK 1068 with code 951068.

Field Naming Conventions

Use of Compass Directions in Field Names

As a general rule, a compass direction used as part of a field name is placed at the end of the name. For example, the field

named West Davenport by a State source bears the name DAVENPORT WEST on the FCMF. A field named after a known landmark, such as the town of East Davenport for example, bears the name EAST DAVENPORT on the FCMF.

If the field DAVENPORT WEST is then combined with other wells or fields and the word District, or some similar word, is added to the name, the name will appear on the FCMF as DAVENPORT WEST DISTRICT. This enables users to distinguish between two fields, one named as a result of forming a district with the DAVENPORT WEST field as its nucleus, e.g., DAVENPORT WEST DISTRICT, and the other which is a new district to the west of DAVENPORT DISTRICT, e.g., DAVENPORT DISTRICT WEST.

Abbreviations are not used in connection with onshore field names except for noncardinal compass points, such as NW for Northwest or SE for Southeast, and for names of combined fields in certain States which use all the individual names of the former fields to form the new field name. Cardinal compass points are spelled out in onshore field names.

Offshore field names in the Gulf of Mexico usually consist of an offshore area name and block number specified by the U.S. Minerals Management Service (MMS). Example: EAST CAMERON BLOCK 299. The FCML has retained the subarea identifiers such as EAST CAMERON *SOUTH ADDITION* BLOCK 299 field which yields a 37-character field name. Such lengthy offshore area names must be abbreviated to fit within the 26 characters available. When this is necessary, the following standard abbreviations are used:

North N	North Addition NA
South S	South Addition SA
East E	East Addition EA
West W	West Addition WA
Block BLK	South Extension SX
Island IS	East Extension EX

For example, High Island East Addition South Extension Block A376 is abbreviated HIGH IS EA SX BLK A376.

Special Naming Conventions

Some States regard reservoirs as fields and keep their records on that basis (e.g., Texas and New Mexico). The FCML does not follow the State conventions in these instances. For example, in Texas, PARKER (PENNSYLVANIAN) and PARKER (WOLFCAMP) are considered to be separate fields by the State. PARKER is actually the name of the field and PENNSYLVANIAN and WOLFCAMP are the names of reservoirs in the field. The Texas Railroad Commission requires that the reservoir name appear in parentheses after

the field name in its publications. In the FCML you will only find PARKER listed as the field.

The MMS quarterly publication *OCS Operations Field Names Master List, Gulf of Mexico OCS Region* (FNML) is the primary source for the Federal offshore Fields in the Gulf of Mexico. This publication and the MMS computer file on which it is based do not use the subarea identifiers such as the *SOUTH ADDITION*, although maps of the region still carry these subareas. That is, where the MMS FNML carries the name WEST CAMERON BLOCK 617, most maps and the Field Code Master List call the field WEST CAMERON SA BLK 617 with SA the abbreviation for SOUTH ADDITION.

Reused Field Names

Some States occasionally reuse field names for areas other than the original field location. This situation is handled on the FCMF by indicating (OLD) and (NEW) after the field name, with each being assigned a different field code. This procedure facilitates computerized usage of the database.

Invalid Field Record Procedures

Field records are removed from the FCML when they are found to be incorrect for one of the following reasons:

- The field name as it appears was never approved by the relevant naming authority; i.e., it could have been a misspelled field name or the name of a producing unit, well, lease or offshore platform.
- County or State location data are incorrect.
- Two separate field codes were assigned to the same field name.

When research on a **NISP** field record determines that one of those reasons applies to a field or field alias record, the record type is changed to **INVALID**. Invalid field records appear in the Invalid Field Record List section of the FCML publication for the year in which they have been designated **INVALID**. They will not appear in subsequent years. A cumulative list of **INVALID** records may be obtained by contacting the Field Code Coordinator.

3. User's Guide

Field Code Master List

Fields in the Field Code Master List (FCML) are sorted alphabetically by State and alphabetically by field name within a State. Fields in the Federal Offshore are listed separately. Fields that occur in multiple States are listed in each and are further sublisted by county.

Referring to the layout shown in Figure 2 on page 14, each field record is one line long except for records with a "REMARK", which appears on a second line. Each alias field record is two lines long. A brief description of each data item follows.

Master Field Record

Item 1, FIELD CODE. The six-digit field name code assigned to this field name.

Item 2, FIELD NAME. The field name (26-character limit).

