Abstract

This document describes the contents of the calibration parameter file (CPF) generated by the Image Assessment System (IAS), an element of the Landsat 7 Ground Segment. The IAS periodically performs radiometric and geometric calibration and updates the CPF. This file is stamped with applicability dates and sent to the Earth Resources Observation System (EROS) Data Center (EDC) Distributed Active Archive Center (DAAC) for storage and eventual bundling with outbound Level 0 reformatted (0R) products. The CPF also is sent to international ground stations via the Landsat 7 Mission Operations Center. The CPF supplies the radiometric and geometric correction parameters required during Level 1 processing to create superior products of uniform consistency across the Landsat 7 system.

Section 1. Introduction

This document describes the contents of the calibration parameter file (CPF) generated by the Image Assessment System (IAS), an element of the Landsat 7 Ground Segment. The IAS is responsible for offline assessment of image quality to ensure compliance with the radiometric and geometric requirements of the spacecraft and the Enhanced Thematic Mapper Plus (ETM+) sensor throughout the mission's life.

In addition to its assessment functions, the IAS is responsible for the radiometric and geometric calibration of the Landsat 7 satellite and ETM+. The IAS periodically performs radiometric and geometric calibration and updates the CPF. This file is stamped with applicability dates and sent to the Earth Resources Observation System (EROS) Data Center (EDC) Distributed Active Archive Center (DAAC) for storage and eventual bundling with outbound Level 0 reformatted (0R) products. The CPF also is sent to international ground stations via the Landsat 7 Mission Operations Center. The CPF supplies the radiometric and geometric correction parameters required during Level 1 processing to create superior products of uniform consistency across the Landsat 7 system.

1.1 Document Organization

Section 1 provides an introduction to the CPF. It describes the CPF structure and language; the CPF updates, time stamps, and file-naming conventions; and the attributes used to characterize the calibration parameters. Section 2 contains a table that lists and describes the actual CPF parameters. Section 3 presents the syntax of the CPF Object Description Language (ODL) and a CPF construct that illustrates the actual appearance of the file. The to be submitted (TBS) items in Sections 2 and 3 indicate where actual values for the parameters are not yet known. This document will not be updated to remove the TBS items, as the actual prelaunch and postlaunch CPFs will contain the most recent and accurate data available for these parameters. Following Section 3 is a list of the acronyms and abbreviations used in this document.

1.2 Applicable Document

A useful ODL document is the Jet Propulsion Laboratory (JPL), California Institute of Technology's *Planetary Data System Standards Reference, Version 3.2*, Chapter 12, Object Description Language Specification and Usage, July 24, 1995.

This document can be accessed online at URL http://pds.jpl.nasa.gov/stdref/chap12.htm.

1.3 File Structure

All parameters are stored as American Standard Code for Information Interchange (ASCII) text using the ODL syntax developed by JPL. ODL is a tagged keyword language developed to provide a human-readable data structure to encode data for simplified interchange. The ODL interpreter developed by JPL may, in certain cases, provide for the handling of lexical elements (for example, building blocks) that are included in the Consultative Committee for Space Data

Systems (CCSDS) specification of the Parameter Value Language (PVL). PVL is a superset of ODL. The IAS CPF is a pure ODL implementation without any PVL extensions.

The body of the file is composed of two statement types:

1. Attribute assignment statement used to assign values to parameters
2. Group statements used to aid in file organization and enhance parsing granularity of parameter sets

ODL details can be found in the *Planetary Data System Standards Reference*.

1.4 Calibration Parameter File Updates

The IAS will update and distribute the CPF at least every 90 days. Updates will likely be more frequent during early orbit checkout and also will occur between the regular 90-day cycles, as necessary. Irregular updates, however, will not affect the 90-day schedule. The timed release of a new CPF must be maintained because of the Universal Time Code corrected (UT1) time corrections and pole wander predictions included in the file. These parameters span a 180-day interval time centered on the effective start date of the new IAS CPF.

1.4.1 Time Stamps

The CPF is time-stamped with an effective date range. The first two parameters in the file—Effective_Date_Begin and Effective_Date_End—designate the range and are in YYYY-MM-DD format. The Effective_Date_End for the most recent parameter file is its Effective_Date_Begin plus 90 days. After this date, the file is without applicable UT1 time predictions. The Earth Observing System Data and Information System (EOSDIS) Core System (ECS) maintains a database of CPF names and their effective dates for associating product orders with the appropriate parameter files. The parameter file that accompanies an order has an effective date range that includes the acquisition date of the image ordered.

1.4.2 File Naming Conventions

Through the course of the mission, a serial collection of CPFs will be generated and sent to the EDC DAAC for coupling to 0R distribution products. The probability exists that a CPF will be replaced due to improved calibration parameters for a given period or perhaps file error. The need for unique file sequence numbers becomes necessary as file contents change. The following file-naming procedure is used by the IAS to name the CPF.

