Grand Challenge Status

D. Olson

19 June 1998

RCF Mtg, BNL

Outline

- Reminder: “What is the GC project?”
- T3E usage status
- The GC data access software status
- MDC1 preparations
- demo

Reminder:
"What is the Grand Challenge Project?"

- 3-year (FY97,98,99) project funded by DOE MICS (~ 4 FTE) and HENP effort
- Collaboration between CS & HENP
- In progress since March 1997
- Simulated data production on T3E
- Data access at RHIC (prototype or stepping stone for LHC)

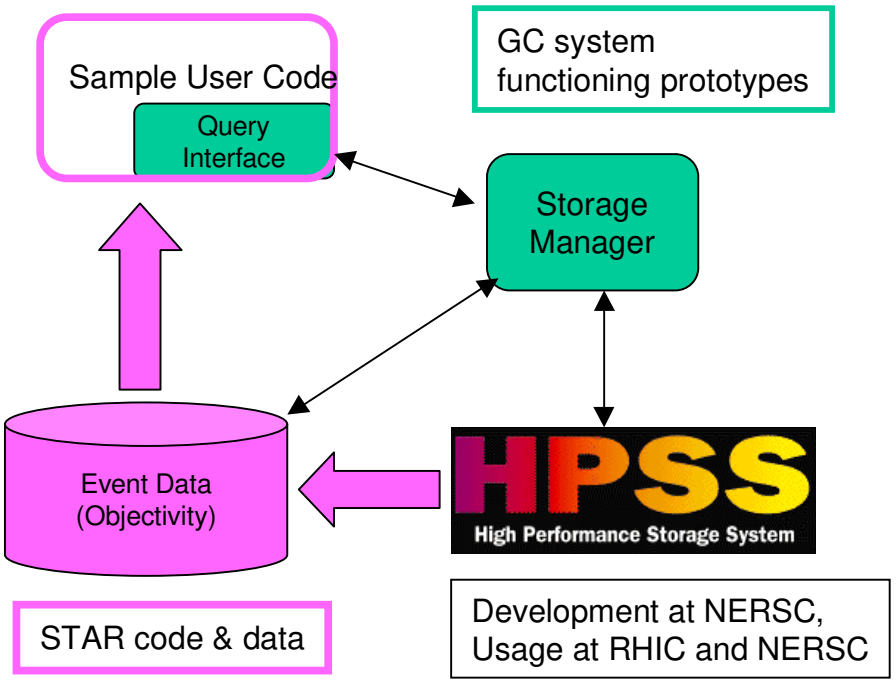
T3E Status

- mcurie.nersc, jaromir.psc
  - event generators running - venus, rqmd, hijing
  - CERNlib ported & installed (27 May 1998)
    - (thanks to Mark Durst, Pavel Nevski, others)
  - STAR GEANT runs on mcurie (May 98)
    - (same acknowledgements)
  - STARProd, simulations production, getting underway