Item 3, STATE POSTAL ABBREVIATION AND STATE SUBDIVISION CODE. The four-character code indicating the State and State subdivision. The first two positions are the State postal abbreviation. The last two positions are the two-digit subdivision code used only in Alaska, California, Louisiana, New Mexico and Texas, and in offshore areas to differentiate between State and Federal waters. Table 2 on page 15 is a listing of these codes. Figures 4 through 8, at the end of the Users' Guide, are the subdivision maps.

Item 4, COUNTY CODE. The three-character code for the county or parish. For all States except Alaska this is the Federal Information Processing Standards (FIPS) county code, as presented in FIPS publication 6-3 dated December 15, 1979 and its amendments. As Alaska has no counties, the FCML uses the U.S. Geological Survey 1° x 3° quadrangles for Alaska and the three-digit pseudo-county codes assigned to them by the American Petroleum Institute. Codes used for fields located in State or Federal offshore areas are: Offshore-State, 990; Offshore-Federal, 995; Offshore-General, 999.

Item 5, COUNTY NAME. The county or parish name (23-character limit) as defined in FIPS publication 6-3 for all State onshore areas except Alaska. For Alaska, the name associated with the USGS 1° x 3° quadrangle is used. Table 3 on page 16 is a listing of the pseudo-county codes and names for Alaska. If the field is in an offshore area, see the list in Item 4 above.

Item 6, FIELD DISCOVERY YEAR. The four-digit year of first discovery of oil or gas in this field, if it is known. In the case of combined fields, this is the earliest date among the formerly separate fields.

Item 7, FIELD TYPE. The three-character block giving the type of hydrocarbon found in the field using the symbols defined below.

Symbol	Meaning of Symbol
ONA	Oil, nonassociated gas, and associated-dissolved gas are present.
ON	Oil and nonassociated gas present; associated-dissolved gas absent.
N	Nonassociated gas present; oil and associated-dissolved gas absent.
O	Oil present; nonassociated gas and associated-dissolved gas absent.
OA	Oil and associated-dissolved gas present; nonassociated gas absent.
Blank	Type of hydrocarbon is unknown.

Item 8, REMARKS. This is a 23-character entry specifying an attribute of the field. Common remarks are:

- AKA Field is also called by another name, i.e., Also Known As. The year (YY) it became known as this field also may shown (AKA JOHN SMITH 71).
- COMB Field combined with another field. The year (YY) also may be shown after the combined field code (COMB 123456 78).
- LBI Although listed in State offshore, this field and block are located Landward of the Barrier Islands (see BRETON SOUND BLK 18).
- PBI Used when referring to offshore blocks. Part of Block In will reference another offshore field code (PBI 921300) in which a portion of this block is included (i.e., portions of this block occur in two different fields).
- STOR Field used to store natural gas or it is a DOE strategic oil reserve. The storage field will be gas unless the REMARKS section includes an entry such as DOE OIL. The year (YY) it was designated a storage field is shown in parentheses following the STOR label (STOR (69) AQF). AQF is used in conjunction with STOR to signify aquifer gas

storage field. ABD signifies abandonment of storage operations.

UNIT An area made up of a group of leases (either State or Federal). It may or may not include a field and it may be composed of one or more fields.

Alias Field Record

Item 1, ALIAS FIELD CODE. The six-digit field name code assigned to this alias field name, printed in italics.

Item 2, ALIAS FIELD NAME. The alias field name (26-character limit), printed in italics.

Item 3, STATE POSTAL ABBREVIATION and STATE SUBDIVISION CODE. Same as Master Field Record, *Item 3.*

Item 4, COUNTY CODE. Same as Master Field Record, *Item 4.*

Item 5, COUNTY NAME. Same as Master Field Record, *Item 5.*

Item 6, CROSS-REFERENCE. This is the identification of the master field code and field name which should be used in place of the alias name listed in Item 2 of this record. This item consists of the label “Alias For:” followed by the correct six-digit field name code and the correct (i.e., current) field name.

Item 7, ALIAS TYPE. The code indicating type of alias (five-character limit). It is present only for alias fields. The types of alias codes are:

ALTER	This field name is an alternative for the official field name. The correct name and code follow “Alias For:”.
BLOCK	This offshore field extends into more than one offshore block. This offshore block name is not the one for which the field is named. The block for which the field is named follows “Alias For:”.
COMB	This field has been combined with another field which is listed after “Alias For:”.
MULTI	This offshore lease block has portions of two or more fields in it. In the FCML, the record is listed once for each field to which it is aliased so that appropriate cross reference is made.
RENAM	This field has been renamed. The new name follows “Alias For:”.
SPLIT	This field has been split into two or more fields, none of which retains this name. One of the new

fields is listed after “Alias For:”. Contact the Field Code Coordinator for the additional fields and information relating to this alias field.