L7CPFyyyymmdd_yyyymmdd.nn

where L7 = Constant for Landsat 7

CPF = 3-letter CPF designator

yyyy = 4-digit effectivity starting year

mm = 2-letter effectivity starting month

dd = 2-letter effectivity starting day

_	=	Effectivity starting/ending date separator
yyyy	=	4-digit effectivity ending year
mm	=	2-letter effectivity ending month
dd	=	2-letter effectivity ending day
nn	=	Sequence number for this file

As an example, suppose four calibration files were created by the IAS on 90-day intervals and sent to the EDC DAAC during the first year of the mission. Further suppose that the first file was updated twice and the second and third files were updated once. The assigned file names would be as follows:

File 1 L7CPF19980601_19980829.00
L7CPF19980601_19980829.01
L7CPF19980601_19980829.02

File 2 L7CPF19980830_19981127.01
L7CPF19980830_19981127.02

File 3 L7CPF19981128_19990225.01
L7CPF19981128_19990225.02

File 4 L7CPF19990226_19990526.01

It is worth noting the **00** sequence number assigned to the original CPF. This reserve sequence number uniquely identifies the prelaunch CPF. Sequence numbers for subsequent time periods all begin with 01. New versions or updates are incremented by one.

This example assumes the effectivity dates do not change. The effectivity date range for a file can change, however, if a specific problem (e.g., detector outage) is discovered somewhere within the nominal 90-day effectivity range. Assuming this scenario, two CPFs with new names and effectivity date ranges are spawned for the time period under consideration. The **effective_date_end** for a new pre-problem CPF would change to the day before the problem occurred. The **effective_date_begin** remains unchanged. A post-problem CPF with a new file name would be created with an **effective_date_begin** corresponding to the imaging date the problem occurred. The **effective_date_end** assigned would be the original **effective_date_end** for the time period under consideration. New versions of all other CPFs affected by the erroneous parameter also would be created.

Using this example, suppose a dead detector is discovered to have occurred on January 31, 1999. Two new CPFs are created that supersede the time period represented by file number three, version 2, and a new version of file number four is created. The new file names and sequence numbers become

1.5 File Content Description

Each parameter entry is characterized by five attributes:

1. Parameter group—Identifies a related set of parameters.
2. Parameter name—Uniquely identifies and describes the content of each parameter.
3. Value type—Describes the parameter as either static or dynamic. A static value remains unchanged over the mission's life. A dynamic value will change or has the potential to change over the life of the mission. Significant changes to dynamic values trigger a CPF update.
4. Data type—Referred to using Hierarchical Data Format (HDF) number type nomenclature, type#, where type is either char (character), int (integer), or float (floating point), and # is a decimal count of the number of bits used to represent the data type. The type mnemonics int and char may be preceded by the letter u, indicating an unsigned value. For example, the data type uint32 refers to an unsigned 32-bit integer value. Data types relevant to the CPF are as follows:

Data Type	HDF Nomenclature
8-bit character	char8
8-bit unsigned integer	uint8
16-bit signed integer	int16
32-bit signed integer	int32
32-bit floating point number	float32
64-bit floating point number	float64

5. Description—Short description of the parameter, its format, and its nominal or expected value(s).

Section 2. CPF Parameters

The following table lists the CPF parameters.

Parameter Groups	Parameter Name	Value Type	Data Type	Description	LPS Need	LPG Need	Prelaunch Source
FILE_ATTRIBUTES	Effective_Date_Begin	Dynamic	char8	Effective start date for this file Valid format: YYYY-MM-DD, where YYYY = 1998-2050, MM = 01-12, and DD = 01-31	Yes	Yes	IAS
FILE_ATTRIBUTES	Effective_Date_End	Dynamic	char8	Effective end date for this file Valid format: YYYY-MM-DD, where YYYY = 1998-2050, MM = 01-12, and DD = 01-31	Yes	Yes	IAS
FILE_ATTRIBUTES	CPF_File_Name	Dynamic	char8	Original file name assigned by IAS Valid format: L7CPFyyyymmdd-yyyymmdd.nn where yyyymmdd = effective start date and effective end date, respectfully, and nn = incrementing version for within a quarter (01-99)	Yes	Yes	IAS

Notes: 1. Telemetry value contains the power supply temperature for "active" Mux, which could be either Mux 1 or Mux 2.

2. Telemetry value contains the electronics temperature for "active" Mux, which could be either Mux 1 or Mux 2.

3. Telemetry value contains current (mA) of primary on-board calibration lamp (telemetry name = TECLAMP1I)

4. Telemetry value contains current (mA) of secondary on-board calibration lamp (telemetry name = TECLAMP2I)

Section 3. CPF ODL

3.1 Introduction

The ODL syntax employs the following conventions:

- Parameter definition is in the form of parameter = value.
- Value can be either a scaler or an array. Array values are enclosed in parentheses and are separated by commas.
- Parameter arrays can and do exist on multiple lines.
- A carriage return <CR> and line feed <LF> end each line in the file.
- Blank spaces and lines are ignored.
- Each line of comments must begin with /* and end with */, including comments embedded on the same line as a parameter definition.
- Quotation marks are required for values that are text strings, including single characters. The exceptions to this rule are the GROUP and END_GROUP identifiers or values, which do not use quotation marks. The first two parameters in the file, Effective_Date_Begin and Effective_Date_End, also do not have quotations. ODL recognizes dates if they follow prescribed formats.
- Case is not significant, but uppercase is used for GROUP names to aid in readability.
- Indentation is not significant but is used for readability.
- The reserve word END concludes the file.

Unavailable parameter values are denoted by TBS (to be supplied). Most will be derived during prelaunch instrument and spacecraft testing and analysis. Formats for TBS numerical parameters are accurate; however, negative signs are not explicitly stated. A data dictionary that declares each parameter's data type and value range must be defined.