Data access software status

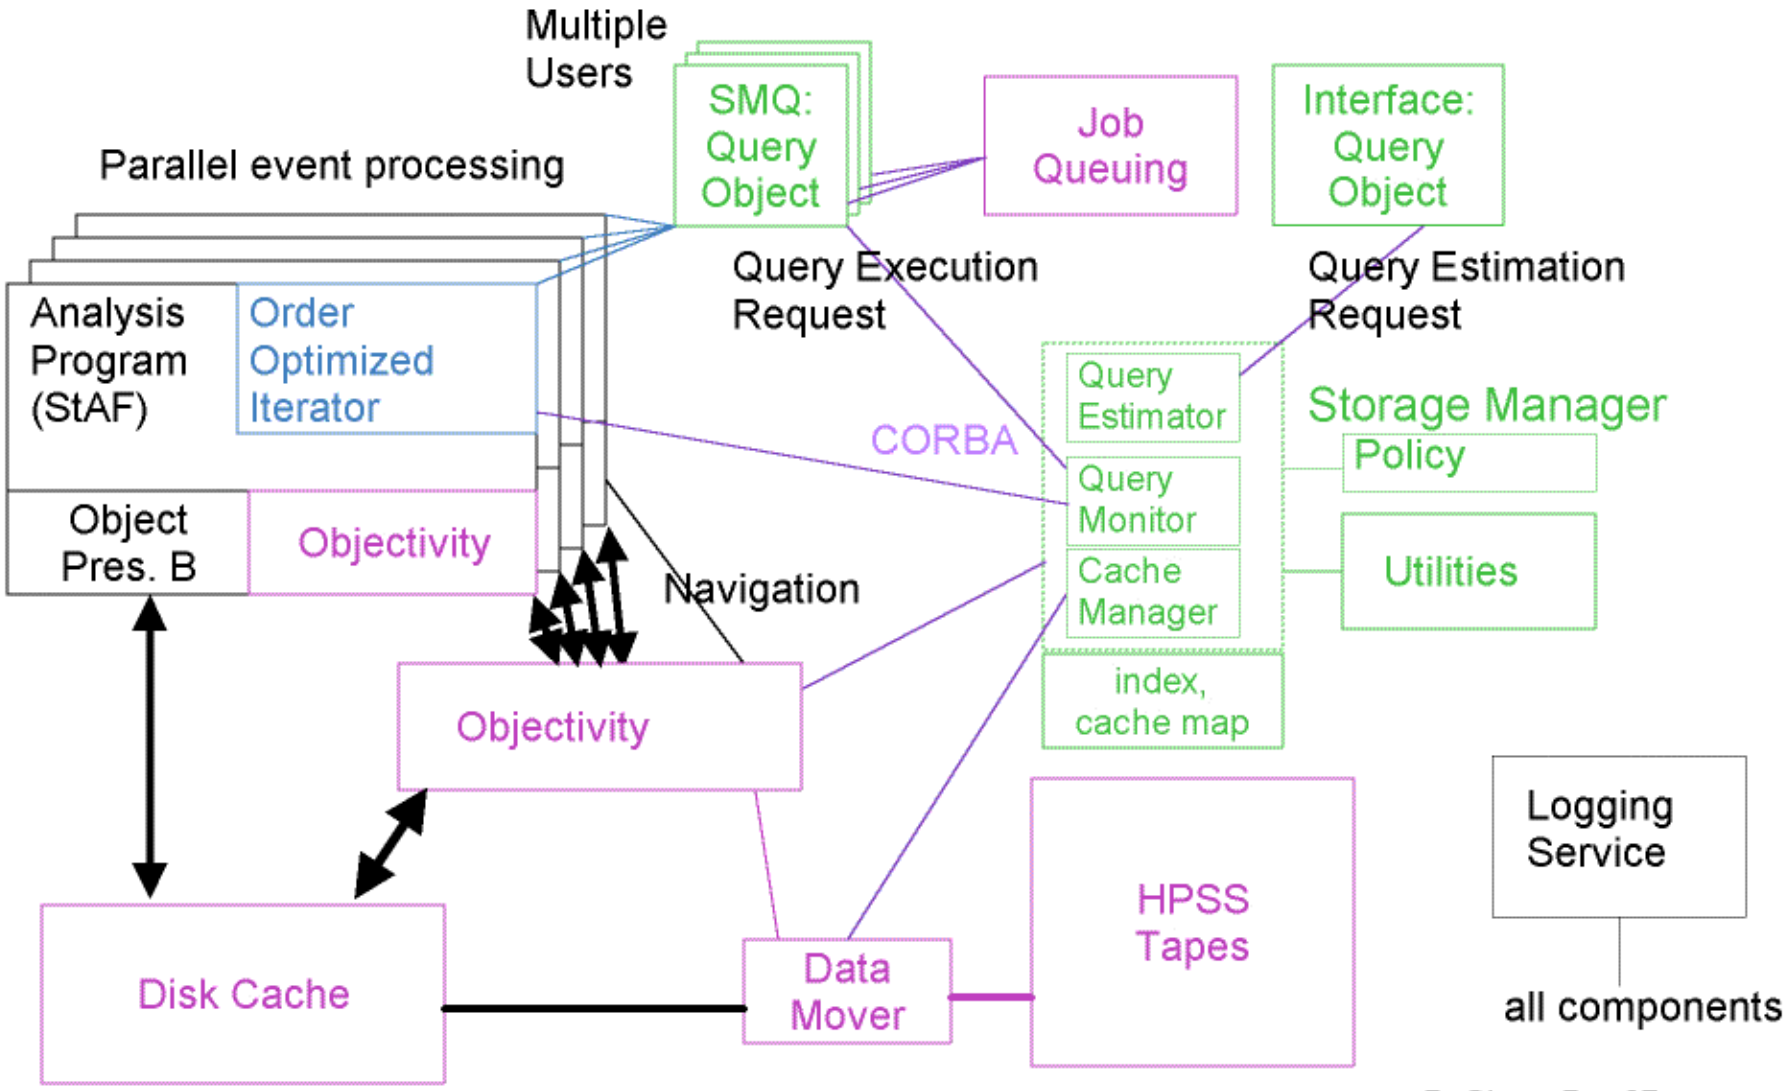
- Storage manager & client code
  - first execution of integrated components 15 May 1998
  - code cleanup and organization proceeding
  - preview & demo at BNL 17 June 1998
  - integration with analysis code - next
  - data mining component of MDC1 milestone for RCF