Field Code Index

In the Field Code Index, the field codes, State abbreviations, and associated field names are listed in ascending field code order. If a field name occurs in more than one State, the names are sorted in alphabetic State abbreviation order.

The field codes are arranged in four columns per page, as shown in Figure 3 on page 17. As the six-digit field code relates directly to the particular field name, there is only one listing in this section per State/field code combination, regardless of the number of counties within that State in which it occurs.

The Index is intended for quick reference only. All detailed information is included in the Oil and Gas Field Code Master List section.

Coalbed Methane Field List

A dramatic rise in coalbed methane’s share of natural gas production has heightened interest in those fields with coalbed methane potential. In Table 4 on page 18, Coalbed Methane Fields, the field name, field code, county code and name, and State are given for those fields currently productive or with drilling activity.

Storage Fields

Storage fields have been developed in many States. Some were developed in existing, official oil and/or gas fields. All storage fields are listed in Table 5 on page 20. In certain States, the storage portion of a field or pool has been given a different name. In this case, the storage field name is carried on the FCML as an alias to the official field name. The storage field names which are aliases are listed in both Table 5 and the FCML in *italics*. These alias field names and codes in *italics* may only be used in filing Form EIA-191, “Underground Gas Storage Report”.

Fields Located in Multiple Jurisdictions

Table 6, Fields Located in Multiple Jurisdictions, at page 26, indicates those oil and/or gas fields which cross State boundaries. In developing the summary statistics on page 1, a

field is only counted once, no matter how many counties or States it is in.

Outer Continental Shelf Planning Areas

Gulf of Mexico Outer Continental Shelf statistics published by the Minerals Management Service (MMS) follow the boundary lines of the Western, Central, and Eastern MMS Planning Areas, shown respectively in Figures 9, 10, and 11.

In order that reports developed from the *U.S. Crude Oil, Natural Gas, and Natural Gas Liquids Reserves* track the reporting by MMS, fields currently found in the Garden Banks leasing area (GB), and those which may be found in GB or in the Keathley Canyon leasing area, are listed in the FCML as Texas Federal Offshore rather than Louisiana-South Federal Offshore.

Note: The State of Alaska does not have counties that can be used for field identification. Areas identified by U. S. Geological Survey quadrangles have been assigned codes by the American Petroleum Institute for use as pseudo-counties. These three-digit codes are analogous to the usual "county code".

Glossary

This Glossary defines many of the technical terms used in this report.

Crude Oil: A mixture of hydrocarbons that exist in the liquid phase in natural underground reservoirs and remain liquid at atmospheric pressure after passing through surface separating facilities. Crude oil may also include:

- Small amounts of hydrocarbons that exist in the gaseous phase in natural underground reservoirs but are liquid at atmospheric pressure after being recovered from oil well (casinghead) gas in lease separators, and that subsequently are commingled with the crude stream without being separately measured.
- Small amounts of nonhydrocarbons produced with the oil.

Field: An area consisting of a single reservoir or multiple reservoirs all grouped on or related to the same individual geological structural feature and/or stratigraphic condition. There may be two or more reservoirs in a field which are separated vertically by intervening impervious strata, or laterally by local geologic barriers, or by both. (See **Reservoir**)

Field Area: A geographic area encompassing two or more pools that have a common gathering and metering system, the reserves of which are reported as a single unit. This concept applies primarily to the Appalachian region. (See **Pool**)

Field Discovery Year: The calendar year in which a field was first recognized as containing economically recoverable accumulations of oil and/or gas.

Natural Gas: A mixture of hydrocarbon compounds and small quantities of various nonhydrocarbons existing in the gaseous phase or in solution with crude oil in natural underground reservoirs at reservoir conditions. The principal hydrocarbons usually contained in the mixture are methane, ethane, propane, butane, and pentane. Typical nonhydrocarbon gases which may be present in reservoir natural gas are carbon dioxide, helium, hydrogen sulfide, and nitrogen. Under reservoir conditions, natural gas and the liquefiable portions occur either in a single gaseous phase in the reservoir or in solution with crude oil and are not distinguishable at the time as separate substances.

Pool: In general, a reservoir. In certain situations a pool may consist of more than one reservoir. (See **Field Area**)

Reservoir: A porous and permeable underground formation containing an individual and separate natural accumulation of producible hydrocarbons (oil and/or gas) which is confined by impermeable rock or water barriers and is characterized by a single natural pressure system.

Subdivision: A prescribed portion of a given State of other geographical region defined in this publication for statistical reporting purposes.
