

APPENDICES

APPENDIX A

Description

Table A-1 lists all streams within the Central California Coast and Southern Oregon/Northern California Coasts coho salmon ESUs for which we found some historical (pre-1989) or current (1989-2000) record of coho salmon occurrence.

The list is arranged geographically according to the following conventions. River basins are listed from north to south according to where the eventual outlet stream or river enters the Pacific Ocean. Within a basin, tributary streams and rivers are listed in the order that they enter the mainstem as one moves upstream from the river mouth. An identical hierarchy is employed for tributaries, with streams listed in order from mouth to headwaters. Where a river splits into two or more major forks of comparable area, we listed the north or west fork first followed by the south or east fork. Where two forks drain areas of unequal size, the smaller drainage is treated as the tributary.

Stream names were derived from 7.5 minute United States Geologic Survey (USGS) topographic maps where possible. Frequently, we found data records in which streams were referred to by alternate names or spellings. These alternative spellings are listed in parentheses next to the name found on USGS maps. We also found records of coho salmon occurring in streams that we could not locate on USGS maps. In most cases, these names are likely local names given to unnamed tributaries. In these instances, a parenthetical (location?) is placed after the name, indicating that we believe the stream lies near to where it is placed in the table but that the precise location could not be determined from the information available to us.

Township (T), range (R), section (S), quarter section ($\frac{1}{4}$), and quarter of quarter sections ($\frac{1}{4}$ of $\frac{1}{4}$) are given where such information was readily available from the sources we used. Some errors were found in published TRS descriptions and these were changed; however, we did not check the accuracy of all geographic coordinates.

The historical sources listed represent both original documents and sources cited in various reviews including Brown and Moyle (1991), Hassler et al. (1991), Adams et al. (1999), and Kier Associates (1999). The bibliography at the end of the appendices denotes whether we have examined the original source or whether we rely on the work of these other authors in documenting historical coho occurrence. If the cell for historical sources is blank, it means that the first record of presence we found was between the years 1989 and 2000, inclusive. It should be noted that we found several inconsistencies in records among authors, often due to the fact that certain common stream names are found multiple times within a watershed. We attempted to resolve these discrepancies as much as possible, but there are still likely a few omissions or duplications within the stream list.

Finally, these appendices will be continuously updated as new information becomes available. We encourage readers of this report who discover errors or omissions in this list to contact Dr. Brian Spence at the following address:

APPENDIX B

Description

Table B-1 shows modern (1989-2000) presence-absence information for all streams within the Central California Coast and Southern Oregon/Northern California Coasts coho salmon ESUs for which we found some historical or current record of coho salmon occurrence. The geographical organization and naming conventions for this table are identical to those used in Appendix A.

The values in the table are coded as follows:

P (upper case) = stream surveyed and juvenile coho salmon found to be present in the year indicated; the number of fish either >5 or unknown.

p (lower case) = stream surveyed and 5 or fewer juvenile coho salmon observed

A = stream surveyed, no juvenile coho found

{ } = adult survey

[] = literature report; date of actual observation of coho salmon presence or absence not known.

Adult spawning surveys often spanned a portion of two calendar years. In this table, we attribute presence or absence only to the first year of a spawning season (i.e., if coho salmon are observed during the 1991-1992 spawning season, a value of {P} is entered only in 1991.

For all analyses discussed in the text, only data for which year of sampling was known (i.e., all values not in square brackets) were included.

Table B-1. Records of modern occurrence of coho salmon in California streams by year. P = presence of juvenile; p = 5 or fewer juveniles observed; A = absence; { } = adult survey; [] = year of observation unknown, date is publication date.