Data access s/w (simple view)

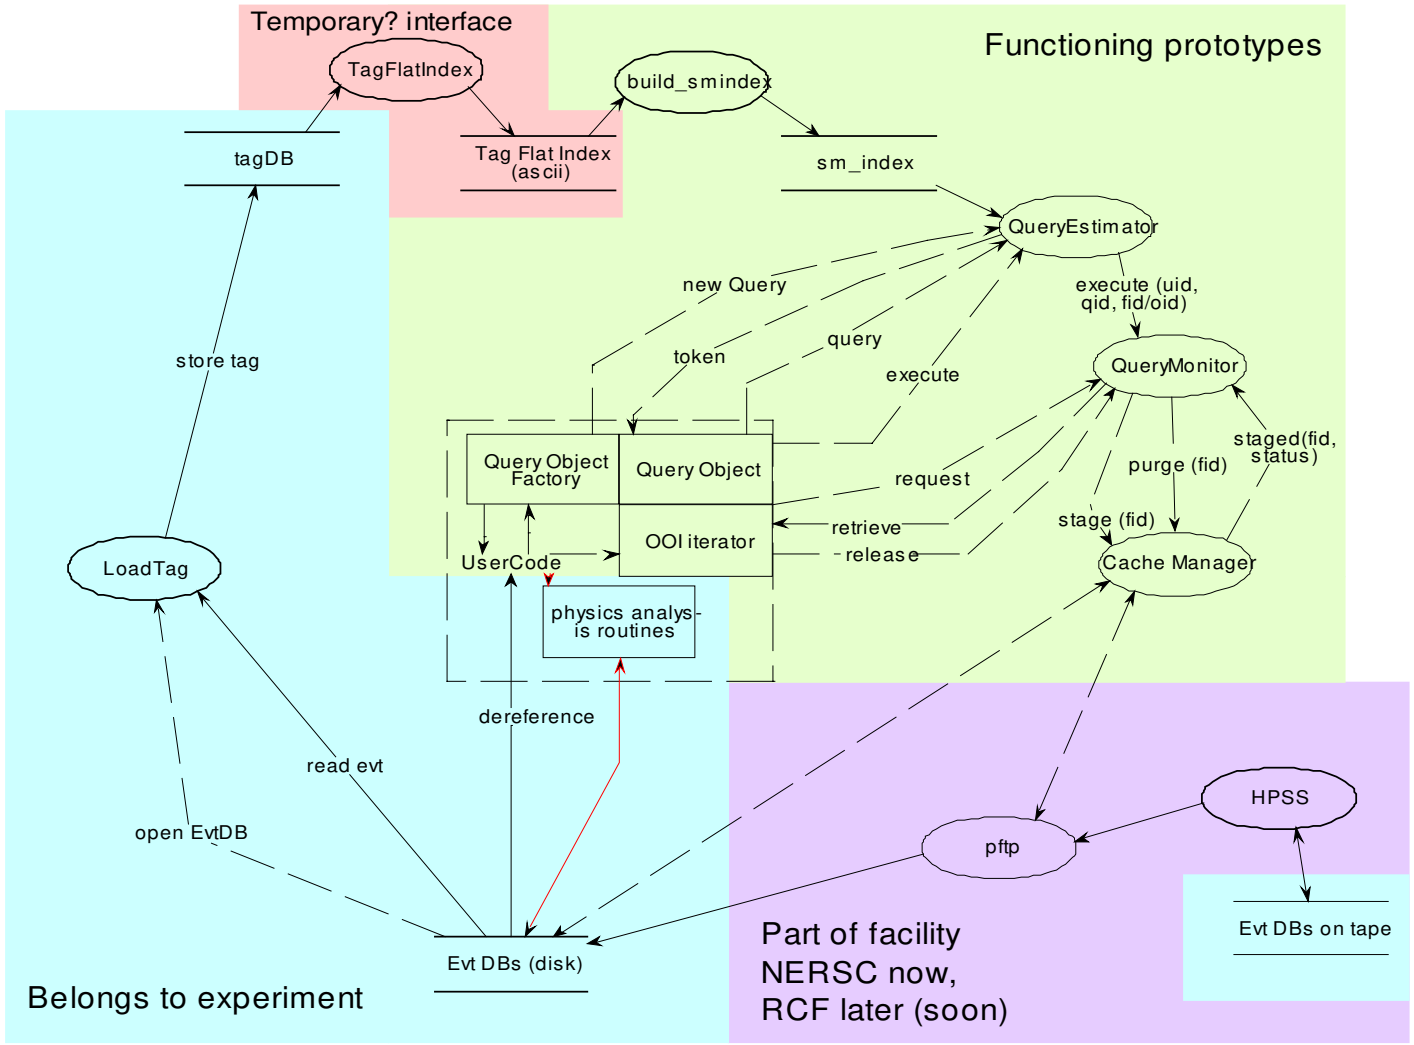


- key developers
  - query estimator
    Henrik Nordberg
  - query monitor
    Alex Sim
  - cache manager
    Luis Bernardo
  - query object
    Jeff Porter
  - order-optimized iterator
    Dave Malon
  - tagDB
    Dave Zimmerman,
    Mark Pollack

RHIC Analysis Architecture



Current Status of GC Software



Load Tag
(example diagram)

Load tagDB

Description

Select EvtDB

open EvtDB

Scan

Iterate oParticles

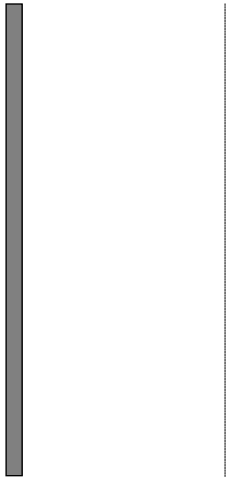
read event

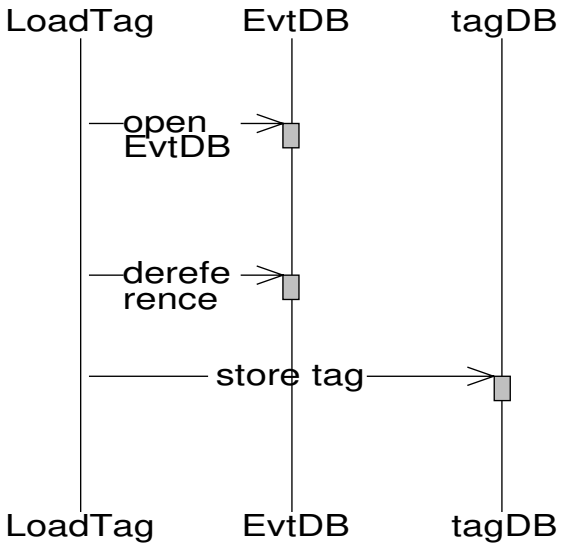
compute tag

store tag

End Iteration

End EvtDB

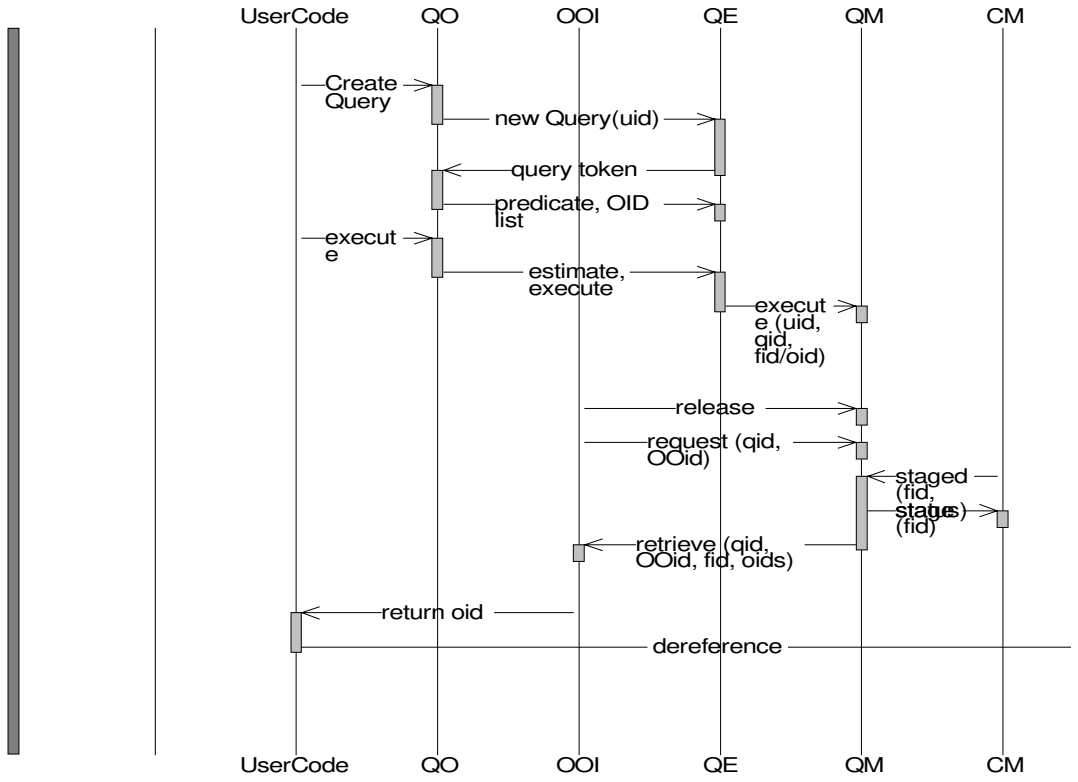




Query execution scenario

Query Execution

Description
New Query
create query object
bind to qe and register new query object
query token is returned
issue predicate
user decides to execute
execute query
qe tells qm to execute qid
iterate over query results
next
release previous file
request oid sublist
file is staged
stage file
retrieve oid sublist
return next
return oid ref
retrieve this event and process it
End Iteration
End Query



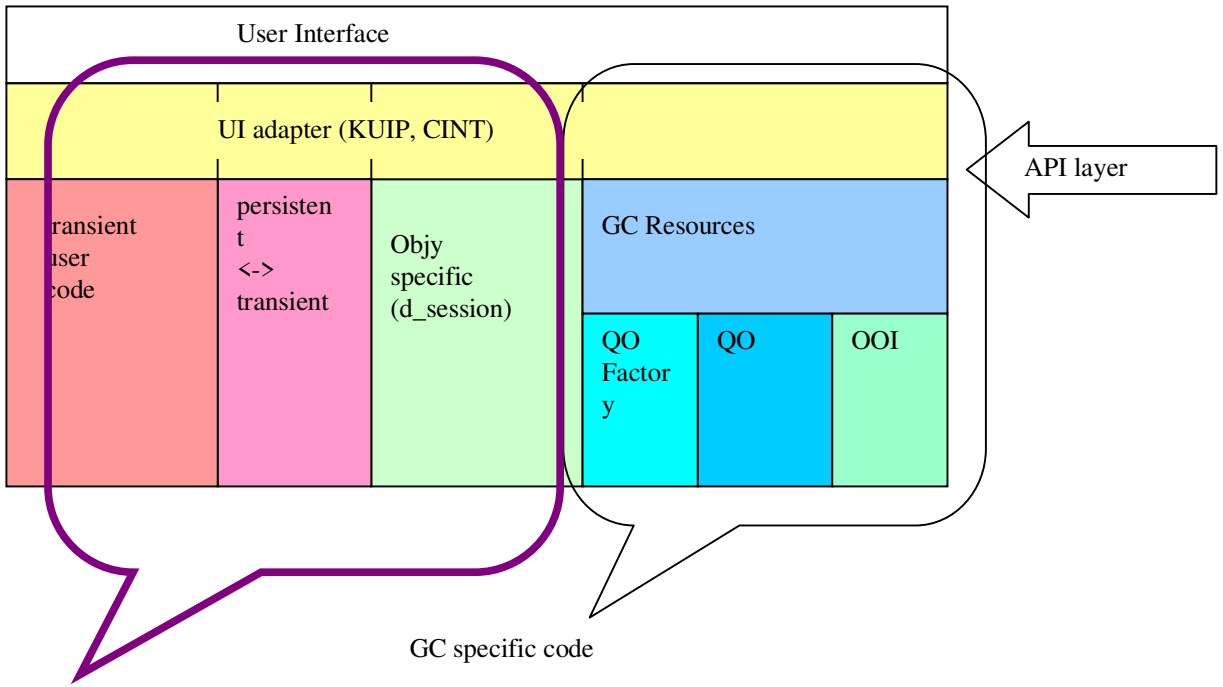
Features (MDC1)

- Extract tag parameters for index
  - base attributes & computed values
- Query estimation
  - # events, # files (disk, tape), # seconds
- Query execution
  - order optimization (sort OID's by file)
  - return OID's as files are staged
- Cache management
  - pre-fetch files
  - coordinate multiple queries

In Progress

- Robustness testing, hardening
- Add logging, monitoring of GC components
- Connection to real analysis code (connect Objectivity to analysis code)
- Define MDC scenarios for measurements
- Data mining scenarios of experiments

Interfacing to analysis code



Needs to be done

Sample driver code for client

http://www-rnc.lbl.gov/GC/meetings/misc/do19jun98/TagQuery4.C

http://www-rnc.lbl.gov/GC/meetings/misc/do19jun98/Usercode.C

cmanager
Will start thread to stage file auau_minb_6601_6900.db with FID 245 and size 557
87520 bytes.
Stage request for file with FID 245 passed to thread.
Thread 20 will transfer file auau_minb_6601_6900.db of size 55787520 bytes.
QM asked for disk space left: 531 MBs.
Will start thread to stage file auau_minb_2101_2400.db with FID 228 and size 593
26464 bytes.
Stage request for file with FID 228 passed to thread.
Thread 23 will transfer file auau_minb_2101_2400.db of size 59326464 bytes.
File auau_minb_6601_6900.db with FID 245 staged.
QM informed that the file with FID 245 was staged.
QM asked for disk space left: 475 MBs.
Will start thread to stage file auau_minb_5101_5400.db with FID 239 and size 518
55360 bytes.
Stage request for file with FID 239 passed to thread.
Thread 26 will transfer file auau_minb_5101_5400.db of size 51855360 bytes.
File auau_minb_2101_2400.db with FID 228 staged.
QM informed that the file with FID 228 was staged.
QM asked for disk space left: 426 MBs.
Will start thread to stage file auau_minb_601_900.db with FID 243 and size 52977
664 bytes.
Stage request for file with FID 243 passed to thread.
Thread 29 will transfer file auau_minb_601_900.db of size 52977664 bytes.
